v.4

A

GENERAL HISTORY

OF THE

DICHLAMYDEOUS PLANTS,

COMPRISING COMPLETE

DESCRIPTIONS OF THE DIFFERENT ORDERS;

TOGETHER WITH THE

CHARACTERS OF THE GENERA AND SPECIES, AND AN ENUMERATION OF THE CULTIVATED VARIETIES;

THEIR PLACES OF GROWTH, TIME OF FLOWERING, MODE OF CULTURE, AND

USES IN MEDICINE AND DOMESTIC ECONOMY;

THE SCIENTIFIC NAMES ACCENTUATED, THEIR ETYMOLOGIES EXPLAINED, AND THE CLASSES AND ORDERS

ILLUSTRATED BY ENGRAVINGS,

AND PRECEDED BY INTRODUCTIONS TO THE LINNÆAN AND NATURAL SYSTEMS,

AND A GLOSSARY OF THE TERMS USED:

THE WHOLE

ARRANGED ACCORDING TO THE NATURAL SYSTEM.

BY GEORGE DON, F.L.S.

IN FOUR VOLUMES.

VOL. IV.—COROLLIFLORÆ.

MISSOURI BOTANIGAL
RECEIVED
APR 26 1923
GARDEN LIBRARY

ADVERTISEMENT.

THE Proprietors take this opportunity of explaining the circumstances under which they find themselves reluctantly obliged to close the Work at its present stage. At the commencement of the undertaking the Editor arranged with them to complete it in *Four Volumes;* but when the present or fourth volume was printed, he informed them for the first time, to their surprise, that his materials had proved so much more voluminous than he anticipated, that the descriptions of the remaining plants would fill *more than two additional volumes* of the same extent. They are compelled to add, that the circulation of the Work has hitherto been too limited to afford them any prospect of reimbursement of the large additional expense which would be incurred if they proceeded to complete the Work; an expense which they had not originally contemplated. As, however, the Work has been compiled upon the *Natural System,* the description of that division of the science which is contained in the four published volumes is complete, and the volumes are consequently not, in this respect, rendered imperfect by the absence of the remaining two, since they contain a complete account of the *Dichlamydeous* plants. In justice to the Editor they feel bound to add, that he has spared no labour to render the Work as comprehensive and perfect as possible; and they are confident that no publication has hitherto appeared in this country which contains nearly so large a compass of valuable information upon that division of Botany of which it treats. They can only account for the confined circulation which the present Work has hitherto met with in the altered taste of the day for treatises of a less recondite and extensive nature.

The Proprietors would be ready to complete the Work if they could hope for

sufficient encouragement from the Public to induce them to proceed in this unusually expensive undertaking.

At the end of this volume new title-pages for the four volumes are added, in accordance with their contents, as a "*General History of the Dichlamydeous Plants.*"

London, February, 1838.

INDEX TO THE FOURTH VOLUME,

COMPRISING THE

SYSTEMATIC AND ENGLISH GENERIC NAMES, AND THE ENGLISH AND SYSTEMATIC SYNONYMES.

*** In this Index the systematic names used, and the English names in common use, are in *Roman letters;* the synonymes in *Italics;* the names of Classes, Sub-classes and Orders in *large capitals;* and the names of Sub-orders and Tribes in *small capitals.*

THE

GARDENER'S AND BOTANIST'S DICTIONARY.

SUB-CLASS III.

COROLLÆFLO'RÆ (from *corolla*, and *flos*, a flower.) Corolla monopetalous, or the petals combined into the form of a hypogynous corolla, which is not attached to the calyx. To this sub-class are to be referred all orders which have a monopetalous corolla, with the stamens inserted into it, and a superior ovarium; but those orders with a monopetalous corolla, having the stamens inserted into it and the inferior ovarium, as *Rubiàceæ*, *Ericàceæ*, *Epacrídeæ*, *Campanulàceæ*, *Lobeliàceæ*, *Caprifoliàceæ*, *Loranthàceæ*, &c. are still retained in the sub-class *Calyciflòræ*.

ORDER CXL. SYMPLOCI'NEÆ (this order only contains the genus *Sýmplocos*). D. Don. prod. fl. nep. p. 144.—Guaiacànæ, part 2. Juss. gen. 157.

Calyx 5-parted or 5-cleft (f. 1. *a*.). Corolla monopetalous, rotate (f. 1. *c*.), with a 5 (f. 1. *c*.) -10-parted spreading limb; when 8 or 10, 4 or 5 of which are interior and smaller: imbricate in æstivation. Stamens very numerous, inserted in the tube of the corolla, disposed in 3 or 4 series or rows; filaments cuspidate at the apex, polyadelphous at the base; anthers erect, roundish-elliptic, 2-celled, bursting lengthwise. Ovarium half inferior, 3-5-celled; ovula 4 in each cell, fixed to inner parietes of the cells at various heights, the 2 superior ones peritropous, and the 2 inferior ones pendulous. Style 1; stigma 3-5-lobed. Drupe rather fleshy, crowned by the calyx, containing a 3-5-celled nut; cells 1-seeded; seeds bony. Embryo inverted and furnished with albumen, having a superior radicle.

Trees with alternate branches. Leaves alternate, entire, or serrulated, exstipulate, turning yellow on drying. Flowers axillary, sessile, or pedunculate, almost solitary, conglomerate, or somewhat racemose, white or scarlet, furnished with imbricating bracteas at the base (f. 1. *b*.), sometimes fragrant. The leaves of most of the species are astringent; those of *Sýmplocos tinctòria* are used in America, under the name of *Sweetleaf*, for dyeing yellow; and the bark of *S. racemòsa* is used with mungeet for dyeing red in the East Indies, under the name of *Lohd*.

I. SY'MPLOCOS (*συμπλοκη*, *symploke*, a connection; in reference to the stamens being combined at the base). Lin. gen. 677. Jacq. amer. 166. Swartz, prod. 109. obs. t. 7. f. 1. Juss. gen. 157. L'Herit. in Lin. trans. 1. p. 174. H. B. et Kunth, nov. gen. amer. 3. p. 256. D. Don. prod. fl. nep. p. 144.—Ciponìma, Aubl. guian. 1. p. 226. Cav. diss. 7. p. 370. t. 217. Alstònia, Mut. in Lin. suppl. p. 264.—Hòpea, Lin. but not of Roxb.

LIN. SYST. *Polyadélphia*, *Polyándria*. Character the same as that of the order.

SECT. I. ALSTÒNIA (named in memory of Charles Alston, Professor of Botany in the University of Edinburgh). Corolla 8-10-parted; segments disposed in a double row. Stamens disposed in 3 or 4 series. Drupe half inferior, 3-5-celled; cells 1-seeded.—Species natives of South America.

1 S. ALSTÒNIA (Lher. in Lin. trans. 1. p. 176.) glabrous in every part; leaves roundish-elliptic or oblong, obtuse, rounded at the base, obsoletely crenated at the apex, coriaceous, shining; flowers by threes or fours, sessile. ♄. S. Native of New Granada, near Santa Fe de Bogota and Popayan. Humb. et Bonpl. pl. æquin. 1. p. 181. t. 51. Alstònia theæfórmis, Lin. suppl. p. 264. Habit of *Thèa Bohèa*. Leaves pale green and shining above, and pale beneath, and are employed as tea on account of their slight astringency. Corollas white, 8-10-cleft. Drupe 3-celled.

Alston's Symplocos. Tree 12 to 15 feet.

2 S. CE'RNUA (Humb. et Bonpl. pl. æquin. 1. p. 188. t. 53.) branches glabrous; leaves oblong, bluntish, running into the petioles at the base, serrulated at the apex, coriaceous, glabrous and shining above, pilose on the nerves beneath; flowers solitary, on short pedicels, drooping. ♄. S. Native of Peru, in woods, near the town of Jaen de Bracamoros. Leaves $2\frac{1}{2}$ inches long. Corolla 10-11-parted, white. Ovarium 3-celled.

Drooping-flowered Symplocos. Tree 30 feet.

3 S. COCCÍNEA (Humb. et Bonpl. pl. æquin. 1. p. 185. t. 52.) branches hispid from pili; leaves elliptic-oblong, acuminated, rounded at the base, obsoletely crenulated, membranous, glabrous, shining, pilose on the middle nerve; flowers solitary, almost sessile. ♄. S. Native of Mexico, near Xalapa and elsewhere. Corolla rose-coloured or purplish, silky outside, 10-11-parted, an inch in diameter when expanded. Drupe 5-celled. Stamens disposed in 4 series.

Scarlet Symplocos. Tree tall.

4 S. SERRULA'TA (Humb. et Bonpl. pl. æquin. 1. p. 190. t. 54.) branchlets clothed with rusty hairs; leaves obovate-

oblong, acuminated, rounded at the base, remotely denticulated, membranous, glabrous above, but clothed with adpressed pili beneath; peduncles short, usually 3-flowered. ♄. S. Native of New Granada, in woods near Popayan. Leaves 3½ to 4½ inches long. Corolla white, 6-9-parted, clothed with adpressed hairs outside. Stamens disposed in 3-4 series.

Serrulated-leaved Symplocos. Tree 12 to 15 feet.

5 S. RUFE'SCENS (Humb. et Bonpl. pl. æquin. 1. p. 192. t. 55.) branchlets clothed with rusty hairs; leaves obovate-oblong, much acuminated, rounded at the base, almost quite entire, membranous, glabrous above, and clothed with rusty hairs beneath, the middle nerve hairy; peduncles very short, 2-5-flowered. ♄. S. Native of New Granada, on the Andes about Quindiu. Leaves obsoletely and remotely denticulated, 7 inches long and 2½ broad. Corolla white, silky outside, 5-6-parted (ex Kunth), 7-8-parted (ex Bonpl.). Ovarium 3-5-celled (ex Kunth). Drupe 4-celled (ex Bonpl.).

Rufescent Symplocos. Tree 50 to 60 feet.

6 S. TOMENTÒSA (Humb. et Bonpl. pl. æquin. 1. p. 195.) branchlets clothed with rusty hairs; leaves obovate-oblong, acuminated, rounded at the base, denticulated, rather coriaceous, glabrous and shining above, but clothed with rusty tomentum beneath; peduncles short, 4-7-flowered. ♄. S. Native of New Granada, near Ibague. Flowers sessile. Corolla 10-parted. Ovarium 5-celled.

Tomentose Symplocos. Tree.

7 S. NU'DA (Humb. et Bonpl. pl. æquin. 1. p. 195.) branchlets glabrous; leaves oblong, acutish, cuneated at the base, remotely serrulated at the apex, glabrous above, but rather pilose beneath; peduncles short, 1-flowered. ♄. S. Native of New Granada, in woods, near Loxa. Leaves 2½ to 3 inches long. Drupe oblong, 3-celled, about the size of a small plum.

Naked Symplocos. Tree 12 feet.

8 S.? LIMONCÍLLO (Humb. et Bonpl. pl. æquin. 1. p. 196.) glabrous in every part; leaves oblong, acute at both ends, almost quite entire, shining; flowers racemose. ♄. G. Native of Mexico, in woods near Xalapa. Leaves a little serrulated. Drupe glaucous, containing a 3-4-celled nut (ex Bonpl.).

Limoncillo Symplocos. Tree tall.

9 S. MUCRONA'TA (Humb. et Bonpl. pl. æquin. 1. p. 196.) glabrous in every part; leaves oblong, mucronate, denticulated, coriaceous; peduncles 1-flowered. ♄. S. Native of Mexico, in the woods of Xalapa. Peduncles solitary. Flowers pale red, ex Schlecht.

Mucronate-leaved Symplocos. Tree 12 feet.

10 S. SCHIEDEA'NA (Schlecht. in Linnæa. 8. p. 527.) branches glabrous, angular; leaves large, oblong-elliptic, cuneated at the base, and with a short abrupt acumen at the apex, quite entire, glabrous; flowers axillary, subspicate. ♄. G. Native of Mexico, between Tiocelo and Jicochimalco. The branches are furnished with an elevated, acute line on both sides, from the decurrent bases of the petioles. Leaves 8-10 lines long.

Schiede's Symplocos. Tree.

11 S. MARTINICE'NSIS (Lin. spec. 747.) glabrous; leaves ovate, acute, shining above, rather coriaceous, crenulated; peduncles sub-racemose. ♄. S. Native of Martinico, in woods. Lher. in Lin. trans. 1. p. 175. Swartz, obs. 293. t. 7. f. 1. Jacq. amer. 166. t. 175. f. 68. pict. 81. t. 261. f. 41. Corolla white, 5-cleft. Drupe 5-celled.

Martinico Symplocos. Tree 25 feet.

12 S. CIPONÌMA (Lher. in Lin. trans. 1. p. 175. Meyer. ess. 248.) branches villous; leaves ovate-oblong, entire, villous beneath; peduncles many-flowered. ♄. S. Native of Guiana, where it is called *Ciponìma*. Ciponìma Guianénsis, Aubl. guian. 1. p. 567. t. 226. Cav. diss. 7. p. 371. t. 217. Corolla white, 10-parted. Drupe 5-celled, black.

Ciponima Symplocos. Shrub 7 feet.

13 S. ARE'CHEA (Lher. in Lin. trans. 1. p. 176.) leaves serrated, almost glabrous; peduncles about 5-flowered. ♄. S. Native of Peru, in woods, where it was collected by Dombey, under the name of *Arechea*. Corolla 10-parted? Drupe 5-celled.

Arechea Symplocos. Tree.

14 S. OCTOPE'TALA (Swartz, fl. ind. occ. 3. p. 1287.) leaves ovate, short-acuminated, glabrous, bluntly serrated; pedicels axillary, solitary, towards the tops of the branches; calycine segments 5, ciliated; limb of corolla 8-parted. ♄. S. Native of the south of Jamaica, on high mountains. Flowers white, about the size of those of the orange. Drupe 5-celled.

Eight-petalled Symplocos. Tree 20 to 36 feet.

15 S. TINCTÒRIA (Lher. in Lin. trans. 1. p. 176.) leaves oblong or lanceolate-ovate, a little serrated, glaucous, shining; flowers axillary, 8-10 together; fruit containing a 3-celled nucleus. ♄. G. Native of Carolina. Hòpea tinctòria, Lin. mant. 14. syst. ed. 1. 699.—Catesb. car. 1. t. 54. Bracteas concave, villous. Flowers yellow, sweet-scented. Corolla 5-parted. Stamens combined in 5 bodies. The juice, or a decoction of the leaves, will dye linen and silk of a bright yellow.

Dyers' Symplocos or Yellow-leaf. Clt. 1780. Tree.

16 S.? PENTA'GYNA (Spreng syst. 3. p. 340.) leaves opposite, oblong-lanceolate, acuminated, quite entire, glabrous; flowers racemose, pentagynous. ♄. S. Native of Brazil. Sello.

Pentagynous Symplocos. Shrub.

SECT. II. LÓDHRA (the Sanscrit name of *S. racemòsa*). Corolla 5-parted. Stamens numerous, inserted without order. Drupe containing a 3-5-celled nut, inferior.—Species natives of Asia. Perhaps the same as Decàdia, Lour. the Dicàlyx, Blum.

17 S. LO'HA (Hamilt. mss. ex D. Don, prod. fl. nep. 144.) leaves lanceolate, acuminated, serrulated, glabrous; spikes usually twin, tomentose, longer than the petioles; calycine segments and bracteas roundish. ♄. G. Native of Nipaul, at Narainhetty. S. subspinòsa, Hamilt. mss. Leaves 3-6 inches long, pale green, and from 1½ to 2 inches broad.

Loha Symplocos. Shrub.

18 S. SUMU'NTIA (Hamilt. mss. ex D. Don, prod. fl. nep. p. 145.) leaves elliptic, coriaceous, acuminated, slightly serrulated, glabrous; spikes pilose, twice the length of the petioles; calycine segments and bracteoles oblong. ♄. G. Native of Nipaul, at Narainhetty, and on Sheopore. S. floribúnda, Wall. cat. no. 4419. Leaves 3-6 inches long, and 1½ to 2 inches broad. Flowers rather large.

Sumuntia Symplocos. Fl. March. Shrub.

19 S. THEÆFÒLIA (D. Don, prod. fl. nep. p. 145.) leaves elliptic, acuminated, serrulated; spikes aggregate, densely pubescent, equal in length to the petioles; calycine segments and bracteoles roundish, ciliated. ♄. G. Native of Nipaul, at Narainhetty. S. attenuàta, Wall. cat. 4426. Leaves 3 inches long, and 1½-2 inches broad. Nothing but *S. racemòsa*, Roxb.

Tea-leaved Symplocos. Fl. Nov. Shrub.

20 S. FERRUGI'NEA (Roxb. fl. ind. 2. p. 542.) leaves lanceolate, serrulated, acuminated, parallel-veined, downy beneath; spikes axillary, solitary, compound, downy; stigma 3-lobed. ♄. S. Native of the East Indies, in the Garo country, where it is called *Foolinazur*. Flowers yellow. Bracteas 3 to each flower, broad-ovate, downy. Leaves 4-7 inches long, and 1-2 broad.

Rusty Symplocos. Tree.

21 S. SPICA'TA (Roxb. fl. ind. 2. p. 541.) leaves from lanceolate to oblong, serrated, acute; spikes axillary, compound; drupe urceolate, torose; nut 1-celled, 1-seeded. ♄. S. Native of Silhet, where it is called *Booree*. Leaves 4-6 inches long. Flowers small, yellow. Bracteas 3 to each flower, ciliated. The nuts are hard, about the size of a pea, and resemble

a minute fluted pitcher; when bored they are strung like beads, and by the natives put round the necks of their children, to prevent evil. The nuts only of *Nagèia putranjìva*, are employed in the same manner and for the same end.

Var. β; *platistàchya* (Wall. cat. no. 4428.) spikes compound, downy. ♄. S. Native of Silhet.

Spicate-flowered Symplocos. Tree or shrub.

22 S. racemòsa (Roxb. fl. ind. 2. p. 539.) leaves oblong, glabrous, serrulated; racemes axillary, generally simple; nut 3-celled. ♄. S. Native of Burdwan and Midnapore, in Bengal. The Sanscrit name of the tree is *Savura* and *Lodhra*, and the Bengalee one *Lodh*. Mýrtus, Retz, obs. 4. p. 26. Leaves 2-6 inches long. Flowers yellow. The bark of this tree is in request among dyers of red in Calcutta, and is met with in the markets of that town for a trifling price. It seems to be used as a mordaunt only to dye with Mungeet (a species of *Rùbia*), in which the bark called *Lodh* is an ingredient. For three yards of cloth take *Lodh* and the bark of *Bura Hur* (*Terminàlia Chébula*) of each one chatuk, or two ounces, pound them together, and mix them with water, and steep the cloth in it; then dry it. Take one chatuk of alum, dissolve it in water, and boil it; put the cloth into this solution, and let it boil for an hour, then wash and dry it. Then take *Al* (*Morínda tinctòria*) one chatuk, Dhawra flowers (*Grislea tomentòsa*) one chatuk, Mungeet half a seer (nearly a pound), separately mix them with lukewarm water, and boil it. Then put in the cloth and let it boil for 40 minutes. *Aboor*, the red powder used by the natives during the Hoolee holidays, is made about Kheerpaee of the bark of this tree.

Racemose-flowered Symplocos. Tree 20 feet.

23 S. cauda'ta (Wall. cat. no. 4413.) leaves lanceolate, or elliptic-lanceolate, tapering to both ends, long-acuminated, obsoletely denticulated; racemes simple, axillary, downy; calyx minute. ♄. S. Native of Silhet.

Tail-leaved Symplocos. Shrub or tree.

24 S. lu'cida (Wall. cat. no. 4414.) leaves smooth, shining on both surfaces, coriaceous, elliptic, or elliptic-lanceolate, entire at the base, and serrated from below the middle, acuminated; racemes downy, branched. ♄. S. Native of the East Indies.

Shining-leaved Symplocos. Shrub or tree.

25 S. pyrifòlia (Wall. cat. no. 4415.) leaves elliptic or oblong, acuminated, shining, coriaceous, entire, or denticulated towards the tops; racemes simple, slender, glabrous, twice the length of the petioles. ♄. S. Native of Silhet.

Pear-leaved Symplocos. Shrub or tree.

26 S. laurìna (Wall. cat. no. 4416.) leaves oblong or elliptic, acuminated, denticulated, shining, smooth; racemes simple or branched at the base, downy. ♄. S. Native of the East Indies. Mýrtus laurìna, Herb. madr. Eugènia laurìna, Rottl. herb.

Laurel-like Symplocos. Shrub or tree.

27 S. Hamiltonia'na (Wall. cat. no. 4420.) leaves elliptic-lanceolate or oblong, repandly denticulated; racemes simple, downy. ♄. S. Native of the East Indies. Decàdia racemòsa, Hamilt. herb.

Hamilton's Symplocos. Shrub or tree.

28 S. ri'gida (Wall. cat. no. 4422.) leaves oblong, coriaceous, stiff, quite entire, or repand, obtuse; racemes long, downy, simple, or branched at the base. ♄. S. Native of the Burman empire, at Moalmeyne.

Stiff Symplocos. Shrub or tree.

29 S. polyca'rpa (Wall. cat. no. 4423.) leaves elliptical, acuminated, repandly denticulated; spikes compound. ♄. S. Native of the East Indies, at Amherst and Tavoy.

Many-fruited Symplocos. Shrub or tree.

30 S. obtu'sa (Wall. cat. no. 4424.) leaves coriaceous, quite entire, oblong-obovate, obtuse, tapering to the base, shining; spikes simple; lobes of calyx rounded, imbricate, obtuse. ♄. S. Native of the East Indies, on the Neelgherry mountains.

Blunt-leaved Symplocos. Shrub or tree.

31 S. ramosíssima (Wall. cat. no. 4425.) leaves membranous, elliptic, or elliptic-lanceolate, acuminated, denticulated; racemes axillary and lateral, simple and compound. ♄. S. Native of Nipaul, on Sheopore.

Much-branched Symplocos. Shrub or tree.

32 S. adenophy'lla (Wall. cat. no. 4427.) leaves coriaceous, lanceolate, tapering to both ends, long-acuminated, usually quite entire; racemes compound, downy. ♄. S. Native of Penang.

Gland-leaved Symplocos. Shrub or tree.

33 S. móllis (Wall. cat. no. 4433.) branches, racemes, petioles, and nerves of leaves on the under surface clothed with rusty hairs; leaves elliptic, acuminated, quite entire; spikes compound. ♄. S. Native of Penang.

Soft Symplocos. Shrub or tree.

Sect. III. Palu'ra (meaning unknown to us). Corolla 5-parted. Stamens disposed in a triple series. Ovarium inferior. —Species natives of Nipaul and China.

34 S. Sini'ca (Ker. bot. reg. 710.) leaves elliptic-oblong, attenuated at both ends, mucronately serrated, downy on both surfaces and wrinkled; racemes compound, terminal, and axillary; calycine segments acuminated. ♄. H. Native of China. Flowers white. (fig. 1.)

FIG. 1.

Chinese Symplocos. Fl. May. Clt. 1822. Shrub 3 feet.

35 S. cratægoìdes (Hamilt. mss. ex D. Don, prod. fl. nep. p. 145.) leaves ovate, acute, serrated, villous beneath as well as on the branches; panicles racemose, terminal, villous; calycine segments roundish, membranous. ♄. G. Native of Nipaul, in the Great Valley, near the town of Thankot. S. paniculàta, Wall. Palùra odoràta, Hamilt. mss. Flowers white, fragrant. This shrub hardly belongs to *Sýmplocos*, and has the habit of *Prùnus Mahàbeb*.

Hawthorn-like Symplocos. Tree or shrub.

Cult. The species of *Sýmplocos* grow well in a mixture of loam, sand, and peat; and cuttings of them strike readily in sand, under a hand-glass; those of the tropical kinds in heat.

Order CXLI. STYRACI'NEÆ (this order only contains the genus *Stỳrax*). Styráceæ, part. Richard, ann. du fruct. 1808. Styracíneæ, part. Rich. in H. B. et Kunth, nov. gen. amer. 3. p. 256. Guiacànæ part. Juss. gen. 156.

Calyx permanent, campanulate, 5-toothed (f. 2. *a*.). Corolla monopetalous, funnel-shaped; deeply 3-7-cleft, but usually 5 or 6-cleft, valvate in æstivation. Stamens 10, exserted; filaments monadelphous at the base, adnate to the tube of the corolla; anthers linear, 2-celled, dehiscing lengthwise inside. Ovarium superior, 3-celled, many-ovulate, erect. Style 1 (f. 26.). Stigma obsoletely 3-lobed. Drupe nearly dry, containing a 1-celled, 1-3-seeded nut. Testa of seed double; inner cobwebbed, outer spongy. Embryo inverted, with elliptic coty-

ledons, and a thick superior radicle. Albumen fleshy.—Elegant trees or shrubs, usually clothed with stellate tomentum. Leaves entire, alternate, exstipulate. Peduncles axillary or terminal, one or many-flowered. Flowers racemose, bracteate, white or cream-coloured. The *Stỳrax officinàle*, affords the officinal storax of Asiatic Turkey, and *S. Benzòin* the fragrant resin of that name. This order is very nearly allied to *Halesiàceæ*, but differs by the decidedly superior ovarium, in the more deeply cleft corolla; and from *Symplocíneæ* in the superior ovarium, and entire or slightly lobed calyx, and in the stamens being fewer and monadelphous.

I. STY'RAX (*στυραξ, stỳrax*, of Theophrastus and Dioscorides; the name is a mere alteration of *assthirak*, the Arabic name of *S. officinàle*). Lin. gen. no. 595. Tourn. t. 369. Juss. gen 156. Gærtn. fruct. 1. p. 284. t. 59.

LIN. SYST. *Decándria, Monogýnia.* Character the same as that of the order.

* *A species native of Europe.*

1 S. OFFICINA'LE (Lin. spec. 635.) leaves ovate, clothed with hoary villi beneath, shining and green above; racemes simple and axillary, 5-6-flowered, shorter than the leaves. ♄. H. Native of Italy and the Levant. Cav. diss. 6. p. 338. t. 188. f. 2. Woodv. med. bot. 197. t. 71. Church et Stev. med. bot. 1. t. 47. Andr. bot. rep. 631. Lodd. bot. cab. 928. Plench, icon. 341. Mill. fig. 260. Lob. icon. 151. Leaves about 2 inches long. Flowers white. Drupe ovate, globose.

FIG. 2.

The *S. officinàle* is chiefly remarkable for producing the very powerful and fragrant balsam called storax. It is a native of Syria and the Levant, and is not uncommon all over Greece and the Peloponnesus, being known by the name of *λαγομηλια* in modern Greek. It is naturalized in hedges in some parts of Italy, particularly about Tivoli. The finest tree of this species in Britain is in the Apothecaries' Garden at Chelsea.

The best storax comes from Asiatic Turkey, and is obtained in a fluid state, from incisions made in the bark of the trunk or branches of the storax-tree. It is brought from Turkey; but is so adulterated that it is very rarely met with in a pure state. Storax is bitter and pungent to the taste, and has a strong fragrant odour. Two sorts of balsam are found in the markets—storax in the tear, and common storax in larger masses; this has been called "storax in the lump," "red storax," and the separate tears, "storax in the tear." The former is very rarely in separate tears, but in masses, composed of white and pale reddish tears, or having a uniform reddish-yellow or brownish appearance, being unctuous to the touch, soft, like wax, and free from visible impurities. This is the *στυραξ καλαμιτης* of the ancient Greeks. According to Galen it was formerly brought from Pamphylia, in hollow canes or reeds, whence it was called *Styrax calamita*. It is preferred to the common storax, in larger masses, which are lighter, less compact than the preceding, and have a large admixture of woody matter, like saw dust. Although the impurities of this kind of storax render it less valuable, it is not less useful, and when purified, its medical qualities are no less potent. Storax should be chosen of a reddish brown colour, rather softish, unctuous to the touch, yet brittle and friable, and of a pleasant sweet smell. On account of its yielding a pleasant odour of Benzoic acid, when ignited, it is much used in Roman Catholic countries for incense. Spirits dissolve it entirely; it consists principally of resin, with a small portion of Benzoic acid. The directions of the London Pharmacopœia for purifying storax are:—

"Dissolve Balsam of storax in rectified spirit and strain it; then distil off the spirit by a gentle heat until the balsam acquires a proper consistence." It may not be improper here to observe, that the storax of the Pharmacopœia ought not to be confounded with the storax of commerce, which is a liquid balsam, said to be obtained from *Liquidámber styracíflua*.

Storax is stimulating and expectorant, and was formerly prescribed for asthma and chronic affections of the windpipe; for amenorrhœa, &c. It is so far discarded from practice as hardly ever to be used, and is justly designated by Dr. Thomson, as a useless article in the list of Materia Medica.

Officinal Storax. Fl. July. Clt. 1597. Tree 12 to 15 feet.

** *Species natives of North America.*

2 S. GRANDIFÒLIUM (Ait. hort. kew. 2. p. 75.) leaves broad, obovate, acuminated, green above, but clothed with hoary tomentum beneath; lower peduncles solitary, 1-flowered. ♄. H. Native of South Carolina. Lodd. bot. cab. t. 1016. Wats. dend. brit. t. 129. S. officinàle, Walt. fl. car. 140. S. grandiflòrum, Michx. fl. bor. amer. 2. p 41. Flowers white.

Great-leaved Storax. Fl. Jul. Cult. 1765. Tree 12 to 15 feet.

3 S. LÆVIGA'TUM (Ait. hort. kew. 2. p. 75. Willd. spec. 2. p. 624.) leaves oval-lanceolate, acute at both ends, glabrous on both surfaces, toothed; peduncles axillary, solitary or twin, 1-flowered. ♄. H. Native of South Carolina and Virginia, in swamps. Lodd. bot. cab. 960. Wats. dendr. brit. t. 40. S. octándrum, Lher. stirp. nov. 2. t. 17. S. glàbrum, Cav. diss. 6. p. 340. t. 188. f. 1. S. læ've, Walt. fl. car. 140. S. Americànum, Lam. dict. 1. p. 82. Stamens from 6 to 10.

Smooth-leaved Storax. Fl. Jul. Aug. Clt. 1765. Shrub 3 to 4 feet.

4 S. PULVERULE'NTUM (Michx. fl. amer. bor. 1. p. 41. Wats. dendr. brit. 41.) leaves almost sessile ovate or obovate, obtuse; clothed with powdery tomentum beneath; flowers axillary and nearly terminal by threes on short pedicels. ♄. H. Native of Virginia and Carolina, in woods. S. lævigàtum, Curt. bot. mag. 921.

Powdery Storax. Fl. Ju. Aug. Clt. 1794. Shrub 4 to 6 feet.

*** *Species natives of South America.*

5 S. TOMENTÒSUM (Humb. et Bonpl. pl. æquin. 2. p. 72. t. 101. H. B. et Kunth, nov. gen. 3. p. 264.) leaves oblong or ovate-oblong, acute, glabrous above, but clothed with white tomentum beneath; racemes axillary, simple, 5-8-flowers. ♄. S. Native of Quito near Malacates. Pedicles, peduncles, and rachi, clothed with whitish or rusty tomentum, and the calyx with white tomentum. Flowers white. Leaves $3\frac{1}{2}$ to $4\frac{1}{2}$ inches long.

Tomentose Storax. Tree 30 to 40 feet.

6 S. FLO'RIDUM (Pohl. pl. bras. 2. p. 54. t. 134.) leaves oblong-elliptic, attenuated at both ends, glabrous above, but clothed beneath with greenish-hoary down; racemes axillary, simple, erectly spreading; calyx clothed with rusty tomentum. ♄. G. Native of Brazil, in the province of Goyaz, among bushes in mountainous places. Corollas yellowish-white.

Flowery Storax. Tree 10 feet.

7 S. FERRUGÍNEUM (Pohl. l. c. p. 55. t. 135.) leaves oblong-ovate, acute, rather attenuated at the base, glabrous above, but greenish-grey beneath, and dotted from tufts of rusty tomentum; racemes axillary, very short, few flowered; peduncles and calyxes clothed with hoary yellow tomentum. ♄. G. Native of Brazil,

in the province of Minas Geraes, about Villa Rica. Corollas yellowish-white.

Rusty Storax. Shrub 5 feet.

8 S. CAMPÒRUM (Pohl. l. c. p. 56. t. 135.) leaves oblong, acuminated, somewhat attenuated at the base, shining and glabrous above, and clothed with greenish hoary tomentum beneath; racemes axillary, few-flowered; peduncles and calyxes clothed with hoary yellow tomentum. ♄. S. Native of Brazil. Corollas yellowish-white.

Field Storax. Shrub 5 feet.

9 S. CRYMOPHY'LLUM (Pohl. l. c. p. 57. t. 137.) leaves oblong-lanceolate, acuminated, quite glabrous on both surfaces; racemes axillary, very short, about 4-flowered, and are, as well as the calyxes, clothed with white or greenish tomentum. ♄. S. Native of Brazil at Rio Janeiro, among bushes, about Agoacin. Corollas yellowish-white.

Ice-leaved Storax. Shrub.

10 S. PARVIFÒLIUM (Pohl. l. c. p. 53. t. 133.) leaves oblong-ovate, or oblong-elliptic, obtuse, glabrous above, and clothed with greenish canescent tomentum beneath; racemes axillary, compound; calyx clothed with yellowish down girding the pericarp to the middle. ♄. S. Native of Brazil, in the province of Minas Geraes. Corollas white.

Small-leaved Storax. Shrub 7 to 8 feet.

11 S. ACUMINA'TUM (Pohl. l. c. p. 58. t. 138.) leaves ovate, acuminated, glabrous, clothed with greenish hoary tomentum beneath; racemes axillary, simple; calyx girding the fruit to the fourth part of its length, and is, as well as the peduncles, clothed with yellowish tomentum. ♄. S. Native of Rio Janeiro, among bushes, about Marambaia. Corollas greenish-white.

Acuminated Storax. Shrub 6 to 8 feet.

12 S. CHRYSA'STERUM (Pohl. l. c. p. 59. t. 139.) leaves oblong, acute, glabrous and shining above, but clothed with greenish hoary tomentum beneath; racemes axillary, simple, many-flowered; calyxes and peduncles clothed with white tomentum. ♄. G. Native of Brazil, in the province of Goyaz, among bushes, by the edges of rivers and fields.

Golden-starred Storax. Tree 10 feet.

13 S. LATIFÒLIUM (Pohl. l. c. p. 60. t. 140.) leaves large, oval-ventricose, acute, glabrous above, clothed with rusty tomentum beneath; racemes axillary and terminal, compound; calyxes and peduncles clothed with rusty tomentum. ♄. G. Native of Brazil, in the province of Minas Geraes, in shady mountain-woods. Corollas yellowish-white, downy.

Broad-leaved Storax. Tree 15 to 20 feet.

14 S. MACROPHY'LLUM (Pohl. l. c. p. 61. t. 141.) leaves large, oblong-ovate, acute, rather cordate at the base, glabrous above, clothed with greenish-white tomentum beneath: with reddish-brown villous veins; racemes axillary, short, few-flowered; calyxes and peduncles clothed with reddish brown villi. ♄ S. Native of Rio Janeiro, among bushes about Pillar. Corolla yellowish-white.

Long-leaved Storax. Tree.

15 S. A'LBUM (Mart, in Spreng. syst. 2. p. 284. Pohl. l. c. p. 62.) leaves oblong-ovate, acute, glabrous above, but clothed with white tomentum beneath, as well as stellate rusty tomentum on the veins and nerves; calyxes and branches clothed with rusty villi. ♄. G. Native of Brazil. Flowers whitish.

White Storax. Shrub.

16 S. RETICULA'TUM (Mart. reis. bras. ex Linnæa. 5. p. 41.) leaves ovate or obovate-oblong, acute, glabrous above, but clothed with white tomentum beneath, and reticulated with parallel veins and cross nerves; calyxes clothed with white tomentum, about equal to the corolla in length. ♄. S. Native of Brazil. Leaves at length repand.

Reticulated Storax. Shrub.

17 S. AU'REUM (Mart. l. c.) leaves ovate, acute, beset with stellate tufts of tomentum above, but at length shining, clothed with golden yellow tomentum beneath, as well as the branchlets and calyxes, which are a little shorter than the corolla. ♄. G. Native of Brazil.

Golden-leaved Storax. Shrub or tree.

18 S. TINIFÒLIUM; leaves oblong-lanceolate, quite entire, hoary beneath; racemes panicled, terminal, tomentose. ♄. S. Native of Jamaica. Cléthra tinifòlia, Swartz. prod. 74. Tìnus occidentàlis. Lin. spec. 530. Volkameria, P. Browne, jam. 214. t. 21. f. 1. Sloan. jam. 2. p. 86. t. 198. f. 2. Leaves dark green above. Fruit containing a sweet mealy pulp and a hard stone. Sloane calls it the bastard Locust tree.

Tinus-leaved Storax. Shrub 10 to 12 feet.

* * * * *A species native of Africa.*

19 S. GUINEE'NSE; glabrous, leaves oblong, entire, ending in an obtuse acumen, on short petioles; peduncles many-flowered, corymbose, axillary; calyx nearly entire or a little toothed. ♄. S. Native of Guinea in the island of St. Thomas. Flowers very fragrant, white; anthers combined into a tube. Stigma large ovate. Corolla of 4 and 5 petals.

Guinea Storax. Shrub 6 to 10 feet.

* * * * * *Species natives of Asia.*

20 S. AGRE'STE; leaves ovate, acuminated, a little serrated; glabrous; peduncles many-flowered, almost terminal; calyx 5-toothed. ♄. H. Native of Cochin China, among bushes. Cýrta agréstis, Lour. coch. 278. Tube of corolla equal to the calyx in length. Drupe oblong, curved, containing a furrowed nut. Flowers white.

Field Storax. Shrub 6 to 8 feet.

21 S. VILLÒSUM (Blum. bijdr. p. 671.) leaves oblong, acuminated, acutish at the base, unequal sided, rather villous beneath; racemes simple, shorter than the leaves; flowers with 6, rarely with 5 stamens. ♄. S. Native of Java, in woods, on Mount Salak.

Villous Storax. Fl. Oct. Shrub.

22 S. JAVA'NICUM (Blum. bijdr. p. 671.) leaves oblong acute, rounded at the base, glabrous, rather tomentose on the rib beneath; racemes crowded, many-flowered, much shorter than the petioles; flowers hexandrous. ♄. S. Native of Java on the Parang mountains, in the province of Tjanjor; and in woods on Mount Burangrang.

Java Storax. Fl. Aug. Tree 40 to 50 feet.

23 S. VIRGA'TUM (Wall. cat. no. 4400.) branches downy; leaves ovate-oblong, acuminated, denticulated; calyx and corolla downy outside. ♄. S. Native of Silhet. Calyx obsoletely 5-toothed. Segments of corolla lanceolate.

Twiggy Storax. Shrub.

24 S. PORTERIA'NUM (Wall. cat. no. 4401.) branches, calyxes, corollas, petioles and young leaves, downy; leaves ovate-oblong, acuminated, almost quite entire. ♄. S. Native of Penang. Calyx entire. Corolla 6-parted, with elliptic-lanceolate acute segments.

Porter's Storax. Shrub.

25 S. FINLAYSONIA'NUM (Wall. cat. no. 4403.) downy like the last; leaves elliptic-acuminated, quite entire, canescent beneath. ♄. S. Native of the East Indies. Flowers fasciculated, terminal racemose. Leaves, green above. Calyx obsoletely 5-toothed. Corolla 5-6 cleft.

Finlayson's Storax. Shrub.

26 S. SERRULA'TUM (Roxb. fl. ind. 2. p. 415.) leaves oblong acuminated, serrulated, glabrous, racemes terminal, simple, villous; branches pubescent at top, as well as the young leaves beneath. ♄. S. Native of Chittagong. Cýrta, Ham. mss.

Koom-jameva is the Bengaleese name of the tree. Leaves 3 inches long. Corolla 6-cleft. Drupe 1-4-seeded.

Serrulated-leaved storax. Shrub.

27 S. Benzòin (Dryand. in trans. roy. soc. 77. p. 307. t. 12. Woodv. med. bot. p. 200. t. 72.) leaves ovate-oblong, acuminated, glabrous above, but clothed with leprous tomentum beneath, as well as the calyxes; racemes compound almost the length of the leaves; flowers with 7-9-10-stamens. ♄. S. Native of Sumatra and Java. Church. & Stev. med. bot. 3. t. 112. Blum. bijdr. p. 671. Plench, icon. t. 342. Benjùi, Garc. in Clus. exot. p. 155. A'rbor. Benzoìni, Grim. in ephem. acad. nat. cur. dec. 2. ann. 1. p. 370. f. 31. Benzòin, Radermacher, in act. Soc. batav. 3. p. 44. Laúrus Benzòin Houtt. in act. harlem. vol. 21. p. 265. t. 7. Benjamin or Benzoin, Marsden, Sumatra, p. 123. Luban is the Bengalese name of the resin. Leaves a hand long. Corolla white, downy outside; segments linear.—Though Garcias, Grim and Sylvias were acquainted with the real tree from which Benzoin is collected, their descriptions are so imperfect that succeeding botanists have fallen into many errors concerning it; and it is remarkable that, although this drug was always imported from the East Indies, most of the later writers on the Materia Medica have conceived it to be collected from a species of *Laúrus*, native of Virginia, to which, from this erroneous supposition, they have given the trivial name Benzoin. Linnæus Mant. p. 297., seems to think that the drug is furnished by the *Cròton Bentzòe*, and afterwards, in the Supplementum Plantarum, p. 434, he describes the same plant again under the name of Terminàlia Benzòin. Jacquin, who was informed that this shrub was called by the French, Bienjoint, may have occasioned the mistake, from the similar sound of the word. Mr. Dryander, however, in the year 1787, clearly proved it to be a species of *Stỳrax*. The tree is deemed in Sumatra to be of sufficient age in 6 years, or when the trunk is about 7 or 8 inches in diameter, to afford the Benzoin. The bark is then cut through longitudinally or somewhat obliquely, at the origin of the principal lower branches, from which the drug exudes in a liquid state, and by exposure to the sun and air soon concretes, when it is scraped off. The trees are not found to sustain the effects of these annual incisions longer than 10 or 12 years. The quantity each tree yields never exceeds 3 pounds. The Benzoin which issues first from the wounded bark is the purest, being soft, extremely fragrant, and very white; that which is less esteemed is of a brownish colour, very hard, and mixed with various impurities. In Arabia, Persia, and other parts of the East, the coarser sort is consumed in fumigating and perfuming temples, and in destroying insects. The Benzoin which we find here in the shops is in large brittle masses, composed partly of white, partly of yellowish or light brown; that which is clearest and contains the most white matter, is accounted the best. This resin has very little taste, impressing on the palate only a slight sweetness; its smell, especially when rubbed or heated, is extremely fragrant and agreeable. It totally dissolves in rectified spirit, the impurities excepted, into a deep yellow-red liquor, and in this state discovers a degree of warmth and pungency as well as sweetness. It imparts, by digestion, to water also, a considerable share of its fragrance, and a slight pungency; the filtered liquor, gently exhaled, leaves not a resinous or mucilaginous extract, but a crystalline matter, seemingly of a saline nature, amounting to one-tenth of an eighth of the weight of Benzoin. Exposed to the fire in proper vessels, it yields a quantity of white saline concrete, called Flores Benzoes, of an acidulous taste, and grateful odour, soluble in rectified spirit, and in water by the assistance of heat.

As the trees which afford Storax and Benzoin, are species of the same genus, their products are very similar in their external appearance, and not widely different in their sensible qualities; it is therefore reasonable to suppose that they are analogous in their medicinal effects. Benzoin, however, though rarely employed in a simple state, has been frequently prescribed as a pectoral, and is recommended for inveterate coughs, asthmas, obstructions of the lungs, and all phthisical complaints, unattended by much fever; it has also been used as a cosmetic, and in the way of fumigation for the resolution of indolent tumours. Dr. Cullen classes benzoin with the stimulants, and says that the *flores benzoes*, which is the only preparation employed, are manifestly a saline substance, of an acid kind, of considerable acrimony and stimulant power; and although it has been recommended as a pectoral, he found it heating and hurtful in asthmatic cases in a dose of half a drachm. In the Pharmacopœias the flowers are directed in the *tinctura opii camphorata*, and it is ordered in substance in the *tinctura benzoes composita*.

Benzoin Storax. Tree.

Cult. The hardy species of *Stòrax* are proper plants for shrubberies, being very handsome when in flower. A light soil suits them best. The best way of increasing them is by layers put down in the autumn or spring. The stove and greenhouse species will grow freely in a mixture of loam, peat, and sand; and will be easily propagated by cuttings planted in sand, under a hand-glass; those of the tropical species in heat.

Order CLXII. HALESIA'CEÆ (this order only contains the genus *Halèsia*, or Snow-drop trees). D. Don, in edinb. phil. journ. dec. 1828. Symplocíneæ, part. of authors. Guaiacànæ, part. Juss. 156.

Calyx small, 4-toothed. Corolla monopetalous, ventricosely campanulate, with a 4-lobed, erect border. Stamens 12-16; filaments combined into a tube at the base, and adnate to the corolla; anthers oblong, erect, 2-celled, dehiscing lengthwise. Ovarium inferior. Style 1; stigma simple. Drupe dry, corticate, oblong, with 2-4-winged angles, terminated by the permanent style: containing a 2-4-celled putamen, which is acute at both ends; cells 1-seeded; seeds attached to the bottom of the cells; testa of seeds simple, very thin. Embryo length of albumen, with linear-oblong cotyledons; and a long, linear, compressed inferior radicle. Albumen fleshy.—Trees with alternate, serrated leaves; and lateral fascicles of pedicellate, drooping, white flowers. This order comes nearest to *Symplocíneæ*, from which it differs in the inferior ovarium, in the fruit being a hard, dry, winged nut, and in the corolla being more decidedly monopetalous.

I. HALE'SIA (so named by Ellis in honour of the learned and venerable Stephen Hales, D.D. F.R.S., author of Vegetable Staticks in 1722). Ellis in Lin. gen. no. 596. Gærtn. fruct. 1. p. 160. t. 32. Juss. gen. 156.

Lin. syst. *Dodecándria, Monogýnia*. Character the same as the order.

1 H. tetra'ptera (Lin. spec. 636. Ellis in phil. trans. vol. 51. p. 931. t. 22. f. A.) leaves ovate-lanceolate, acuminated, sharply serrated; petioles glandular; fruit with 4 wings. ♄. H. Native of South Carolina, along the banks of rivers. Curt. bot. mag. 910. Lodd. bot. cab. 1173. Cav. diss. 6. p. 338. t. 186. Lam. ill. 404. Leaves acuminated, with the middle depressed. Flowers pure white, 9-10 in a fascicle, drooping, resembling those of the snow-drop. The wood is hard and veined; the bark is of a darkish colour, with many irregular fissures.

Four-winged-fruited Halesia, or Common Snow-drop Tree. Fl. April, May. Clt. 1756. Tree 15 to 20 feet.

2 H. parviflòra (Michx. fl. amer. bor. 2. p. 40.) leaves

ovate-oblong, acute, nearly entire; flowers octandrous; fruit clavate, slightly 4-winged. ♄. H. Native of Florida. Ker. bot. reg. t. 952. Leaves downy, glaucous beneath. Racemes panicled. Flowers white, drooping. Calycine teeth ovate.

Small-flowered Snow-drop-tree. Fl. May. Clt. 1802. Tree 10 feet.

3 H. DÍPTERA (Lin. spec. 636.) leaves ovate, acute, serrated; petioles smooth and even; pedicels elongated; fruit with 2 large opposite wings and 2 obsolete ones. ♄. H. Native of Georgia and Carolina, in shady places on the banks of rivers. Cav. diss. 6. p. 338. t. 187. Lodd. bot. cab. 1172. Flowers octandrous. Leaves much larger than those of either of the preceding species.

Two-winged-fruited Snow-drop-tree. Fl. April, May. Clt. 1758. Tree 10 feet.

Cult. The species of Snow-drop-tree are well fitted for shrubberies and lawns, on account of the profusion of early snow-drop-like blossoms which they bear. They will grow in any common soil, and are to be increased by slips of the root and by seeds.

ORDER CXLIII. MYRSINEA'CEÆ (this order contains plants agreeing with *Mýrsine* in important characters). Myrsíneæ, R. Br. prod. p. 533. Alph. D. C. in Lin. trans. 17. p. 100. Ardisiàceæ, Juss. ann. mus. 15. p. 349. Ophiospérmæ, Vent. cels. p. 86. Sapòtæ, part. Juss. gen. p. 168.

Calyx permanent, 4-5-lobed (f. 3. *a.* f. 4. *a.*). Corolla gamopetalous (f. 4. *b.* f. 5. *b.*), rarely polypetalous, regular; lobes or petals equal in number to the lobes of the calyx. Stamens equal in number to the lobes of the corolla, inserted in its base (f. 4. *b.*), and opposite the lobes, free from each other or combined. Pollen ovoid-globose, smooth. Ovarium free or adherent, 1-celled; ovula immersed in the central placenta. Style 1. Drupe or berry 1 or many-seeded. Albumen horny, conforming to the seed, or deficient. Cotyledons short. Plumule inconspicuous or very short.—Trees, shrubs, or subshrubs. Leaves alternate, rarely almost opposite or subverticillate, simple, entire, or toothed. Flowers axillary, pedunculate, or sessile, with indefinite centripetal floration. All the parts are more or less furnished with resinous matter, which appears in dots. The hairs are simple or stellate, usually rising from cells, generally very short; on the peduncles, calyxes, and lower surface of the leaves they are most frequent; in most of the species the situation, form, and number are variable.

The plants contained in this order are mostly inhabitants of the warmer regions of Asia and America, but never beyond the 39th degree of latitude. The order is intermediate between *Sapòteæ* and *Primulàceæ*. *Sapòteæ* differs from it in the whorl of stamens being alternate with the lobes of the corolla; and from *Primulàceæ* in the fruit being indehiscent, and in habit. The *Myrsìneæ* have more or less a disposition to produce a resinous substance, which appears as dots in different parts of the plant, chiefly on the leaves, flowers, and berries. It may be seen also in the hard wood of *Mýrsine* and *Ægíceras;* these dots are dark or light brown, reddish, orange, or yellow; they vary in size, shape, and position in different species. Alphonse de Candolle supposes the styptic taste of the fruit of *Embèlia Ribes* to depend very much upon the quantity, and some peculiar quality, of this resinous substance.

Synopsis of the genera.

TRIBE I.

ÆGICE'REÆ. *Flowers pentamerous. Filaments connate at the base. Ovarium superior, many-seeded. Stigma simple. Drupe long, cylindrical, follicular,* 1*-seeded. Albumen none. Embryo erect.*

1 ÆGI'CERAS. Characters the same as the tribe.

TRIBE II.

ARDISIE'Æ. *Calyx and corolla* 4*-*5*-lobed* (f. 3. *a. b.* f. 4. *a. b.* f. 5. *a. b.*). *Stamens usually free. Ovarium superior, many-seeded. Drupe or berry globose,* 1*-seeded. Albumen horny. Embryo transverse.*

2 WALLE'NIA. Calyx and corolla tubular, 4-lobed; filaments connate at the base; anthers ovoid. Stigma dot-formed.

3 WEIGE'LTIA, Calyx and corolla 4-parted. Filaments free; anthers ovoid. Style short.

4 CONOMÓRPHA. Calyx and corolla 4-cleft, funnel-shaped; filaments free, inserted in the upper part of the corolla; anthers ovate-triangular. Stigma simple.

5 CYBIA'NTHUS. Calyx and corolla 4-cleft, rotate; filaments very short; anthers oblong, opening by 2 pores at top. Stigma sessile, sub-capitate.

6 MY'RSINE. Calyx and corolla 4-6-lobed (f. 3. *a. d.*). Filaments short, free. Stigma fringed, lobed, or simple (f. 3. *b.*).

7 BA'DULA. Calyx 5-lobed (f. 4. *a.*). Corolla 5-cleft (f. 4. *b.*). Stigma thick, capitate, or obscurely lobed (f. 4. *c.*).

8 ONCOSTE'MUM. Calyx and corolla 5-cleft. Stamens combined into a mass, or into a 5-toothed tube. Stigma funnel-shaped, nearly entire, or denticulated.

9 ARDI'SIA. Calyx and corolla 5-cleft (f. 5. *a. b.*). Filaments free; anthers triangular, free, or combined. Stigma simple, subulate, or dot-formed.

10 EMBE'LIA. Calyx and corolla 5-parted. Filaments free; anthers ovoid. Stigma capitate.

11 CHORIPE'TALUM. Calyx 4-cleft. Corolla 4-petalled. Stamens combined, and with the petals at the base. Style filiform.

TRIBE III.

MÆ'SEÆ. *Calyx* 5*-lobed. Corolla* 5*-lobed, induplicate in æstivation. Stamens* 5*, free. Ovarium adherent, half inferior, many-ovulate. Style short; stigma obscurely* 3*-*5*-lobed. Seeds numerous, small, angular, fixed to the central placenta. Embryo transverse.*

12 MÆ'SA. Character the same as that of the tribe.

† *A genus doubtful whether belonging to the present order.*

13 CORYNOCA'RPUS. Calyx of 5 concave sepals. Corolla of 5 roundish petals. Stamens 5, from the claws of the petals. Drupe clavate, containing a 1-seeded nut.

Tribe I.

ÆGICE'REÆ (this tribe contains only the genus *Ægíceras*). Alph. D. C. in Lin. trans. 17. p. 100. Calyx 5-parted; segments obliquely imbricated. Corolla 5-cleft. Filaments connate at the base; anthers free, sagittate, having the cells burst-

ing lengthwise. Ovarium superior, many-seeded. Stigma simple. Drupe long, cylindrical, follicular, 1-seeded. Albumen none. Embryo erect. Habit of the genera of *Sapòteæ*.

I. ÆGI'CERAS (from *αιξ αιγος, aix aigos*, a goat, and *κερας, keras*, a horn; form of fruit). Gærtn. fruct. 1. p. 216. t. 46. Kœn. ann. bot. 1. p. 129. R. Br. prod. p. 534.

Lin. syst. *Pentándria, Monogýnia.* Character the same as that of the tribe.—Small trees, natives of the sea-shore, among mangroves.

1 Æ. fra`grans (Kœn. in ann. bot. 1. p. 129. with a figure. Hook. bot. misc. 3. p. 84. t. 21.) leaves obovate, repand, veiny; umbels pedunculate. axillary, and terminal; fruit cylindrical, subulate, a little arched. ♄. G. Native of New Holland, Moluccas, Java, Burman empire, Penang, Delta of Ganges, and Malabar, by the sea side, amongst mangroves. Æ. màjus, Gærtn. fruct. 1. p. 216. t. 46. Æ. obovàtum, Blum. bijdr. p. 693. Æ. flóridum, Rœm. et Schultes, syst. 4. p. 512. Rhizóphora corniculàta, Lin. spec. 635.—Rumph. amb. 3. t. 117. A stout milky shrub. Superior surface of leaves covered with saline excrescence. Flowers white, fragrant, in terminal umbels.

Fragrant Ægiceras. Clt.? Tree small.

2 Æ. fe'rreum (Blum. bijdr. p. 693.) leaves small, spatulate, with subrecurved margins, almost veinless; umbels axillary and terminal: fruit cylindrical, subulate, arched. ♄. S. Native of the east shore of Java, where it is called *Kalemugon*. Mángium férreum, Rumph. amb. 3. t. 79.

Iron Ægiceras. Fl. year. Shrub.

Cult. The species of this genus grow well in a mixture of sand, loam, and peat; and ripened cuttings will strike root in sand, under a hand-glass, in heat.

Tribe II.

ARDISIE'Æ (this tribe contains shrubs agreeing with the genus *Ardìsia* in important characters). Alph. D. C. in Lin. trans. 17. p. 101. Calyx 4-5-lobed. Corolla gamopetalous. Stamens usually free; cells of anthers bursting lengthwise or at the apex. Ovarium superior, many-seeded. Drupe or berry globose, 1-seeded. Albumen horny. Embryo transverse.

II. WALLE'NIA (so named in memory of Matthew Wallen, a native of Ireland, many years resident in Jamaica, who cultivated both indigenous and exotic plants there, at considerable expense, and much assisted Patrick Browne in his Natural History of Jamaica). Swartz. prod. 1. p. 31. fl. ind. occ. 1. p. 248. Schreb. gen. no. 1722. p. 789.

Lin. syst. *Tetrándria, Monogýnia.* Calyx and corolla tubular, 4-lobed at the apex. Stamens inserted in the base of the corolla; filaments combined at the base, free at top and exserted; anthers ovoid, much shorter than the filaments, dehiscing lengthwise. Style short; stigma dot-formed.—Small trees. Leaves alternate, nearly opposite, or 3 in a whorl, oblong, more or less obtuse, entire, coriaceous, glabrous. Panicles terminal, naked, many-flowered; pedicels forming umbellets at the tops of the peduncles. Lobes of calyx and corolla obtuse, imbricate in æstivation.

1 W. laurifòlia (Swartz. prod. p. 31. fl. ind. occ. 1. p. 248. t. 6.) calyx and corolla covered with glandular dots. ♄. S. Native of Jamaica, Hispaniola, and Cuba. Petesioìdes laurifòlium, Jacq. amer. 17.—Sloane, jam. 2. p. 234. t. 145. f. 5. Flowers yellow. Berries scarlet. Glandular dots orange-coloured. Jacquin describes the leaves as 6 inches long, and greasy; and the flowers as white.

Laurel-leaved Wallenia. Tree 10 to 14 feet.

2 W. angula`ta (Jacq. hort. schœnbr. 1. t. 30.) peduncles thicker; calyx and corolla without glandular dots. ♄. S. Native of the East Indies? Cultivated in the gardens of the Mauritius, and in those of Vienna.

Angular Wallenia. Tree 10 to 12 feet.

Cult. See *Ardìsia*, p. 20. for culture and propagtion.

III. WEIGE'LTIA (named after M. Weigelt, who first collected the plant). Alph. D. C. in Lin. trans. 17. p. 102.

Lin. syst. *Tetrándria, Monogýnia.* Calyx and corolla 4-parted. Stamens 4, inserted in the base of the corolla; filaments free, filiform, shorter than the lobes of the corolla; anthers ovoid, much shorter than the filaments, horizontal; having the cells dehiscing lengthwise. Style acuminated, 3 times shorter than the stamens. This genus differs from *Wallènia* in the inflorescence; in the calyx and corolla being deeply divided; in the filaments being free, &c.

1 W. myria'nthos (Alph. D. C. l. c.). ♄. S. Native about Surinam. Wallènia myriánthos, Rchb. in Weigelt. pl. exsic. sur. Branches glabrous. Leaves obovate, more or less acute, glabrous, 3-5 inches long, beset with red pellucid dots when examined by a lens. Peduncles numerous, alternate in the axils of the leaves, rather velvety. Bracteas alternate, oblong. Corolla white, dotted with red.

Myriad-flowered Weigeltia. Tree small.

Cult. See *Ardìsia*, p. 20. for culture and propagation.

IV. CONOMO'RPHA (from *χωνη, chone*, a funnel, and *μορφη, morphe*, form; in reference to the shape of the corolla). Alph. D. C. in Lin. trans. 17. p. 102.—Wallènia spec. Mart. nov. gen. bras. 3. p. 89.—Conóstylus, Pohl. in litt. to D. C.

Lin. syst. *Tetrándria, Monogýnia.* Calyx and corolla 4-cleft, funnel-shaped. Stamens 4, one half shorter than the corolla; filaments inserted in the upper part of the tube of the corolla, very short, free; anthers erect, ovate-triangular, inclosed, fixed by the base; having the cells dehiscing lengthwise. Ovarium conical in the abortive flowers, and nearly globose in the fertile flowers. Style short; stigma simple. Drupe 1-seeded.—Small, American trees. Leaves alternate, entire, full of dots, coriaceous, varying in size on the same branch. Racemes axillary; pedicels alternate, short, in the axils of the bracteas. Flowers probably polygamous, the ovarium not always being perfect.

1 C. oblongifòlia (Alph. D. C. l. c. p. 103.) leaves oblong; peduncles shorter than the petioles. ♄. S. Native of Brazil. Conóstylus oblongifòlius, Pohl. ined. Branches slender, glabrous. Leaves oblong or obovate, 3-4 inches long, 12-15 lines broad, obtuse, or acute, beset with blackish dots. Peduncles many-flowered. Bracteas ovate, obtuse. Lobes of calyx and corolla ovate, acute, glabrous. Corolla whitish, funnel-shaped.

Oblong-leaved Conomorpha. Tree small.

2 C. laxiflòra (Alph. D. C. l. c.) leaves obovate or oblong, bluntish, cuneated towards the base; racemes nearly equal, length of leaves, pendulous; bracteas linear-lanceolate, acuminated; calycine segments triangular, a little ciliated; corolla campanulate, having the lobes reflexed at the apex. ♄. S. Native on the banks of the river Amazon. Wallènia laxiflòra, Mart. nov. gen. 3. p. 89. Flowers white?

Loose-flowered Conomorpha. Tree small.

Cult. See *Ardisia*, p. 20., for culture and propagation.

V. CYBIA'NTHUS (from *κυβος, kybos*, a square, and *ανθος, anthos*, flower; square form of corollas). Mart. nov. gen. 3. p. 87. Alph. D. C. in Lin. trans. 17. p. 103.

Lin. syst. *Tetrándria, Monogýnia.* Calyx deeply 4-cleft. Corolla 4-cleft, rotate, flat, making the circumference nearly square: having the lobes as well as the calyx marked with dots and immersed glandular lines. Stamens 4; filaments very short; anthers nearly sessile, oblong, erect, opening by 2 pores at the apex. Ovarium superior, minute (abortive?), depressedly glo-

bose. Stigma sessile, sub-capitate. Ovula erect, probably numerous. Drupe 1-seeded.?—Small trees, natives of Brazil. Leaves scattered, but approximate towards the extremities of the branches, petiolate, beset with gland-like tubercles. Flowers small, unibracteate, disposed in axillary erectish or drooping racemes. Lobes of corolla, but particularly those of the calyx, fringed with hairs.

1 C. pendulìnus (Mart. nov. gen. bras. 3. p. 87. t. 236.) leaves oblong, acute at both ends, glabrous; petioles pilose at the base; racemes loose, pendulous, about equal in length to the leaves, downy; calycine segments acute. ♄. S. Native of Brazil, in the province of Rio Negro. Flowers white.

Drooping Cybianthus. Tree.

2 C. cuneifòlius (Mart. l. c. p. 88.) leaves broad-lanceolate, acute, tapering much to the base, glabrous; petioles pilose; racemes spreading, downy, 3 times shorter than the leaves; calycine segments bluntish. ♄. S. Native of Brazil, near Sebastionople. Flowers white.

Wedge-leaved Cybianthus. Tree.

3 C. príncipis (Alph. D. C. in Lin. trans. 17. p. 104) leaves lanceolate, attenuate at the apex and bluntish; panicles axillary and terminal, shorter than the leaves; peduncles spreading, angular; flowers somewhat fascicled at the apex; segments of corolla oblong, reflexed. ♄. S. Native of Brazil, at the river Ilheos, where it was collected by Prince Neuweid. Wallènia angustifòlia, Nees. et Mart. beitr. zur. fl. bras. in nov. act. bonn. 11. p. 87. Flowers white.

Prince Neuweid's Cybianthus. Tree.

4 C. Humbóldtii (Alph. D. C. l. c.) leaves oblong, acuminate, undulately ciliated, glabrous, shining above; panicles terminal, simple; flowers disposed in fascicular umbels; segments of corolla oblong, obtuse, revolute. ♄. S. Native of New Granada, on the Andes, about Quindiu, at the altitude of about 1200 hexapods. Flowers pedicellate, 3-5 in a fascicle. Berries red. Ardísia tetrándra, H. B. et Kunth. nov. gen. amer. 3. p. 243. Habit of *Ardísia crenàta*.

Humboldt's Cybianthus. Tree 15-20 feet.

Cult. For culture and propagation see *Ardìsia*, p. 20.

VI. MY'RSINE (*μυρσινη, myrsine*, the Greek name of Myrrh). Lin. gen. ed. 1. p. 54. no. 269. Juss. gen. 152. Gærtn. fruct. t. 59. R. Br. prod. p. 533. Alph. D. C. in Lin. trans 17. p. 104.—Rapànea, Aubl. guian. 1. p. 121.—Caballèria, Ruiz. et Pav. prod. fl. per. p. 141.—Manglílla, Juss. gen. 152. Pers. ench. 1. p. 237.—Athrurophy'llum, Lour. coch. 148.—Sideróxylon, Scleróxylon, Samàra, Rœmèria, Chrysophýllum, species of authors.

Lin. syst. *Tètra-Hexándria Monogỳnia*, or *Polygàmia Dioècia*. Calyx and corolla 4-5-6-lobed (f. 3. *a. d.*); lobes of corolla imbricate in æstivation. Stamens equal in number to the lobes of the corolla, free; filaments very short, inserted in the tube of the corolla; anthers usually almost sessile, erect, acute: having the cells dehiscing lengthwise. Ovarium with an indefinite number of ovula, 4-5, ex R. Br. Style short, usually caducous; stigma fringed, or lobed, or simple. Drupe, or berry, pea-formed, 1-seeded.—Trees, or small shrubs, with alternate leaves. Flowers polygamous or hermaphrodite, sessile, or on very short pedicels, in fascicles; fascicles axillary, more or less covered by imbricate, obtuse, permanent bracteas. This is a very polymorphous genus, distinguished by its peculiar inflorescence readier than by any other character.

* *Stigma fringed or lobed.*

1 M. Urvíllei (Alph. D. C. in Lin. trans. 17. p. 105.) glabrous; leaves ovate, obtuse, entire, full of pellucid dots; flowers almost sessile, fascicled, pentandrous, polygamous; lobes of calyx small, tooth-formed; anthers sessile, ovoid. ♄. G. Native of New Zealand, in Tasman's Bay, and Cook's Strait. Leaves 1-2 inches long, obtuse, and somewhat emarginate, membranous, covered with yellow dots. Bracteas a little ciliated. Corolla 5-parted; glabrous, hardly a line long. Berry ovoid.

D'Urville's Myrsine. Shrub.

2 M. Africa'na (Lin. spec. 285) glabrous; leaves elliptic, serrated, acute, dotted; flowers axillary, by threes, pentandrous, polygamous; segments of corolla ciliated; corolla full of testaceous dots; calycine segments obovate. ♄. G. Native of the Cape of Good Hope. M. glàbra, Gærtn. fruct. 1. p. 282.—Comm. hort. 1. p. 123. t. 164.—Pluk. phyt. t. 80. f. 5.—Breyn. cent. 9. t. 5. Flowers on short pedicels, pale. Berries blue, dotted. Stigma panicled.

Var. β, retùsa (Alph. D. C. in Lin. trans. 17. p. 105.) leaves obovate, obtuse, emarginately toothletted at top. ♄. G. Native of the Azores. M. retùsa, Ait. hort. kew. 1. p. 271. Vent. cels. t. 86.—M. scàbra, Gærtn. fruct. 1. p. 182. Berries size of red currants, rugged from small tubercles, with a straw-coloured rind. Cultivated since 1788, and flowers in June. (f. 3.)

FIG. 3.

African Myrsine. Fl. Mar. May. Clt. 1691. Shrub 3-6 feet.

3 M. bifa'ria (Wall. in Roxb. fl. ind. 2. p. 296.) branches and petioles villous; leaves small, lanceolate, cuspidately serrated, cuneated and entire at the base, glabrous, dotted; flowers almost sessile, tetrandrous, polygamous, in axillary fascicles; calycine segments lanceolate, ciliated; filaments very short; anthers large, exserted. ♄. G. Native of Nipaul, from Hetounra to the valley, and on the surrounding mountains. It is also a native of Kamaon and Shreenagur. A large shrub, with hardly any defined stem. Leaves bifarious, coriaceous. Flowers white, tinged with pink, 5 or 6 in a fascicle, besprinkled with copious brown elevated dots. Stigma warted. Drupe round, and about the size of a coriander seed.

Bifarious-leaved Myrsine. Fl. Dec. March. Clt. 1822. Tree 20 feet.

4 M. subspinòsa (D. Don, prod. fl. nep. 147.) leaves lanceolate, acuminated, stiff, glabrous, spinulosely serrated; flowers dioecious, tetrandrous, in sessile axillary umbellate downy fascicles. ♄. G. Native of Nepaul, at Narainhetty, where it is called *Mina Bocoshi* by the natives. Samàra subspinòsa, Hamilt. mss. ex D. Don. l. c.

Subspinose-leaved Myrsine. Clt. 1823. Tree 20 feet.

5 M. se'ssilis (D. Don, l. c. p. 146.) leaves elliptic-oblong, acuminated, glabrous, shining, denticulated at the apex; flowers hermaphrodite, tetrandrous, in sessile umbellate axillary fascicles; stigma 2-lobed. ♄. G. Native of Nipaul, in woods, at Narainhetty. Samàra séssilis, Hamilt. mss.

Sessile-flowered Myrsine. Fl. Oct. Shrub.

6 M. semiserra'ta (Wall. in Roxb. fl. ind. 2. p. 293. tent. fl. nep. 1. p. 34, with a figure) leaves dense, linear, or linear lanceolate, sharply serrulated from the middle to the apex; flowers tetrandrous and pentandrous, polygamous, pedicellate, 6-12 in a fascicle; teeth of calyx lanceolate, acute, ciliated; stigma unilateral, fringed, 3-lobed. ♄. G. Native throughout Nipaul, where it is called, in Newar language, *Bilsee*, *Beresse*, and *Kalikatha*. A branchy tree. Branches dotted. Leaves besprinkled with reddish resinous dots, coriaceous, from 3 to 5 inches long.

Corolla pale pink. Drupe size of a pea, round, smooth and shining; flesh soft and pulpy. The wood of this tree is of a chocolate colour, radiated, compact, and heavy; it is much esteemed by the hill-people for various carpenter's work. They eat the ripe fruit.

Half-serrated-leaved Myrsine. Fl. Dec. March. Clt. 1822. Tree 30-40 feet.

7 M. VARIA'BILIS (R. Br. prod. p. 532. Sieb. pl. exsic. nov. holl. no. 262.) leaves obovate, oblong, entire, or toothed; flowers in umbellate sessile fascicles; pedicels glabrous; flowers tetrandrous and pentandrous, polygamous; anthers sessile. ♄. G. Native of New South Wales.

Variable Myrsine. Fl. June, July. Clt. 1824. Shrub.

8 M. URCEOLA'TA (R. Br. l. c.) leaves lanceolate-oblong, quite entire; flowers in axillary sessile umbels; pedicels glabrous; flowers tetrandrous, polygamous; corolla of the male flowers urceolate; stamens inclosed. ♄. G. Native of New Holland, within the tropic.

Urceolate-flowered Myrsine. Shrub.

9 M. CRASSIFÒLIA (R. Br. l. c.) leaves obovate, coriaceous, entire; flowers axillary, aggregate, almost sessile. ♄. G. Native of New Holland, within the tropic; and of Norfolk Island. Endlicher, prod. fl. ins. norf. p. 48. Bauer, ill. ins. norf. t. 124. Leaves 2 or $2\frac{1}{2}$ inches long.

Thick-leaved Myrsine. Shrub.

10 M. EXCE'LSA (D. Don, prod. fl. nep. p. 147) leaves lanceolate, acute, quite entire, glabrous, attenuated at the base; flowers dioecious, pentandrous; umbels sessile, glomerate, woolly; lobes of stigma oblong. ♄. G. Native of Nipaul, in woods.

Tall Myrsine. Tree 30-40 feet.

11 M. CAPITELLA'TA (Wall. in Roxb. fl. ind. 2. p. 295.) leaves oblong-lanceolate, quite entire, coriaceous; flowers pentandrous, polygamous, sessile: in heads, from the axils of the fallen leaves, in which case they appear lateral; calycine teeth ovate-acute; anthers oblong, large. ♄. G. Native of Nipaul, where it is called, in the Newar language, *BhoollaBilloo*. Branches angular. Leaves 5-7 inches long, copiously dotted. Flowers greenish, with copious resinous elevated brown dots; æstivation valvate. Calyx urceolate. Corolla with lanceolate-recurved segments and short tube. Stigma slightly 2-lobed. Drupes like those of M. *semiserràta*, but smaller.

Var. β, *parvifòlia* (Alph. D. C. in Lin. trans. 17. p. 106) leaves smaller; heads few-flowered. ♄. G. Native of Silhet. M. lanceolàta, Wall. cat. no. 2297. Leaves 2-3 inches long. Flowers scattered.

Small-headed Myrsine. Fl. Dec. March. Clt. 1822. Tree 30-40 feet.

12 M. LÙCIDA (Wall. cat. no. 2298.) leaves lanceolate, quite entire, glabrous, with dotted margins; flowers lateral, in fascicles, pentandrous, polygamous? calycine lobes ovate, acute, a little ciliated. ♄. G. Native of the Burman Empire, on Mount Taong Dong. Branches brown. Leaves 4-5 inches long, acuminated or bluntish, coriaceous. Berries globose, deep purple.

Shining-leaved Myrsine. Tree small.

13 M. PORTERIA'NA (Wall. cat. no. 6525. Alph. D. C. in Lin. trans. 17. p. 106.) glabrous; leaves lanceolate, acute at both ends, entire; flowers sessile, glomerate, few, pentandrous, polygamous?; calycine lobes ovate, acute, ciliated. ♄. G. Native of Penang. Branches with white dots, leafy at top. Leaves $1\frac{1}{2}$ to 2 inches long, beset with depressed dots beneath.

Porter's Myrsine. Tree small.

14 M. WIGHTIA'NA (Wall. cat. no. 2300. Alph. D. C. l. c.) glabrous; leaves oblong-lanceolate, acute, entire, scabrous from dots; flowers few, sessile, pentandrous, polygamous?; calycine lobes ovate, acute, ciliated. ♄. G. Native of the East Indies. Branches inflated at the origin of the leaves and flowers. Leaves approximate at the tops of the branches, 2-3 inches long, sometimes obtuse, coriaceous, beset with elevated dots.

Wight's Myrsine. Tree.

15 M. LINEA'RIS (Poir. dict. suppl. 3. p. 709.) leaves linear, quite entire, flat, shining, crowded at the tops of the branches; flowers pentandrous, in fascicles. ♄. G. Native of Cochin China, in woods. M. athrurophy'llum, R. Br. Athrurophy'llum lineàre, Lour. coch. p. 148. Flowers small, whitish red.

Linear-leaved Myrsine. Tree tall.

16 M. MÌTIS (Spreng. syst. 1. p. 663.) glabrous; leaves oblong, acute at both ends; flowers lateral, sessile, aggregate, pentandrous; lobes of calyx roundish, obtuse; corolla rotate, with oblong, obtuse, concave segments; stigma sessile. ♄. G. Native of the Cape of Good Hope. Sideróxylon mìte, Lin. syst. p. 193. Jacq. coll. 2. p. 249. Scleróxylon mìte, Willd. spec. 1. p. 1089. Sideróxylon más inérme, Mill. fig. t. 299. Manglílla Millerià̀na, Pers. ench. 1. p. 237. Chrysophýllum Millerià̀num, Lam. ill. no. 2477. In Miller's figure the peduncles are lateral and axillary, cymose.

Mild Myrsine. Fl. July. Clt. 1692. Shrub 6-feet.

17 M. MELANOPHLE'OS (R. Br. prod. p. 533.) glabrous; leaves elliptic or lanceolate-oblong, bluntish; flowers axillary, aggregate, on short angular pedicels, pentandrous. ♄. G. Native of the Cape of Good Hope. Sideróxylon melanophlèum, Lin. mant. p. 48. Jacq. hort. vind. 1. p. 89. t. 71.—Burm. afr. 238. t. 84. f. 2.—Comm. hort. 1. p. 195. t. 109. Manglílla melanophlèos, Pers. ench. 1. p. 237. Chrysophýllum melanophlèum, Lam. dict. Scleróxylon melanophlèum, Willd. enum. 1. p. 249. Rœmèria melanophlèa, Thunb. nov. gen. in Rœm. arch. 2. B. p. 1. Flowers hermaphrodite.

Black-paper Myrsine. Fl. ?. Clt. 1783. Shrub.

18 M. SAMA'RA (R. Br. l. c. Rœm. et Schultes, syst. 4. p. 511) leaves elliptic; flowers pentandrous, in small corymbs. ♄. G. Native of the Cape of Good Hope. Samàra pentándra, Ait. hort. kew. 1. p. 160. Willd. spec. 1. p. 665. Flowers small. Branches leafy at top.

Samara Myrsine. Fl. Feb. Nov. Clt. 1770. Shrub.

19 M. AVE'NIS (Alph. D. C. in Lin. trans. 17. p. 107.) leaves lanceolate, bluntish at the apex, narrowed at the base, quite entire, coriaceous, glabrous, nearly veinless; flowers in axillary and lateral fascicles; calycine teeth acute. ♄. S. Native of Java, on the top of Mount Burangrang. Ardísia avènis, Blume, bijdr. t. 691.

Veinless Myrsine. Tree 20 feet.

20 M. MADAGASCARIE'NSIS (Alph. D. C. l. c.) leaves oblong, obtuse, entire, glabrous, coriaceous, thick, beset with black dots beneath; flowers in fascicles, pentandrous, polygamous.? calycine lobes ovate, a little ciliated; berries globose, pedicellate. ♄. S. Native of Madagascar. Leaves 2-4 inches long, emarginate, attenuated into the petioles. Pedicels three lines long.

Madagascar Myrsine. Shrub or tree.

21 M. RAPA'NEA (R. Br. prod. 533. Rœm. et Schultes, syst. 4. p. 509.) glabrous; leaves obovate, entire, full of excavated dots on both surfaces: flowers pentandrous, male and hermaphrodite, in axillary and lateral fascicles; corolla white; calycine segments ovate, acute. ♄. S. Native of French Guiana, Island of Trinidad; and about Bahia, in Brazil. Rapànea Guianénsis, Aubl. guian. 1. p. 121. t. 46. Swartz, fl. ind. 1. p. 262. Lam. ill. t. 121, f. 1. Samàra pentándra, Swartz, descr. 262. but not of Ait. Samàrá floribúnda, Willd. spec. 1. p. 665. Caballèria coriàcea, Meyer. esseq. p. 118. Berries globose, violaceous, size of a grain of pepper. Flowers white. Leaves 4-5 inches long.

Rapanea Myrsine. Shrub 5-6 feet.

22 M. CORIA'CEA (R. Br. prod. p. 533. Rœm. et Schultes,

syst. 4. p. 509.) leaves ovate-lanceolate, acute, coriaceous; flowers pentandrous, hermaphrodite,? sessile, in axillary fascicles. ♄. S. Native of Jamaica, Cuba, and Porto Rico. Samàra coriàcea, Swartz, prod. 32. descr. 261. Willd. spec. 1. p. 665.

Coriaceous-leaved Myrsine. Fl. Nov. Feb. Clt. 1770. Tree.

23 M. FLORIDA'NA (Alph. D. C. in Lin. trans. 17. p. 107.) glabrous; leaves oval-oblong, entire, coriaceous, dotted beneath; fascicles few-flowered, but numerous; flowers pentandrous; calyx 5-parted. ♄. G. Native of Florida. Sideróxylon punctàtum, Lam. ill. no. 2460.? Bumèlia punctàta, Rœm. et Schultes, syst. 4. p. 498.? Branches beset with ovate white warts. Leaves 2-3 inches long, obtuse or acutish, shining above, dotted. Berries globose, spotted. Allied to M. *Manglílla*, but the leaves are more oblong, and on shorter petioles; and to M. *coriàcea*, from which it differs in the larger leaves, which are never emarginate; oval-oblong, not cuneate-oblong, &c.

Florida Myrsine. Shrub.

24 M. MANGLÍLLA (Rœm. et Schultes, syst. 4. p. 509. ex R. Br. prod. 533.) glabrous; leaves oblong, obtuse, white beneath; fascicles axillary and lateral, on short pedicels; calycine segments ovate. ♄. G. Native of Peru, about Lima. Sideróxylon Manglíllo, Lam. dict. 1. p. 245. Manglílla, Juss. gen. 151. Manglílla Peruviàna, Gmel. syst. p. 398. Scleróxylon Manglíllo, Willd. mag. 3. p. 59. Duhamèlia Manglíllo, Dombey. Caballèria oblónga, Ruiz. et Pav. syst. fl. per. 1. p. 280. Manglílla Jussièui, Pers. ench. 1. p. 237. Chrysophy'llum Manglílla, Lam. ill. 2. p. 45. Bumèlia Manglílla, Willd. spec. 2. p. 1087.

Manglilla Myrsine. Shrub or tree.

25 M. TRINITA'TIS (Alph. D. C. in Lin. trans. 17. p. 108.) leaves elliptic, acute at both ends, glabrous, entire, dotted beneath; fascicles few-flowered; flowers small, pedicellate, pentandrous. ♄. S. Native of Trinidad. M. coriàcea, Sieb. pl. exsic. trin. no. 50. and 302. Extremities of the branches rusty, and rather velvety. Leaves 1-2 inches long, paler and dotted beneath. Calycine lobes small, lanceolate. This species differs from *M. coriàcea* in the acute leaves and smaller glabrous flowers.

Trinidad Myrsine. Tree or shrub.

26 M. SALICIFÒLIA (Alph. D. C. l. c.) leaves elliptic, entire; petioles pilose; fascicles many-flowered; flowers pentandrous; calycine lobes ciliated; berries globose, marked with oblong spots. ♄. S. Native of Guadaloupe. Bumèlia salicifòlia, Bert. ined. in herb. Balb. Branches dotted, velvety at top. Leaves 1½ to 2 inches long, firm, paler and dotted beneath. Calycine segments ovate-oblong, marked with yellow oblong spots. Style short, obtuse. Very nearly allied to *M. Trinitàtis*.

Willow-leaved Myrsine. Tree or shrub.

27 M. BERTE'RII (Alph. D. C. l. c. p. 109.) branches puberulous; leaves oblong-lanceolate, acutish, entire, glabrous above, puberulous beneath and on the petioles; flowers nearly sessile, rather velvety, pentandrous; lobes of calyx and corolla obtuse. ♄. S. Native of Hispaniola. Sideróxylon Mastichodéndron, Balb. in herb. D. C. Branches and petioles as if they were covered with powder. Leaves 2 inches long, narrowed into the petioles. Flowers 4-5 in each fascicle. Berry globose, glabrous, terminated by the truncate style. This species comes very near *M. salicifòlia*, but the leaves are a little smaller, less acute, and are downy beneath, as well as the branches, petioles, and flowers.

Bertero's Myrsine. Shrub or tree.

28 M. FERRUGÍNEA (Spreng. syst. 1. p. 664) leaves lanceolate, acute, quite entire, coriaceous, rather pilose; flowers in fascicles, on short pedicels, hermaphrodite, pentandrous; lobes of calyx and corolla acute; stigma 2-lobed. ♄. G. Native of Peru, in mountain groves. Caballèria ferrugínea, Ruiz. et Pav. syst. 1. p. 210. Branches rather pilose. Leaves 2½ inches long, rusty and dotted beneath: having the petioles, and central nerve rufous and velvety. Calyx smoothish. Berry spotted much.

Rusty Myrsine. Shrub or tree.

29 M. RUFE'SCENS (Alph. D. C. in Lin. trans. 17. p. 109.) branches and nerves of leaves dotted with rufescent velvety down; leaves oblong-lanceolate, acute, entire, on long petioles; flowers tetrandrous; stigma 2-lobed, thickish. ♄. S. Native of Brazil, in the woods of Corcovado, near Rio Janeiro. Branches twiggy. Leaves 2-3 inches long, pale and dotted beneath. Flowers in fascicles at the base of the branches. Berry globose, full of elongated marks.

Rufescent Myrsine. Shrub.

30 M. LATIFÒLIA (Spreng. syst. 1. p. 664.) leaves oblong, quite entire, dotted on both surfaces; flowers numerous, pentandrous, conglomerate. ♄. G. Native of Peru, in the woods of Muna and Pillao. Caballèria latifòlia, Ruiz. et Pav. syst. 1. p. 279.

Broad-leaved Myrsine. Shrub or tree.

31 M. PELLU'CIDA (Spreng. l. c.) leaves obovate-oblong, dotted; dots pellucid, roundish on the upper surface, but linear on the under: flowers pentandrous, aggregate. ♄. G. Native of Peru, on the mountains, in woods. Caballèria pellùcida, Ruiz. et Pav. l. c.

Pellucid-dotted Myrsine. Shrub or tree.

32 M. DENTA'TA (Spreng. l. c.) branches dependent; leaves crowded, ovate and cordate, upper ones dentated; flowers racemose, pentandrous; style long; stigma depressed. ♄. G. Native of Peru, on the mountains. Caballèria dentàta, Ruiz. et Pav. l. c. p. 281.

Tooth-leaved Myrsine. Shrub or tree.

33 M. VENOSÍSSIMA (Spreng. l. c.) leaves oblong-lanceolate, quite entire, full of pellucid dots; flowers aggregate, pentandrous. ♄. G. Native of Peru, on the mountains. Caballèria venosíssima, Ruiz. et Pav. l. c. p. 282.

Very veiny-leaved Myrsine. Shrub or tree.

34 M. DEPE'NDENS (Spreng. l. c.) branches dependent, velvety; leaves crowded, broad-elliptic, retuse or mucronulated, entire, ciliated, shining above, full of dots beneath; flowers axillary, solitary or twin, on short pedicels, tetrandrous; calycine segments ovate, acute; lobes of corolla oblong, twice as long as the calyx. ♄. G. Native of Peru, on the higher mountains; and on Silla de Caraccas. Caballèria dependens, Ruiz et Pav. syst. 1. p. 281. Caballèria myrtifòlia, Deless. herb. ex Ruiz. et Pav. Mýrsine ciliàta, H. B. et Kunth. nov. gen. 3. p. 248. t. 245. Leaves 4-6 lines long. Stigma capitate. Berry ovate-globose, spotted with black.

Hanging-branched Myrsine. Shrub or tree.

35 M. POPAYE'NSIS (H. B. et Kunth. nov. gen. amer. 3. p. 249.) leaves oblong, tapering to both ends, bluntish, quite entire, revolute at the base, glabrous and shining above, but clothed with fine down or hairs beneath; umbels or fascicles axillary, sessile; flowers on short pedicels, pentandrous; calycine lobes ovate-acute, a little ciliated; stigma pentagonal. ♄. G. Native of New Granada, near Popayan, in mountainous places. Samàra myricoìdes, Rœm. et Schultes, mant. 3. p. 294. ex Kunth. in Linnæa. 1830. p. 367. Branches downy, clothed with rusty tomentum while young; segments of corolla marked with black lines, oblong, acute. Flowers white. Anthers yellow.

Popayan Myrsine. Tree 20 feet.

36 M. MYRICOÌDES (Schlecht. in Linnæa, 8. p. 525.) leaves oblong-lanceolate, attenuated into the petioles, with revolute edges, smoothish and shining above, but paler beneath, and clothed with soft down; nerves prominent beneath, and are, as

well as the petioles, young branches, and buds, beset with more dense rusty down; flowers aggregate on short pedicels. ♄. G. Native of Mexico, at Jalapa. Leaves 3-4 inches long, and 8-10 lines broad. Fruit small, globose, bluntly mucronate, seated on the 5-cleft stellate calyx, marked with lines, brownish. Calycine segments slightly ciliated. Stigma pentagonal.

Myrica-like Myrsine. Fl. March, May. Shrub.

* * *Stigma simple.*

37 M. ardisioìdes (H. B. et Kunth. nov. gen. amer. 3. p. 249.) leaves oblong, somewhat acuminated, cuneated at the base, quite entire, membranous, glabrous; corymbs axillary, sessile, few-flowered; pedicels glabrous; flowers pentandrous; calycine segments roundish-ovate, obtuse, dotted with glands. ♄. G. Native of Peru. Branches glabrous, brown. Leaves 4-5 lines long. Fascicles 6-7-flowered. Corolla white?, with revolute, ovate, obtuse segments, which are full of glandular dots. Berries dry, depressedly globose.

Ardisia-like Myrsine. Tree small.

38 M. penduliflòra (Moc. et Sesse, icon. fl. mex. ined. Alph. D. C. in Lin. trans. 17. p. 110.) glabrous; leaves ovate, bluntish, entire, narrowed into the petioles; umbels axillary, pendulous, one-half shorter than the petioles; flowers pentandrous; teeth of calyx ovate, acute, small; lobes of corolla ovate, acute, 3 times as large as the calyx; anthers lanceolate, sessile, inserted in the middle of the lobes of the corolla, and shorter than them; style acute, inclosed; berry globose. ♄. G. Native of Mexico. Leaves an inch long. Flowers either solitary, or 2-5 in a fascicle. Corolla pale red.

Pendulous-flowered Myrsine. Tree or shrub.

39 M. Canarie'nsis (Spreng. syst. 1. p. 663.) leaves oval-oblong, bluntish, almost sessile, large, glabrous, coriaceous, entire; flowers axillary, in fascicles, sessile; calyx 5-6-toothed; corolla 5-6-cleft: having the lobes linear-lanceolate; stamens inclosed, inserted in the middle of the corolla; anthers acute; style inclosed, acuminated. ♄. G. Native of Teneriffe. Scleróxylon Canariénse, Willd. mag. berol. nat. freund. 3. p. 59. Manglílla Canariénsis, Rœm. et Schultes, syst. 4. p. 505. Branches spotted with white. Leaves 4-6 inches long, and 2-4 broad. Flowers 3-8 in a fascicle. Lobes of calyx ovate, obtuse, a little ciliated. Berry globose. There are varieties of this having the leaves more or less full of pellucid dots, which are either round or oblong. Flowers whitish.

Canary Island Myrsine. Fl.? Clt. 1820. Tree 30-40 feet.

40 M. pachysa'ndra (Wall. in Roxb. fl. ind. 2. p. 297. cat. no. 2284.) branches velvety; leaves lanceolate, acuminated, entire, dotted, glabrous above, rather pilose beneath, having the lateral nerves arched; flowers fascicled, pedicellate, hermaphrodite, pentandrous; calycine lobes ovate, ciliated; corolline lobes reflexed; anthers large, triangular, connate at the time of flowering; style acuminated. ♄. S. Native of Penang and Singapore. This is an anomalous species: the dots on the leaves and flowers are more like those of *Ardísia* than *Mýrsine*; but the inflorescence is that of *Mýrsine*. The alabastrum is spirally twisted, and the æstivation imbricate. Perhaps a new genus.

Thick-anthered Myrsine. Tree small.

† *Species unknown, or very doubtful.*

41 M. sca'bra (Gærtn. fruct. 1. p. 282.) ♄. G. Native of the Cape of Good Hope. Perhaps the same as M. *Africàna*, *var. β, retùsa.*

Scabrous Myrsine. Shrub 3-6 feet.

42 M. læ'ta (Alph. D. C. in Lin. trans. 17. p. 112) leaves ovate, obtuse, or lanceolate-elliptic, even on both sides; flowers fascicled, pedicellate, hardly longer than the petioles. ♄. S. Native of the West Indies. Samàra læ'ta, Lin. mant. 199. syst. 159. Swartz, prod. 151. Memècylon umbellàtum, Lin. fl. zeyl. no. 469. Burm. ind. 87. fl. zeyl. 76. t. 31. Branches purplish. Flowers numerous, yellow.

Joyful Myrsine. Shrub 6-10 feet.

43 M. myrtifòlia (Alph. D. C. l. c.) leaves elliptic, acute; flowers white. ♄. G. Native of South America. Samàra myrtifòlia, Rœm. et Schultes, mant. 3. p. 220. This plant is entirely unknown to Kunth, see Linnæa, 1830. p. 376. It is perhaps the same as M. *depéndens*, which is marked *Caballèria myrtifòlia* in Deless. herb.

Myrtle-leaved Myrsine. Shrub or tree.

44 M. salígna (Alph. D. C. l. c.) leaves oblong-lanceolate, bluntish, narrowed at the base, clothed with rufous tomentum on the middle nerve beneath, as well as the petioles and branches; flowers pentandrous. ♄. G. Native of South America. Samàra salígna, Willd. mss. ex Rœm. et Schultes, mant. 3. p. 220. This species is also unknown to Kunth. see Linnæa. 1830, p. 367. Flowers sometimes tetrandrous and hexandrous.

Willowy Myrsine. Shrub or tree.

Cult. The species of this genus grow well in any light rich soil, or a mixture of loam, peat, and sand; and cuttings, not too ripe, root readily if planted in a pot of sand, with a hand-glass placed over them: those of the tropical species require a little heat.

VII. BA'DULA (a name used by Burman, in his Flora Zeylanica.) Juss. gen. 420, exclusive of the syn. Burm. zeyl. Alph. D. C. in Lin. trans. 17. p. 112. Barthèsia, Comm. in herb. mus. par. Anguillària species, Lam. ill. Mýrsine species, Rœm. et Schultes, syst. vol. 4.

Lin. syst. *Pentándria Monogýnia.* Calyx 5-lobed (f. 4. *a.*). Corolla 5-cleft (f. 4. *b.*). Stamens 5, shorter than the corolla; anthers almost sessile, acute, free, 2-celled (f. 4. *d.*); cells bursting by a longitudinal chink. Style shorter than the stamens; stigma thick, capitate or obscurely-lobed (f. 4. *c.*). Berry globose.—Trees or shrubs. Leaves alternate, entire, dotted. Inflorescence like that of *Ardísia*, that is, the pedicels are approximate or umbellate at the extremities of the peduncles. The species are all natives of the Mauritius or Bourbon.

1 B. micra'ntha (Alph. D. C. in Lin. trans. 17. p. 112.) peduncles velvety; leaves broad-oblong, obtuse, glabrous; panicles terminal, pyramidal, many-flowered, longer than the leaves; flowers small, velvety; alabastra globose. ♄. S. Native of the Island of Bourbon and the Mauritius. Leaves $1\frac{1}{2}$ to 2 inches long, dotted. Lobes of calyx small, acute; those of the corolla ovate, obtuse. Stigma obtuse.

Small-flowered Badula. Shrub or tree.

2 B. Barthe'sia (Alph. D. C. l. c. p. 113.) leaves lanceolate, acutish, tapering a long way at the base, glabrous, thin, dotted; peduncles racemose, many-flowered, rather shorter than the leaves; calycine lobes obtuse, ciliated; anthers acute; stigma capitate, obscurely-lobed. ♄. S. Native of the Mauritius. Barthèsia, Comm. in herb. mus. par. Bádula, Juss. gen. p. 240. Anguillària Barthèsia, Lam. ill. no. 2742. Mýrsine Barthèsia, Rœm. et Schultes, syst. 4. p. 507. Bark of branches yellow. Leaves half a foot long, besprinkled with reddish dots. Corolla white.

Barthesia Badula. Shrub or tree.

3 B. insula'ris (Alph. D. C. l. c.) glabrous; leaves ovate, obtuse, coriaceous; peduncles shorter than the leaves; pedicels alternate; calyx 5-parted; alabastra ovate; stigma obtuse. ♄. S. Native of the Isle of Bourbon or the Mauritius. Branches rusty. Leaves 1-3 inches long. Lobes of calyx acute, ciliated a little.

Island Badula. Shrub or tree.

4 B. Siebe'rii (Alph. D. C. l. c. t. 5.) leaves obovate, obtuse, petiolate, full of pellucid dots, glabrous; peduncles axillary, 4 times shorter than the leaves, 4-8-flowered; alabastra obtuse; calycine lobes ovate, acute, a little ciliated; anthers cuspidate. ♄. S. Native of the Mauritius. Ardísia latifòlia, Sieb. fl. maur. 11. p. 53, but not of Rœm. et Schultes. Leaves 3-4 inches long, full of pellucid dots, approximate at the tops of the branches. Peduncles velvety. Corolla white, dotted; lobes obtuse. Stigma peltate, or somewhat 2-lobed. (f. 4.)

FIG. 4.

Sieber's Badula. Shrub or tree.

5 B. ovalifòlia (Alph. D. C. l. c. p. 114.) glabrous; leaves ovate, acute at both ends, membranous, full of black dots; peduncles 3 times shorter than the leaves; alabastra ovoid, full of dots; anthers nearly sessile; style short, obtuse. ♄. S. Native of the Mauritius. Leaves 3-6 inches long. Peduncles dotted like the flowers. Calycine segments simple, acute. Lobes of corolla ovate, acute.

Oval-leaved Badula. Shrub or tree.

6 B. cra'ssa (Alph. D. C. l. c.) glabrous; branches thick; leaves elliptic, or oblong, obtuse, coriaceous; peduncles shorter than the leaves; pedicels alternate, short. ♄. S. Native of the Isle of Bourbon and the Mauritius. Leaves 3-5 inches long, full of pellucid dots. Lobes of calyx obtuse. Berry globose.

Thick-branched Badula. Shrub or tree.

7 B. angustifòlia (Alph. D. C. l. c.) leaves lanceolate, acute at both ends, nearly entire, dotted, glabrous; peduncles velvety, stiff, rather longer than the leaves. ♄. S. Native of Bourbon, in the more elevated places. Branches rusty. Leaves 12-15 lines long, shining above. sometimes irregularly toothed on one side, towards the apex. Calyx rather pilose: with acute lobes. Berry globose. Stigma obtuse.

Narrow-leaved Badula. Shrub or tree.

Cult. For culture and propagation see *Ardísia*, p. 20.

VIII. ONCOSTE'MUM (from *ογκος*, *onkos*, a mass; and *στημων*, *stemon*, a stamen; the stamens are combined into an egg-formed mass in the first species). Adr. Juss. ann. mus. 19. p. 136. t. 11. Alph. D. C. in Lin. trans. 17. p. 115.

Lin. syst. *Pentándria Monogýnia.* Calyx and corolla 5-cleft. Stamens combined into an ovoid or cylindrical mass, which is joined to the tube of the corolla at the base: or is 5-toothed at the apex. Ovarium superior. Style simple.—Stigma funnel-shaped, nearly entire, or denticulated, &c. Shrubs, natives of Madagascar, with the habit of *Ardísia* and *Bádula*.

1 O. Commersonia'num (Andr. Juss. l. c. t. 11.) leaves lanceolate or oblong-obovate, and bluntly acuminated; peduncles and pedicels quite glabrous; calyx 5-cleft; stamens conferruminated into an egg-formed mass. ♄. S. Native of Madagascar.

Commerson's Oncostemum. Shrub or tree.

2 O. Capeliera'num (Juss. l. c. p. 137.) leaves lanceolate, or oblong-obovate, and bluntly acuminated; peduncles and pedicels hairy, as well as the calyxes; calyx 5-parted; stamens combined into a 5-toothed tube. ♄. S. Native of Madagascar.

Capelier's Oncostemum. Shrub or tree.

Cult. See *Ardísia*, p. 20, for culture and propagation.

IX. ARDI'SIA (from *αρδις*, *ardis*, a point, in reference to the acute, spear-pointed anthers.) Swartz, prod. p. 48. Schreb. gen. no. 1735. R. Br. prod. p. 533. Roxb. fl. ind. 2. p. 268. Alph. D. C. in Lin. trans. 17. p. 116. Anguillària, Gærtn. fruct. 1. p. 372. t. 77. Schreb. gen. p. 823. no. 345. Bládhia, Thunb. fl. jap. p. 7. Py'rgus, Lour. coch. p. 120.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft (f. 5. *a.*) Corolla 5-cleft (f. 5. *b.*); lobes imbricate in æstivation. Stamens 5, with free filaments; anthers free, rarely combined, equal to the filaments in length, or longer, erect, triangular, acute or acuminated, 2-celled; cells dehiscing by a longitudinal chink. Ovarium globose. Style filiform, permanent, longer than the stamens. Stigma simple, subulate, or dot-formed. Ovula 5, ex R. Br. or more. Berry globose.—Trees shrubs and subshrubs. Leaves alternate, rarely almost opposite, or 3 in a whorl, dotted. Flowers more or less panicled. Panicles sometimes many-flowered at the extremities of the branches, and longer than the leaves; sometimes few flowered, and in the axils of the leaves; pedicels rather umbellate at the tops of the peduncles. Flowers larger than those of *Myrsine*, always hermaphrodite, white or rose-coloured, and often dotted.

Sect. I. Ardísiæ ve'ræ (this section contains the legitimate species of the genus.) Alph. D. C. in Lin. trans. 17. p. 116. Anthers free, longer than the filaments. Style subulate, longer than the stamens. Bracteas much shorter than the pedicels.

§ I. *Leaves entire, glabrous.*

1 A. acumina'ta (Willd. spec. 2. p. 1062) leaves oblong, acuminated, attenuated at the base; panicles terminal and axillary, many-flowered; lobes of calyx small, acute, dotted. ♄. S. Native of Guiana, in cultivated fields. Sims, bot. mag. t. 1678. Icacòrea Guianénsis, Aubl. guian. suppl. l. t. 368. Corolla nearly white.

Acuminated-leaved Ardisia. Fl. July, Aug. Clt. 1803. Shrub 6-8 feet.

2 A. tinifòlia (Swartz, prod. 48. fl. ind. occ. 1. p. 468.) leaves elliptic, nerved; panicle terminal; calycine segments subulate. ♄. S. Native of Jamaica, on the mountains.—Sloane, jam. 2. p. 98. t. 105. Leaves dark green, 4 inches long, and 2 broad. Corollas pale red, revolute.

Tinus-leaved Ardisia. Fl. Jul. Aug. Clt. 1820. Tr. 20-30 ft.

3 A. laurifòlia (Alph. D. C. in Lin. trans. 17. p. 116.) leaves ovate-lanceolate, obtuse, coriaceous, glabrous; racemes simple, axillary, and terminal. ♄. S. Native of the Antilles. A. latifòlia, Rœm. et Schultes, syst. 4. p. 514. Anguillària laurifòlia, Lam. ill. 2. p. 109. no. 2741. Very nearly allied to *A. coriàcea*, except in the shape of the leaves and the disposition of the flowers.

Laurel-leaved Ardisia. Tree.

4 A. macula'ta (Poiteau, in herb. D. C. ex Alph. D. C. in Lin. trans. 17. p. 116.) leaves oblong, obtuse, coriaceous; panicle terminal, branched, many-flowered, pyramidal; calycine lobes oval, obtuse, large; berry spotted. ♄. S. Native of Hispaniola. A. Domingénsis, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 803. ? Leaves 2 to $2\frac{1}{2}$ inches long.

Spotted-berried Ardisia. Shrub or tree.

5 A. cestrifòlia (H. B. et Kunth, nov. gen. amer. 7. p. 212.) branches rather angular; leaves glabrous, lanceolate-oblong, acuminated, cuneated at the base, quite entire, dotless; panicles axillary and terminal, sessile, crowded, glabrous; flowers pedicellate, racemose, 4-5-androus. ♄. S. Native of the Andes, about Quindiu. Calycine segments ovate, bluntish. Segments of the corolla oblong, acute.

Cestrum-leaved Ardisia. Shrub.

6 A. Capollìna (Moc. et Sesse, icon. mex. ined. ex Alph.

D. C. in Lin. trans. 17. p. 116.) leaves lanceolate, acute at both ends, shining; panicle terminal, compound, longer than the leaves: peduncles alternate; pedicels umbellate; lobes of corolla ovate, acute, reflexed, 4 times as long as the calyx. ♄. S. Native of Mexico, where it is called *Capollin*. Bracteas caducous. Berry globose, wine-coloured. Flowers of a pale rose-colour.

Capollin Ardisia. Shrub or tree.

7 A. revolu'ta (H. B. et Kunth, nov. gen. amer. 3. p. 246.) glabrous; leaves rather membranous, oblong, obtuse, cuneated at the base and revolute; panicles terminal, simple; pedicels fasciculate or umbellate; lobes of calyx obtuse, full of glandular dots; berry nearly globose. ♄. S. Native of Mexico, on the western declivities of the mountains near La Venta de Moxonera, in oak woods; and in woods near Jalapa. Leaves same colour on both surfaces, full of glandular dots, $4\frac{1}{2}$ inches long. Flowers white. Berries dry, about the size of a peppercorn, wrinkled, glandular.

Revolute-leaved Ardisia. Tree 30 to 40 feet.

8 A. compre'ssa (H. B. et Kunth, nov. gen. amer. 3. p. 245.) glabrous; branches compressed; leaves obovate-oblong, short-acuminated, nearly quite entire; panicles terminal, sub-racemose; pedicels in umbellate fascicles; lobes of calyx roundish-ovate, obtuse; lobes of corolla oblong, obtuse, revolute, glandular. ♄. S. Native of New Andalusia, in temperate places, near the monastery of Caripe. Branches pendulous. Leaves membranous, full of pellucid dots, palest beneath, 5-6 inches long. Corolla white. Berry dry, smooth.

Compressed-branched Ardisia. Tree 15 feet.

9 A. durifòlia (H. B. et Kunth, nov. gen. amer. 7. p. 214.) branches terete, glabrous; leaves obovate-oblong, obtuse, and somewhat retuse, running into the petioles at the base, revolute on the edges, quite entire, beset with scaly dots beneath, as well as the panicles; flowers racemose. ♄. S. Native on the Andes, about Quindiu. Flowers white. Calyx calyptrate before expansion, divided into 2-4 unequal segments. Corolla pentapetalous; petals oblong, revolute, valvate in æstivation.

Hard-leaved Ardisia. Tree 20 feet.

10 A. micra'ntha (H. B. et Kunth, l. c. 3. p. 246.) glabrous; leaves oblong, acute; panicles terminal and lateral, simple, crowded: with short branches; pedicels in umbellate fascicles; lobes of calyx and corolla elliptic, obtuse. ♄. S. Native of South America, on the banks of the river Magdalena, near Teneriffe. Bumèlia micrántha, Willd. mss. ex Rœm. et Schultes, syst. 4. p. 805. Branches brown, beset with linear purple dots. Leaves and flowers full of glandular dots, 5-6 inches long. Corolla small, white. Stigma truncate.

Small-flowered Ardisia. Tree.

11 A. Orinoce'nsis (H. B. et Kunth, l. c. p. 244.) leaves oblong, acute; panicles terminal and lateral, almost simple; pedicels in umbellate fascicles; lobes of calyx ovate, obtuse, with diaphanous margins; lobes of corolla ovate-roundish, obtuse, reflexed. ♄. S. Native on the banks of the river Orinoco, between the falls of Ature and the town of St. Borja. Branches brownish. Leaves rather membranous, paler beneath, $1\frac{1}{2}$ inch long. Corolla white, full of glandular dots. Very like *A. coriàcea*.

Orinoco Ardisia. Fl. May. Tree.

12 A. propínqua (H. B. et Kunth, nov. gen. amer. 7. p. 213.) branches nearly terete, warted; petioles and leaves glabrous; leaves elliptic-oblong, acute at both ends, quite entire, membranous, full of glandular dots; racemes terminal, solitary, always simple, glabrous; fruit pedicellate. ♄. S. Native of South America, near the banks of the Orinoco.

Allied Ardisia. Shrub.

13 A. ferrugínea (H. B. et Kunth, l. c. 3. p. 244.) branches, petioles, and panicles clothed with rusty tomentum; leaves oblong, acuminated, glabrous and shining above, and clothed with fuscescent down beneath; panicles terminal, almost simple; pedicels in umbellate fascicles; lobes of calyx ovate, acute. ♄. S. Native along with the preceding. Leaves narrowed at the base, membranous, full of glandular dots, $4\frac{1}{2}$ inches long. Berry glabrous. Habit of *A. crenàta*.

Rusty Ardisia. Shrub.

14 A. thyrsiflòra (D. Don, prod. fl. nep. p. 148.) leaves lanceolate; panicles thyrsoid, terminal; segments of corolla roundish-ovate, acute; anthers almost sessile. ♄. S. Native of Nipaul.

Thyrse-flowered Ardisia. Clt. 1824. Shrub.

15 A. purpu'rea (Blum. bijdr. p. 684.) leaves oblong, acuminated at both ends, quite entire, coriaceous, glabrous; panicle terminal, pyramidal; pedicels subumbellate; calycine segments rounded. ♄. S. Native of Java and Nusæ-Kambanga, in mountain woods, where it is called *Kilampani*.

Purple Ardisia. Fl. year. Shrub.

16 A. mucrona'ta (Blum. bijdr. p. 685.) leaves oblong, acuminated at both ends, mucronately awned at the apex, quite entire, coriaceous, glabrous; panicle terminal, short; pedicels umbellate; calycine segments rounded. ♄. S. Native of Java, in the province of Krawang, near Tjiradjas, in mountain woods.

Mucronate-leaved Ardisia. Shrub or tree.

17 A. sanguinole'nta (Blume, l. c. but not of Wall.) leaves oblong, acuminated, acute at the base, quite entire, coriaceous, glabrous; panicle terminal, divaricate; pedicels umbellate; calycine teeth acute. ♄. S. Native of Java, in shady places on the Parang mountains. Nearly allied to *A. speciòsa*, Bl. but the flowers are much smaller.

Bloody-flowered Ardisia. Shrub or tree.

18 A. Ròthii (Alph. in Lin. trans. 17. p. 117.) leaves oblong, obtuse, attenuated at both ends, glabrous, quite entire; raceme terminal, pyramidal; peduncles alternate, compressed, umbelliferous; stem arboreous. ♄. S. Native of the East Indies. A. pyramidàlis, Roth. nov. spec. p. 123. exclusive of the syn. of Cav. This species differs from A. pyramidàlis, Cav. in the leaves being quite entire.

Roth's Ardisia. Shrub 5 feet.

19 A. Py'rgus (Rœm. et Schultes, syst. 4. p. 518. ex R. Br. prod. 533.) leaves ovate-lanceolate, quite entire, glabrous, on short petioles; racemes ovate-oblong, terminal; segments of corolla lanceolate. ♄. G. Native of Cochin-china. Pýrgus racemòsa, Lour. coch. p. 121. A shrub with spreading branches. Flowers reddish-white.

Tower Ardisia. Shrub 5 feet.

20 A. lanceola'ta (Roxb. fl. ind. 2. p. 275. Wall. cat. no. 2292.) glabrous; leaves broad-lanceolate, shining; panicles terminal and axillary, composed of a few simple racemes; segments of calyx ovate; lobes of corolla ovate, pointed. ♄. S. Native of Pulo Penang. Leaves 6-9 inches long and 2-3 broad. Style length of stamens.

Lanceolate-leaved Ardisia. Fl. July. Clt. 1820. Shrub.

21 A. panicula'ta (Roxb. fl. ind. 2. p. 270.) glabrous; leaves cuneate-oblong, almost sessile, reflexed; panicles terminal, oval, composed of many alternate compound branches; segments of calyx and corolla ovate. ♄. S. Native of Chittagong and Silhet, where it makes a conspicuous appearance, on account of its large reflexed leaves, and very ample elegant panicles of innumerable rose-coloured flowers. Ker. bot. reg. 638. Sims, bot. mag. 2364. Young shoots thick, green. Leaves from 6-20 inches long, and from 3-5 inches broad, crowded at the ends of the branches. Berries red, smooth, size of a pea, juicy.

Panicled-flowered Ardisia. Fl. year. Clt. 1818. Shrub 8 to 10 feet.

22 A. a'nceps (Wall. in Roxb. fl. ind. 2. p. 280.) glabrous; branches climbing, 2-edged; leaves oblong-lanceolate, acuminated; panicles terminal: with flattened, nearly smooth ramifications; segments of calyx lanceolate, acute, of the corolla ovate, acute. ♄. S. Native of Silhet. Branches pale grey. Leaves 5-10 inches long, coriaceous. Pedicels subumbellate. Flowers small, pink, dotted.

Two-edged-branched Ardisia. Shrub cl.

23 A. complana'ta (Wall. in Roxb. fl. ind. 2. p. 280. cat. no. 2277.) branches terete; leaves oblong-lanceolate, acuminated glabrous; panicles axillary and terminal: with villous, divaricate, flexuous ramifications; lobes of calyx triangular, acute, ciliated, dotted. ♄. S. Native of Penang and about Chappedong. A. polycárpa, Wall. cat. no. 2285. A rambling subscandent shrub. Branches rather tomentose and rusty while young. Leaves coriaceous, 6-8 inches long. Pedicels in umbellate fascicles. Flowers small, pink. Berries dark purple. Very like *A. ánceps*, but is readily distinguished by its terete branches.

Flattened-peduncled Ardisia. Clt. 1824. Shrub cl.

24 A. sca'ndens (Blum. bijdr. p. 686.) leaves oval, rounded at the apex, acute at the base, quite entire, glabrous; panicles terminal, drooping; pedicels racemose; calycine teeth acute; stem climbing. ♄. S. Native of Java, in mountain woods, where it is called *Ojot Katjambang* and *Kibaralalakkie*.

Climbing Ardisia. Shrub cl.

25 A. Blu'mii (Alph. in D. C. Lin. trans. 17. p. 117.) leaves oblong-lanceolate, acuminated at both ends, subrepand, glabrous, finely dotted beneath; panicles axillary and terminal, short; pedicels subumbellate; calycine teeth roundish; branchlets 2-edged. ♄. S. Native of the island of Nusæ Kambanga, where it is called *Sikattan*. A. ánceps, Blum. bijdr. p. 685. but not of Wall.

Blume's Ardisia. Shrub cl.

26 A. floribu'nda (Wall. in Roxb. fl. ind. 2. p. 272. cat. no. 2263.) young shoots and tender leaves covered on both sides with dense, scaly, purple, loose tomentum; leaves crowded towards the tops of the branches, oblong-lanceolate, acuminated at both ends, very obscurely crenulated, coriaceous, shining above and glaucous beneath; panicles terminal, oval; pedicels umbellate; calyx dotted: with ovate, acute lobes; segments of corolla ovate, acute. ♄. G. Native of Nipaul, on Sheopore, and of Noakote. Leaves 5-6 inches long. Flowers small, red.

Bundle-flowered Ardisia. Shrub 10 feet.

27 A. missiònis (Wall. cat. no. 6524. Alph. D. C. in Lin. trans. 17. p. 117.) glabrous; leaves oblong-lanceolate; panicle terminal, loose, length of leaves; lobes of calyx ovate, acute. ♄. S. Native of the East Indies. Leaves crowded at the extremity of the branches, 4-5 inches long. Peduncles axillary, remotish, 3-6-flowered. Lobes of corolla lanceolate, acuminated.

Mission Ardisia. Shrub or tree.

28 A. hu'milis (Vahl. symb. p. 40. Blum. bijdr. p. 687.) glabrous; leaves oblong-lanceolate, acuminated at both ends, glabrous, veined, shining; umbels simple, axillary, pedunculate; flowers drooping; segments of calyx short and rounded, ciliated; lobes of corolla lanceolate, first recurved, then revolute. ♄. S. Native of Coromandel, Nipaul, Bengal, Martaban, Ceylon, Sumatra, Java, Penang, &c. A. solonàcea, Roxb. cor. 1. p. 22. t. 27. Sims, bot. mag. 1677. Wall. cat. 2283. A. littoràlis, Andr. bot. rep. 630. A. dòma, Wall. cat. no. 2283. A. oleràcea, Wall. cat. 2283. G. A. umbellàta, Roxb. fl. ind. 2. p. 273. Lodd. bot. cab. 531. Wall. cat. no. 2283. A. nàna, Wall. cat. no. 2283. L. Leaves deep green, 3-4 inches long and about 2 broad. Peduncles solitary, bearing each a simple racemose umbel of many pretty, large, drooping, rose-coloured flowers. Anthers united by their heads into a cone. Berry size of a pea, shining, black, juicy. Blume says the racemes are compound and divaricate, composed of umbels of flowers.

Var. β; leaves more acute, membranous, with rather prominent nerves; peduncles and pedicels elongated, few-flowered. ♄. S. Native of the mountains of Silhet. A. solonàcea, Wall. cat. 2283. A. K.

Var. γ; flowers large; bracteas more ample. ♄. S. Native of the Nelligherry mountains. A. grandiflòra, Wall. cat. no. 2372.

Var. δ; leaves larger, shining on both surfaces. ♄. S. A. Wightiàna, Wall. cat. no. 2330.

Humble Ardisia. Fl. Ju. Sept. Clt. 1798. Shrub 4 to 8 ft.

29 A. lu'rida (Blum. bijdr. p. 687.) leaves oblong-lanceolate, acuminated at both ends, quite entire, coriaceous, glabrous; panicles umbellately racemose, axillary; calycine segments rounded. ♄. S. Native of Java, on the western mountains, and near Tjiradjas.

Lurid Ardisia. Fl. year. Shrub.

30 A. neriifòlia (Wall. cat. no. 2278. Alph. D. C. in Lin. trans. 17. p. 118. t. 8.) leaves oblong, acuminated, on long petioles, with the nerves rather distinct; panicles loose, terminal, and lateral, shorter than the leaves; peduncles and pedicels rather velvety; calycine segments small, acute, ciliated; lobes of corolla ovate, acuminated; style exserted; anthers cuspidate, almost sessile. ♄. S. Native of Silhet. Peduncles sometimes elongated and cirrhose.

Var. β, *montàna* (Alph. D. C. l. c.) leaves oblong-lanceolate, long-acuminated; pedicels shorter; calycine segments broader; alabastra small, acuminated. ♄. S. A. neriifòlia? β. Wall. cat. no. 2278.

Nerium-leaved Ardisia. Shrub or tree.

31 A. escallonioìdes (Cham. et Schlecht. in Linnæa. 6. p. 393.) glabrous; leaves cuneated-obovate, quite entire, paler beneath, ending in a blunt acumen; panicle terminal, formed from dense-flowered erect racemes, pyramidal; calycine segments elliptic, obtuse. ♄. G. Native of Mexico, in woods at Papantla. Leaves 4 inches long, with the petioles. Flowers white. Berries black.

Escallonia-like Ardisia. Shrub or tree.

32 A. dive'rgens (Roxb. fl. ind. 2. p. 275. Wall. cat. no. 2269.) glabrous; branches diverging; leaves ovate-lanceolate, attenuated at both ends, almost sessile; peduncles rather velvety, bearing a few small, alternate umbellets or corymbs. ♄. S. Native of the Moluccas and Penang. A. punctàta, Jack, ined. ex Roxb. fl. ind. l. c. Leaves 4-5 inches long. Corymbs terminal, paniculate.

Diverging-branched Ardisia. Shrub.

33 A. polyce'phala (Wall. cat. no. 2293.) glabrous; leaves oblong, acute, ample, unequally revolute on the margins beneath; peduncles numerous at the tops of the branches, compressed, one half shorter than the leaves; flowers densely racemose; calycine lobes obtuse; alabastra acute; style inclosed. ♄. S. Native of the East Indies, on the banks of the river Atran. Leaves 5-7 inches long, $1\frac{1}{2}$ and $2\frac{1}{2}$ inches broad, coriaceous. Pedicels incurved, approximate at the tops of the peduncles. Lobes of corolla acuminated. Berry black, striated.

Many-headed Ardisia. Shrub.

34 A. tuberculà'ta (Wall. cat. no. 2274.) leaves ovate-acuminated, coriaceous, dotted everywhere; racemes axillary and terminal, many-flowered, shorter than the leaves; peduncles rather compressed, glabrous; calycine segments ovate-acute, a little ciliated. ♄. S. Native of Singapore. Branches angularly compressed at the apex. Leaves 2-4 inches long, narrowed at the base, full of resinous dots. Pedicels umbellulate. Flowers small.

Tubercled Ardisia. Shrub or tree.

35 A. attenua'ta (Wall. cat. no. 2286.) glabrous; leaves oblong-lanceolate, acuminated at both ends, much dotted on the edges; peduncles axillary, elongated; flowers racemose; pedicels and peduncles glabrous; calycine lobes ovate, acute, a little ciliated. ♄. S. Native of the Burman empire, about Tavoy. Leaves 5-8 inches long. Pedicels thickened a little at the apex. Berry smoothish.

Attenuated-leaved Ardisia. Shrub.

36 A. elli'ptica (Thunb. nov. gen. pt. 8. ups. 1795. ex Rœm. et Schultes, syst. 4. p. 517.) glabrous; branches angular; leaves elliptic; panicles lateral. ♄. S. Native of Ceylon. Leaves a hand long. Stem terete.

Elliptic-leaved Ardisia. Tree.

37 A. oxyphy'lla (Wall. cat. no. 2291.) glabrous; leaves elliptic, acute at both ends, much dotted on the margins; peduncles terminal and axillary, shorter than the leaves; pedicels loosely umbellate; calycine segments ovate, a little ciliated; lobes of corolla lanceolate; style inclosed. ♄. S. Native of Penang. Leaves 4-5 inches long, stiff, shining. Inflorescence like that of *A. humilis*, but the flowers are smaller and less numerous.

Sharp-leaved Ardisia. Shrub.

38 A. eugeniæfo'lia (Wall. cat. no. 2276.) leaves oblong-lanceolate, acute at the base, and acuminated at the apex: having the nerves thick, and arched near the margin; peduncles axillary, short, panicled, many-flowered, much shorter than the leaves; pedicels and calyx velvety; segments of calyx and corolla ovate-acute; style exserted. ♄. S. Native of Silhet, on the mountains. Leaves 3-6 inches long, dotted.

Eugenia-leaved Ardisia. Shrub.

39 A. arbore'scens (Wall. cat. no. 2289.) glabrous; leaves oblong-lanceolate, acute, coriaceous; peduncles axillary, elongated, stiff; panicles loose, shorter than the leaves; pedicels long; calycine lobes ovate, acute. ♄. S. Native of the Burman empire, on Mount Taong Dong. Leaves 5-7 inches long. Peduncles often compressed.

Arborescent Ardisia. Tree.

40 A. Amherstia'na (Alph. D. C. in Lin. trans. 17. p. 120.) leaves oblong, acute; peduncles terminal, and are, as well as the pedicels downy; flowers umbellate; calycine segments ovate, obtuse, ciliated, velvety on the back; lobes of corolla ovate, acute; style inclosed. ♄. S. Native of the province of Martaban, near the town of Amherst. A. refléxa, Wall. cat. no. 2282. part. Branches silky at top and fulvous. Leaves 6-8 inches long. Flowers numerous.

Lady Amherst's Ardisia. Shrub.

41 A. pauciflo'ra (Heyne, herb. Roxb. fl. ind. 2. p. 279. Wall. cat. no. 2270.) glabrous; leaves lanceolate or oblong-lanceolate, acuminated; petioles short; peduncles lateral and axillary, 2-3-flowered. ♄. S. Native of the East Indies, at Wynaad? Young branches clothed with rusty dense scaly tomentum. Leaves 4-5 inches long, tapering into a bluntish sometimes retuse acumen. Flowers small.

Few-flowered Ardisia. Shrub.

42 A. tenuiflo'ra (Blum. bijdr. p. 686.) leaves oblong-lanceolate, bluntish, quite entire, glabrous; panicles divaricate, axillary, and terminal; pedicels racemose; calycine teeth acute; stem scandent; flowers very minute. ♄. ب. S. Native of Java, in the provinces of Buitenzorg and Bamtam, in woods, where it is called *Kitjambang*.

Var. β; leaves rounded at the base. ♄. S. Native at the foot of Mount Salak.

Fine-flowered Ardisia. Fl. year. Shrub cl.

43 A. nu'tans (Alph. D. C. in Lin. trans. 17. p. 121.) leaves oblong-lanceolate, bluntish, lined transversely, quite entire, glabrous, dotted beneath, clothed with fuscous tomentum while young, as well as the branchlets; umbels simple, axillary, and terminal, nutant; segments of calyx acute. ♄. S. Native of the island of Nusæ Kambanga, in shady places on the banks of rivulets. A. punctàta, Blum. l. c. p. 687. but not of Lindl.

Drooping-flowered Ardisia. Shrub.

44 A. margina'ta (Blum. bijdr. p. 688.) leaves lanceolate, acuminated at both ends, quite entire, glabrous, finely dotted beneath, with parallel transverse stripes, and girded on the margin by the approximation of veins and stripes; umbels subcorymbose, axillary; calycine teeth acute. ♄. S. Native of Java, on Mount Burangrang, in the higher woods.

Marginate-leaved Ardisia. Shrub.

45 A. læviga'ta (Blum. bijdr. p. 690.) leaves oblong, acuminated at both ends, quite entire, coriaceous, glabrous; racemes axillary and lateral, simple; calycine segments acuminated. ♄. S. Native of Java, on the top of Mount Gede.

Smooth Ardisia. Shrub.

46 A. obova'ta (Blum. bijdr. p. 688.) leaves obovate, rounded or obtuse at the top, quite entire, coriaceous, glabrous, marked with fine parallel stripes; flowers subumbellately racemose, axillary; calycine segments rounded. ♄. S. Native of the island of Nusæ Kambanga, on the sea shore, where it is called *Lampanee*.

Obovate-leaved Ardisia. Fl. Sept. Oct. Shrub.

47 A. cymo'sa (Blum. bijdr. p. 689.) leaves oblong, bluntish, attenuated at the base, quite entire, transversely striated; petioles, branchlets, and peduncles beset with rusty, leprous-like dots; cymes compound, axillary, and terminal, pedunculate; pedicels umbellate; teeth of calyx acute. ♄. S. Native of Java, in the province of Bamtam, among bushes.

Cymose-flowered Ardisia. Fl. Aug. Shrub.

48 A. oblo'nga (Alph. D. C. in Lin. trans. 17. p. 121.) leaves oblong, acuminated, dotted; peduncles nearly terminal, much shorter than the leaves; pedicels umbellate, few-flowered, and are, as well as the peduncles, glabrous; calycine lobes ovate, obtuse, a little ciliated. ♄. S. Native about Tavoy. A. attenuàta, Wall. cat. no. 2286. part. see no. 35. Leaves 4-5 inches long. Pedicels often reflexed. Berry smoothish.

Oblong-leaved Ardisia. Shrub or tree.

49 A. oxya'ntha (Wall. cat. no. 2275. Alph. D. C. l. c.) leaves lanceolate, acuminated at both ends, thin; flowers few, axillary; peduncles 1-flowered, filiform, about equal in length to the petioles; calycine segments lanceolate, a little ciliated; lobes of corolla elongated, long-acuminated. ♄. S. Native of Silhet on the mountains. Leaves 3-4 inches long. Pedicels rather velvety. This is an anomalous species.

Sharp-flowered Ardisia. Shrub.

§ 2. *Leaves entire, pilose.*

50 A. refle'xa (Wall. cat. no. 2282. Alph. D. C. in Lin. trans. 17. p. 122.) leaves oblong, acute, glabrous above and downy beneath; peduncles nearly terminal, reflexed, much shorter than the leaves, downy; pedicels umbellate, densely pilose, as well as the calyxes; calycine segments ovate, acute. ♄. S. Native of the province of Martaban. Branches brown and hispid at the top. Leaves 4-7 inches long; petioles hispid.

Reflexed-peduncled Ardisia. Shrub.

51 A. grandifo'lia (Alph. D. C. l. c.) leaves oblong, ample, cuspidately acute, glabrous above and pilose beneath; branches and petioles hispid; peduncles nearly terminal, puberulous, stiff, much shorter than the leaves; pedicels umbellate; calycine segments lanceolate, acute, a little ciliated. ♄. S. Native about Tavoy, in the Burman empire. A. macrophýlla, Wall. cat. no. 2290. but not of Blum. Leaves 5-9 inches long, and 3-4 broad, having the central nerve hispid beneath, and the lateral ones

pilose. Hairs on the branchlets and leaves silky and purplish. Berries ovoid, glabrous.

Great-leaved Ardisia. Shrub or tree.

52 A. macrophy'lla (Reinwdt. ex Blum. bijdr. p. 691. but not of Wall.) leaves rather large, oblong, acuminated, obtuse at the base, quite entire, coriaceous, tomentose beneath, as well as the umbels, which are subcorymbose and axillary. ♄. S. Native of Java, in the western provinces, on the mountains, where it is called *Lampanie-Badak*.

Long-leaved Ardisia. Shrub or tree.

§ 3. *Leaves glabrous, crenated, toothed or serrated.*

53 A. serra'ta (Pers. ench. 1. p. 233.) glabrous; leaves lanceolate, serrated; racemes terminal, compound. ♄. S. Native of South America, near Santa Cruz. A. Cavanillesiàna, Rœm. et Schultes, syst. 4. p. 515. Anguillària serràta, Cav. icon. 6. p. 2. t. 503. Leaves 6 inches long. Panicle pyramidal. Segments of corolla ovate-lanceolate.

Serrated-leaved Ardisia. Tree 15 to 20 feet.

54 A. pyramida'lis (Pers. l. c. but not of Roth.) glabrous; leaves lanceolate-ovate; racemes terminal, composed of umbel-bearing compressed peduncles; segments of calyx ovate, acute, ciliated; corolline lobes lanceolate. ♄. S. Native near Santa Cruz. Anguillària pyramidàlis, Cav. icon. 6. p. 1. t. 502. Leaves nearly sessile, a little toothed, tapering into the petioles, 6 inches long. Panicles ample, pyramidal. Calyxes rufescent. Corolla red. Drupe coriaceous.

Pyramidal Ardisia. Fl. July, Aug. Clt. 1818. Tree 20 to 25 feet.

55 A. speciòsa (Blum. bijdr. p. 684.) leaves oblong, acuminated, rather attenuated at the base, obsoletely denticulated, coriaceous, glabrous; panicles terminal, divaricate; pedicels subumbellate; calycine segments rounded. ♄. S. Native of Java, in mountain woods, where it is called *Kissamplak*. Allied to *A. divaricàta*.

Showy Ardisia. Shrub or tree.

56 A. serrula'ta (Swartz, prod. p. 48. fl. ind. occ. 1. p. 471.) glabrous; leaves lanceolate, acuminated, wrinkled, serrulated, beset with rusty dots beneath; panicles terminal; pedicels umbellate; segments of the corolla ciliated. ♄. S. Native of Hispaniola, on the banks of rivers. Plum. icon. t. 80. Branches downy. Pedicels and calyxes coloured. Corollas deep red. Berries blood red.

Var. β, chrysophýlla (Rœm. et Schultes, syst. 4. p. 515.) panicle terminal; leaves ovate-lanceolate, acuminated, golden yellow beneath. ♄. S. Native of St. Domingo. Anguillària chrysophýlla, Lam. ill. 2. p. 109. no. 2743. Flowers violaceous. Berries red.

Serrulated-leaved Ardisia. Fl. July, Aug. Clt. 1820. Sh. 2 to 3 feet.

57 A. fuliginòsa (Blum. bijdr. p. 692.) leaves oblong-acuminated, cuneated at the base, obsoletely denticulated at the apex, glabrous in the adult state, but clothed with rusty tomentum while young, as well as the branchlets; umbels subracemose, axillary; calycine teeth acute. ♄. S. Native of Java, in mountain woods. Allied to *A. solanàcea*.

Fuliginous Ardisia. Fl. year. Shrub.

58 A. glabra'ta (Blum. l. c.) leaves oblong-lanceolate, acuminated at both ends, with rather crenulated subglandular margins, smooth on both surfaces; umbels corymbose, terminal; calycine segments semi-lanceolate, obtuse, about equal to the corolla in length. ♄. S. Native of Java, in the province of Bantam, where it is called *Lampanie*. Allied to the preceding.

Smooth Ardisia. Shrub or tree.

59 A. macroca'rpa (Wall. in Roxb. fl. ind. 2. p. 277.) glabrous; leaves oblong, acute, tapering downwards, glandularly crenated, dotted; racemes terminal, corymb-formed, almost sessile; segments of corolla ovate, obtuse; berries large. ♄. S. Native of Nipaul, on most of the hills about the great valley. Branches greenish. Leaves approximate, coriaceous, 6-8 inches long, paler beneath, veinless. Racemes slightly pubescent. Flowers flesh-coloured, dotted. Pedicels clavate. Berry vermillion-coloured, as large as a gooseberry. This is a beautiful shrub.

Large-fruited Ardisia. Clt. 1824. Shrub 5 to 6 feet.

60 A. membrana'cea (Wall. cat. no. 2288.) glabrous; leaves approximate, oblong-lanceolate, acuminated, tapering a long way at the base, irregularly crenulated, membranous; peduncles axillary, 4 times shorter than the leaves; pedicels short, approximate; alabastra obtuse; calycine segments ovate, acute, about equal in length to the lobes of the corolla; style inclosed. ♄. S. Native of Silhet, on the mountains. Branches thick, filled with medulla. Leaves 4-5 inches long, dotted. Peduncles often reflexed. Flowers small, in loose fascicles.

Membranous-leaved Ardisia. Shrub 2 to 3 feet.

61 A. Wallíchii (Alph. D. C. in Lin. trans. 17. p. 123.) leaves obovate, acute, or obtuse, narrowed into the marginate petioles, repandly crenulated; peduncles axillary, one half shorter than the leaves, and are, as well as the pedicels pilose; flowers in loose racemes; calycine segments ovate, acute, a little ciliated; lobes of corolla ovate, acuminated; anthers nearly sessile, bluntish; style inclosed. ♄. S. Native of the Burman empire, on the banks of the Irawaddy and the Atran. A. sanguinolénta, Wall. cat. no. 2287. but not of Blum. A humble shrub: with thick, hardly woody branches. Young branches and leaves full of blood-coloured juice. Leaves 4-5 inches long, and 2 broad, thickish.

Wallich's Ardisia. Shrub dwarf.

62 A. Japónica (Blum. bijdr. p. 690. Hornstedt, diss. nov. pl. gen. pt. 1. p. 6-7. with a figure. Thunb. fl. jap. p. 95. t. 18. under *Bládhia*) glabrous; leaves nearly opposite, or 3-5 in a whorl, on short petioles, cuneate-oblong, acute, glabrous, serrated; pedicels subumbellate, secund. drooping; calyx 5-toothed; racemes simple, axillary. ♄. G. Native of Japan, on the mountains among bushes. Sankits vulgo Jamma Tadsi banna, Kæmpf. amœn. 5. p. 775. Root creeping. Leaves a hand long. Pedicels red. Corollas white.

Japan Ardisia. Shrub 1 foot.

63 A. gla'bra (Alph. D. C. in Lin. trans. 17. p. 123.) glabrous; leaves nearly opposite, serrated, ovate-acuminated. ♄. G. Native of Japan. Bládhia glàbra, Thunb. fl. jap. p. 350. Lin. trans. 2. p. 331. Stem frutescent, articulated, simple. Leaves approximate at the top of the stem, $1\frac{1}{2}$ inch long. Berries red, size of small peas.

Glabrous Ardisia. Shrub 1 foot.

64 A. pu'mila (Blum. bijdr. p. 688.) stem suffruticose, procumbent at base, rooting; leaves lanceolate-elliptic, acute, narrowed into the petioles at the base, obsoletely crenulated, marked with transverse stripes, glabrous; flowers subumbellately racemose; calyx 5-toothed; segments of corolla crenulate. ♄. S. Native of Java, in shady places on Mount Salak.

Dwarf Ardisia. Shrub 1 foot.

65 A. crísPA (Alph. D. C. l. c.) glabrous; leaves oblong-lanceolate, attenuated at both ends, with repandly crenulated glandular edges; cymes terminal, usually solitary, often compound; pedicels smooth, finely veined, umbellate, drooping; segments of calyx and corolla obtuse. ♄. G. Native of Penang, Singapore, Japan, and China. Bládhia crísPA, Thunb, fl. jap. p. 97. Banks, icon. Kæmpf. t. 7. Ardísia élegans, Andr. bot. rep. t. 263. A. crenàta Roxb. fl. ind. 2. p. 276. Wall.

cat. no. 2262. A. glandulòsa, Blum. bijdr. 690. but not of Roxb. Leaves bluntish. Racemes generally solitary, from the extremities of the corymbiform lateral branchlets. Flowers small, drooping, red. Berries red, size of peas. (fig. 5.)

FIG. 5.

Var. β; corolla white, dotted with red. ♄. S. A. crenàta, Sims, bot. mag. t. 1950. A. lentiginòsa, Ker. bot. reg. t. 553.

Var. γ; corolla white. ♄. S. A. crenulàta, Lodd. bot. cab. t. 2.

Curled-leaved Ardisia. Fl. July, Aug. Clt. 1809. Shrub 4 to 8 feet.

66 A. pentagòna (Alph. D. C. l. c.) leaves lanceolate, acuminated at both ends, obsoletely crenulated, glabrous; umbels simple, lateral; calycine teeth acute; fruit depressedly pentagonal. ♄. G. Native of China. A. quinquegòna, Blum. bijdr. 689.

Five-angled Ardisia. Fl. year. Shrub.

67 A. punctà'ta (Lindl. bot. reg. t. 827.) glabrous; leaves lanceolate, coriaceous, repandly crenated, tapering to the base; peduncles umbellate, terminal, and axillary; umbels involucrated by deciduous bracteas; segments of corolla 4-5, obovate, obtuse; flowers subcampanulate, secund. ♄. G. Native of China. Flowers greyish white, beset with dark dots: and the pedicels with dark lines.

Dotted Ardisia. Fl. June, Aug. Clt. 1822. Shrub 6 to 10 feet.

§ 4. *Leaves pilose, crenated, toothed, or serrated.*

68 A. crenula'ta (Vent. choix. t. 5.) leaves lanceolate-ovate, tapering at both ends, repandly crenulated, pilose; panicles terminal; pedicels umbellate. ♄. G. Native of Porto Rico, Mexico between Tampico and Real del Monte, Antilles, &c. A. lateriflòra, Swartz, prod. p. 48. fl. ind. occ. 1. p. 473.? Anguillària lateriflòra, Poir. dict. suppl. 7. p. 687.? Ang. crenulàta, Poir. dict. 7. p. 689. Flowers of a reddish violet colour. Berries black, size of currants. There are varieties of this with more or less repand and hairy leaves.

Var. β; leaves coriaceous, without pellucid dots, very pilose beneath.

Crenulated-leaved Ardisia. Fl. June, Sept. Clt. 1809. Sh. 3 to 6 feet.

69 A. Cuba'na (Alph. D. C. in Lin. trans. 17. p. 124.) leaves ovate-oblong, bluntish, undulated, glabrous above, rather pilose beneath; panicles terminal, branched, about equal with the leaves; peduncles rusty; calycine segments acute; lobes of corolla linear-lanceolate, spreading, velvety. ♄. S. Native of Cuba. Extreme branches and peduncles velvety. Leaves 2-3 inches long, obtuse or acutish; hairs stellate. Flowers like those of *A. crenulàta*, from which species it hardly differs, unless in the smaller, obtuse, less repand leaves.

Cuba Ardisia. Shrub.

70 A. melanostícta (Schlecht. in Linnæa, 8. p. 526.) leaves elliptic or oblong-elliptic, tapering into the petioles at the base, short-acuminated at the apex, glabrous above, but beset with rusty down and black dots beneath, with erosely crenulated membranous edges; umbels crowded into axillary racemes, which are shorter than the leaves; corolla downy inside, at length revolute, with a short tube and narrow segments. ♄. G. Native of Mexico, in woods, between San Salvador and Jalapa. Flowers white. Anthers cordate at the base.

Black-dotted Ardisia. Shrub or tree.

71 A. Ica'ra (Wall. cat. no. 2264. Alph. D. C. l. c. t. 7. p. 125.) leaves oblong-lanceolate, acuminated at the base, acute at the apex, denticulated, rather pilose above, but glabrous and paler beneath; panicles branched, nearly terminal, about equal to the leaves; peduncles umbellate; pedicels and flowers velvety; calycine segments subulate; lobes of corolla ovate, acute. ♄. S. Native of Bengal, about Bhatgong and Mateabo. Leaves 6 inches long. Hairs simple. Umbellets surrounded by whorls of bracteoles.

Icara Ardisia. Shrub.

72 A. odontophy'lla (Wall. cat. no. 2279. Alph. D. C. l. c. t. 6.) leaves lanceolate-oblong, acute at both ends, on long petioles, sharply toothed, puberulous; racemes axillary, much shorter than the leaves; pedicels short, alternate, and are, as well as the peduncles, velvety; calycine lobes ovate, acute, ciliated and downy; corolla deeply parted: with ovate, acute lobes. ♄. S. Native of Bengal, towards Silhet, and about Gualpara. A. pavonìna, Hamilt. herb. Branches ascending, filled with medulla. Leaves 4-6 inches long.

Toothed-leaved Ardisia. Shrub.

73 A. móllis (Blum. bijdr. p. 689.) leaves oblong-lanceolate, acuminated at both ends, crenulated, dotted, rather villous beneath; umbels axillary and terminal, simple; calycine segments semi-lanceolate, acute, about equal in length to the corolla. ♄. S. Native of Java, in the province of Bamtam, on the mountains. Allied to *A. glandulòsa*.

Soft Ardisia. Fl. Feb. Shrub.

74 A. Tavoya'na (Alph. D. C. l. c.) extremities of branches downy; leaves oblong-lanceolate, acuminated at both ends, glabrous above, pilose and much dotted beneath, rather crenulated, thin; peduncles lateral, simple, velvety, rather shorter than the leaves; pedicels umbellate; calycine segments linear-lanceolate, acuminated, pilose outside. ♄. S. Native about Tavoy, in the Burman empire. A. villòsa, Wall. cat. no. 2280. B. It differs from A. villòsa, Roxb. in the leaves being larger and pilose beneath, &c. Berries pilose.

Tavoy Ardisia. Shrub.

75 A. villòsa (Roxb. fl. ind. 2. p. 274.) branchlets villous; leaves lanceolate, acuminated, villous beneath, crenulated; umbels axillary and terminal, very villous; calycine segments linear-lanceolate. ♄. S. Native of Penang and Singapore. Leaves 5-7 inches long, tapering to the base, copiously dotted. Berries villous. Hairs simple, jointed. All the upper parts of the plant are densely beset with hairs. Umbellets terminal, compound.

Villous Ardisia. Fl. Oct. Shrub.

76 A. pusílla (Alph. D. C. l. c. p. 126.) stem filiform, tomentose; leaves opposite, ovate, acute, serrated, villous; peduncles few-flowered, tomentose; flowers lateral. ♄. G. Native of Japan. Bládhia villòsa, Thunb. fl. jap. p. 96. t. 19.

Least Ardisia. Shrub 1 foot.

77 A. vestìta (Wall. in Roxb. fl. ind. 2. p. 274. cat. no. 2281.) branches densely villous and hairy; leaves lanceolate, acuminated, remotely and bluntly crenated, tapering at the base, minutely and copiously dotted: and clothed with abundance of long, soft, jointed hairs: umbels axillary and terminal, villous; segments of calyx linear-lanceolate, acute; berries villous. ♄. S. Native of Singapore. Leaves 5-7 inches long. All the upper parts of the shrub are exceedingly thickly clothed with soft hairs.

Clothed Ardisia. Shrub.

Sect. II. Hymena'ndra (from *ὑμην*, *hymen*, a membrane, and *ανηρ ανδρος*, *aner andros*, a male; the anthers are membrane-winged in the first species). Alph. D. C. in Lin. trans. 17. p. 126. Anthers combined. Style about equal in length to the stamens; stigma dot-formed. Bracteas much shorter than the pedicels.

78 A. hymena'ndra (Wall. in Roxb. fl. ind. 2. p. 282. cat. no. 2266.) glabrous; leaves obovate, acuminated, coarsely crenated, tapering and entire downwards; corymbs lateral, leafy from large bracteas; segments of corolla nearly linear, long; anthers combined, membrane-winged and tailed. ♄. S. Native of Silhet, on the Juntyapoor mountains. Wall. pl. rar. asiat. 1. t. 175. Branches marked with callous tubercles. Leaves scattered, approximate, subverticillate by threes or fours, 6-10 inches long. Corymbs rising from the vestiges of the fallen leaves, composed of approximate spreading umbels of large pink flowers. Peduncles flattened. Calycine segments lanceolate, slightly ciliated.

Membrane-anthered Ardisia. Fl. Mar. July. Clt. 1828. Shrub 6 to 8 feet.

79 A. glandulòsa (Roxb. fl. ind. 2. p. 276.) glabrous; leaves lanceolate, having the margins coloured and glandular; umbels few-flowered, on long peduncles, globular, at and round the tops of the branches; corolline segments round and emarginate; anthers united. ♄. S. Native of Silhet, where it is called by the natives *Bun-nurukalee*. Leaves 4-6 inches long. Flowers small, white, on short pedicels. Calyx rusty from dots.

Glandular-leaved Ardisia. Shrub.

Sect. III. Micranthe'ra (from *μικρος*, *micros*, small, and *ανθηρα*, *anthera*, an anther; in allusion to the anthers being much shorter than the filaments.) Alph. D. C. in Lin. trans. 17. p. 126. Filaments elongated; anthers free, much shorter than the filaments. Style subulate, not longer than the stamens.

§ 1. *Style about equal in length to the stamens. Old anthers horizontal, twisted.*

80 A. coria'cea (Swartz, prod. p. 48. fl. ind. occ. 1. p. 470.) glabrous; leaves oblong, bluntish, quite entire, coriaceous; panicle terminal, pyramidal, rather longer than the leaves; calycine lobes ovate, bluntish; lobes of corolla ovate, acute, reflexed; filaments almost combined, inserted in the top of the tube of the corolla, rather longer than the anthers. ♄. S. Native of Guadaloupe and Hispaniola. Anguillària coriàcea, Poir. dict. suppl. 7. p. 683. The flowers and inflorescence agree with *Wallènia*. Corollas red, rather large.

Coriaceous-leaved Ardisia. Clt. 1824. Shrub.

81 A. Hamiltònii (Alph. D. C. in Lin. trans. 17. p. 126.) leaves obovate, bluntish, coriaceous, veined beneath, and obscurely so above, dotted on both surfaces; panicles terminal, rather crowded; racemes undulated, jointed. ♄. S. Native of St. Domingo. A. obovàta, Hamilt. prod. fl. ind. occ. p. 26. but not of Blum. Desv. herb. ex. Hamilt. l. c. Perhaps distinct from *A. coriàcea*.

Hamilton's Ardisia. Shrub or tree.

82 A. exce'lsa (Ait. hort. kew. 1. p. 261. Chr. Smith, in herb. D. C. et Deless. ex Alph. D. C. l. c.) leaves ovate-oblong, bluntish, middle-sized, entire, glabrous; peduncles axillary; pedicels umbellate, longer than the peduncles; calycine segments acute, glabrous; alabastra acute; lobes of corolla lanceolate, 3 times longer than the calyx; filaments subulate, twice as long as the anthers. ♄. F. Native of Madeira, on the mountains, where it is called *Aderno tree*. Heberdènia excélsa, Banks. Anguillària Bahaménsis, Gærtn. fruct. 1. p. 373. t. 77. f. 1.? My'rsine heberdènia, Rœm. et Schultes, syst. 4. p. 508. Icacòrea Bahaménsis, Lam. ill. t. 136. f. 1. Peduncles very short, therefore it comes near to the genus *Myrsine*. Flowers red.

Tall Ardisia or Aderno-tree. Fl. July, Aug. Clt. 1794. Tree 20 to 40 feet.

§ 2. *Style one half shorter than the stamens. Anthers erect.*

83 A. Lhótskya (Alph. D. C. in Lin. trans. 17. p. 127.) glabrous; leaves oblong, entire, bluntish, dotted; panicles terminal and axillary, many-flowered, much shorter than the leaves; pedicels umbellate; lobes of calyx acute; corolla funnel-shaped, with oblong lobes; filaments length of corolla. ♄. S. Native of Brazil, about Rio Janeiro. Leaves 2-3 inches long, full of black dots. Lobes of corolla white, spotted with yellow.

Lhotsky's Ardisia. Tree.

84 A. racemòsa (Spreng. syst. 1. p. 661.) leaves obovate-oblong, subrevolute, coriaceous, shining on both surfaces, parallelly nerved beneath, full of dots; racemes axillary, straight. ♄. S. Native of Brazil.

Racemose-flowered Ardisia. Tree.

85 A. lepidòta (H. B. et Kunth, nov. gen. amer. 3. p. 247.) branches clothed with rusty tomentum; leaves obovate-oblong, acuminated, quite entire, glabrous, lepidotted beneath; panicles terminal, much branched; flowers conglobate, almost sessile; segments of calyx ovate, acutish, full of glandular dots; lobes of corolla oblong, obtuse, reflexed; filaments filiform, 4 times longer than the anthers. ♄. S. Native of New Granada, between the mines of Santanna and the town of Mariquita. Branches angular. Branches of panicle clothed with rusty tomentum. Flowers small.

Lepidotted Ardisia. Shrub or tree.

Sect. IV. Tyrbæ'a (meaning unknown to us). Alph. D. C. in Lin. trans. 17. p. 127. Flowers loosely panicled; peduncles alternate. Bracteas large, caducous. Flowers alternate, almost sessile, large.

86 A. bracteòsa (Alph. D. C. l. c.) leaves oblong, acutish, entire, coriaceous; bracteas ovate, acute; lobes of calyx and corolla ovate, acute; anthers ovoid, horizontal, smaller than the filaments; style rather longer than the stamens. ♄. G. Native of Mexico. Tyrbæ'a, Moc. et Sesse, icon. mex. ined. Branches fuscous. Leaves approximate, 3-4 inches long. Corolla of a whitish rose-colour.

Bracteate Ardisia. Tree.

87 A. escule'nta (Pavon, in herb. Moricand. Alph. D. C. l. c. p. 128.) leaves ovate-oblong, acutish, entire, coriaceous, glabrous, dotted; petioles margined; panicles longer than the leaves; bracteas ovate, bluntish; calycine lobes ovate, acute, ciliated; anthers triangular, acute, longer than the filaments; style subulate, inclosed. ♄. S. Native of South America. Leaves 3-4 inches long, full of resinous black dots. Panicle slightly velvety. Lobes of corolla obtuse, spotted. Hardly distinct from the preceding species, nevertheless the stamens are very different. Berries esculent.

Esculent Ardisia. Tree or shrub.

88 A. fœ'tida (Rœm. et Schultes, syst. 4. p. 803.) leaves oblong-obovate, acuminated, coriaceous, shining above, and nearly veinless; spikes panicled, terminal; bracteas ovate, concave, obvolute; calycine segments ovate; lobes of corolla revolute; anthers connivent. ♄. S. Native of South America. Wood white and fetid. Flowers pale rose-coloured. Corolla campanulately rotate. Style longer than the corolla.

Fetid-wooded Ardisia. Tree 10 to 15 feet.

† *Species not sufficiently known.*

89 A. Bahame'nsis (Alph. D. C. in Lin. trans. 17. p. 128.) ♄. G. Native of the Bahamas. Heberdènia excélsa, Banks. herb. ex Gærtn. Anguillària Bahaménsis, Gærtn. fruct. 1.

p. 372. t. 77. f. 1. Icacòrea Bahaménsis, Lam. ill. t. 136. f. 1. Perhaps the same as *A. excélsa*.

Bahama Ardisia. Tree.

90 A. LINEA'TA (Rœm. et Schultes, syst. 4. p. 804. ex herb. Willd) leaves oblong-ovate, parallelly veined, glabrous ; panicle terminal, divaricate. ♄. S. Native of South America. Humb. et Bonpl.

Lined-leaved Ardisia. Shrub.

91 A. DIVARICA'TA (Rœm. et Schultes, l. c.) leaves lanceolate, tapering into the petioles ; flowers panicled ; branches of panicle divaricate. ♄. S. Native ?

Divaricate-panicled Ardisia. Shrub or tree.

92 A.? PARVIFÒLIA (Rœm. et Schultes, l. c.) leaves ovate-lanceolate ; cymes trifid, axillary. ♄. S. Native of Peru. Humb. et Bonpl. Calyx small, 5-toothed. Corolla salver-shaped, having the tube inflated at the apex, and the limb 5-parted. Stamens inclosed. Style inclosed. Stigma ovate, thickened. Drupe ovate, clammy, 1-celled, 1-seeded.

Small-leaved Ardisia. Shrub 6 feet.

93 A.? PARASÍTICA (Swartz, prod. p. 48. fl. ind. occ. 1. p. 474.) glabrous ; leaves lanceolate, ovate, lined, sessile ; racemes axillary, simple. ♄. S. Native of Dominica, on the trunks of trees, among the mountains. Anguillària parasítica, Poir. dict. suppl. 7. p. 687. Branches slender, brittle, tetragonal. Leaves quite entire, paler beneath, with blackish veins. Pedicels short, bracteate at the base. Calyx coloured : with ovate, acute lobes. Corolla whitish purple, subrotate, dotted inside. Filaments short ; anthers ovate, emarginate, diverging. Style length of stamens. Stigma obtuse. Drupe globose, dotted.

Parasitical Ardisia. Shrub par.

94 A.? ARGU'TA (H. B. et Kunth, nov. gen. amer. 3. p. 247.) branches and under side of leaves covered with small, rusty scales ; leaves elliptic-oblong, acute, sharply toothed ; panicles lateral, much branched ; flowers pedicellate, rather racemose. ♄. S. Native of the province of Popayan, on the burning mount Purace, near El Primer Pajonal. Leaves 5-6 inches long. Panicle beset with rusty scales. Calyx 5-parted, having the segments dotted with glands in the middle. Stamens 5-6, opposite the lobes of the corolla. Filaments short ; anthers oblong-lanceolate. Ovarium ovate-conical, glabrous. Style filiform ; stigma obtuse. Perhaps a distinct genus, although it has the habit and dotting of *Ardisia*.

Sharp-tooth leaved Ardisia. Tree 15 to 20 feet.

95 A. OVA'TA (Thunb. nov. gen. pt. 8. ups. 1795. ex Rœm. et Schultes, syst. p. 517.) leaves ovate ; stem compressed, furrowed. ♄. S. Native of the East Indies. Stem simple, a span high, glabrous : bearing 2-3 petiolate, coriaceous, entire, glabrous leaves, with reflexed margins, a hand long. Flowers panicled.

Ovate-leaved Ardisia. Shrub 1 foot.

Cult. Almost all the species are handsome, and of easy culture. Any light rich soil answers them well, or a mixture of loam, peat, and sand. Cuttings, either of the branches or root, strike freely in a pot of sand, in heat. When propagated by pieces of the root, the pieces should be planted so as their tops may be above the mould, and they should not, like cuttings of the branches, be placed under a hand-glass, as they are very apt to rot.

X. EMBE'LIA (the Ceylonese name of one species). Burm. fl. ind. t. 23. Juss. gen p. 427. Roxb. fl. ind. 2. p. 285. Alph. D. C. in Lin. trans. 17. p. 129.—Ribesioìdes, Lin. fl. zeyl. no. 403.

LIN. SYST. *Pentándria*, *Monogýnia*. Calyx 5-parted. Corolla 5-parted ; lobes rather valvate in æstivation. Stamens 5, about equal to the lobes of the corolla in length. Anthers ovoid, much shorter than the filaments, which are free, horizontal at the time the flowers are open. Ovarium superior, 1-ovulate (ex Wall.). Style shorter than the stamens : stigma capitellate. Berry globose, 1-seeded.—Usually climbing shrubs, natives of Asia ; petioles sometimes denticulated. Racemes axillary or terminal, simple or branched. Flowers small. Alabastra obtuse. Peduncles and pedicels alternate, usually pilose or velvety.

* *Panicles or racemes terminal.*

1. E. RÌBES (Roxb. fl. ind. 2. p. 285. Wall. cat. no. 2304.) scandent ; tender shoots and peduncles hoary ; leaves oblong, entire, glabrous ; panicles terminal, hoary. ♄. ب. S. Native of Silhet, Ceylon, Penang, Singapore, Golgipori, &c. Ribesioìdes, Lin. fl. zeyl. p. 403. Rìbes, Burm. prod. 62. t. 23. A large climber. Leaves 2-3 inches long. Flowers numerous, very small, of a greenish yellow colour. Lobes of calyx concave. Berries size of black pepper, succulent, black. The natives in the vicinity of Silhet, where the plants grow abundantly, gather the berries, and when dry sell them to the small traders in black pepper, who fraudulently mix them with that spice, which they so resemble as to render it almost impossible to distinguish them, by sight, or by any other means, as they are withal somewhat spicy. The vernacular name of the shrub is *Baberung*.

Currant Embelia. Shrub cl.

2 E. CANE'SCENS (Jack. ex Wall. in Roxb. fl. ind. 2. p. 292. Wall. cat. no. 2311.) branches villous ; leaves ovate-oblong, acuminated, retuse at the base, villous beneath ; petioles with curled glandular margins ; panicle terminal, consisting of very long hairy branches ; petals villous. ♄. ◡ S. Native of Penang, where it is called *Assum-Oatan*, in the Malay language. Leaves membranous, with revolute edges. Lobes of corolla lanceolate. Flowers white. Very like *E. rìbes*.

Canescent Embelia. Shrub cl.

* * *Racemes axillary.*

3 E. FERRUGÍNEA (Wall. cat. no. 2310. Alph. D. C. l. c.) young branches and peduncles tomentose, rusty ; leaves ovate-roundish, entire, coriaceous, glabrous above, and dotted with rusty stellate hairs beneath. ♄. ◡ S. Native of the Burman Empire, on the banks of the Irrawaddy. Leaves 5 inches long, velvety on the nerves above ; petioles pilose, not winged. Berry blackish.

Rusty Embelia. Shrub cl.

4 E. VILLÒSA (Wall. in Roxb. fl. ind. 2. p. 289. cat. no. 2313.) climbing or rambling ; branches villous, and with numerous callous dots ; leaves oval, or roundish-oval, short-acuminated, acute at the base, villous beneath ; racemes simple, axillary, fascicled, long, slender, and villous. ♄. ◡ S. Native about Rajmahul and Tavoy. Leaves ciliated, 4-5 inches long, glabrous above. Flowers small, whitish, very numerous. It comes very near *E. robústa*, but differs from it in hairiness, and in the long fascicled slender racemes. There are varieties of this species with broadly obovate-roundish, very pilose leaves ; or ovate-acute, small, smoothish leaves.

Villous Embelia. Shrub cl.

5 E. PÍCTA (Wall. cat. no. 2302.) branches and peduncles velvety and rusty ; leaves oval, smoothish, remotely denticulated ; racemes axillary, simple, longer than the leaves ; calyx and corolla velvety. ♄. ◡ S. Native of the East Indies, in Gongachara and Goalpara. Samàra pícta, Hamilt. herb. Branches pilose, and spotted with white. Leaves 3-5 inches long, and 2-3 broad, glabrous above, remotely marked with black dots beneath. Flowers as in *E. villòsa*.

Painted-branched Embelia. Shrub cl.

6 E. FLORIBU'NDA (Wall. in Roxb. fl. ind. 2. p. 291. cat. no. 2305. A.) climbing, glabrous; branches slender; leaves oblong-lanceolate, finely-acuminated, with straight margins; panicles axillary, of many long slender racemes. ♄. ◡. G. Native of Nipaul, on Chundragiri, Sheopore, and at Thankote. A beautiful climber. Branches scabrous from dots. Leaves 5-6 inches long, with entire revolute edges; dark green above, and pale underneath. Flowers fragrant, dense, yellowish green.

Var. β; macrophýlla (Alph. D. C. l. c.) leaves longer. ♄. ◡ S. Native of Silhet. E. floribúnda, Wall. cat. no. 2305. B.

Bundle-flowered Embelia. Shrub cl.

7 E. VESTÌTA (Roxb. fl. ind. 2. p. 288.) villous, scandent, very much branched; leaves oblong-lanceolate, attenuated, subserrated; racemes axillary. ♄. ◡. S. Native of Silhet. The shrub is uncommonly well-furnished with branches and foliage. The flowers are particularly small and delicate, collected into little, oblong, subsessile, axillary racemes.

Clothed Embelia. Shrub cl.

8 E. NU'TANS (Wall. in Roxb. fl. ind. 2. p. 290. cat. no. 2303.) shrub nutant, at length pendulous, with very slender dense branches; leaves somewhat bifarious, approximate, lanceolate, acuminated, smooth and shining, waved; racemes numerous, short, 2-3 together, in axillary fascicles. ♄. S. Native of Silhet. Bark of branches dotted, while young downy. Leaves rather coriaceous, entire, pale, and minutely dotted beneath. Flowers small, white, verging to greenish, with a disagreeable smell. This is a very elegant shrub; its dense branches and pendulous habit render it a desirable ornament in tropical gardens.

Drooping Embelia. Shrub 5-6 feet.

9 E. ROBU'STA (Roxb. fl. ind. 2. p. 287.) rambling; leaves, smooth, from oblong to ovate; racemes axillary and terminal, solitary. ♄. S. Native of the East Indies, on the Rajmahul hills. Young branches, and under surfaces of leaves downy, the tender parts clothed with rust-coloured jointed and glandular tomentum. The leaves and flowers are beset with dots, which are elevated on the latter. Flowers greenish white. Calyx villous.

Robust Embelia. Clt. 1823. Shrub rambling.

10 E. PARVIFLÒRA (Wall. cat. no. 2307. Alph. D. C. l. c.) leaves bifarious, small, spproximate, ovate, acute, obtuse at the base, entire, glabrous, shining; racemes axillary, shorter than the leaves; flowers small, densely umbellulate; peduncles velvety. ♄. S. Native of Silhet.

Var. β, major (Alph. D. C. l. c.) leaves oblong, acute at both ends, larger, a little toothed. ♄. S.

Small-flowered Embelia. Shrub.

11 E. UROPHY'LLA (Wall. cat. no. 2309. Alph. D. C. l. c. 131.) quite glabrous; leaves ovate-lanceolate, acuminated at both ends, entire, coriaceous, shining; peduncles simple, elongated, about equal in length to the leaves; pedicels very short. ♄. S. Native of Singapore. Leaves 2-3 inches long, cuspidate. Flowers small.

Tail-leaved Embelia. Shrub.

† *Doubtful species.*

12 E. TSJE'RIAM-CÓTTAM (Alph. D. C. l. c.) leaves ovate or elliptic, quite entire, thickish, evergreen, paler beneath; racemes small, axillary, shorter than the leaves; lobes of corolla roundish. ♄. S. Native of Malabar. Tsjèriam-Cóttam, Rheed. mal. 5. p. 21. t. 11. Basal, No. 2. Lam. dict. 1. p. 381. Ardísia; Tsjèriam-Cóttam, Rœm. et Schultes, syst. 4. p. 518. Racemes solitary or twin. Flowers greenish-brown. Stigma globose. Berry round, reddish, rather acid.

Tsjeriam-Cottam Embelia. Shrub or tree.

13 E.? BASA'AL (Alph. D. C. l. c.) leaves ovate, acute, quite entire, aggregate, terminal; racemes small, lateral, shorter than the leaves; segments of corolla acute. ♄. S. Native of Malabar and Cochinchina. Ardísia? Basàal, Rœm. et Schultes, syst. 4. p. 517. Basàal, Rheed. mal. 5. p. 23. t. 12. Lam. dict. 1. p. 381. Leaves glabrous, dark green. Flowers small, numerous, white, sweet-scented. Berries small.

Basaal Embelia. Tree middle-sized.

Cult. For culture and propagation see *Ardísia*, p. 20. The climbing species answer well for training up the rafters in stoves.

XI. CHORIPE'TALUM

(from χωρις, *choris*, separately; and πεταλον, *petalon*, a petal; the petals are separate, not joined together as in other genera of the order.) Alph. D. C. in Lin. trans. 17. p. 131. Mýrsines dùbiæ, Wall.

LIN. SYST. *Tetrándria Monogýnia.* Calyx 4-cleft. Corolla 4-petalled; petals falling off separately. Stamens 4, opposite the petals, and combined with them at the base. Anthers shorter than the filaments. Style filiform, shorter than the petals. Ovarium superior, perhaps sometimes abortive, therefore the flowers are sometimes polygamous. Drupe globose, 1-seeded. —Woody plants, natives of Asia. Leaves alternate, entire, glabrous, ovate at the base, and narrowed a long way into the petioles. Flowers racemose; peduncles axillary; bracteas permanent, alternate, small; the inflorescence is therefore that of *Embèlia*. This genus, having the corolla composed of separate petals, verges towards *Rhamneàceæ*.

1 C. AURANTI'ACUM (Alph. D. C. l. c. p. 131.) leaves ovate-lanceolate; peduncles spike-formed, simple, 3 times shorter than the leaves; petals lanceolate; filaments longer than the petals. ♄. S. Native of the Indian peninsula. Mýrsine aurantìaca, Wall. in Roxb. fl. ind. 1. p. 300. cat. no. 2299. Flowers yellowish. A large rambling shrub.

Orange-like Choripetalum. Shrub rambling.

2 C. UNDULA'TUM (Alph. D. C. l. c. p. 132.) branches full of elevated callous protuberances; leaves ovate or lanceolate, acute at both ends, a little undulated, thin, full of pellucid dots; peduncles 3 times shorter than the leaves; petals lanceolate, acute, glandularly ciliated. ♄. G. Native of Nipaul, on Sheopore. Mýrsine undulàta, Wall. in Roxb. fl. ind. 2. p. 299. A large climbing shrub. Flowers small, scentless, yellowish-white.

Undulated-leaved Choripetalum. Shrub cl.

Cult. For culture and propagation see *Ardísia*, p. 20.

Tribe III.

MÆ'SEÆ (this tribe only contains the genus *Mæ'sa*) Alph. D. C. in Lin. trans. 17. p. 132. Calyx 5-lobed. Corolla 5-lobed, induplicate in æstivation. Stamens 5, free, inserted in the base of the corolla, inclosed. Anthers ovoid-cordate, equal in length to the filaments. Ovarium adherent, half-inferior, many-ovulate. Style short; stigma 3-5 lobed. Seeds small, numerous, angular, fixed to the central placenta. Embryo transverse.—Shrubs or trees, natives of Asia and Africa. Leaves alternate, sometimes full of pellucid dots, variable on the same specimen. Racemes usually axillary, simple, or branched, many-flowered; flowers alternate, on short pedicels; bracteas 2, almost opposite, near the base of the calyx.

XII. MÆ'SA

(maas, the Arabic name of one of the species.) Forsk. desc. p. 66. Alph. D. C. in Lin. trans. 17. p. 133. Bæóbotrys, Forst. nov. gen. t. 11. Blum. bijdr. 864. Sibouràtia, Pet. Th. nov. gen. mad. p. 12.

LIN. SYST. *Pentándria Monogýnia.* Character the same as that of the tribe. This genus joins the present order to *Primulàceæ*, through *Samòlus*.

* *Panicles or racemes terminal.*

1 M. PANICULA'TA (Wall. cat. no. 2320. Alph. D. C. in Lin. trans. 17. p. 133.) quite glabrous; leaves broad elliptic, acute at both ends, large, toothed; racemes axillary and terminal, elongated slender. ♄. S. Native about Tavoy, in the Burman Empire. Leaves 6 inches long, and 3 broad, membranous, shining, a little dotted. Flowers approximate. Stigma 3-lobed.

Panicled-flowered Mæsa. Shrub.

2 M. MUSCÒSA (Blum. bijdr. p. 866. under Bæóbotrys) leaves ovate-oblong, long-acuminated, rather repand, glabrous on both surfaces, as well as the branchlets; panicles axillary, fastigiate. ♄. G. Native of Java, among bushes on the mountains.

Mossy Mæsa. Fl. year. Shrub.

3 M. VIRGA'TA (Blum. bijdr. 864, under Bæóbotrys) leaves ovate-oblong, much acuminated, glandularly denticulated above the base, glabrous on both surfaces, as well as the branchlets; racemes compound, twiggy, axillary. ♄. S. Native of Java, in mountain woods.

Var. β; leaves quite entire. ♄. S. On the top of Mount Gede.

Twiggy Mæsa. Fl. year. Shrub.

4 M. LATIFÒLIA (Blum. bijdr. p. 866, under Bæóbotrys) leaves elliptic-oblong, bluntly acuminated, glandularly denticulated above the base, and are, as well as the branchlets, glabrous; racemes axillary, simple. ♄. S. Native of Java, on the top of Mount Gede.

Broad-leaved Mæsa. Fl. year. Shrub.

* * *Racemes usually lateral.*

5 M. OVA'TA (Wall. cat. no. 2324. Alph. D. C. l. c. p. 133. t. 4.) glabrous; leaves ovate, acuminated, rather cordate, entire, shining on both surfaces; racemes axillary, elongated, slender, rather longer than the leaves. ♄. S. Native of Penang. Branches not dotted. Leaves 2-3 inches long, membranous. Flowers not numerous. Hardly distinct from *M. ramentàcea*.

Ovate-leaved Mæsa. Shrub.

6 M. RAMENTA'CEA (Roxb. fl. ind. 2. p. 231.) glabrous; leaves lanceolate, acuminated, entire, smooth; panicles terminal, axillary, and lateral, ramentaceous. ♄. S. Native of Silhet, where it is called Mulmooriya; and of the Burman Empire, about Rangoon, Moalmyne, and Tavoy. Bæóbotrys lùcida, Wall. cat. no. 2323. Leaves 2-6 inches long. Panicles numerous, small, crowded with small abortive rusty ramentaceous branchlets. Flowers small, greenish yellow. Berries small, white, succulent. Stigma 2-3-lobed.

Ramentaceous Mæsa. Shrub.

7 M. MISSIÒNIS (Alph. D. C. l. c. p. 134.) glabrous; leaves ovate, acuminated, entire; racemes shorter than the leaves. ♄. S. Native of the East Indies. Bæóbotrys? missiònis, Wall. cat. no. 6523. Intermediate between *M. ramentàcea* and *M. nemoràlis*. Leaves 1-3 inches long, acutish at the base, a little toothed.

Mission Mæsa. Shrub.

8 M. NEMORA'LIS (Alph. D. C. l. c.) glabrous; leaves ovate-oblong, repandly toothed; racemes axillary, short and crowded. ♄. S. Native of Silhet, where it is called *Mulmooriya*. Bæóbotrys nemoràlis, Forst. nov. gen. p. 22. Vahl. symb. p. 19?. Roxb. fl. ind. 2. p. 232. Mart. choix. de pl. mun. p. 6. t. 6. Leaves 3-4 inches long. Racemes twice the length of the petioles. Flowers small, white. Stigma 3-lobed.

Grove Mæsa. Fl. March, May. Clt. 1830. Shrub.

9 M. BLU'MII; leaves oblong-lanceolate, acuminated at both ends, glandularly serrulated from the middle to the apex, and are, as well as the branches, glabrous; racemes axillary, simple and compound, shorter than the leaves. ♄. S. Native of Java, in mountain woods, where it is called *Kipiit burriet*. Bæóbotrys lanceolàta, Blum. bijdr. 865.

Var. α; leaves oval, acutish at both ends. ♄. S. Native of Java, in the province of Cheribon, and among bushes at Tjiradjas.

Var. β; leaves rounded at the base; racemes compound. ♄. S. Java, in woods on Mount Salak.

Blume's Mæsa. Fl. year. Shrub.

10 M. I'NDICA (Alph. D. C. l. c.) glabrous; leaves from ovate to lanceolate, coarsely serrated; racemes axillary and terminal: the terminal ones most generally compound. ♄. G. Native of Chittagong and Nipaul. Hook, bot. mag. 2052. Bæóbotrys I'ndica, Roxb. fl. ind. 2. p. 230. Bæob. lanceolàta, Vahl. symb. 1. p. 19. t. 6. Mæ'sa Chísea, D. Don. prod. fl. nep. p. 148?. Mæ'sa Forsk. fl. ægypt. arab. p. 22. t. 11. Leaves 3-6 inches long, pretty smooth. Racemes usually aggregate. Flowers numerous, pure white. Stigma lobed. The berries, which are white, are eaten by the Parbuteeyas, or hill people of Nipaul.

Indian Mæsa. Fl. Nov. Clt. 1817. Shrub 5 to 6 feet.

11 M. LANCEOLA'TA; glabrous; leaves lanceolate, quite entire, acuminated; racemes twin, many-flowered. ♄. G. Native of Nipaul. Bæóbotrys lanceolàta, D. Don, prod. fl. nep. p. 148. Leaves 3 inches long. Racemes sometimes by threes, or trifid or bifid from the base.

Lanceolate-leaved Mæsa. Shrub.

12 M. DU'BIA (Wall. in Roxb. fl. ind. 2. p. 235.) almost glabrous; leaves ovate, acuminated, coarsely serrated; panicles axillary, racemose, equal in length to the leaves. ♄. S. Native of the East Indies, at Wynaad and Coorg. Branches hardly pubescent, dotted. Leaves 5-6 inches long. Panicles composed of long slender racemes. Flowers very small.

Doubtful Mæsa. Shrub.

13 M. ARGE'NTEA (Wall. in Roxb. fl. ind. 2. p. 233.) young branches villous, old ones downy; leaves ovate, acuminated, sharply toothed, downy, of a silvery white colour beneath; racemes axillary, short. ♄. G. Native of Nipaul, on Chundragiri. Branches subscandent. Leaves 6-8 inches long. Racemes downy: having a few alternate branches at the base, giving it the appearance of being fascicled. Flowers dense, white, nodding. Berries smooth white.

Silvery Mæsa. Fl. April, May. Clt. 1818. Shrub 5 to 6 feet.

14 M. MACROPHY'LLA (Wall. in Roxb. fl. ind. 2. p. 234. cat. no. 2325,) arboreous, densely villous; leaves ovate, subcordate, very soft, obtuse or acute, strongly toothed; panicles axillary and terminal. ♄. G. Native of Nipaul, at Hetounra, and on Chundragiri, Naokote, foot of Sheopore, and on hills called Chiriaghaut. Bæóbotrys tomentòsa, D. Don, prod. fl. nep. p. 148.? Young branches ferruginous. Leaves 6 to 12 inches long. Flowers white, smaller than those of the preceding, as also the berries.

Long-leaved Mæsa. Fl. April, July. Clt. 1818. Tree 10 feet.

15 M. MÓLLIS (Blum. bijdr. p. 865, under *Bæóbotrys*,) leaves elliptic, oblong, acute, almost entire, soft beneath, as well as the branchlets; racemes axillary, simple. ♄. S. Native of Java, on the mountains.

Soft Mæsa. Fl. year. Shrub.

16 M. MOLLÍSSIMA (Blum. bijdr. p. 866, under *Bæóbotrys*) leaves oblong, acute, almost quite entire, clothed with silky down above, but very soft beneath, as well as the branchlets; racemes compound, axillary. ♄. S. Native of Java, on the mountains.

Very soft Mæsa. Fl. year. Shrub.

Cult. See *Ardísia*, p. 20, for culture and propagation.

XIII. CORYNOCA'RPUS (from *κορυνη, coryne*, a club; and *καρπος, karpos*, a fruit, in reference to the shape of the fruit.) Forster, gen. t. 16. Schreb. gen. 394. Juss. 288.

Lin. syst. *Pentándria Monogýnia.* Calyx of 5 concave sepals. Corolla of 5 roundish petals, narrowed at the base: alternating with as many petal-formed scales, which are furnished each with a gland inside at the base. Stamens 5, rising from the claws of the petals, subulate; anthers oblong; style one, short; stigma obtuse. Drupe terbinately clavate, containing a single 1-seeded nut.—A shrub, with alternate, stalked, obovate, wedge-shaped, sub-emarginate, quite entire, glabrous leaves; and terminal, large, sessile panicles of white flowers.

1 C. læviga'ta (Forst. l. c. Lin. syst. 242.) ♄. G. Native of New Zealand.

Smooth Corynocarpus. Fl. ? Clt. 1823. Tree. 20 feet.

Cult. For culture and propagation see *Ardísia*, p. 20.

† *Shrubs belonging to the Myrsineàceæ, but doubtful to which of the genera they appertain.*

* *Natives of Asia.*

1 Embe'lia? lùcida (Wall. cat. no. 2315. Alph. D. C. l. c. p. 134.) branches grey; leaves oval, alternate, 2-4 inches long, acute at both ends, coriaceous, entire, with revolute hardly dotted edges, having the lateral nerves arched near the margin; peduncles spike-formed, axillary, solitary or twin, 4 times shorter than the leaves, velvety: covered with ovate-acute, imbricating bracteas their whole length; ovarium sessile, ovoid, in the axils of the bracteas, terminated by a 2-5 lobed stigma. ♄. S. Native of Singapore. From the ovarium, stigma, and bracteas about the base of the peduncles, it agrees with *Mýrsine;* but from the flowers being alternate on secund peduncles, it agrees with *Embèlia.*

Shining Embelia. Shrub.

2 Embe'lia? coria'cea (Wall. cat. no. 2314. Alph. D. C. l. c.) branches blackish, striated; leaves lanceolate, acute, half a foot long, entire, glabrous, coriaceous, glaucescent beneath, having the lateral nerves hardly evident, besprinkled with small dots on both surfaces; panicle terminal, elongated, loose, length of leaves; peduncles and pedicels pilose; calyx glabrous; berries round, dotted, glabrous; style shorter than the berry; stigma capitate. ♄. S. Native of Penang. Leaves and inflorescence those of *Ardísia*, but the stigma is capitellate.

Coriaceous-leaved Embelia. Shrub.

3 My'rsine? umbella'ta (Wall. cat. no. 2312. Alph. D. C. l. c. p. 135.) branches glabrous; leaves 2-3 inches long, oblong, obtuse, glabrous, a little denticulated, with revolute margins, thickish, slightly dotted; flowers axillary, on a common short peduncle: covered by ovate, acute, concave, rather ciliated, short bracteas; pedicels umbellate, filiform, 4-6 in number; calyx 5-parted. ♄. S. Native of Singapore. Inflorescence that of *Mýrsine.*

Umbellulate-flowered Myrsine. Shrub.

4 Ardísia? spica'ta (Wall. cat. no. 2273. Alph. D. C. l. c.) glabrous; leaves on long petioles: petioles 3 inches long, dilated and marginated, sheathing at the base for the space of one inch: limb ovate, acute at both ends, 3-4 inches long, 1½ to 2½ inches broad, repandly crenulated, coriaceous, full of pellucid dots, having the nervation very singular for the order: the lateral nerves are numerous, parallel, and very distinct, even to near the margin, with smaller, hardly perspicuous, transverse nerves; peduncles axillary, 1-3 inches long, and are, as well as the pedicels and flowers, rather downy: bearing lateral, many-flowered, or 1-flowered, alternate branchlets; pedicels usually umbellate at the tops of the branchlets, 2 lines long; bracteas subulate, caducous; calyx deeply 5-cleft, with slender, subulate, erectly incurved lobes; corolla and stamens unknown; ovarium superior, ovoid, terminated by the filiform style, which is the length of the calyx; berries globose, thick, 1-seeded, as in *Ardísia.* ♄. S. Native of Singapore. The inflorescence is that of *Choripétalum.* The petioles, being dilated at the base, are very like those of *Alísma*, and it will therefore form a new genus.

Spicate-flowered Ardisia. Shrub or tree.

5 Ardísia denticula'ta (Blum. bijdr. p. 691.) leaves oblong, acuminated at both ends, bluntish at the apex, denticulated at top, glabrous; umbels sub-corymbose, rarely solitary, terminal or axillary; calycine segments obtuse; flowers for the most part tetrandrous. ♄. S. Native of Java, on the Seribu mountains, and about Rompien.

Denticulated-leaved Ardisia. Fl. March. Shrub.

6. Mæ'sa tetra'ndra (Roxb. fl. ind. 2. p. 233.) leaves alternate, oblong, entire; racemes axillary; flowers tetrandrous. ♄. S. Native of the Moluccas.

Tetrandrous Mæsa. Shrub.

* * *Natives of Africa, and probably belonging to the genus Bádula.*

7 Ardísia microphy'lla (Rœm. et Schultes, syst. 4. p. 804, ex Pet. Th. in. herb. Willd.) leaves obovate, acutish, quite entire; peduncles axillary, 1-flowered. ♄. S. Native of Madagascar.

Small-leaved Ardisia. Shrub.

8 Ardísia floribu'nda (Rœm. et Schultes, l. c.) panicles axillary, divaricate; leaves elliptic-obovate, quite entire. ♄. S. Native of Madagascar.

Bundle-flowered Ardisia. Shrub.

9 Ardísia pyrifòlia (Rœm. et Schultes, l. c.) peduncles racemose, terminal; leaves obovate, coriaceous, quite entire. ♄. S. Native of Madagascar.

Pear-leaved Ardisia. Shrub.

10 Ardísia erythroxyloìdes (Rœm. et Schultes, l. c.) flowers lateral, subspicate at the tops of the branches; leaves lanceolate-obovate, coriaceous. ♄. S. Native of Madagascar.

Erythroxylon-like Ardisia. Shrub.

* * * *Natives of America.*

11 My'rsine? spica'ta (H. B. et Kunth. nov. gen. amer. 3. p. 250.) leaves obovate-oblong, rounded at the apex, quite entire, glabrous, glaucous, pruinose and shining above; spikes axillary, about equal in length to the petioles; flowers sessile; corollas 4-5-parted. ♄. S. Native of the province of New Guiana, in inundated places on the banks of the river Atabapo. Leaves coriaceous, 3-3½ inches long. Segments of calyx ovate-acute, full of glandular dots. Corolla yellowish, with bluntish revolute segments, full of glandular dots. Stamens, with very short glabrous filaments: and erect, lanceolate, and tetragonal anthers, which dehisce lengthwise inside. Style filiform; stigma simple. Ovarium ovate, glabrous. Perhaps a species of Weigéltia; but, nevertheless, it differs in the form and size of the anthers. Inflorescence not that of *Mýrsine.*

Spicate-flowered Myrsine. Shrub 8 to 12 feet.

12 Ardísia Brazilie'nsis (Spreng. syst. 1. p. 662.) leaves lanceolate-oblong, tapering to both ends, membranous, entire; panicles lateral; peduncles umbelliferous. ♄. S. Native of Brazil.

Brazilian Ardisia. Shrub.

* * * * *Native country doubtful.*

13 Ardísia multiflòra (Rœm. et Schultes, syst. 4. p. 804. ex herb. Willd.) flowers racemose; leaves oblong, attenuated

at both ends, with slender parallel veins. ♄. S. Native country unknown.

Many-flowered Ardisia. Shrub.

† † *Plants referred to the order Myrsineàceæ, which ought to be excluded.*

1 ARDÍSIA TURBACE'NSIS (H. B. et Kunth. nov. gen. amer. 3. p. 245.) From the description given of the fruit and seeds, in the above work, this plant belongs to the order *Sapòteæ*.

2 BÆÓBOTRYS ACUMINA'TA (Wall. cat. no. 2321.) From the corolla being polypetalous, and the stamens alternating with the petals, it probably belongs to the order *Rhamneàceæ*, but certainly not to *Myrsineàceæ*.

3 EMBE'LIA? RAMÒSA (Wall. cat. no. 6522.) leaves without dots. Petals wanting. Stamens 5, inserted in the lobes of the perigone, and opposite them. Stigma discoid, toothed. Probably belonging to the order *Urtíceæ*.

4 ARDÍSIA ACERÒSA (Gærtn.) is Cyathòdes aceròsa, R. Br.

5 ÆGÍCERAS MÌNUS (Gærtn.) is Connàris santaloìdes, Vahl. ex Kœnig.

6 MY'RSINE? THEÆFÒLIA (Wall. cat. no. 6391.) does not belong to the order, as the stamens alternate with the lobes of the corolla.

† † † *Genera referred to Myrsíneæ.*

1 OPÍLIA (Roxb.) is very like *Groútia*, Perrot. et Guill. fl. seneg. 1. p. 100. t. 22, which belongs to the order *Olacíneæ*, according to the authors.

2 SAMA'RA (Lin. but not of Swartz) the Córnus Zeylánica, Burm. zeyl. t. 76, belongs to the order *Rhámneæ*.

ORDER CXLIV. THEOPHRA'STEÆ (so called from the plants of the order agreeing with Theophrásta in important characters.) Bartl. D. Don, mss.—Myrsíneæ part of authors. Calyx 5-parted, imbricate, sessile, permanent. Corolla monopetalous, 5-lobed; the lobes imbricate in æstivation, and having squamæform appendages alternating with them. Stamens 5, opposite the lobes of the corolla; anthers turned outwardly, bilocular; the cells parallel, opening lengthwise; pollen farinaceous. Ovarium free, superior 1-celled; the ovula erect, usually indefinite, inserted into a central placenta. Stigma simple, undivided. Berry crustaceous, 1-celled, valveless; 1 or many-seeded; filled by the fleshy placenta. Seeds with a hollow umbilicus; the testa simple, thin, and cartilaginous. Albumen copious, horny. Embryo erect, with foliaceous cotyledons: and a cylindrical radicle, which is opposite the hylum.—Non-lactescent, small, evergreen trees or shrubs, natives of equinoxial America; with usually simple stems, bearing leaves at their tops. Leaves alternate, callous, and often toothed on the edges, reticulately veined; the primary veins transverse; petioles callous at the base. Flowers terminal or lateral, racemose.

Synopsis of the genera.

1 JACQUÍNIA. Corolla campanulate; the appendages distinct and petaloid. Stamens free. Berry 1-seeded.—Leaves entire, with inconspicuous veins.

2 CLAVÌJA. Corolla salver-shaped; the appendages fleshy and adnate. Stamens monadelphous. Berry 2 or many-seeded. —Leaves veiny; the margin entire or toothed.

3 THEOPHRA'STA. Corolla campanulate; the appendages combined into an angularly-lobed, fleshy, arched ring. Stamens free. Berry many-seeded.—Leaves toothed, veiny.

4 ONCÌNUS. Corolla funnel-shaped, fleshy; segments all hooked; the appendages combined into a 5-cleft ring. Stamens free. Berry many seeded.—Leaves entire, opposite.

5 LEÒNIA. Corolla rotately sub-campanulate; the appendages combined with the filaments into a cup-shaped tube. Berry many-seeded, seeds fixed to parietal placentas—.Leaves entire.

I. JACQUI'NIA (so named by Linnæus, in honour of Nicholas Joseph de Jacquin, Professor of Botany at Vienna, born at Leyden in 1727, author of many splendid works). Lin. gen. no. 254. Jacq. amer. 23. Juss. gen. 151. H. B. et Kunth, nov. gen. amer. 3. p. 250.

LIN. SYST. *Pentándria, Monogýnia.* Segments of calyx obtuse. Corolla campanulate; segments of corolla are, as well as the distinct appendages in the throat, obtuse. Stamens 5, inserted in the base of the tube of the corolla; anthers ovate. Ovarium containing many ovula. Style short; stigma obtuse. Berry globose, 1-6-seeded.—Branched shrubs and small trees. Leaves scattered, obtuse, or verticillate, quite entire, crowded at the tops of the branches, with revolute edges. Flowers terminal, racemose, or solitary.

1 J. ARBÒREA (Vahl, eclog. p. 26. H. B. et Kunth, nov. gen. amer. 3. p. 250.) leaves opposite, or almost 4 in a whorl, obovate-oblong, obtuse, unarmed, glabrous; flowers racemose. ♄. S. Native of the Spanish Main, about Cumana; and the island of Montserrat. At Cumana it is called *Barbasco*. Branches somewhat dichotomous, the lower ones 4 together. Leaves about 1½ inch long, and 6-7 lines broad. Corolla white. Calycine segments ciliated. Lobes of crown or appendages scale-formed. Berries red, 1-seeded.

Tree Jacquinia. Fl. July, Aug. Clt. 1829. Tree 20 feet.

2 J. ARMILLA'RIS (Jacq. amer. 53. t. 39. pict. t. 36. Lin. spec. 272.) leaves wedge-shaped, obtuse, unarmed, alternate; flowers racemose. ♄. S. Native of South America, and the West Indies, on calcareous rocks by the coast; Jamaica, Curaçoa, Martinico, Carthagena, &c.—Loefl. itin. 244. t. 277.—Sloan. jam. 2. p. 89. t. 190. f. 2. Branches nodose at the ramifications, 4-5 in a whorl. Leaves oblong-obovate, sometimes emarginate, but always with a little stiff mucrone. Flowers small, white, with the scent of jasmine. Berry of a reddish orange colour, containing 4 seeds, or thereabouts.

Bracelet Jacquinia. Fl. June, July. Clt. 1768. Shrub 4 to 6 feet.

3 J. CARACA'SANA (H. B. et Kunth. nov. gen. 3. p. 251.) leaves scattered, lanceolate-oblong, glabrous, terminating in a spiny point. ♄. S. Native on the Caraccas shore, between the port of La Guayra and Cabo Blanco, in dry places. Leaves cuneated at the base, 1½ inch long, and 5 lines broad. Berry edible, 4-6 seeded. Seeds imbedded in sweet fleshy pulp.

Caraccas Jacquinia. Shrub 6 to 8 feet.

4 J. PUBE'SCENS (H. B. et Kunth. l. c. t. 244.) leaves scattered; upper ones sub-verticillate, obovate-oblong, rounded at the apex, and terminating in a spine, downy beneath; flowers racemose. ♄. S. Native of South America, in the province of Bracamoros, on the banks of the river Amazon, near Tomependa. J. mucronàta, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 802. Branches sub-verticillate. Leaves 18-20 lines long, and 7-8 lines broad. Flowers probably white. This species differs from *J. macrocárpa*, Cav. in the leaves being obovate-oblong, and downy beneath.

Downy-leaved Jacquinia. Shrub 4-5 feet.

5 J. BERTE`RII (Spreng. syst. 1. p. 668.) leaves scattered, subspatulate, acutish, coriaceous, quite glabrous; corymbs terminal, few-flowered. ♄. S. Native of Hispaniola.

Bertero's Jacquinia. Shrub.

6 J. MACROCA´RPA (Cav. icon. 5. p. 55. t. 483.) leaves lanceolate or lanceolate-obovate, mucronate, glabrous; flowers racemose. ♄. S. Native of Mexico, by the sea shore, not far from Panama, Acapulco, &c. Bark violaceous. Leaves 2-3 inches long. Flowers orange-coloured. Berry orange-coloured, cherry-shaped.

Long-fruited Jacquinia. Fl. May, Sept. Clt. 1825. Shrub 6 to 8 feet.

7 J. AURANTI`ACA (Ait. hort. kew. 2d ed. vol. 2. p. 6.) leaves obovate-lanceolate, acuminated, ending in a pungent point, glabrous; flowers racemose. ♄. S. Native of the Sandwich Islands. Sims, bot. mag. 1639. Branches sub-verticillate. Flowers orange-coloured. (f. 6.)

FIG. 6.

Orange-coloured flowered Jacquinia. Fl. April, Sept. Clt. 1796. Shrub 3 to 6 feet.

8 J. RUSCIFÒLIA (Jacq. amer. 54. ed. pict. t. 57.) leaves lanceolate, verticillate, glabrous, ending in a spiny taper point; peduncles 1-flowered, drooping. ♄. S. Native of South America, and of Cuba, in mountain-woods. Medèola aculeàta, Lin. spec. 339.—Dill. elth. p. 148. t. 123. f. 119. Branches dichotomous. Leaves 5-8 in a whorl, an inch long. Flowers white.

Ruscus-leaved Jacquinia. Fl.? Clt. 1729. Shrub 2 to 3 feet.

9 J. FERRUGÍNEA (Spreng. syst. 1. p. 668.) leaves alternate, linear, straight, cuspidate, rather coriaceous, rusty beneath, veiny; peduncles sub-racemose, axillary, few-flowered. ♄. S. Native of Hispaniola.

Rusty-leaved Jacquinia. Shrub.

10 J. LINEA`RIS (Jacq. amer. 54. t. 40. f. 1. ed. pict. t. 58.) leaves linear, acuminated, pungent, whitish beneath, usually twisted, with revolute edges; pedicels solitary, 1-flowered, pendulous. ♄. S. Native of St. Domingo, on the sea-shore; and of the Cayman islands, on the shore, within reach of the tide, where we have seen it in great profusion. Habit of *Andrómeda polifòlia*. Flowers red. Segments of corolla reflexed.

Linear-leaved Jacquinia. Fl. May, Sept. Clt. 1823. Shrub 1 foot.

11 J.? VENÒSA (Swartz, prod. p. 47.) leaves ovate-lanceolate, veiny, rather membranous. ♄. S. Native of the West Indies. Swartz has omitted this plant in Flora Indiæ Occidentalis. It is probably the *Pychótria megalaspérma*, Vahl. and not a species of the present genus.

Veiny Jacquinia. Shrub.

Cult. Jacquinia is a genus of very pretty shrubs, when in blossom, and are, therefore, very desirable in every collection of stove plants. A mixture of sand and peat is a good soil for them; and if they were watered occasionally with salted water, they would probably grow and flower more freely. Cuttings will strike root in sand, under a hand-glass, in heat.

II. CLAVIJA (named by Ruiz and Pavon, after J. Clavijo Faxardo, a Spanish naturalist) Ruiz et Pav. syst. fl. per. 1. p. 284. gen. t. 30. D. Don, in edinb. phil. journ. jan. 1831.—Theophrásta species of authors.

LIN. SYST. *Monadélphia, Pentándria.* Segments of calyx nearly orbicular, concave, finely and erosely serrulated. Corolla rotate; segments fleshy, with finely crenulated margins. Crown of the throat 10-lobed; lobes obtuse, fleshy. Filaments combined into a pyramidal tube; anthers trigonal, combined into a starry disk, with the cells hardly drawn out at the base, at length 4-lobed behind. Style attenuated; stigma small, truncate. Berry globose, crustaceous, 1-celled, usually many-seeded, rarely 1-2-seeded. The rest as in *Theophrásta*.—Shrubs with simple, unbranched stems: furnished with a tuft of long, spiny-toothed leaves at top, somewhat in the manner of palm trees. Leaves alternate, crowded so as to appear verticillate, spreading, oblong-lanceolate, coriaceous, glabrous, reticulately-veined, with spiny-toothed or quite entire edges; petioles callous at the base. Flowers terminal, racemose, white or orange-coloured; they are hermaphrodite, but never dioecious, as said by the authors of *Floræ Peruvianæ*.

§ 1. *Leaves with quite entire edges.*

1 C. MACROCA´RPA (Ruiz. et Pav. syst. fl. per. et chil. 1. p. 284. gen. t. 30.) leaves spatulate-oblong, acute, stiff, dotted beneath; petioles hardly an inch long; racemes very long, pendulous, glabrous. ♄. S. Native of Peru, in the forests of Cuchero and Muna, where it is commonly called *Lucuma de Monte*. Leaves 1 to 1½ foot long, with cartilaginous, sub-reflexed edges. Racemes from a span to 1 foot long. Flowers larger than other species of the genus. Berry size of a crab-apple.

Large-fruited Clavija. Clt. 1816. Shrub 10 to 12 feet.

2 C. LONGIFÒLIA (Ruiz. et Pav. syst. fl. per. et chil. 1. p. 284.) leaves spatulate-lanceolate, acuminate, rather membranous; petioles 3 inches long; racemes erect, downy. ♄. S. Native of Peru, in Pati and Macora. C. lancifòlia, Desf. in nouv. ann. mus. 1. p. 402. t. 14. Leaves 1½ to 2 feet long, and a hand in breadth. Berry size of a cherry.

Long-leaved Clavija. Fl. Aug. Sept. Shrub 8 feet.

3 C. SPATULA`TA (Ruiz. et Pav. l. c. p. 285.) leaves oblong-spatulate, obtuse; petioles 1½ inch long; racemes erect, smoothish. ♄. S. Native of Peru, in the woods of Pozuzo and Muna. Leaves rather membranous, a foot or more long, and 5 inches broad. Racemes 3-4 inches long. Berry size of a cherry.

Spatulate-leaved Clavija. Shrub 6 feet.

4 C. PE´NDULA (Ruiz. et Pav. l. c. p. 285. D. Don, in edinb. phil. journ. jan. 1831.) leaves lanceolate; racemes long, pendulous. ♄. S. Native of Peru, in the forests of Pozuzo.

Drooping-racemed Clavija. Shrub 4 to 6 feet.

§. 2. *Leaves with spiny-toothed edges.*

5 C. ORNA`TA (D. Don, l. c.) leaves long-lanceolate, acute, spiny-toothed; petioles a nail in length; racemes drooping; berries usually 2-seeded. ♄. S. Native of Caraccas, in woods. Theophrásta longifòlia, Jacq. coll. 4. p. 136. hort. schœnbr. 1. t. 116. Leaves 1½ foot long, acute at the base. Racemes 3 to 4 inches long. Flowers orange-coloured. Berry size of a small cherry.

Ornamental Clavija. Clt. 1828. Shrub 10 to 12 feet.

6 C. UNDULA`TA (D. C. l. c.) leaves cuneate-lanceolate, acuminated, spiny-toothed; petioles half an inch long. ♄. S. Native of Guayaquil. Clavìja, spec. nov. Ruiz. et Pav. in herb. Lamb. Leaves hardly a foot long, acute at the base, with the margins sinulately toothed and undulated. Flowers not seen.

Undulated-leaved Clavija. Shrub.

Cult. Shrubs very like *Theophrásta* in habit, which see, p. 26. for culture and propagation.

III. THEOPHRA'STA (so named from Theophrastus, the father of natural history.) Juss. gen. Lin. spec. Lindl. coll. t. 26.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, cartilaginous; segments elliptic-oblong, with erosely-toothed edges. Corolla campanulate, with a short tube, a dilated pentagonal throat, and a spreading limb; throat girded by an elevated, angularly-lobed, fleshy, arched ring. Stamens 5, combined with the tube of the corolla; anthers furnished with a beak-formed, obtuse appendage. Style attenuated; stigma capitate. Berry spherical, crustaceous, many-seeded, bursting irregularly; seeds half immersed in the placenta.—This is a small tree, with a simple, unbranched stem: furnished with a tuft of long, evergreen leaves at top, somewhat in the manner of a palm tree. Leaves alternate, crowded so as to appear somewhat verticillate, almost sessile, oblong-lanceolate, coriaceous, stiff, glabrous, pale green, a foot or a foot and a half long, with undulated, dentately spinose margins, usually truncate at the base and apex, paler beneath, very smooth, with a very thick midrib: having the veins hardly evident, except in the dried state. Flowers terminal, racemose; racemes numerous, many-flowered, hidden among the leaves, very short, hardly 2 inches long. Corolla white. Berry size a crab apple, yellowish.

1 T. Jussieu'i (Lind. coll. t. 26.) ♄. S. Native of St. Domingo, on the mountains. Th. Americàna, Lin. spec. 1. p. 212.? Swartz, obs. p. 58. Th. Henrìci, Hamilt. prod. fl. ind. occ. p. Erèsia foliis aquifolii longissimis, Plum. gen. p. 8. t. 28. icon. t. 126.?

Jussieu's Theophrasta. Fl.? Clt. 1818. Tree 10 feet.

Cult. A small tree, handsome on account of its long, holly-like leaves. A mixture of peat, loam, and sand, answers it well; and cuttings, having the leaves remaining on entire, will take root readily in sand, under a hand-glass, in heat.

IV. ONCI'NUS (from *ογκινος, onkinos,* a hook; in reference to the segments of the corolla being hooked.) Lour. coch. p. 123.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, 5-notched. Corolla funnel-shaped, fleshy; limb 5-parted: segments obtuse, all hooked to one side, emarginate; crown 5-cleft, in the mouth of the tube. Filaments fixed to the middle of the tube. anthers simple. Ovarium globose. Style short. Stigma acute. Berry globose, large, shining, 1-celled, many-seeded. Seeds small, roundish, nestling in the pulp.—A climbing shrub. Leaves ovate-lanceolate, entire, glabrous, shining, opposite.? Flowers white, in long, racemose, terminal corymbs. Berry red, edible, sweet, and somewhat astringent.

1 O. Cochinchine'nsis (Lour. l. c.). ♄. G. Native of Cochinchina. Theophrásta Cochinchinénsis, Spreng. syst. 1. p. 671.

Cochin-china Oncinus. Shrub cl.

Cult. See *Theophrásta* above for culture and propagation.

V. LEO'NIA (named after Don Francisco Leon, a great promoter of the sciences, who by his munificence assisted in bringing out some volumes of the Flora Peruviana.) Ruiz. et Pav. fl. per. et chil. 2. p. 69. t. 222. Mart. nov. gen. bras. 2. p. 86. t. 200. f. 4. in letterpress. Steudèlia, Mart. l. c. in tab. 168 and 169.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, 5-lobed, deciduous, with scarious edges. Corolla rotately sub-campanulate. Stamens 5, combined into a pentagonal, cup-shaped tube, inclosing the pistil. Anthers didymous, 2-celled. Berry corticate, 1-celled. Seeds many, oblong, attached to parietal placentas, (ex Mart. l. c.) nestling in the pulp.—Trees with alternate, coriaceous leaves, on short petioles, entire, full of pellucid dots, glabrous. Flowers cream coloured, full of glandular dots, disposed in axillary racemes or cymes.

1 L. racemòsa (Mart. nov. gen. bras. 2. p. 86. t. 168, and t. 200. f. 4. under *Steudèlia,* in tab.) leaves oblong, ending in a short, acute point; flowers disposed in drooping, compound, aggregate racemes. ♄. S. Native of Brazil, on the banks of the Amazon, at Serpa; and of Peru. L. glycicárpa, Ruiz. et Pav. fl. per et chil. 2. p. 69. t. 222. Corolla yellow, with obovate, concave segments. Seeds obovate.

Racemose-flowered Leonia. Tree 30 to 40 feet.

2 L. cymòsa (Mart. l. c. 2. p. 88. t. 169. under *Steudèlia,* in tab.) leaves oblong, acuminated at both ends; cymes of flowers bifid, erect. ♄. S. Native of Brazil, in the province of Rio Negro, at Ega, in woods. Seeds oblong.

Cymose-flowered Leonia. Tree 10 to 15 feet.

Cult. For culture and propagation see *Theophrásta* above.

Order CXLV. SAPOTA'CEÆ. Sapòtæ, Juss. gen. p. 151. R. Br. prod. p. 528.

Flowers hermaphrodite. Calyx divided, regular, permanent. Corolla monopetalous, hypogynous, regular: having the segments equal in number to the divisions of the calyx, rarely double or triple that number, deciduous. Stamens epipetalous, definite, distinct; fertile ones equal in number to the segments of the calyx, rarely more, and opposite them, but alternating with the segments of the corolla; sterile ones equal in number to the fertile ones, and alternating with them, sometimes wanting. Anthers usually behind. Ovarium many-celled; cells 1-seeded. Ovula erect. Style 1; stigma undivided, sometimes lobed. Berry many-celled, or only 1-celled from abortion. Seeds nucumentaceous, sometimes combined into a many-celled putamen; testa bony, shining, with the front more or less scraped away, and opaque. Embryo erect, white, large, usually inclosed in fleshy albumen. Cotyledons foliaceous in those seeds furnished with albumen, and fleshy in those without, sometimes connate; with a short straight or a little inclined radicle, looking towards the hilum, and an inconspicuous plumule.—Exotic trees or shrubs, the greater part natives within the tropics, most of which are milky. Leaves alternate, exstipulate, quite entire, coriaceous. Inflorescence axillary.

This order is more nearly allied to *Ebenàceæ* than to any other, but differs from it in the species being milky, in the wood being soft, in the stamens being definite, in the flowers being hermaphrodite, in the style being undivided, in the cells of the ovarium being always 1-seeded, in the ovula being erect, in the testa of the seeds being bony, and in many other characters.

The plants contained in this order are chiefly valuable for their fruit, which in many cases contribute richly to the dessert. *Mimùsops Elèngi, Imbricària, Commersònii,* and *Argània Sideróxylon* are all of this description; the star-apples of the West Indies, the produce of several species of *Chrysophýllum,* and particularly of *C. Cainìto,* are esteemed delicious; and the medlars, lucumas, and sapotillas of equinoxial America, all the fruit of different kinds of *A'chras* are among the most valuable productions of the Western world. The seeds of all the order are oily; those of *A'chras sapòta* are accounted diuretic and aperient. Their oil is not fluid, but so concrete as to have the appearance and consistence of butter, whence the name of butter-tree has been applied to different species, both in India and

Africa. The most famous of this description are the Indian *Mava, mahva*, or *Madhuca*, the *Bássia butyràcea*, and the African *Shea-tree, Bássia Párkii;* the seeds of the former are so oleaginous, that a single tree has been known to produce three quintals of oil; the dried flowers of the same tree are mixed by some Indians with their food, and a kind of spirit is distilled from them by others. The juice of all the sapotas is milky, but not acrid and poisonous, like that of most other lactescent orders, but, on the contrary, yielding a wholesome beverage or food. According to Mr. R. Brown, the bark of some species of *A`chras* and *Lucùma* is so astringent and febrifugal as to be substituted for quinquina or Peruvian bark.

Synopsis of the genera.

1 Sersalísia. Calyx 5-parted. Corolla 5-cleft. Stamens 10, 5 fertile and 5 sterile. Stigma undivided. Ovarium 5-celled. Berry 1-5-seeded. Seeds exalbuminous, crustaceous.

2 Arga`nia. Calyx 10-parted, disposed in a double series. Corolla 5-cleft; segments sub-emarginate. Stamens 10, 5 fertile, and 5 sterile, petal-like. Drupe containing a 2-3-celled nut, some of the cells usually above, marked by as many furrows as there are cells.

3 Sideróxylon. Calyx 5-parted. Corolla 5-cleft, with a denticulated lobe at the base of each segment. Stamens 5, alternating with the 5 teeth or sterile stamens. Berry 5-celled; cells 1-seeded, not all fertile; seeds exalbuminous, bony.

4 Bume`lia. Calyx and corolla 5-parted. Stamens 10, 5 fertile, alternating with 5 membranous sterile ones. Ovarium 5-celled. Berry 1-seeded. Seeds albuminous.

5 Nycterisítion. Calyx and corolla 5-parted. Stamens 5, fertile, without any sterile ones. Ovarium 5-celled; cells 1-seeded. Stigma obtuse. Seeds bony, albuminous.

6 Chrysophy´llum. Calyx and corolla 5-parted. Stamens 5, fertile, and no sterile ones. Stigma obsoletely 10-lobed. Berry 10-celled. Seeds bony and albuminous.

7 A`chras. Calyx 6-parted. Corolla 6-cleft. Stamens 12, 6 sterile and 6 fertile. Ovarium 12-6-celled, 12-6-seeded. Seeds albuminous, bony.

8 Lucu`ma. Calyx 5-parted. Corolla 5-cleft. Stamens 10, 5 fertile, and 5 sterile, scale-like. Ovarium 10-5-celled. Berry 1-10-seeded. Seeds bony, exalbuminous.

9 Inoca´rpus. Calyx 2-cleft. Corolla 5-cleft, long and linear. Stamens 10, inserted in a double row. Stigma concave, sessile. Drupe compressed, ovate, incurved at top, containing a fibry reticulated nut. Embryo exalbuminous.

10 Mimu`sops. Calyx 8-6-parted, in a twin order. Corolla with a double row of segments. Stamens 6-8 fertile (f. 7. *a.*), and 6-8 sterile (f. 7. *a.*). Ovarium 6-8-celled. Berry few-seeded from abortion. Seeds albuminous, nucumentaceous.

11 Imbrica`ria. Calyx 8-parted. Corolla with a triple series of trifid segments. Stamens 8 sterile and 8 fertile. Ovarium 8-celled, 8-seeded. Berry few-celled from abortion. Seeds albuminous, nucumentaceous.

12 Omphaloca´rpum. Calyx many-parted, covered by 11-12 concave scales. Corolla 6-7-cleft; segments alternating with as many fringed scales. Stamens 30-40, disposed in unequal series. Fruit solid, woody, umbilicate, many-celled, many-seeded.

13 Ba´ssia. Calyx 4-5-parted. Corolla 8-parted. Stamens 16, disposed in a double row. Berry 6-8-celled; cells 1-seeded. Seeds without albumen, somewhat trigonal, bony.

14 Laba`tia. Calyx 4-parted, the 2 outer segments the largest. Corolla 4-cleft. Stamens 8, 4 sterile and scale-formed, and 4 fertile ones inserted in the bottom of the corolla. Berry hard, roughish, 4-celled, rarely 2-celled 4-seeded. Seeds exalbuminous.?

15 Poute`ria. Calyx and corolla 4-cleft. Stamens 8, 4 sterile and bristle-formed, and 4 fertile. Capsule ovate, hispid, 4-valved; each valve containing an arillate almond-formed seed.

16 Phellìne. Calyx 4-toothed. Corolla 4-parted. Stamens 4, fertile. Capsule 4-celled; cells corky, dehiscing inside. Seeds solitary.

† *A genus hardly known.*

17 Monta`bea. Calyx tubular, with 5 unequal segments. Corolla funnel-shaped, with unequal segments. Nectary monophyllous, or stamens 5-8 combined, fixed to the superior part of the tube of the corolla, 5-toothed at top, with an anther between each of the teeth, which are probably abortive stamens. Stigma globose, obtuse. Berry 3-5-celled, 3-5-seeded. Seeds arillate, umbilicate on one side.

I. SERSALI´SIA (named in memory of John Baptist Sersalis, a Neapolitan ecclesiastic, much praised by Fabius Columna). R. Br. prod. p. 529.—Sideróxylon species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla 5-cleft. Stamens 10, 5 of which are sterile and scale-formed, and the other 5 fertile and bearing anthers, alternating with the scale-formed sterile ones. Ovarium 5-celled. Stigma undivided. Berry 1-5-seeded. Seeds exalbuminous, with a crustaceous testa, and longitudinal hilum.—Shrubs, with obovate leaves, and axillary, white flowers. The flowers are almost those of *Sideróxylon*, and the fruit almost that of *Bumèlia.*

1 S. serícea (R. Br. prod. p. 530.) leaves ovate or obovate, obtuse, tomentose beneath as well as the peduncles and calyxes; corollas villous outside, having the tube exceeding the calyx; sterile filaments lanceolate; style filiform, villous at the base. ♄. S. Native of New Holland, within the tropic. Sideróxylon seríceum, Ait. hort. kew. 1. p. 262.

Silky-leaved Sersalisia. Clt. 1772. Shrub 6 to 10 feet.

2 S. obova`ta (R. Br. l. c.) leaves obovate, a little attenuated at the base, rather silky beneath; calyxes smoothish; corolla 5-parted, glabrous: with orbicular segments, which much exceed the lanceolate, sterile filaments; stigma sessile, round. ♄. S. Native of New Holland, within the tropic.

Obovate-leaved Sersalisia. Shrub.

Cult. A mixture of loam, peat, and sand is a good soil for the species of *Sersalísia;* and cuttings strike root freely in sand, with a hand-glass over them.

II. ARGA`NIA (*Argan* is the aboriginal name of the tree). Rœm. et Schultes, syst. XLVI. Sideróxylon spinòsum, Lin.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-10-cleft; leaflets, or rather scales, roundish, concave, disposed in a double

series. Corolla cup-shaped, 5-parted, with ovate-lanceolate, sub-emarginate segments; having 5 petal-like, linear-subulate segments, adhering to the base of the corolla, and alternating with its segments. Stamens 5, filiform, length of corolla, and adnate to its base; anthers incumbent, ovate, keeled on the back. Ovarium conical, hairy. Style glabrous; length of stamens; stigma simple. Drupe ovate, terminated by the style, 2-3-celled; cells 1-seeded. Seeds hard, smooth, having a longitudinal furrow inside.—A small evergreen tree.

1 A. SIDERÓXYLON (Rœm. et Schultes, syst. 4. p. 502.). ♄. H. Native of the southern parts of the kingdom of Morocco; abundant in woods situated in the southern provinces, between the rivers Tansif and Sur. Sideróxylon spinòsum, Lin. spec. p. 279. exclusive of the syn. of Rheede, mal. Ait. hort. kew. ed. 2. vol. 2. p. 14. Dry. in Lin. trans. 2. p. 225. Correa, in ann. mus. 8. p. 393. Elæodéndron A'rgan, Retz. obs. 6. p. 26. Willd. spec. 1. p. 1148. exclusive of the syn. Rhámnus pentaphýllus, Jacq. and Boccone. Schousb. mar. p. 89. Rhámnus Sículus, Lin. syst. 3. p. 227. exclusive of the synonymes.—Comm. hort. amst. 1. p. 161. t. 83. An evergreen tree of middle size, with a bushy head. Branches terminated by strong spines. Leaves lanceolate, entire, bluntish, glabrous, paler beneath; the lower ones in fascicles. Flowers lateral and axillary, scattered, crowded, sessile. Corolla greenish-yellow. Fruit dotted with white, size of a plum, full of white, milky juice.

Iron-wood Argania. Fl. July. Clt. 1711. Tr. 15 to 20 ft.

Cult. The tree will grow against a south wall, but will require the protection of a mat in severe weather in winter. It is to be propagated by cuttings in sand, under a hand-glass.

III. SIDERO'XYLON (from σιδηρος, *sideros*, iron, and ξυλον, *xylon*, wood; from the hardness of the wood). Dill. elth. p. 357. t. 265. f. 344. Lin. gen. no. 264. Juss. gen. 151. Gærtn. fruct. 3. p. 123. t. 202. Lam. ill. t. 120. Vent. choix. t. 22.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, 5-parted. Corolla 5-cleft, with roundish, concave segments; having a lobe in each recess. Stamens 5 (in one species 10), length of corolla, alternating with the teeth inside the corolline segments, which are probably sterile stamens; anthers oblong. Style length of stamens. Stigma obtuse. Berry 5-celled, 5-seeded, but some of the cells are usually abortive. Albumen subcartilaginous. Embryo obliquely ascending.—Evergreen trees, with axillary and lateral fascicles of flowers.

* *Shrubs unarmed.*

1 S. INE'RME (Lin. in Dill. hort. elth. 357. t. 265. f. 344.) spec. p. 278.) leaves oblong-ovate, obtuse, glabrous; flowers in lateral and axillary fascicles. ♄. G. Native of the Cape of Good Hope. Jacq. coll. 2. p. 250. Mill. ill. t. 299. S. A'rgan, Lam. dict. 1. p. 245. ill. no. 2455. t. 120. f. 1. Rœmèria inérmis, Thunb. in Rœm. arch. 2. p. 2. Leaves coriaceous, shining, 3 inches long, attenuated at the base. Flowers small, with a green calyx and white petals and stamens. Sterile filaments lanceolate, acuminated, usually cut.

Unarmed Iron-wood. Fl. July. Clt. 1692. Sh. 5 to 6 ft.

2 S. CINE'REUM (Lam. dict. 1. p. 244. exclusive of the synonymes) leaves obovate, flat, reticulated with veins beneath; flowers axillary, 1-4 in a fascicle. ♄. S. Native of the Isle of France.—Burm. afr. t. 84. f. 2. Branches rufescent. Leaves coriaceous, glabrous, dotted beneath. Flowers small, white.

Grey-barked Iron-wood. Shrub 6 to 10 feet.

3 S. NÍTIDUM (Blum. bijdr. 675.) leaves oblong, attenuated at both ends, shining; flowers crowded into axillary racemes. ♄. S. Native of Java, in the province of Buitenzorg, in woods on Mount Sulin, where it is called *Njalu*.

Shining Iron-wood. Tree 80 feet.

4 S.? RUGÒSUM (Rœm. et Schultes, syst. 4. p. 501.) leaves oblong, acuminated, glabrous; flowers in axillary fascicles; fruit wrinkled, acuminated. ♄. S. Native of Jamaica, on the higher mountains. Chrysophýllum rugòsum, Swartz, prod. p. 49. fl. ind. occ. 1. p. 484. Willd. berl. mag. 3. p. 60. Leaves large, paler beneath. Corolla 10-cleft, 5 of the segments obtuse and 5 very short. Fruit size of a filbert, yellowish brown. Seeds ovate-oblong, compressed.

Wrinkled-fruited Iron-wood. Tree.

5 S.? CANTONIE'NSE (Lour. coch. p. 122.) leaves palmate, glabrous, on long petioles; peduncles solitary, axillary, many-flowered. ♄. G. Native of China, in the suburbs of Canton. Shrub climbing. Calyx a small, lancéolate, deciduous spathe. Corolla 5-cleft. Nectarium acutely 5-cleft. Stamens 5. Stigma obtuse. Berry roundish, 4-celled, 1-seeded. Root a large round tube, tapering at the base. This is certainly not a *Sideróxylon*, nor does it appear to belong to the order.

Canton Iron-wood. Shrub cl.

6 S.? ATROVÍRENS (Willd. enum. suppl. p. 11.) leaves lanceolate, acute, smooth, pale beneath, approximate; flowers small, racemose, axillary. ♄. G. Native? An erect, branched shrub, with greyish white branches; petioles blackish, brown. Flowers white. Perhaps the same as S. atrovírens, Lam., or probably S. nígricans, Dum. Cours.

Dark-green Iron-wood. Shrub 6 to 10 feet.

7 S. GUADALUPE'NSIS (Spreng. syst. 1. p. 666.) unarmed; leaves ovate-oblong, bluntish, coriaceous, quite glabrous, parallelly veined beneath; peduncles solitary, 1-flowered, axillary. ♄. S. Native of Guadaloupe.

Guadaloupe Iron-wood. Tree or shrub.

8 S. TOMENTÒSUM (Roxb. cor. 1. p. 28. t. 28.) leaves oblong, undulated, downy; flowers in axillary fascicles; berry 1-5-seeded. ♄. S. Native of the East Indies, on the tops of mountains. Bark ash-coloured. Leaves smooth in the adult state, but clothed with rust-coloured down while young, 3-5 inches long. Flowers small, dull white. Berry ovate, size of an olive. Segments of corolla acutish. S. Wightiànum, Wall. no. 4154. appears to be only a more glabrous variety of *S. tomentòsum*.

Tomentose Iron-wood. Clt. 1818. Tree 8 to 10 feet.

9 S. GRANDIFÒLIUM (Wall. in Roxb. fl. ind. 2. p. 348.) leaves obovate-elliptic, obtuse or acuminated, tapering downwards, smooth, crowded at the tops of the branches; flowers globular, in numerous axillary and lateral, crowded fascicles; segments of corolla obtuse; ovarium densely bearded. ♄. S. Native of Silhet. Branches angular. Leaves 6-12 inches long. Flowers small, pea-green. Stigma truncate. S. règium, Wall. cat. no. 415. (a native of Pegu) does not appear to differ from this.

Great-leaved Iron-wood. Tree large.

10 S. WALLICHIA'NUM; branches, petioles, and midrib of leaves clothed with rusty villi while young; leaves large, elliptic-oblong, or oblong-obovate, acuminated, on short petioles, crowded at the tops of the branches. ♄. S. Native of Penang. S. rugòsum, Wall. cat. no. 4158. but not of Rœm. et Schultes.

Wallich's Iron-wood. Tree.

11 S. NERVÒSUM (Wall. cat. no. 4159.) branches, petioles, and midrib of young leaves, calyxes, and pedicels clothed with rusty villi; flowers rather large, in crowded, close, axillary and lateral fascicles; leaves large, oblong, with a short acumen, on short thick petioles, rusty beneath. ♄. S. Native of the Burmese empire, at Trogle, on the banks of the Saluen river.

Nerved Iron-wood. Tree.

* * *Armed shrubs.*

12 S. arma'tum (Roth. nov. spec. p. 67.) prickles axillary, about equal in length to the petioles; leaves elliptic, tapering to both ends, downy beneath, tomentose while young; pedicels axillary and lateral, crowded. ♄. S. Native of the East Indies. Very like *S. tomentòsum* in the leaves and flowers. The flowers are scattered without order.

Armed Iron-wood. Tree.

13 S.? deca'ndrum (Lin. mant. p. 48. Willd. spec. 1. p. 1091. berol. mag. p. 55.) spinose; leaves elliptic, deciduous, glabrous; flowers in axillary fascicles; stamens 10, fertile, length of nectary. ♄. S. Native of South America. Spines axillary, solitary. Corolla funnel-shaped, with concave segments. Segments of nectary or abortive stamens serrated. Anthers sagittate. Berry black, 3-5-celled.

Decandrous Iron-wood. Tree.

Cult. For culture and propagation see *Sersalisia*, p. 27.

IV. BUME'LIA (from *βουμελια*, *boumelia*, the Greek name for the common ash). Swartz, prod. p. 49. fl. ind. occ. 1. p. 493. Schreb. gen. 1736.—A'chras species, Lin. Poir.—Sideróxylon species, Lam. and others.—Chrysophýllum species, Aubl. and others.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-parted. Corolla with a short tube, and a 5-parted limb, furnished with 2 scales at the base of each segment. Stamens 5, inserted in the tube of the corolla, and opposite its segments, having as many membranous scales or sterile filaments alternating with them. Ovarium 5-celled; cells 1-ovulate. Stigma simple. Drupe oval, 1-seeded. Seed albuminous.—Trees, rarely shrubs. Leaves scattered, entire, permanent. Peduncles axillary and lateral, 1-flowered, usually crowded in fascicles. Flowers whitish.

* *Unarmed shrubs or trees.*

1 B. nìgra (Swartz, prod. 49. fl. ind. occ. 1. p. 487.) leaves oblong-lanceolate, glabrous, with undulated margins; branchlets twiggy; flowers 4-6 in a fascicle. ♄. S. Native of Jamaica, in mountain woods. A'chras nìgra, Poir. suppl. 6. p. 532.—A'chras, Browne, jam. p. 201. Sideróxylon nìgrum, Gærtn. fil. carp. 1. fasc. 3. p. 123.? Bark blackish. Leaves crowded at the tops of the branches, dark green, drooping. Segments of corolla and calyx ovate, concave, white. Sterile filaments lanceolate undulated. Drupe glabrous, roundish.

Black Bumelia. Clt. 1806. Tree 30 feet.

2 B. pa'llida (Swartz, prod. p. 40. fl. ind. occ. 1. p. 489.) leaves elliptic, obtuse; pedicels crowded, lateral; branches erect. ♄. S. Native of Jamaica, in fields. A'chras pállida, Poir. suppl. 6. p. 533. Sideróxylon pállidum, Spreng. syst. 1. p. 668. Very nearly allied to *B. nìgra*, from which it differs in the smaller stature, whitish bark, and stiffer branches. Two of the calycine segments are larger than the other three. Corolla yellowish white, divided even to the base; segments without any scales at the base. Scales or sterile filaments trifid at the apex.

Pale Bumelia. Tree small.

3 B. retu'sa (Swartz, prod. p. 49. fl. ind. occ. 1. p. 490.) leaves cuneate-ovate, retuse, stiff; flowers in axillary fascicles. ♄. S. Native of the west of Jamaica, on the mountains. Gærtn. fil. carp. 3. p. 126. t. 202. f. 3. A'chras retùsa, Poir. suppl. 6. p. 533.—Browne, jam. 201. no. 7. Leaves alternate and opposite, shining above, white beneath, and full of black dots. Calyx white, roughish. Sterile filaments lanceolate, undulated. Drupe ovate. Browne calls this *Bastard Bully-tree*.

Retuse-leaved Bumelia. Tree dwarf.

4 B. fœtidíssima (Willd. spec. 1. p. 1086.) leaves lanceolate-oblong, sub-emarginate; flowers in axillary fascicles. ♄. S. Native of St. Domingo, on the mountains. Sideróxylon fœtidíssimum, Lin. mant. p. 49. Jacq. amer. p. 55. Sideróxylon oppositifòlium, Mill. dict. no. 2.? Tree not lactescent. Leaves shining, nearly opposite. Flowers white, fetid. Calycine segments roundish, obtuse, concave. Corolla rotate, with ovate, flat segments. Sterile filaments serrated. Drupe roundish, depressed at top.

Very fetid-flowered Bumelia. Fl. June, Aug. Clt. 1820. Tree 12 feet.

5 B. pauciflòra (Rœm. et Schultes, syst. 4. p. 493.) leaves lanceolate-oblong, alternate, obtuse; flowers spreading, axillary, 3-4 in a fascicle. ♄. S. Native of St. Domingo, in woods on the mountains. Sideróxylon pauciflòrum, Jacq. amer. p. 55. Segments of corolla concave at top. Flowers white, less fetid than the preceding, to which it is very nearly allied.

Few-flowered Bumelia. Tree 20 feet.

6 B. mastichode'ndron (Rœm. et Schultes, l. c.) leaves lanceolate, acute, and obtuse; flowers in axillary fascicles. ♄. S. Native of St. Domingo, and the Bahamas. Sideróxylon mastichodéndron, Lam. ill. no. 2456. t. 120. f. 2. Jacq. coll. 2. p. 253. t. 17. f. 5. Gærtn. fil. carp. 3. p. 125. t. 202.—Catesb. car. 2. t. 75. Branches long, flexible. Leaves shining above and paler beneath. Flowers yellowish. Corolla rotate, with ovate, obtuse, concave segments. Sterile filaments subulate. Drupe yellow, ovate, obtuse.

Mastich-tree Bumelia. Tree 40 to 50 feet.

7 B. salicifòlia (Swartz, prod. p. 50. fl. ind. occ. 1. p. 491.) leaves ovate-lanceolate, acuminated; flowers in axillary and lateral fascicles. ♄. S. Native of Jamaica and St. Domingo. Willd. spec. 1. p. 1085. exclusive of Mastichodéndron, Jacq. Sideróxylon salicifòlium, Lam. ill. 2458.? Gærtn. fil. carp. 3. p. 124. A'chras salicifòlia, Lin. spec. 470.—Browne, jam. 201. t. 17. f. 4.—Sloane, hist. 2. p. 98. t. 206. f. 2. The tree is called in Jamaica *Galimeta-wood*, or from the bark *White Bully-tree*. Leaves shining. Calyx clothed with rusty down. Corollas white. Fruit small, oblong, often 2-seeded.

Willow-leaved Bumelia. Clt. 1820. Tree 20 feet.

8 B. monta'na (Swartz, prod. 49. fl. ind. occ. 1. p. 493.) leaves oblong, obtuse; flowers solitary, or 3 or 4 in a fascicle. ♄. S. Native of the south of Jamaica, on the higher mountains. A'chras montàna, Poir. suppl. 6. p. 533. Branches a little warted. Calycine segments 5-8, concave, roundish. Corolla having the tube ventricose at the base; and the segments of the limb undulated. Scales or sterile filaments acute, connivent.

Mountain Bumelia. Tree.

9 B. nervòsa (Vahl, eclog. p. 28. Willd. spec. 1. p. 1087.) leaves elliptic, of a different colour beneath; flowers tomentose, disposed in lateral and axillary fascicles. ♄. S. Native of Cayenne and Guiana. Chrysophýllum Cainìto, Aubl. guian. 1. p. 234. Chrysophýllum macrophýllum, Lam. dict. 2. p. 44. Tops of branches rather angular, and clothed with rusty tomentum. Leaves acute at the base, and bluntish at the apex, 4-5 inches long, shining above, but of a rufescent glaucous colour beneath, hardly downy. Petioles clothed with rusty tomentum. Calycine segments ovate, acute, length of corolla. Sterile filaments subulate. Ovarium tomentose.

Nerved-leaved Bumelia. Clt. 1820. Tree 20 feet.

10 B. rotundifòlia (Swartz, prod. 50. fl. ind. occ. 1. p. 495.) leaves nearly orbicular or elliptic, rounded at the apex, acute at the base, coriaceous, glabrous, shining; flowers in axillary and lateral fascicles. ♄. S. Native of Jamaica, on the mountains among bushes; and in the province of Bracamoros, on the banks of the Amazon, at the confluence of the Chincapin. B. obtusifòlia, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 802. A'chras rotundifòlia, Poir. ency. 6. p. 534. Leaves palest beneath. Calyxes clothed with silky down: having ovate, ob-

tuse concave segments. Corolla white, also clothed with silky down, having roundish-ovate segments, with 2 subulate scales at the base of each segment. Drupe roundish-ovate, glabrous. The plant of Humboldt does not differ from that of Swartz, unless that the calyx and branchlets of the former are downy.

Round-leaved Bumelia. Clt.? Tree 20 feet.

11 B. cunea'ta (Swartz, fl. ind. occ. 1. p. 496.) leaves cuneate-obovate, glabrous; flowers in lateral and axillary fascicles towards the tops of the branches. ♄. S. Native of Jamaica, and other west Indian islands, among bushes on the mountains. Sideróxylon obovàtum, Lam. ill. no. 2464. Gærtn. fil. carp. cent. 1. p. 125. A'chras cuneifòlia, Poir. ency. 6. p. 534. Leaves sometimes as if they were in fascicles, and rather emarginate at the apex. Calycine segments roundish, concave. Corolla small, with acuminated segments, hardly lònger than the calyx; inner scales small, acute.

Cuneate-leaved Bumelia. Clt. 1823. Tree.

** *Armed shrubs or trees.*

12 B. cela'strina (H. B. et Kunth, nov. gen. amer. 7. p. 212.) spiny; leaves obovate-oblong, rounded at the apex, cuneated at the base, quite entire, rather coriaceous, glaucous-green. ♄. S. Native of Mexico, on the western declivities of mountains. Leaves in fascicles of 2-6. Calycine segments 4, roundish elliptic. Peduncles solitary or twin, rising from the fascicles of leaves.

Celastrus-like Bumelia. Shrub.

13 B. buxifòlia (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 802. H. B. et Kunth, nov. gen. amer. 7. p. 212.) spiny erect; leaves elliptic, rounded at the apex and cuneated at the base, or obovate, quite entire, somewhat coriaceous, glabrous, shining, clothed with silky down beneath while young. ♄. S. Native of the Spanish Main, near Cumana, where it is called *Pejoui* by the inhabitants. Leaves $1\frac{1}{2}$ inch long. Calycine segments roundish-elliptic, somewhat concave. Corolla hemispherically campanulate, 5-6-parted. Flowers umbellately crowded, small, white.

Box-leaved Bumelia. Tree 40 feet.

14 B. lycioìdes (Gærtn. fil. carp. 3. p. 127. t. 120. Pers. ench. 1. p. 237.) spiny; leaves broad-lanceolate, bluntish, tapering to the base, glabrous; flowers in axillary fascicles. ♄. S. Native of Carolina, in shady woods. Sideróxylon lycioìdes, Duham. arb. 2. p. 260. t. 68. Willd. spec. 1. p. 1090. Ait. hort. kew. ed. 2. vol. 2. p. 12. Pursh, fl. amer. sept. 1. p. 155. Sider. læ've, Walt. fl. corol. p. 100. Lycioìdes, Lin. hort. cliff. p. 488. Spines subulate. Leaves 2 inches long, deciduous, a little silky while young. Flowers greenish white. Segments of corolla trifid? perhaps from the 2 scales inside each segment.

Boxthorn-like Bumelia. Fl. Aug. Clt. 1758. Sh. 8 to 10 ft.

15 B. fe'rox (Cham. et Schlecht. in Linnæa. 6. p. 392.) nearly glabrous in every part, with strong flexuous branches and spreading spinescent branchlets; leaves coriaceous, glaucescent, on short petioles, cuneated, obtuse, spatulate-lanceolate, elliptic and obovate; flowers aggregate, axillary, calycine segments ovate-obtuse, unequal. ♄. G. Native of Mexico. Leaves 1-2 inches long. Pedicels 1-flowered. Segments of corolla a little longer than the calyx, erosely crenulated. Stamens equal in length to the corolla; sterile ones spatulate, lanceolate, with dentately jagged edges. Ovarium 5-celled. Flowers white.

Fierce Bumelia. Shrub or tree.

16 B. reclina'ta (Vent. choix. t. 22. Pursh, fl. amer. sept. 1. p. 155.) spiny, bushy, diffusely reclinate; leaves small, obovate, quite smooth; flowers in axillary fascicles. ♄. H. Native of Georgia, on the banks of rivers. Sideróxylon reclinàtum, Michx. fl. bor. amer. 1. p. 122. Young branches terminated by a long spine. Leaves alternate or in fascicles. Flowers small, white. Corolla and scales serrated. Sterile filaments subulate, entire. Drupe ovate.

Reclinate-branched Bumelia. Fl. Jan. Clt. 1806. Sh. 3 to 4 ft.

17 B. te'nax (Willd. spec. 1. p. 1085. enum. p. 248.) leaves obovate-lanceolate, of a rusty silvery colour beneath, silky; flowers in axillary fascicles. ♄. H. Native of Carolina, in dry situations. B. chrysophylloìdes, Pursh. fl. amer. sept. 1. p. 155. Sideróxylon tènax, Lin. mant. p. 48. Jacq. coll. 2. p. 252. Lam. dict. 1. p. 245. Siderox. chrysophylloìdes, Michx. fl. bor. amer. 1. p. 123. Chrysophýllum Caroliniénse, Jacq. obs. 3. p. 3. t. 54. Chrys. glàbrum, Juss. Siderox. seríceum, Walt. fl. car. p. 100. Branches very tough. Bark white. Leaves deciduous. Calycine and corolline segments ovate, obtuse. Segments of nectary trifid. Stamens length of corolla. Drupe oval. Flowers white.

Tough-branched Bumelia. Fl. Jul. Aug. Clt. 1765. Tr. 20 ft.

18 B. lanuginòsa (Pursh. fl. amer. sept. 1. p. 155.) rather spinose; branchlets spreading, downy; leaves oval-lanceolate, glabrous above and woolly beneath, but not silky; flowers in axillary fascicles. ♄. H. Native of Carolina and Georgia, in humid situations among bushes. Sideróxylon lanuginòsum, Michx. fl. bor. amer. 1. p. 123. Siderox. tènax, Walt. fl. car. p. 100. Very nearly allied to *B. tènax*, but differs in the leaves being woolly beneath, not silky, often obtuse.

Woolly-leaved Bumelia. Clt. 1806. Tree small.

19 B. pentagòna (Swartz, prod. p. 49. fl. ind. occ. 1. p. 494.) leaves lanceolate, acuminated, shining; flowers in axillary and lateral fascicles; drupe pentagonal. ♄. S. Native of St. Domingo, on the mountains. Sideróxylon pauciflòrum, Lam. ill. 2459. as is seen by Poir. suppl. 1. p. 445. no. 12. A'chras pentagòna, Poir. ency. 6. p. 533. Branches warted, cinereous. Segments of the calyx roundish, villous. Corolla white, hardly the length of the tube of the calyx: having the segments ovate, concave. Sterile filaments lanceolate. Drupe ovate, glabrous.

Pentagonal-fruited Bumelia. Tree 20 feet.

20 B. oblongifòlia (Nutt. gen. amer. 1. p. 135.) spiny; leaves smooth, oblong, obtuse, deciduous; flowers conglomerate, nearly sessile, very numerous; scales or sterile filaments trifid. ♄. H. Native of North America, on the Mississippi, near the lead mines of St. Louis; it is also abundant as far down the river as Natches. Tree, with numerous twisted branches. Calycine segments ovate, concave. Drupe purple. Wood fetid.

Oblong-leaved Bumelia. Fl. July, Aug. Clt. 1818. Tree 18 to 20 feet.

21 B. strigòsa (Spreng. syst. 1. p. 665.) somewhat spinose; leaves oblong, obtuse, shining above, but pale and clothed with adpressed bristles beneath. ♄. S. Native country unknown. Sideróxylon strigòsum, Willd. enum. suppl. p. 11. Flowers whitish.

Strigose Bumelia. Fl. July, Aug. Clt. 1818. Tree 20 ft.

22 B. crenula'ta (Spreng. syst. 1. p. 665.) leaves oblong-lanceolate, attenuated at the base, quite glabrous on both surfaces, crenulately serrated; branches glabrous, subspinose; peduncles 1-flowered, usually solitary. ♄. S. Native of Porto Rico.

Crenulated-leaved Bumelia. Shrub or tree.

† *Species not sufficiently known.*

23 B.? multiflòra (Rœm. et Schultes, syst. 4. p. 498.) spiny; leaves obovate-cuneated, obtuse, glabrous, coriaceous; peduncles divided, fasciculate, lateral. ♄. G. Native of the Cape of Good Hope. Sideróxylon multiflòrum, Lam. ill. no. 2465. Poir. suppl. 1. p. 446. no. 16. Habit, flowers, and fruit unknown.

Many-flowered Bumelia. Tree or shrub.

24 B.? PUNCTA'TA (Rœm. et Schultes, l. c.) unarmed; leaves oblong-oval, bluntish, glabrous, dotted beneath; flowers lateral, almost sessile. ♄. H. Native of Carolina. Sideróxylon punctàtum, Lam. ill. no. 2460. Poir. suppl. 1. p. 446. Drupes roundish, size of a pepper-corn, 1-seeded. The rest unknown.

Dotted-leaved Bumelia. Tree or shrub.

25 B.? ARGE'NTEA (Rœm, et Schultes, syst. 4. p. 499.) unarmed; leaves ovate, retuse, tomentose; flowers pedunculate, racemose. ♄. G. Native of the Cape of Good Hope. Sideróxylon argénteum, Thunb, prod. p. 36. Willd. spec. 1. p. 1090. Rœmèria argéntea, Thunb. in Rœm. arch. 2. p. 1.—Burm. dec. pl. afr. t. 92. f. 1. Leaves ovate-oblong, emarginately cleft, clothed with white tomentum, especially beneath. Perhaps a species of *Bádula*.

Silvery Bumelia. Shrub 2 to 3 feet.

26 B.? LU'CIDA (Rœm. et Schultes, l. c.) unarmed; leaves ovate-oblong, quite glabrous, shining above; flowers in axillary fascicles. ♄. S. Native of America. Sideróxylon lùcidum, Sol. in Lam. dict. 1. p. 246. no. 2. Sideróx. nítidum, Lam. ill. p. 42. no. 2457. Leaves coriaceous, 2 inches long. Flowers small, white.

Shining-leaved Bumelia. Tree or shrub.

27 B.? AUZU'BA (Rœm. et Schultes, l. c.) unarmed; leaves oblong, attenuated at both ends, shining, veiny; pedicels axillary, 1-flowered, alternate; fruit ovate, yellow, fleshy, full of a clammy juice, containing a nut very like an olive. ♄. S. Native of St. Domingo, where it is called *Acomat*. Sideróxylon Auzùba, Plum. mss. vol. 5. p. 124.

Auzuba Bumelia. Tree.

28 B.? CUNEIFÒLIA (Rudge, pl. guian. 1. p. 30. t. 47.) leaves cuneate-lanceolate, nerved, acuminated, quite glabrous, except the nerves, which are pubescent; flowers in axillary and lateral fascicles; anthers ovate, cuneated. ♄. S. Native of Guiana. Branches clothed with rusty down. Flowers small. Calycine segments tomentose. Segments of corolla obtuse. Stamens shorter than the corolla, sessile, obtuse.

Wedge-leaved Bumelia. Tree tall.

Cult. The hardy species of this genus thrive very well in a sheltered situation, or against a wall where they can be covered with a mat in severe frost; and cuttings of them, planted in sand under a hand-glass, strike root readily. For the culture and propagation of the stove and greenhouse species, see *Sersalísia*, p. 27.

V. NYCTERISI'TION (from *νυκτερις*, *nycteris*, a bat, and *σιτιον*, *sition*, food; flowers). Ruiz et Pav. gen. fl. per. et chil. p. 300. t. 5. fl. 2. t. 187. H. B. et Kunth, nov. gen. amer. 3. p. 238.—Chrysophýllum species of authors.

LIN. SYST. *Pentándria*, *Monogýnia*. Calyx 5-parted. Corolla with a short tube, and a 5-parted limb, without any scales inside the segments. Stamens 5, inserted in the top of the tube of the corolla and opposite to its segments. Ovarium 5-celled; cells 1-ovulate. Style short; stigma obtuse, slightly 5-toothed. Fruit fleshy, 5-celled, 5-seeded. Seeds albuminous, bony. Embryo erect.—Trees with the habit of *Bumèlia*. Leaves scattered, entire. Flowers disposed in axillary, umbellate fascicles; pedicels 1-flowered. This genus hardly differs from *Chrysophýllum*, unless in the 5-celled ovarium, and in the almost entire stigma.

1 N. ARGE'NTEUM (H. B. et Kunth, nov. gen. amer. 3. p. 238. t. 244.) branchlets downy; leaves elliptic-oblong, pale green and shining above and silvery beneath. ♄. S. Native of New Granada, near Jaen de Bracamoras. Chrysophýllum Granaténse, Spreng. syst. 1. p. 667. Buds silky. Leaves acute or obtuse, a little cuneated at the base. Flowers 6-9 together, about the size of those of the *Alatérnus*. Ovarium hairy.

Silvery Nycterisition. Tree.

2 N. FERRUGÍNEUM (Ruiz et Pav. fl. per. 2. p. 47. t. 187.) leaves oblong-ovate, with an emarginate acumen, shining above, but clothed with silky rusty down beneath, as well as the calyxes and branchlets. ♄. S. Native of Peru, in woods at Cuchero Chincao and Pillao. Chrysophýllum ferrugíneum, Spreng. syst. 1. p. 666. Corollas whitish yellow, clothed with rusty down.

Rusty Nycterisition. Clt. 1823. Tree 30 feet.

3 N. LANCEOLA'TUM (Blum. bijdr. 676.) branchlets clothed with rusty tomentum; leaves oblong-lanceolate, obliquely attenuated at the base, tomentose on the midrib beneath. ♄. S. Native of Java, in woods on the mountains, where it is called *Kilakkatang*.

Lanceolate-leaved Nycterisition. Tree 60 to 80 feet.

Cult. For culture and propagation see *Chrysophýllum*, p. 33.

VI. CHRYSOPHY'LLUM (from *χρυσος*, *chrysos*, gold, and *φυλλον*, *phyllon*, leaf; the leaves of most of the species are clothed with yellow silky down beneath). Lin. gen. 263. Schreb. gen. 355. Juss. gen. 152.—Cainìto, Plum. 9. Jacq. amer. 51.

LIN. SYST. *Pentándria*, *Monogýnia*. Calyx 5-parted. Corolla campanulately rotate, with a 5-parted spreading limb. Stamens 5, inserted in the tube of the corolla and opposite its segments, without any scales inside the segments. Ovarium 10-celled; cells 1-ovulate. Stigma almost sessile, somewhat peltately depressed, obsoletely 10-lobed. Fruit globose, 1-10-celled; cells 1-seeded; endocarp bony, brittle. Seeds albuminous.—Lactescent trees. Leaves alternate, quite entire. Flowers disposed in axillary umbellate fascicles.

* *Leaves clothed with silky, silvery, or golden tomentum beneath.*

1 C. CAINÌTO (Lin. spec. 278. Jacq. amer. p. 51. t. 37. f. 1. ed. pict. p. 30. t. 51.) leaves oblong, acute at the base and apex, quite glabrous above, but silky and rusty beneath. ♄. S. Native of the West Indian islands, and almost throughout South America within the tropics. Cainìto, Laet, amer. 390. Plum. gen. 10. t. 69. Sideróxylon Pacurèro, Loefl. itin. p. 204. A tall tree with a large head. Branches clothed with silky rusty down. Leaves $3\frac{1}{2}$ to 4 inches long. Flowers small, whitish. Fruit large, rather depressed, rose-coloured, mixed with green and yellow, having the skin smooth and glabrous: the flesh soft, clammy, sweet, and insipid. The Americans are very fond of it, but it is seldom eaten by Europeans.

Var. β, Jamaicénse (Jacq. amer. l. c. t. 52. pict. t. 31.) fruit purple, sub-ovate. ♄. S. Native of Jamaica.—Brown. jam. 171. t. 14. f. 2.—Sloane, hist. 3. p. 170. t. 229. Fruit with a green or purple rind; the pulp also purple, and rather better flavoured than the species. It is called Star Apple in Jamaica.

Var. γ, cœrùleum (Jacq. amer. l. c. t. 37. pict. t. 52.) fruit blue, globose. ♄. S. Native of Martinico. Both pulp and rind of the fruit entirely blue, of the same taste as the latter.

Var. δ, microphýllum (Jacq. amer. pict. p. 31. t. 53.) leaves smaller. ♄. S. Native of Cuba, about the Havanna. The tree scarcely grows above 10 feet high, and the leaves do not exceed $1\frac{1}{2}$ inch long.

Cainito, or Common Star Apple. Fl. May, June. Clt. 1737. Tree 30 to 50 feet.

2 C. AQUA'TICUM (H. B. et Kunth. nov. gen. amer. 3. p. 236.) leaves oblong, acuminated, obtuse at the base, quite glabrous and shining above, but clothed with rusty silky down beneath. ♄. S. Native of the Missions of the Orinoco, in inundated places on the banks of the river Atabapo, betwixt San Fernando and Javita. Branches angular, silky, brown. Leaves 3-4 inches long. Flowers and fruit unknown.

Aquatic Star Apple. Tree.

3 C. monopyre'num (Swartz. prod. p. 49. fl. ind. occ. 1. p. 480.) leaves oval or oblong, short-acuminated, clothed with golden-silky tomentum beneath; fruit ovate, 1-seeded. ♄. S. Native of Jamaica, Martinico, St. Domingo, &c. among bushes. Hook. bot. mag. 3303. C. olivifórme, Lam. dict. 1. p. 552. no. 2. C. Cainìto, Mill. dict. no. 1. C. Cainìto, β, Willd. spec. 1. p. 1083.—Burm. amer. t. 69. Branchlets flexible, clothed with rusty tomentum. Corolline segments ovate-acute. Fruit bluish, obtuse. Wood resembling that of box. Bark rufescent, dotted with white. Style crowned by 5 rufous stigmas. Called Damson plum by Browne.

One-seeded Star Apple. Fl.? Clt. 1812. Tr. 20 to 30 ft.

4 C. acumina'tum (Lam. ill. no. 2469. Poir. dict. suppl. 2. p. 15, but not of Wall.) leaves ovate, acuminate, with parallel stripes: pale, shining, and tomentose beneath. ♄. S. Native of Cayenne and St. Domingo. Branches terete. Leaves clothed with rusty, shining tomentum beneath. Calycine segments ovate, concave.

Acuminated-leaved Star Apple. Tree.

5 C. bícolor (Poir. suppl. 2. p. 15.) leaves ovate, rather acuminated, clothed with golden and silvery silky down beneath, but glabrous and shining above; fruit pear-shaped. ♄. S. Native of Porto Rico. Very nearly allied to *C. acuminàtum*, but the branches are more flexuous; the leaves have one half silvery and the other golden yellow beneath. Fruit size of a small nut, pulpy.

Two-coloured-leaved Star Apple. Tree.

6 C. angustifòlium (Lam. ill. 2. p. 44. no. 2470.) leaves lanceolate, shining, with parallel stripes, clothed with rusty silky down beneath; fruit olive-formed. ♄. S. Native of St. Domingo. Poir. suppl. 2. p. 16. Allied to C. monopyrènum; but the leaves resemble those of Olive or Privet, and are, therefore, much smaller. Fruit usually 2-seeded, irregular at the base.

Narrow-leaved Star Apple. Clt. 1819. Tree 20 feet.

7 C. arge'nteum (Jacq. amer. p. 53. t. 38. f. 1. ed. pict. p. 31. t. 54.) leaves ovate-oblong, falcately acuminated, glabrous and shining above, but clothed with silky silvery down beneath; fruit round. ♄. S. Native of Martinico. Fruit of a dirty purplish blue colour, size of an ordinary plum: containing a soft, bluish, edible pulp.

Silvery-leaved Star Apple. Fl.? Clt. 1758. Tree 20 feet.

8 C. microca'rpum (Swartz. prod. 1. p. 49. fl. ind. occ. 1. p. 482.) leaves ovate, acute, glabrous above, and downy beneath; fruit oblong, oblique, 1-seeded. ♄. S. Native of Hispaniola, on the banks of rivers. Distinguished from *C. glàbrum*, in the higher stature, in the leaves being downy and paler beneath. Corolla with a white tube, silky outside: with concave, obtuse segments. Fruit size of a gooseberry, fixed obliquely to the pedicel, of a very sweet, delicious taste.

Small-fruited Star Apple. Tree.

9 C. macrophy'llum (G. Don, in hort. trans. 5. p. 458. Loud. hort. brit. p. 69.) leaves large, oblong-lanceolate, clothed with rusty silky down beneath. ♄. S. Native of Sierra Leone. Leaves long and large. Fruit large.

Long-leaved Star Apple. Clt. 1824. Tree 50 to 60 feet.

10 C. obova'tum (G. Don, in hort. trans. 5. p. 458.) leaves obovate, tapering to the base, and acuminated at the apex, shining and green above, but clothed with silvery silky white tomentum beneath. ♄. S. Native of Sierra Leone. A small branchy tree.

Obovate-leaved Star Apple. Tree 10 to 12 feet.

11 C. a'lbidum; leaves elliptic-oblong, coriaceous, acuminated, shining above, but clothed with white down beneath; fruit roundish-ovate, pointed, 5-seeded. ♄. S. Native of the African island of St. Thomas. Flowers whitish. Perhaps a species of *Nycterisition*.

White-leaved Star Apple. Tree 50 to 60 feet.

12 C. Humboldtia'num (Rœm. et Schultes, syst. 4. p. 813.) leaves ovate, acuminated, acute, attenuated at the base, shining above, and clothed with rusty silky down beneath. ♄. S. Native of South America. Humb. et Bonpl. C. acuminàtum, Willd. herb. This species is unknown to Kunth.

Humboldt's Star Apple. Tree.

13 C. obtusa'tum (Willd. herb. ex Rœm. et Schultes, l. c.) leaves lanceolate, nerveless, acuminated, clothed with rusty silky down beneath. ♄. S. Native of South America, on the banks of the river Atabapo. Humb. et Bonp. Unknown to Kunth. Perhaps *C. aquáticum*, Kunth.

Bluntish-leaved Star Apple. Tree.

* * *Leaves glabrous on both surfaces.*

14 C. Michìno (H. B. et Kunth. nov. gen. amer. 3. p. 236.) leaves obovate, bluntish, acute at the base, quite glabrous, and of the same colour on both surfaces. ♄. S. Native of the province of Bracamoras, near Cavico and Matara, where it is called *Michino* by the natives. Branches terete, glabrous, fuscescent. Leaves approximate, 2-3 inches long. Fruit yellow outside, whitish and clammy inside; very grateful, edible.

Michino Star Apple. Tree 40 to 50 feet.

15 C.? rugòsum (Swartz. prod. p. 49. fl. ind. occ. 1. p. 484). leaves oblong, acuminated, glabrous on both surfaces; fruit nearly globose, wrinkled, acuminated. ♄. S. Native of the west of Jamaica, on the mountains. Leaves large, obtuse, undulated, paler beneath. Calyx and pedicels rusty. Corolla with a very short tube: and ovate, obtuse segments, furnished with 5 small secondary ones, between the others. Fruit size of a nut, yellowish brown; containing many oblong, compressed seeds. This is certainly not a species of *Chrysophýllum*, from the corollas being furnished with scales inside, as in *Bumèlia*, of which probably it is a species. It differs from other species of this genus, in the leaves, flowers, and fruit.

Wrinkled-fruited Star Apple. Tree.

16 C.? Macóucou (Aubl. guian. 1. p. 233. t. 92.) leaves glabrous on both surfaces, ovate-oblong, acuminated; fruit pear-shaped, yellow, glabrous, and smooth. ♄. S. Native of Guiana. Lam. dict. 1. p. 552. C. pyrifórme, Willd. spec. 1. p. 1084. Bark greyish yellow. Wood hard, white. Leaves pale green. Fruit by twos or fours, the whole length of the branches; having a fleshy, yellowish, thick rind, covering a nut, which is much excavated on one side, edible. Perhaps this, with *Bumèlia nervòsa*, and *C. rugòsum*, will form the genus named *Vitellària* by Gærtn.

Macoucou Star Apple. Tree 30 feet.

17 C. pomifórme (Bert. ex Spreng. syst. 1. p. 667.) leaves oblong, attenuated at both ends, and quite glabrous on both surfaces, opaque, finely and parallelly veined, coriaceous; pedicels very short, sub-aggregate; fruit apple-shaped. ♄. S. Native of Jamaica.

Apple-formed-fruited Star Apple. Tree.

18 C. sessiliflòrum (Poir. suppl. 2. p. 16.) leaves coriaceous, glabrous on both surfaces, obovate: with distant, alternate nerves; flowers sessile, fasciculate. ♄. S. Native of Cayenne. Form and size of the leaves that of *Bumèlia nervòsa*. Leaves shining above, and pale beneath. Flowers downy outside, sessile, and pedicellate.

Sessile-flowered Star Apple. Tree.

19 C. gla'brum (Jacq. amer. p. 53. t. 38. f. 2. ed. pict. p. 31. t. 55. Lin. spec. 278.) leaves ovate-oblong, quite glabrous on both surfaces; fruit elliptic and smooth. ♄. S. Native of Martinico. Mill. dict. no. 2. Leaves hardly 2 inches long. Fruit blue, form and size of a small olive, seldom eaten except by children.

Var. β; pauciflôrum (Lam. ill. no. 2473.) leaves ovate, acuminated, almost glabrous on both surfaces; flowers few together.

Glabrous Star Apple. Clt. 1823. Tree 15 feet.

20 C. Roxbu'rghii; leaves lanceolate, acuminated, glabrous on both surfaces; fruit globose, 5-seeded. ♄. S. Native of Silhet, where it is called *Pitakara*. C. acuminàtum, Roxb. fl. ind. 2. p. 346, but not of Lam. Leaves with parallel veins, 3-4 inches long. Pedicels recurved. Stigma 5-lobed. Fruit size of a small crab, yellow when ripe, smooth, and is greedily eaten by the natives of Silhet, although insipid; the pulp is tolerably firm, but excessively clammy, adhering to the lips or knife with great tenacity.

Roxburgh's Star Apple. Tree middle-sized.

21 C. nítidum (Meyer, esseq. p. 116.) leaves oval, drawn out at the apex, obtuse and emarginate, glabrous on both surfaces, shining above. ♄. S. Native of the continent of America, about Essequibo, in woods. Branches terete, clothed with rusty, adpressed, silky tomentum, when young. Leaves 3 inches long. Calyx tomentose, with roundish segments. Corolla downy: with ovate, obtuse, rather concave segments. Ovarium villous. Stigma crowned by 5 tubercles, full of liquid.

Shining-leaved Star Apple. Tree.

Cult. The species of Star Apple are grown in hot-houses, only for the sake of their beautiful foliage, which are either clothed with golden yellow, or silvery, silky, glossy down, beneath; for they cannot be grown for their fruit in this country, as they never bear until they attain to large trees. A mixture of sandy loam and peat is a good soil for them; and cuttings taken from ripened wood strike root in sand, under a hand-glass, in a strong moist heat.

VII. A'CHRAS (*αχρας, achras*, the Greek name of the wild pear.) Lin. gen. no. 438. Schreb. no. 538. Jacq. amer. p. 56. Juss. p. 152. R. Br. prod. p. 530. H. B. et Kunth. nov. gen. amer. 3. p. 239.—Sapòta, Plum. 4. Gærtn. fruct. 2. t. 104.

Lin. syst. *Pentándria, Monogýnia.* Calyx 6 rarely 5-parted. Corolla 6-cleft. Stamens 12, 6 of which are sterile and scale-formed, alternating with the other 6, which are fertile. Ovarium 12-6-celled. Style filiform; stigma obtuse. Fruit 12-6 seeded. Seeds or nuts compressed, bony, scraped lengthwise in front, albuminous.—Lactescent trees; with scattered, coriaceous, quite entire leaves; and axillary, 1-flowered peduncles. Fruit large, edible.

1 A. Sapòta (Lin. spec. 470.) leaves oblong-lanceolate, obtuse, veinless, glabrous; flowers solitary, hexandrous; peduncles and calyxes clothed with fine tomentum; calyx 6-parted. ♄. S. Native of South America, on the main land, within the tropics. About Cumana it is called *Nispero*. Jacq. amer. p. 57. t. 41. ed. pict. t. 41. Sapòta A'chras, Gærtn. fruct. 2. p. 103. t. 104. Mill. dict. no. 1. A'chras, Browne, jam. p. 200. t. 19. Loef. itin. p. 186. Plenck, icon. 277. Leaves 3-4 inches long. Flowers white, scentless. Bark of tree full of cracks. Fruit elliptic or globose, bigger than a quince, covered with a thick, brown, scabrous rind, which, when the fruit is ripe, becomes tough and yellowish; the flesh is yellow, it smells well, and the taste is agreeable to many.

Var. β; zapotílla (Browne and Jacq. l. c.) fruit roundish. ♄. S. Native of Jamaica, and many parts of South America. Sloane, hist. 2. p. 171. t. 230. p. 172. t. 169. f. 2.—Catesb. car. 2. t. 87. Fruit about the size of an apple, when ripe of a delicious mellow flavour. The kernels of the seeds are bitter, and may be used occasionally in strengthening emulsions. Called Sapodillo tree, or small Sapota.

Common *Sapota* Tree. Fl.? Clt. 1731. Tree 10 to 50 feet.

2 A. sessiliflòra (Poir. ency. 6. p. 531.) leaves cuneate-oblong, obtuse and emarginate, coriaceous, glabrous; flowers almost sessile, solitary. ♄. S. Native of the Mauritius. Calyx rather downy.

Sessile-flowered Sapota Tree. Tree.

3 A. costa'ta (Endlicher, prod. fl. ins. norf. p. 49.) leaves obovate-elliptic, bluntish, ribbed; pedicels and calyxes pilose; flowers pentandrous; sterile filaments linear, subulate; fruit 1-4-seeded. ♄. G. Native of Norfolk Island. Bauer, ill. pl. ins. norf. t. 161. Fruit about the size of a walnut.

Ribbed-leaved Sapota. Shrub or tree.

4 A. austra'lis (R. Br. prod. p. 530.) leaves elliptic-oblong, glabrous as well as the calyxes and peduncles; sterile filaments linear-subulate; ovarium 6-celled. ♄. G. Native of New South Wales. Calyx, as well as corolla, often 5-cleft.

Southern Sapota Tree. Fl.? Clt. 1827. Tree 20 feet?

Cult. For culture and propagation see *Chrysophýllum*, above.

VIII. LUCU'MA (the name of one of the species in Peru.) Juss. gen. p. 152. Gærtn. fruct. 3. p. 129. H. B. et Kunth. nov. gen. amer. 3. p. 239.—A'chras species, Lin. Jacq.

Lin. syst. *Pentándria Monogýnia.* Calyx 5-parted. Corolla 5-cleft. Stamens 10, 5 of which are sterile and scale-formed: the other 5 fertile, alternating with sterile ones. Ovarium 10-5-celled. Fruit 1-10-seeded; nuts or seeds bony, marked by a large umbilical areola, without albumen.—Lactescent trees, with scattered quite entire coriaceous leaves; and 1-flowered axillary or lateral peduncles, which are either solitary or 2-3 in a fascicle.

1 L. mammòsa (Gærtn. fil. fruct. 3. p. 129.) leaves obovate-lanceolate, and oblong, cuspidate, glabrous; flowers solitary. ♄. S. Native of South America, in many places within the tropics; and of many of the West India Islands, where it is also cultivated. A'chras mammòsa, Lin. spec. 1. p. 469. A'chras Sapòta màjor, Jacq. amer. 56. t. 182. f. 19. ed. pict. p. 32. t. 59. Sapòta mammòsa, Mill. dict. no. 2. Gærtn. fruct. 2. p. 104. About Javita it is called *Johoinco*.—Sloane, jam. 2. p. 124. t. 218.—Plukn. alm. p. 39. t. 268. f. 2. A tall tree, with a spreading head. Leaves 1-2 feet long, shining. Flowers small, whitish. Sterile filaments subulate. The Mammee Sapota, or American Marmalade, is a large oval or top-shaped fruit, covered with a brownish, rough skin, under which is a soft pulp, of a russet colour, very luscious, which is called natural marmalade, from its likeness to marmalade of quinces. In the West Indies, and parts of the main land of South America, the tree is commonly planted in gardens for its fruit. There is a variety of this tree called by P. Browne, the Bully tree, or Nisberry Bully tree, because it generally grows the tallest of all the trees in the woods; its fruit is small, and the wood is esteemed one of the best timbers in Jamaica.

Common or *Teated* Mammee Sapota. Clt. 1739. Tree 50 to 100 feet.

2 L. Caimìto (Rœm. et Schultes, syst. 4. p. 701.) leaves obovate-lanceolate, glabrous, coriaceous; flowers aggregate, tetrandrous; calyx glabrous; fruit oval, 1-seeded. ♄. S. Native of Peru, on the Andes. A'chras Caimìto, Ruiz et Pav. fl. per. 3. p. 18. t. 240. A lofty tree, with a frondose head. Fruit softer, with a better flavour than the preceding; pulp soft, yellow. Corolla ovate-tubular, yellowish. Calyx 4-parted, fulvous. The fruit is called *Caimitos*, and the tree *Caimito*, in Peru. The wood is yellow, and used for various useful purposes.

Caimito Mammee Sapota. Tree 50 to 100 feet.

3 L. Bonpla'ndii (Humb. mss. ex H. B. et Kunth. nov. gen. amer. 3. p. 240.) leaves obovate-oblong, obtuse, cuneated at the base, papery: having the nerves and veins, as well as the petioles and calyxes, downy. ♄. S. Native of Cuba, cultivated about the Havanna. Branchlets pilosely tomentose. Leaves 8-9 inches

long, and 2-3 broad. Calyx 9-12 parted; segments ovate, imbricate, pilose outside. Sterile stamens scale-formed, acuminated. Fruit ovate, 4-6 inches long.

Bonpland's Mammee Sapota. Clt. 1822. Tree 60 feet.

4 L. Campechia'num (H. B. et Kunth. l. c.) leaves oblong, somewhat acuminated, acute at the base, membranous, glabrous, shining; flowers 3 in a fascicle; calyxes and peduncles clothed with fine, canescent tomentum. ♄. S. Native of Mexico, about Campeche. Leaves 8-9 inches long, paler beneath. Segments of corolla and calyx obtuse. Sterile stamens scale-formed, oblong-lanceolate. Ovarium ovate, globose, having 5 cells; cells 1-ovulate. Habit of Chrysophy'llum macrophy'llum, Lam.

Campechy Mammee Sapota. Tree.

5 L. salicifòlium (H. B. et Kunth. l. c. p. 241.) leaves lanceolate, a little acuminated, narrowed at the base, membranous, glabrous, shining; flowers twin; calyxes and peduncles clothed with fine tomentum. ♄. S. Native of Mexico, where it is called *Sapote-borocho*. Leaves 5-6 inches long, and 1 inch broad, paler beneath. Sterile stamens lanceolate-linear, longer than the fertile ones. Ovarium ovate, hairy.

Willow-leaved Mammee Sapota. Clt. 1823. Tree.

6 L. Tema're (H. B. et Kunth. l. c.) leaves lanceolate, subacuminated, narrowed at the base, undulated, membranous, glabrous. ♄. S. Native about the Orinoco, in woods, where it is called *Temare*. Leaves 6-7 inches long, paler beneath. Fruit ovate, fleshy, clammy, 3-seeded. Very like the preceding species.

Temare Mammee Sapota. Tree.

7 L. obova'tum (H. B. et Kunth. l. c.) leaves obovate-elliptic, rounded at the apex, acute at the base, rather membranous, glabrous; flowers solitary, or 2-3 together; calyxes and peduncles clothed with fine rusty down. ♄. S. Native of Peru, near the town of Loxa, in the temperate regions, where it is called *Lucuma*. A'chras Lucùma, Ruiz. et Pav. fl. per. 3. p. 17. t. 239. Pers. syn. 1. p. 235. Tree with a globose head. Leaves 4 inches long. Flowers about the size of those of *A'chras Sapòta*. Segments of calyx and corolla greenish, roundish obtuse. Sterile stamens linear, a little ciliated. Fruit depressedly globose, green, glabrous, yellow and clammy inside, crowned by a scaly ring, 1-5 seeded, but usually 3-seeded. The wood is compact and white, and used for various economical purposes.

Obovate-leaved Mammee Sapota. Clt. 1822. Tree 20 to 40 feet.

† *A doubtful species.*

8 L. serpenta'ria (H. B. et Kunth. l. c. p. 242.) leaves obovate-oblong, or oblong, rounded at the apex, acute at the base, coriaceous, quite glabrous, shining above. ♄. S. Native of Cuba, near Regla, where it is called *Sapote de Coulevra*. A lactescent tree, with glabrous, hoary branches. Leaves 1-2 inches long. Fruit depressedly globose, edible, 5-seeded.

Serpent Mammee Sapota. Tree.

Cult. For culture and propagation see *Chrysophy'llum*, p. 33.

IX. INOCA'RPUS (from ις ινος, *is inos*, a fibre, and καρπος, *karpos*, a fruit; the nut is full of fibres.) Forst. gen. t. 33. Schreb. gen. no. 754. Thunb. nov. gen. 45. Juss. gen. 152. Gærtn. fruct. 3. t. 199 and 200. f. 1. Blum. bijdr. 551.

Lin. syst. *Decándria, Monogýnia.* Calyx tubular, bifid, deciduous. Corolla funnel-shaped, 5-6-cleft; segments long, linear. Stamens 10-12, disposed in two rows; filaments very short, adnate to the corolla inside; anthers didymous, dehiscing at the sides. Ovarium oblong, villous, containing one pendulous ovulum. Style none; stigma concave. Drupe large, a little compressed, ovate, incurved at top, containing a 1-seeded nut, which is covered with reticulated fibres. Albumen none.—A tree, with long, alternate, veiny, quite entire leaves; and axillary, spicate racemes of flowers.

1 I. edu'lis (Forst. fl. austr. no. 197. pl. escul. 50. no. 18. Lin. syst. 408. suppl. 239.) leaves oblong, sub-cordate at the base; racemes axillary, hairy; flowers small, bracteate. ♄. S. Native of the Society and Friendly Islands, and New Hebrides, in the South Seas; also of Amboyna and Java. Lam. ill. t. 362. —Rumph. amb. 1. t. 65. Forster describes this as a lofty tree, with brown, chinky bark. Leaves sub-distich, ovate-oblong, hardly cordate, blunt and retuse, seldom acute, a span long, and on young trees a foot. Flowers pale yellow. In Otaheite this tree is called *Hi*, and the fruit *Ratta*. In Mallicollo the name of the tree is *Nias;* and in Tanna, *Emmer*. In Cook's last voyage, 1. p. 393, the nuts are called *Eisi*. The kernel of these, which is kidney-shaped, and about an inch in diameter, is eaten roasted by the inhabitants of the Society and Friendly Islands, the New Hebrides, New Guinea, the Molluccas, &c. It is sweetish, but less pleasant than the chestnut, harder, and less farinaceous. The bark is astringent, and is used in dysentery. In New Guinea they smear the heads of their arrows with the expressed resinous juice.

Edible Otaheite-chestnut. Clt. 1793. Tree 40 to 50 feet.

Cult. See *Chrysophyllum*, p. 33, for culture and propagation.

X. MIMU'SOPS (from μιμω, *mimo*, an ape; and οψις, *opsis*, a face; so named on account of the form of the corolla.) Lin. gen. no. 478. Gærtn. fruct. t. 42. Juss. gen. 152. R. Br. prod. p. 530.

Lin. syst. *Octándria Monogýnia.* Calyx 8-6-parted; segments disposed in a twin order. Corolla with a double row of segments (f. 7. *e.*); outer row containing from 6 to 16 in number, which are either entire or divided; the inner row containing 6-8 entire segments. Antheriferous stamens 6-8, opposite the inner segments of the corolla, alternating with as many sterile ones (f. 7. *a.*) Ovarium 6-8-celled. Berry one or few-seeded, from abortion. Seeds nucumentaceous, albuminous.—Trees with alternate, quite entire, glabrous, coriaceous leaves; and axillary fascicles of 1-flowered pedicels. Flowers small, white. Fruit edible. Old bark of trees chinky.

1 M. parvifòlia (R. Br. prod. 531.) leaves oval, acuminated, glabrous on both surfaces; peduncles 1-3 together, exceeding the petioles a little, which are tomentose. ♄. S. Native of New Holland, within the tropic. Very like *M. Eléngi*, whose peduncles are more numerous, and shorter than the petioles, which are glabrous.

Small-leaved Mimusops. Clt. 1824. Tree.

2 M. acumina'ta (Blum. bijdr. p. 672.) leaves oval, acuminated, rather unequal at the base. ♄. S. Native of Java, on the Seribu mountains, where it is called *Genkot*.

Acuminated-leaved Mimusops. Tree 80 to 120 feet.

3 M. Ele'ngi (Lin. spec. 497.) leaves oval-lanceolate, or oblong, acuminated, glabrous; pedicels many together, shorter than the petioles, which are glabrous. ♄. S. Native of the East Indies, where it is much planted on account of its fragrant flowers, which come out chiefly in the hot season. Gærtn. fruct. 1. p. 198. t. 42. Roxb. cor. 1. p. 15. t. 14. Lam. ill. t. 300. Bacula, Roxb. asiat. res. 4. p. 273.—Rumph. amb. 2. p. 189. t. 63. Eléngi, Rheed. mal. 1. p. 34. t. 20.—Plukn. alm. 203.

FIG. 7.

—Breyn. cent. 20. t. 8.—Burm. zeyl. 27. Flowers middle-sized, drooping, white. Segments of corolla lanceolate, and a little torn at their tips. Berry ovate, with a slight groove on one side, dotted, yellow when ripe. *Elengi* is the Malabar name of the tree; *Bokul* is the Bengalese name; *Mulsari* is the Hindostanee name; *Pagadoo* of the Telingas.

Elengi Mimusops. Clt. 1796. Tree 15 feet.

4 M. Kau'ki (Lin. spec. 497.) leaves obovate, very blunt, silvery or hoary beneath, hardly 3 times as long as the petioles, crowded at the ends of the branches; flowers fascicled, hexandrous. ♄. S. Native of the East Indies and New Holland, within the tropic. Benectària, Forst. descrip. p. 82.—Rumph. amb. 3. t. 19. t. 8. Fruit oval, drooping, edible.

Kauki Mimusops. Clt. 1796. Tree 30 feet.

5 M. obtusifòlia (Lam. dict. 4. p. 186. Blum. bijdr. 675.) leaves oval-oblong, obtuse and emarginate, attenuated a little at the base, coriaceous, with revolute edges. ♄. S. Native of Java, in gardens, where it is called *Kambang Tanjong;* and of the Mauritius. Branches thick, like those of a species of *Achras*. Leaves crowded at the tops of the branches.

Blunt-leaved Mimusops. Tree.

6 M. hexa'ndra (Roxb. cor. 1. p. 10. t. 16.) leaves obovate, deeply emarginate, green and shining on both surfaces; pedicels 1-6 together, nearly as long as the petioles, which are smooth. ♄. S. Native of the East Indies, among the Circars. Leaves 3-5 inches long, and 1 to 2 broad. Calyx 6-parted. Corolla having the inner row of segments 6, and the outer 12. Antheriferous stamens 6. Berry size and shape of an olive, yellow. The wood of this species being remarkably heavy, is much used by the washermen to beetle their cloth on.

Hexandrous Mimusops. Clt. 1804. Tree 20 foot.

7 M. Balòta (Gærtn. fil. fruct. vol. 3. ex Blum. bijdr. 673.) leaves obovate, sub-emarginate. ♄. S. Java, in gardens.

Balota Mimusops. Fl. July. Tree 30 feet.

8 M. disse'cta (R. Br. prod. p. 530.) leaves obovate, bluntly emarginate, glabrous; peduncles crowded, length of petioles, which are glabrous. ♄. S. Native of the island of Tongatabu. A'chras dissécta, Forst. pl. escul. no. 13. fl. aust. 155. Lin. syst. 342. Flowers white. Fruit about the size of an olive, edible. Hardly distinct from *M. hexándra*, Roxb. Ovarium 6-celled. Flowers 8-cleft.

Dissected-flowered Mimusops. Clt. 1804. Tree 20 to 30 feet.

9 M. Manilka'ra; leaves obovate, obtuse, glabrous, on petioles an inch long; pedicels crowded, length of petioles; flowers 6-cleft. ♄. S. Native of Malabar and the Philippine islands. Manilkàra, Rheed. mal. 4. p. 53. t. 25. Flowers white, about half an inch in diameter. This tree is cultivated in Malabar for the fruit, which is of the form and size of an olive, succulent, the pulp of a sweetish acid flavour, containing only 1 or 2 seeds. The leaves are used for cataplasms to tumours, being bruised and boiled with the root of *Curcùma* and the leaves of ginger. It is supposed to be a native of the Philippine Islands, where it is called *Manilkara* and *Manil-gale*. It probably also grows in China, for the Dutch call it *Chineesche Irruyen*.

Manil-kara Mimusops. Tree.

10 M. lu'cida (Wall. cat. no. 4147.) leaves glabrous, rusty beneath, dark green and shining above, elliptic-lanceolate, with an obtuse acumen; pedicels axillary, aggregate; calyx having the 4 outer segments roundish and imbricate, shorter than the 4 inner ones; style exserted. ♄. S. Native of Penang.

Shining-leaved Mimusops. Tree.

Cult. For culture and propagation see *Chrysophýllum*, p. 33.

XI. IMBRICA'RIA (from *imbrico*, to cover with tiles; from the wood being used for roofing houses). Commers. Juss. gen. p. 152. Lam. ill. t. 300, R. Br. prod. 531.

Lin. syst. *Octándria, Monogýnia.* Calyx 8-parted, coriaceous: the segments disposed in a twin order. Corolla having the segments disposed in 3 rows, those in the middle row opposite those of the outer row, all trifid, 8 in each row.? Stamens 16, 8 antheriferous: and 8 sterile, filiform, inflexed, alternating with the fertile ones. Fruit large, globular, 8-celled, 8-seeded, many of the cells as well as seeds becoming abortive. Seeds irregularly crested towards the umbilicus.—Trees, natives of the Isle of Bourbon and the Mauritius; with entire, glabrous, coriaceous leaves; and axillary fascicles of white, pedicellate flowers.

1 I. Commersònii; leaves broad, obovate, rusty beneath, scattered, coriaceous, emarginate at apex, pale green and shining above; pedicels thick, angular, aggregate. ♄. S. Native of the Mauritius and Java, in gardens. Mimùsops Imbricària, Willd. spec. 1. p. 326. Blum. bijdr. 675.

Commerson's Imbricaria. Tree.

Cult. For culture and propagation see *Chrysophýllum*, p. 33.

XII. OMPHALOCA'RPUM (*ομφαλος, omphalos*, a navel, and *καρπος, karpos*, a fruit; the fruit is depressed and hollowed at the apex). Beauv. fl. d'ow. 1. p. 6. t. 5-6.

Lin. syst. *Polyándria, Monogýnia.* Calyx many-parted, squarrose; scales 11-12, imbricated, obtuse, villous outside. Corolla with a short tube: having the segments disposed in 2 rows, 6-7 in each row, those of the outer row equal, ovate: those of the inner row fringed and alternating with those in the outer row. Stamens 30-40, disposed in unequal series. Style simple, filiform; stigma simple, sub-capitate, scabrous. Fruit large, solid, woody, roundish, umbilicate about the style, many-celled; cells 1-seeded.—A tall tree, with lanceolate, shining leaves, and sessile, aggregate, or solitary pink flowers rising from the trunk.

1 O. proce'rum (Beauv. l. c.). ♄. S. Native of western Africa, in the kingdom of Warree, at Buonopozo, behind the kingdom of Galbar.

Tall Omphalocarpum. Tree very large.

Cult. See *Chrysophýllum*, p. 33. for culture and propagation.

XIII. BA'SSIA (named by König in honour of Ferdinand Bassi, Curator of the botanic garden at Bologna). Kœn. in Lin. gen. ed. Reich. no. 645. Schreb. 105. Juss. gen. 152. Gærtn. fruct. 2. p. 104. t. 104. f. 2.

Lin. syst. *Dodecándria Monogýnia.* Calyx 4-5-parted, coriaceous. Corolla campanulate, with an 8-parted limb; tube inflated, ovate, fleshy. Stamens 16, disposed in 2 rows; filaments subulate, combined at the base; anthers linear, sagittate, villous outside. Ovarium ovate, 6-8-celled. Style subulate; stigma acute. Fruit fleshy, 5-8-celled; cells 1-seeded. Seeds oblong, somewhat trigonal, exalbuminous.—Lactescent trees, with quite entire, smooth, coriaceous leaves; and axillary, solitary, or aggregate flowers.

1 B. longifòlia (Lin. syst. p. 44. mant. pp. 555. and 563.) leaves ovate-lanceolate, smooth; pedicels axillary, drooping, crowded round the ends of the branchlets; stamens 16-20, within the gibbous tube of the corolla. ♄. S. Native of Malabar, Coromandel, and Ceylon; in the former place it is called *Illipe*, and in the latter *Miele*. Gærtn. fruct. 2. t. 104. Lam. ill. t. 398. A lofty tree, with recurved branches, which are clothed with grey down. Leaves approximate at the tops of the branches, 6 inches long, deciduous. Peduncles at length elongated and drooping, crowded round the ends of the young shoots. Seeds smooth, shining yellow. This tree is called by the Tamuls *Illiepi* or *Illeepie*. The oil pressed from the fruit is used for lamps; it is the principal ingredient in making country soap. It is to the common people a substitute in place of ghee and cocoa-nut oil in their curries and other dishes.

They make cakes of it, and many of the poor get their livelihood by selling these sweet oil cakes. The cake, left after the oil is expressed, is used for washing the head, and is carried as a small article of trade to those countries where these trees are not to be found. The flowers, which fall in May, are gathered by the common people, dried in the sun, roasted, and eaten as food. They are also bruised and boiled to a jelly, and made into small balls, which they sell, or exchange for fish, rice, &c. The leaves are boiled with water, and given as a medicine in several diseases. The milk of the green fruit, and of the tender bark is given also as a medicine. The bark is a cure for the itch. The wood is as hard and as durable as teak, but not so easily worked, nor is it procurable of such a length. Squirrels, lizards, country dogs, and jackals eat the flowers, and the report is that the latter are apt to grow mad by too much feeding on them.

Long-leaved Bassia. Clt. 1811. Tree 40 feet.

2 B. sericea (Blum. bijdr. 674.) leaves oblong-lanceolate, acuminated, clothed with silky down beneath; peduncles axillary, crowded, 1-flowered, shorter than the petioles. ♄. S. Native of Java, in woods, in the province of Tjanjor, on the mountains of Parang. Perhaps sufficiently distinct from *B. longifòlia*.

Silky Bassia. Fl. July. Tree 40 to 50.

3 B. latifòlia (Roxb. cor. 1. p. 20. t. 19.) leaves oblong or elliptic; pedicels drooping, terminal; stamens 20-30, within the gibbous tube of the corolla, on short filaments. ♄. S. Native of the East Indies, on the mountains of Bengal and the Circars. *Madhaca* is the Sanscrit name, see asiat. res. vol. 2. p. 301. and 4. p. 280. *Ipie* is the Telinga name; *Mahva*, *Muhooa*, and *Muhoola* of the Bengalese. Corolla thick and fleshy, with a more than 8-lobed limb; lobes cordate. Leaves smooth above and whitish beneath, 4-8 inches long and 2-4 broad. Limb of corolla 7-14-parted. Berry 1-4-seeded. The wood is hard, very strong, and proper for naves of wheel carriages. The flowers are eaten raw by the natives of the mountainous parts of the Circars, and by jackals. An ardent spirit is distilled from them by the hill people, which is strong and intoxicating. The seeds yield a large quantity of oil by expression, which is used only by the poorer people to burn. On the apices of the flowers, before they open, there is frequently a drop of whitish, soft, tasteless resin to be found.

Broad-leaved Bassia. Clt. 1799. Tree 40 feet.

4 B. obova'ta (Forst. prod. no. 200.) leaves obovate; pedicels aggregate, terminal. ♄. S. Native of the Isle of Tanna.

Obovate-leaved Bassia. Tree.

5 B. cunea'ta (Blum. bijdr. 675.) leaves cuneate-oblong, bluntish, glabrous; peduncles subumbellate, axillary, 1-flowered, about equal in length to the petioles. ♄. S. Native of Java, on mounts Salak and Gede. Very nearly allied to *B. obovàta*.

Cuneated-leaved Bassia. Fl. Aug. Tree 60 to 80 feet.

6 B. Pa'rkii; leaves obovate, coriaceous. ♄. S. Native of Africa, in the kingdom of Bambara. This is the Shea tree mentioned by Mungo Park in his travels; of which he says, "the people were every where employed in collecting the fruit of the Shea trees, from which they prepare a vegetable butter. These trees," he says, "grow in abundance all over this part of Bambara. It is not cultivated by the natives, but grows wild in the woods, and in clearing woodlands for cultivation every tree is cut down but the Shea. The butter is obtained from the kernel of the fruit, first dried in the sun; and is prepared by boiling the kernel in water, which has somewhat the appearance of a Spanish olive. The kernel is enveloped in a sweet pulp, under a thin green rind, and the butter produced from it, besides the advantage of its keeping the whole year round without salt, is whiter, firmer, and, to my palate, of a better flavour than the best butter I ever tasted, made of cows' milk. The growth and preparation of this commodity appears to me to be one of the first objects of the natives in this and the neighbouring states, as it constitutes the main article of inland commerce. The butter serves also for every domestic purpose in which oil would otherwise be used; the demand for it is therefore great. *Shea Toulon* literally means, in the language of the Africans, tree-butter."—Park, trav. p. 26. pp. 202, 203.

Park's Bassia. African Butter Tree, or Shea Tree. Tree 30 to 40 feet.

7 B. butyra'cea (Roxb. asiat. res. 8. p. 477. fl. ind. p. 527. D. Don, prod. fl. nep. p. 146.) leaves obovate, tomentose beneath; pedicels aggregate, and are as well as the calyxes woolly; anthers glabrous, subulate at the apex. ♄. S. Native of Nipaul, at Narainhetty; and on the Almora hills. Leaves a span long and 4-5 inches broad, coriaceous, obovate, or obovate-oblong. Drupe oval. Corolla thin, 8-cleft. Stamens 30-40, on longish filaments. *B. butyràcea* is called *Fulwah* or *Phulwarah* in Almorah. It produces a pure vegetable butter. The kernels of the fruit are bruised into the consistence of cream, which is then put into a cloth bag, with a moderate weight laid upon it, and left to stand till the oil or fat is expressed, which becomes immediately of the consistence of hogs'-lard, and is of a delicate white colour. Its uses in medicine are much esteemed in rheumatism and contractions of the limbs. It is also used by the natives of rank perfumed as an unction. The pulp of the fruit is eaten by some.

Buttery Bassia. Clt. 1823. Tree 30 to 40 feet.

8 B.? du'bia (Gærtn. fruct. 2. t. 105.). ♄. S. Native of the East Indies.—Rumph. amb. 3. t. 184.? Seeds large, half-moon shaped, shiny, bony, of a dark chestnut colour, except the rugged, pale, almost white, umbilical area. It is not said whether the seeds are albuminous or exalbuminous, in which case the genus to which this tree belongs is very doubtful.

Doubtful Bassia. Tree.

9 B. villòsa (Wall. cat. no. 4165.) leaves broad-oblong-obovate, obtuse, villous beneath, glabrous and green above; pedicels aggregate, and are, as well as the flowers, villous. ♄. S. Native on the Taong Dong mountains, near Ava.

Villous Bassia. Tree.

10 B.? polya'ntha (Wall. cat. no. 4166.) glabrous; leaves coriaceous, elliptic-oblong, or oblong-obovate, acutish, rusty beneath; pedicels aggregate, rusty, and are, as well as the calyxes downy; petals entire. ♄. S. Native of Silhet.

Many-flowered Bassia. Tree.

Cult. For culture and propagation see *Chrysophýllum*, p. 33.

XIV. LABA'TIA (so named after J. Baptiste Labat, a Dominican friar, a great writer and traveller; author of Voyage aux Antilles, Paris. 1721 and 1743. 12mo.; Haye, 1724. 4to.; Voyages en Espagne et en Italie, Paris, 1730. &c.). Swartz, prod. p. 32. (exclusive of Poutèria, Aubl.) fl. ind. occ. 1. p. 264. Mart. nov. gen. bras. 2. p. 70.

Lin. syst. *Tetrándria, Monogýnia.* Calyx 4-parted, the 2 outer segments the largest. Corolla tubularly urceolate, 4-cleft, furnished with as many scales (abortive stamens), in the incisures between the lobes. Stamens 4, inserted in the bottom of the corolla. Anthers ovate. Berry hard, roughish, 4-celled, rarely 2-celled. Seeds with a thick crustaceous testa, attached to parietal placentas.—Evergreen trees. Leaves sub-alternate, crowded towards the tops of the branches, quite entire, firm, exstipulate, furnished with shining pili, which are attached by their middle. Flowers small, axillary, aggregate, on short pedicels. Fruit brownish.

1 L. macroca'rpon (Mart. nov. gen. bras. 1. p. 71. t. 160.)

leaves oblong-lanceolate; flowers on short pedicels; berry large, roughish from powder. ♄. S. Native of Brazil, in the province of Rio Negro, on the shady banks, in humid places, of the river Japura. Corolla white, hardly higher than the calyx. Leaves a span long.

Large-fruited Labatia. Tree 50 feet.

2 L. SESSILIFLÒRA (Swartz, prod. p. 23. fl. ind. occ. 1. p. 264.) leaves oblong-lanceolate, acuminated, silvery, but of a golden silky colour in the young state; flowers small, sessile, usually solitary, in the axils of the leaves on the older branches. ♄. S. Native of Hispaniola. Flowers white.

Sessile-flowered Labatia. Shrub 8 feet.

Cult. For culture and propagation see *Chrysophy'llum*, p. 33.

XV. POUTE'RIA (called in Guiana *Pourama-Pouteri* by the Caribs). Aubl. guian. 1. p. 86. t. 33.—Labàtia species, Swartz.

Lin. syst. *Tetrándria, Monogýnia.* Calyx 4-parted. Corolla inserted in the bottom of the calyx, tubularly ventricose, 4-cleft, furnished with a bristle (abortive stamens) in each of the incisures between the lobes. Stamens 4, inserted in the bottom of the corolla. Stigma 4-cleft. Capsule ovate, hispid, 4-valved, each valve containing an almond-formed arillate seed. —A tree, furnished with tufts of leaves at the tops of the branches. Flowers aggregate, axillary, pedicellate, usually 1-3 together.

1 P. Guiane'nsis (Aubl. l. c.). ♄. S. Native of Guiana, in forests by the river Sinemari. Labàtia Guianénsis, Swartz. Bark wrinkled. Wood hard, compact, whitish. Leaves alternate, glabrous, ovate-oblong, firm, ending in a blunt point; the largest 8 inches long and 3 wide. Corollas greenish.

Guiana Pouteria. Fl. Nov. Tree 40 feet.

Cult. For culture and propagation see *Chrysophy'llum*, p. 33.

XVI. PHELLI'NE (φελλινη, from φελλος, *phellos*, cork; because of the cells of the capsule being corky). Labill. sert. cal. 35. t. 38.

Lin. syst. *Tetrándria, Monogýnia.* Calyx small, 4-toothed, permanent. Corolla subrotate, 4-parted. Stamens 4, inserted in the bottom of the corolla. Style short. Stigma 4-toothed. Capsule 4-celled: cells corky, dehiscing inside. Seeds solitary.—A shrub, with linear-lanceolate, sub-spatulate, alternate leaves, which are crowded at the tops of the branches, acuminated, a little toothed, glabrous, glaucous beneath, and with thickish reflexed edges. This genus is nearly allied to *Poutèria*, Aubl. and *Labàtia*, Swartz.

1 P. comòsa (Labill. l. c.). ♄. G. Native of New Caledonia.

Tufted-leaved Phelline. Shrub 8 feet.

Cult. For culture and propagation see *Sersalisia*, p. 27.

XVII. MONTA'BEA (Aimont-Abou is the Guiana name of the first species) Aubl. guian. 2. p. 680. t. 274.—Mutàbea, Gmel.—Cryptóstomum, Willd.—Acósta, Ruiz et Pav. gen. pl. per. et chil. p. 1. t. 1.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, ventricose at the base: with 5 unequal obtuse segments. Corolla funnel-shaped, with a very short tube, fixed to the mouth of the calyx; segments 5, unequal, oblong, obtuse, mucronulate. Nectary monophyllous, closing the corolla, or stamens 5, combined into 1 filament, fixed to the superior part of the tube of the corolla, 5-toothed, incurved at top, with an anther on each of the teeth. Stigma globose, obtuse. Berry 3-5-celled, 3-5-seeded. Seeds involved in pulp, arillate, umbilicate, on one side.—Sarmentose shrubs, with alternate, entire leaves; and short, few-flowered, axillary peduncles. Flowers small, white.

1 M. Guiane'nsis (Aubl. guian. 2. p. 680. t. 274.) branches sarmentose, unarmed; leaves elliptic, acuminated, glabrous; peduncles short, 4-5-flowered; anthers 5. ♄. S. Native of Guiana and Cayenne, in fields. Mutàbea Guianénsis, Gmel. syst. 1. p. 1009. Cryptóstomum laurifòlium, Willd. spec. 1. p. 1061. Stems sarmentose, twisted. Leaves 4 inches long and 1½ broad. Flowers small, white, smelling like those of *Lilac*. Berry yellow, 3-celled, 3-seeded.

Guiana Montabea. Shrub 6 feet, rambling.

2 M. Aco'stæ (Rœm. et Schultes, syst. 527.) branches sarmentose, prickly; prickles recurved; leaves oblong, acuminated, glabrous; anthers 8, combined; fruit 5-celled, 5-seeded. ♄. S. Native of Peru, in groves, at Cuchero and Chincao. Acósta aculeàta, Ruiz et Pav. fl. per. 1. p. 5. t. 6. Spikes crowded. Flowers white. Fruit yellow, size of an apple. Seeds fulvous. From the similitude of the fruit to that of *Achras Caimìto*, it is called *Caimito de Monte*, and is edible, and grateful to the taste.

Acosta's Montabea. Fl. May. Shrub sarmentose.

Cult. See *Chrysophy'llum*, p. 33, for culture and propagation.

Order CXLVI. EBENA'CEÆ (so called from containing the Diόspyrus *Ebénum*, the true Ebony.) Vent. tabl. 443. R. Br. prod. p. 524. Guaiacànæ, part I. p. 155. Ebenàceæ, Tribe Diospỳreæ, D. C. et Dub. fl. fr. 320.

Flowers polygamous or dioecious, rarely hermaphrodite. Calyx 3-6 parted, nearly equal, permanent. Corolla monopetalous, hypogynous, regular, rather coriaceous, for the most part downy outside, and glabrous inside, deciduous; limb 3-6-parted, imbricate in æstivation. Stamens definite, epipetalous or hypogynous; filaments double the number of the segments of the corolla, sometimes 4 times that number; sometimes equal in number to the segments, and alternating with them; in hermaphrodite flowers the filaments are simple; in polygamous and dioecious ones, they are double, having both the segments bearing anthers, the inner segment usually shorter than the outer one; anthers fixed by the base, lanceolate, 2-celled, dehiscing lengthwise, sometimes bearded; pollen smooth, globose. Ovarium sessile, many-celled, not girded by a disk; cells 1-2 seeded; ovula hanging from the top of the cells. Style divided, rarely simple; stigmas bifid or trifid. Berry globose or oval, usually few-seeded, by abortion: having the bark or rind sometimes separating. Testa of seed membranous; proper membrane obsolete. Albumen conforming to the seed, cartilaginous, white. Embryo slender, rather oblique, straight, white, usually longer than half the length of the albumen; cotyledons foliaceous, rather veiny, lying on each other, sometimes a little separate; radicle terete, middle-sized or long, tending to the umbilicus; plumule inconspicuous. —Non-lactescent trees and shrubs, with wood heavy as the Ebony. Leaves alternate, ex-stipulate, quite entire, coriaceous, broadish, having the petioles obsoletely articulated to the branches. Inflorescence axillary; peduncles solitary, those bearing the male flowers divided, and those bearing the female flowers usually simple and 1-flowered, all minutely bracteate.

This order is nearly allied to *Olèinæ*, with which it agrees in the interior structure and placentation of the seeds; but it differs in the leaves being alternate, in the inflorescence being always axillary, and in the flowers being unisexual, and in the sta-

mens being double, &c., while the flowers of *Olèinæ* are hermaphrodite, and the stamens simple.

Some of the order are hardy trees or shrubs, with deciduous leaves and white flowers, natives of woods, mountains, and banks of streams, in North America, Europe, and New Holland. Others are tropical evergreens. Of the latter, many of the *Diospỳri* produce edible fruit; as, for example, the *Mabola* of the Philippine Islands, which is as large as a peach; and the *Kaki* of Japan, which resembles an apricot. All these fruits are remarkable for their extreme austerity before maturity, and the necessity of letting them decay like the medlars before they are fit for the table. These are also distinguished for the excessive hardness of their wood, and for the black colour it sometimes acquires when old, as the Ebony. The bark of *Diospỳros Virginiàna* is used in North America in intermittent fevers.

Synopsis of the genera.

1 Diospy`ros. Flowers polygamous. Calyx deeply 4-cleft, sometimes 3-6 cleft. Corolla urceolate, with the same number of divisions as in the calyx. Stamens in the male flowers, twice the number of the segments of the corolla.

2 Embryópteris. All as in *Diospỳros*, except in the stamens of the male flowers being 4 times the number of the segments of the corolla.

3 Para`lea. Calyx 4-cleft. Corolla thick, with a short tube and a 4-cleft limb. Stamens in the male flowers 4 times the number of the segments of the corolla, with simple filaments; in the hermaphrodite flowers about 8, and the ovarium 8-celled, 8-seeded.

4 Roye`na. This genus differs from *Diospỳros* in the flowers being hermaphrodite, and usually 5-cleft, in the filaments being simple, and in the ovarium being 4-6-8-celled.

5 Diplone`ma. Flowers polygamous; stamens in the male flowers 4 times the number of the segments of the corolla; filaments double; anthers bearded. Ovarium 4-6-celled.

6 Diclidanthe`ra. Flowers hermaphrodite, pentamerous. Corolla funnel-shaped; anthers sessile, 2-valved from the base, probably double. Berry 5-celled; cells 1-seeded; some of the cells abortive.

7 Cargíllia. Flowers polygamous. Calyx semi-4-cleft. Corolla with a 4-cleft limb. Stamens 8; filaments double. Ovarium 4-celled.

8 Ma`ba. Flowers dioecious. Calyx semi-trifid. Corolla urceolate, 3-cleft. Stamens 3-6; filaments simple, or the alternate ones are twin. Ovarium 3-celled.

I. DIOSPY`ROS (from *διος, dios*, divine; and *πυρος, pyros*, wheat; divine wheat; called by Pliny Granum Jovis, or Jupiter's Wheat.) Lin. gen. no. 1161. Juss. gen. 156. Gærtn. fruct. 2. p. 478. t. 179. R. Br. prod. p. 525.—Ebénus, Comm.—Guaiacàna, Tourn. 371.

Lin. syst. *Polygàmia, Dioècia.* Flowers polygamous. Calyx deeply 4-cleft, sometimes 3 or 6-cleft. Corolla urceolate, 4-cleft, sometimes 3 or 6-cleft. Male flowers having the stamens inserted by pairs into the base of the corolla, twice the number of its segments, with double or twin filaments, and the rudiment of a pistil. Hermaphrodite flowers, having fewer and sterile stamens. Ovarium 8-12-celled; cells 1-seeded. Berry globose, with a spreading calyx, which is at length reflexed. Albumen horny. Trees and shrubs. Flowers white, or pale yellow.

* *Leaves downy beneath.*

1 D. lòtos (Lin. spec. 1510.) leaves oblong, acuminate, downy beneath; leaf-buds hairy inside. ♄. H. Native of the southern parts of Caucasus, woods of Hyrcania, and the whole coast of the Caspian, Italy, and Mauritania. Willd. spec. 4. p. 407. Mill. icon. t. 116. Pall. fl. ross. 1. p. 20. t. 58.—Wangh. amer. 84. t. 28. f. 58. Ger. emac. 1495. f. 1.—Park. theatr. 1523. f. 3. Flowers small, reddish white. Fruit size of a cherry, yellow when ripe, sweet with astringency; it is recommended as a cure for diarrhœa.

European *Lotos*, or Common Date Plum. Fl. July. Clt. 1596. Tree 20 to 30 feet.

2 D. pube'scens (Pursh. fl. amer. sept. 1. p. 265.) leaves oblong, acute, downy beneath; petioles long; fruit few-seeded. ♄. H. Native of North America, in the lower counties of Virginia, Carolina, and Georgia. Though Michx. in his abr. for. makes this as only a variety of *D. Virginiàna;* Pursh considers it a distinct species, not only on account of the difference in the structure of the fruit, but in the shape and downiness of the leaves.

Downy-leaved Date Plum. Fl. April. Clt. 1812. Tree 20 to 30 feet.

3 D. Orixe'nsis (Klein. ex Willd. l. c.) leaves oblong, obtuse at the base, acutish at the apex, glabrous above, and clothed with fine soft down beneath. ♄. S. Native of the East Indies.

Orixa Date Plum. Tree.

4 D. tomentòsa (Roxb. fl. ind. 2. p. 532.) dioecious; all the tender parts downy; leaves opposite and alternate, oval, entire; male peduncles 3-flowered: calyx and corolla gibbous, 4-toothed: stamens 12; female flowers having the calyx and corolla 5-parted; berry 5-seeded. ♄. S. Native of the northern parts of Bengal; and is the Ebony of that country. *Kakindoo* is the Sanscrit name; and *Kyou* is the Bengalese name. Leaves deciduous. Male flowers whitish. Styles 2. Berry size of a pigeon's egg, yellow when ripe, and filled with a soft edible pulp.

Tomentose Date Plum. Tree tall.

5 D. hirsu`ta (Lin. syst. 918. suppl. 440.) branches and underside of leaves villous; leaves elliptic, obtuse; flowers aggregate, sessile. ♄. S. Native of Ceylon. Hardly distinct from *Royèna.*

Hairy Date Plum. Clt. 1820. Tree 20 feet.

6 D. chloróxylon (Roxb. cor. 1. p. 38. t. 49.) spiny; leaves oval, villous beneath. ♄ S. Native of the East Indies, on the coast of Coromandel, among the Circars. Branches furnished with strong spines. Male flowers with about 12 stamens, and 16 anthers; and the hermaphrodite ones with 8 single filaments. Styles 4. Berry 2-3-seeded. The tree is called *Nella-woolimera* by the Telingas.

Green-wooded Date Plum. Clt. 1822. Tree.

7 D. cordifòlia (Roxb. l. c. t. 50.) spiny; leaves ovate-lanceolate, cordate, downy beneath. ♄. S. Native of the East Indies, every where. Spines strong, usually branched. Male flowers with 8 double filaments; hermaphrodite flowers with 12 single filaments. Styles 4. Berry 8-seeded. *Tumala* is the Sanscrit name of the tree; *Kok-woolimera* is the Telinga name; and *Bun Gaub* the Bengalese name.

Heart-leaved Date Plum. Clt. 1794. Tree.

8 D. salicifòlia (Willd. spec. 4. p. 407.) leaves lanceolate, obtuse, acute at the base, downy beneath, hoary while young. ♄. S. Native of South America.

Willow-leaved Date Plum. Tree.

9 D. deca'ndra (Lour. coch. p. 227.) leaves ovate-lanceo-

late, woolly; flowers quadrifid or quinquefid. ♄. G. Native of Cochin China. Flowers white. Berry large, nearly globular, umbilicate, pulpy, yellowish when ripe. The fruit has an austerity mixed with its sweetness, with a disagreeable smell; it is, however, eaten and sold in the markets, in the northern provinces of Cochin China. The wood, when of sufficient age, is excellent for cabinet and all elegant work, being of a compact, fine, regular grain, heavy, very white, veined with black, and sometimes black at the heart.

Decandrous Date Plum. Tree 30 to 40 feet.

10 D. pube'scens (Pers. ench. 2. p. 625.) leaves linear-lanceolate, downy beneath, as well as the branches. ♄. S. Native of the Cape of Good Hope. D. hirsùta, Pers. The leaves of this, and *D. lycioìdes*, are small and sub-fasciculate, and therefore have not the habit of the other species. They are closely allied to *Royèna*.

Downy Date Plum. Tree.

11 D. rugulòsa (R. Br. prod. p. 526.) leaves elliptic-acuminated, tomentose beneath, and a little wrinkled, simple and bluntish at the base; flowers quadrifid. ♄. S. Native of New Holland, within the tropic.

Wrinkled Date Plum. Clt. 1823. Tree.

12 D. psidioìdes (H. B. et Kunth. nov. gen. amer. 3. p. 254.) leaves obovate-oblong, rounded at the apex, acute at the base, glabrous and shining above, clothed with fine down beneath; flowers trifid. ♄. S. Native of Peru, near Guayaquil, on the shores of the Pacific Ocean. Leaves 4 inches long. Fruit solitary, at first yellow, then red, edible, with an ungrateful smell, and an insipid taste, 6-celled; an inch in diameter.

Guava-like Date Plum. Tree 12 to 20 feet.

13 D. Acapulce'nsis (H. B. et Kunth. l. c.) leaves obovate-lanceolate, acute, cuneated at the base, hairy on both surfaces, but more particularly beneath; flowers trifid. ♄. S. Native of New Spain, near Acapulco. D. salicifòlia, Willd. spec. 4. p. 1112? Leaves canescent beneath, $2\frac{1}{2}$ inches long. Berry solitary, size of the preceding, nearly globose.

Acapulco Date Plum. Tree 12 to 20 feet.

14 D. conduplica'ta (H. B. et Kunth. l. c.) leaves elliptic-oblong, obtuse, acute at the base, conduplicate, smoothish above, but downy beneath, especially on the nerves and veins; flowers trifid. ♄. S. Native of Peru, near Guayaquil. Leaves 4 to $4\frac{1}{2}$ inches long, paler beneath. Peduncles 3-flowered. Corolla greenish, clothed with silky hairs. Stamens 5-8, unequal.

Conduplicate-leaved Date Plum. Tree 12 to 20 feet.

15 D. macrophy'lla (Blum. bijdr. p. 670.) leaves elliptic-oblong, acuminated, rounded at the base, and sometimes subcordate, coriaceous, glabrous, tomentose on the midrib beneath, as well as on the branchlets; racemes axillary, rarely supra-axillary, few-flowered; lower female flowers almost solitary, 5-cleft. ♄. S. Native of Java, on the Seribu and Parang mountains, &c., called *Kitjallung* by the natives.

Long-leaved Date Plum. Fl. Feb. Tree 60 feet.

16 D. pilosiu'scula (Wall. cat. no. 4132.) leaves obovate-lanceolate, acuminate, rounded at the base, pilose on the mid-rib and margins while young; pedicels lateral, solitary; calyx pilose: segments 4, lanceolate, acuminated; young branches villous. ♄. S. Native of Silhet.

Rather Hairy Date Plum. Shrub or tree.

* * *Leaves glabrous.*

17 D. obtusifòlia (Willd. spec. 4. p. 1112. H. B. et Kunth. l. c. t. 247.) leaves oblong, obtuse, acute and revolute at the base, glabrous, shining above; flowers quinquefid. ♄. G. Native of Mexico, near Cuernavaca, where it is called *Sapote Negro*, by the natives. Leaves 4-5 inches long. Stamens 10-12. Fruit depressedly globose, 3-4 inches in diameter, black, edible.

Obtuse-leaved Date Plum. Tree tall.

18 D. serra'ta (Hamilt. mss. ex D. Don, prod. fl. nep. p. 143.) leaves lanceolate, acuminated, serrated, glabrous; petioles short, and are, as well as the branchlets, villous; pedicels lateral, aggregate, drooping, and are, as well as the calyxes, hairy; stigmas 3, long, acute; flowers quinquefid. ♄. G. Native of Nipaul, at Narainhetty, where it is called, by the Newar people, *Yelang*. Termstroe'mia bifària, Hamilt. mss. Leaves 2-4 inches long. Ovarium 6-celled. Berry 3-celled, many-seeded. Perhaps a distinct genus.

Serrated-leaved Date Plum. Tree large.

19 D. cerasifòlia (D. Don, prod. fl. nep. p. 144.) leaves elliptic, acuminated, glabrous; petioles short, and are, as well as the branchlets, downy; pedicels lateral, drooping, aggregate, and are, as well as the calyxes, downy; stigmas 3, acute; flowers quinquefid. ? ♄. G. Native of Nipaul, at Narainhetty. D. fœmínea, Hamilt. mss. This species agrees in character with the preceding, and will probably, with it, constitute a new genus.

Cherry-leaved Date Plum. Tree.

20 D. frute'scens (Blum. bijdr. p. 668.) leaves oblong, acuminated, acutish at the base, glabrous, shining; fascicles of flowers crowded, axillary and lateral; flowers quadrifid. ♄. S. Native of Java, on the banks of the river Tjisedanie, near Rompien, in the province of Buitenzorg.

Var. β; leaves elliptic-oblong, bluntly acuminated; ultimate branches downy. ♄. S. Native of the Island of Nusæ Kambanga, where it is called *Tallak*.

Shrubby Date Plum. Fl. May, Nov. Shrub.

21 D. Virginia'na (Lin. spec. 1510.) leaves ovate-oblong, acuminated, glabrous, shining above, and paler beneath, reticulately veined; petioles short, and curved, and are, as well as the branchlets, downy; leaf-buds glabrous; flowers quadrifid, rarely quinquefid. ♄. H. Native of Virginia, Carolina, and Pennsylvania, in woods; or from New York to Louisiana. Mill. fig. 126. Wats. dendr. brit. 146.—Park. par. 570. t. 569. f. 6. Guajacàna, Catesb. car. 2. t. 76.—Pluk. alm. 244. f. 5. Flowers pale yellow. Fruit form and size of a date, or common plum, golden yellow when ripe. It is austere when fresh, like the medlar; but when mellowed by the frost, it is then very sweet and glutinous, with very little austerity. In North America it makes a palatable liquor with malt; there is also a spirit distilled from it. The wood is very hard, but brittle and white: it is very good for joiners' tools, such as planes, &c., but it soon rots if exposed to the weather. It is known in North America by the name of *Pishamin* or *Presimon*.

Virginian Date Plum. Fl. July. Clt. 1829. Tree 20 feet.

22 D. Loureiria'na; leaves ovate-lanceolate, smooth, with oblique prominent ribs; flowers solitary, terminating, quinquefid, rarely quadrifid. ♄. G. Native of Cochinchina. Diospyros Lòtos, Lour coch. p. 226. Flowers pale. Fruit downy, half an inch in diameter, round, 8-seeded, with very little pulp.

Loureiro's Date Plum. Shrub 6 feet.

23 D. dígyna (Jacq. schœnbr. 3. p. 35. t. 313.) leaves oblong, acute at both ends, glabrous; flowers digynous, drooping; corolla much longer than the calyx. ♄. S. Native of the Celebes. Flowers white, quinquefid.

Digynous-flowered Date Plum. Tree 20 feet.

24 D. cauliflòra (Blum. bijdr. p. 668.) leaves oblong-lanceolate, acuminated, acute at the base, glabrous; male flowers axillary; hermaphrodite ones digynous, crowded into lateral fascicles; flowers semi-quadrifid. ♄. S. Native of Java, on calcareous mountains, where it is called *Prellek*. Nearly allied to *D. dígyna*.

Stem-flowered Date Plum. Fl. June, July. Shrub.

25 D. sylva'tica (Roxb. cor. 1. p. 37. t. 47.) leaves oblong or oval, acute at both ends, glabrous; female flowers trigynous, erect; corolla of hermaphrodite flowers about equal in length to the calyx; berry 8-seeded. ♄. S. Native of the East Indies, among the Circars. Corolla whitish. Male flowers with about 18 single anthered filaments. *Tella-goda* is the Telinga name of the tree.

Wood Date Plum. Clt. 1812. Tree.

26 D. reticula'ta (Willd. spec. 4. p. 1112.) leaves ovate or elliptic, obtuse; rounded at the base, glabrous and shining on both surfaces, coriaceous, finely reticulated beneath; calyxes villous. ♄. S. Native of the Mauritius.

Reticulated-leaved Date Plum. Clt. 1824. Tree 20 feet.

27 D. ebena'ster (Retz. obs. 5. p. 33.) leaves bifarious, oval-oblong, coriaceous, glabrous on both surfaces; leaf-buds glabrous; flowers quadrifid. ♄. S. Native of the East Indies, in woods, about Calcutta, Amboina, &c. D. Ebènum, Lin. suppl. 440. Hebenáster, Rumph. amb. 3. p. 13. t. 6. Berry yellow when ripe. The wood of this tree is compact, hard, and heavy, whitish next the bark, but towards the middle very black, this blackness gradually tinges the whole body in the same manner as resin of fir. This is said to be the true Ebony, but there is no doubt but the Ebony of commerce is the wood of several species.

Ebony-like Date Plum, or Common Ebony. Clt. 1772. Tree 40 feet.

28 D. oblónga (Wall. cat. no. 4124.) leaves oblong-lanceolate, glabrous, on short petioles, acuminated; flowers axillary, aggregate; calyx 5-cleft, villous inside. ♄. S. Native of Penang. D. frondòsa, and D. nervòsa, Wall. cat. no. 4125 and 4126, hardly appear to be more than varieties of this species.

Oblong-leaved Date Plum. Shrub.

29 D. Sapòta (Roxb. fl. ind. 2. p. 535.) leaves bifarious, oblong, entire, obtuse, polished; filaments 8-10, in both male and hermaphrodite flowers; berry globular, with a few irregular shaped seeds. ♄. S. Native of the Mauritius. Sapotte-nigra, Sonn. voy. nov. guin. p. 45. t. 14, 15, and 16. Berry size of a large orange. Introduced by the late Hyder Ally, into his garden at Seringapatam.

Sapota Date Plum. Tree.

30 D. ramiflòra (Roxb. fl. ind. 2. p. 535.) leaves lanceolate, glossy; hermaphrodite and male flowers in fascicles from the large woody branches; calyx and corolla from 5- to 6-parted; style 5-6-cleft; berry containing from 10 to 20 seeds. ♄. S. Native of the eastern frontier of Bengal, where it is called *Oori-Gaub*, also *Goolul*. It supplies the natives with a strong, hard wood. Leaves 6-10 inches long. Filaments 10-12 in the female flowers, but the males are still unknown. It is probably a species of *Embryópteris*.

Branch-flowered Date Plum. Tree large.

31 D. melanóxylon (Roxb. cor. 1. p. 36. t. 46.) leaves oblong-lanceolate, acute at the base, and obtuse at the apex, nearly opposite, coriaceous, finely veined, glabrous, but villous when young, as well as the branches; flowers 5-cleft. ♄. S. Native of the East Indies, Java, where it is called *Tremble Kibarasma*, and *Kiklor*. Calyx and corolla 5-cleft; male peduncles 3-6-flowered. Styles 3-4; male flowers with about 12 anthers; and female flowers decandrous. This is one of the species which produces Ebony; it is called *Tumballi* by the Tamuls, *Tindoo* by the Hindoos, and *Tumida* by the Telingas; but several other species also produce Ebony, as *D. tomentòsus*, *D. ebénum*, and *D. ebenáster*, &c. It is only the centre of large trees that is black and valuable, which part is more or less in quantity according to the age of the tree. The outside of the wood is soft and white, which time and insects soon destroy, leaving the black untouched. The ripe fruit is eaten by the natives; it has an astringent taste, and is not very palatable. The bark is also astringent; powdered and mixed with pepper, it is given for dysentery by the native doctors.

Black-wooded Date Plum. Clt. 1817. Tree.

32 D. lanceæfòlia (Roxb. fl. ind. 2. p. 537.) leaves bifarious, lanceolate, polished; flowers sessile; male ones crowded in heads; filaments 16, simple. ♄. S. Native of Silhet, where it is called *Goolul*, and where it furnishes the natives with a durable timber, for the construction of their habitations. Stigma 8-cleft. Flowers quadrifid and quinquefid.

Lance-leaved Date Plum. Tree large.

33 D. ebe'num (Retz. obs. 3. p. 5. t. 31.) leaves bifarious, ovate-lanceolate or oblong, acuminated, glabrous; leaf-buds hairy; male flowers sub-racemose, with about 20 anthers; hermaphrodite flowers octandrous, solitary; stigma 4-cleft. ♄. S. Native of Ceylon, in woods. D. glabérrima, Rothb. in nov. act. hafn. 2. p. 540. t. 5. Hebenáster, Rumph. amb. 3. p. 13. t. 6.?

Ebony Date Plum. Clt. 1792. Tree 30 to 40 feet.

34 D. marítima (Blum. bijdr. p. 669.) leaves oblong, obtuse, acutish at the base, and furnished with 2 depressed glands at the base beneath, coriaceous, glabrous, shining; flowers axillary, sessile, male ones crowded, hermaphrodite ones almost solitary; flowers obliquely 4-5-cleft. ♄. S. Native of Java, on the south shore.

Sea-side Date Plum. Fl. Oct. Nov. Shrub.

35 D. monta'na (Roxb. cor. 1. p. 37. t. 48.) leaves ovate-oblong, rounded at the base, acute at the apex, glabrous; male flowers with 8 double filaments; berry 8-seeded. ♄. S. Native of the East Indies, among the Circars, where it is called *Yerra-goda* by the Telingas. Female flowers with about 4 sterile stamens.

Mountain Date Plum. Clt. 1822. Tree.

36 D. mabòla (Roxb. hort. beng. p. 41. Lindl. bot. reg. 1139.) leaves oblong, acute at both ends, deep green above, silky beneath, as well as the branchlets; fascicles of flowers disposed in racemes; stamens 12, in the male flowers. ♄. S. Native of the Philippine Islands. Cavanillea Philippénsis, Desr. in Lam. dict. 3. p. 663. t. 454. Wood black, very compact. Corollas sweet-scented, pale yellow, silky outside. The fruit called *Mabola* is brown, with a pink-coloured, fleshy rind, about the size of a quince: its flavour is said to be agreeable, the pulp is firm and white. The tree is cultivated in the Isle of France, for its fruit.

Mabola Date Plum. Clt. 1822. Tree 8-10 feet.

37 D. obova'ta (Jacq. schœnbr. 3. p. 34. t. 312.) leaves membranous, obovate, obtuse, glabrous on both surfaces; flowers quadrifid, octandrous; berries 4-seeded. ♄. S. Native of Jamaica and St. Domingo. D. tetraspérma, Swartz. prod. 62. fl. ind. occ. 2. p. 678. Corolla orange-coloured.

Obovate-leaved Date Plum. Clt. 1796. Shrub 3 to 6 feet.

38 D. undula'ta (Wall. cat. no. 4136.) leaves glabrous, shining, deep green, oblong, acuminated, on short petioles; flowers axillary, sessile, solitary; calyx villous, 4-lobed; fruit globular. ♄. S. Native of the Burman empire, at Amherst. Leaves 6-10 inches long.

Undulated-leaved Date Plum. Shrub or tree.

39 D. amœ'na (Wall. cat. no. 4139.) leaves lanceolate, or oblong-lanceolate, acuminated, glabrous; flowers lateral and axillary, sessile, solitary, clothed with rusty down; calyx propped by scales. ♄. S. Native of the East Indies. Leaves 7-9 inches long.

Pleasant Date Plum. Shrub or tree.

40 D. ehretioìdes (Wall. cat. no. 4137.) leaves glabrous, oblong-roundish or oblong, rusty beneath; peduncles lateral and axillary, trichotomous, downy: lateral branches 3-flowered, the middle one 1-flowered. ♄. S. Native of the Burmese Empire at Moalmeyne. Leaves 8-10 inches long, and 4-6 broad.

Ehretia-like Date Plum. Shrub or tree.

41 D. stricta (Roxb. fl. ind. 2. p. 539.) leaves ovate-lanceo-

late; male peduncles 3-6-flowered; male flowers with 16 stamina, on a convex receptacle. ♄. S. Native of Tipperah. A tall, slender tree, with a straight trunk, as in firs. The female tree is unknown.

Straight Date Plum. Tree tall.

42 D. bractea'ta (Roxb. fl. ind. 2. p. 539.) leaves oblong, acute; style 4-cleft; berry 8-seeded. ♄. S. Native of Dooab. The male tree has not been found.

Bracteate-flowered Date Plum. Tree.

43 D. loba'ta (Lour. cochin. p. 227.) leaves ovate-lanceolate, glabrous on both surfaces; peduncles 1-flowered; berries 8-lobed; flowers quadrifid. ♄. G. Native of Cochinchina. Leaves small. Corolla white, with a 4-cornered tube. Stigma deeply 4-cleft. Berry pale yellow, about an inch in diameter, having a sweetish austere pulp, without any smell.

Lobed-fruited Date Plum. Clt. 1822. Shrub 8 feet.

44 D. densiflòra (Wall. cat. no. 4140.) leaves oblong, glabrous, coriaceous; peduncles branched, or in clusters, many-flowered; fruit globose. ♄. S. Native of Moalmyne and Martaban. Leaves 5-8 inches long, and 4-5 broad.

Dense-flowered Date Plum. Shrub.

45 D. lycioìdes (Desf. in ann. mus. cah. 36. p. 448.) leaves small, lanceolate, flat, obtuse, glabrous, smooth, subfascicled. ♄. G. Native of the Cape of Good Hope. Flowers hermaphrodite. Hardly distinct from *Royèna*.

Lycium-like Date Plum. Clt. 1806. Shrub.

46 D. vaccinoìdes (Lindl. ex Hook. exot. fl. 139.) leaves ovate, obtuse, shining above, villous beneath, and on the edges; flowers solitary, axillary, quadrifid, tetrandrous; fruit ovate, 3-celled, 3-seeded; calycine segments ovate, subulate, pilose, with coloured edges; corolla sub-campanulate, with ovate, undulated segments. ♄. G. Native of China, Penang, and Singapore. Lodd. bot. cab. 1549. Perhaps a species of Maba, with quadrifid flowers. Stigma quite simple. Corolla white. A small evergreen shrub.

Whortle-berry-like Date Plum. Fl. April, May. Clt. 1823. Shrub 2-3 feet.

47 C. heterophy'lla (Wall. cat. 4138.) leaves variable in size and shape, roundish or oblong-obovate, emarginate, smaller than in most other species: calycine lobes obtuse, reflexed. ♄. S. Native of Ava. Allied to the preceding.

Variable-leaved Date Plum. Shrub.

† *Species hardly known.*

48 D. melanìda (Poir. ency. 4. p. 431. Pers. ench. 2. p. 625.) leaves ovate, petiolate; berries sub-globose, depressed, 10-celled; calyx pentagonal, with a reflexed mouth. ♄. S. Native of the Isle of France. Ebènus melanìda, Commers.

Black-wooded Date Plum. Tree.

49 D. leucome'las (Poir. l. c.) leaves ovate-elliptic, subcordate; calyx 6-toothed, girding the berry one half of its length, which is 2-celled. ♄. S. Native of the Isle of France.

White and Black-wooded Date Plum. Tree.

50 D. nodòsa (Poir. l. c.) leaves ovate-lanceolate, glabrous; flowers quinquefid; fruit globose, solitary. ♄. S. Native of the Isle of France.

Knotted Date Plum. Tree.

51 D. chrysophy'llos (Poir. l. c. p. 433.) leaves oblong, shining and rufescent beneath; flowers solitary, quinquefid; calyx hairy; fruit pear-formed. ♄. S. Native of the Isle of France.

Golden-leaved Date Plum. Tree.

52 D. angula'ta (Poir, l. c. p. 436.) leaves ovate, obtuse, coriaceous; flowers quinquefid; fruit angular. ♄. S. Native of the Isle of France.

Angular-fruited Date Plum. Tree.

53 D. edu'lis (Lodd. cat. p. 9. 1830.) nothing is known of this plant but the name.

Edible-fruited Date Plum. Tree.

Cult. The hardy species of *Diospyros* grow to large shrubs in this country, therefore they should be planted in the back of shrubberies; they are easily increased both by layers and seeds. The greenhouse and stove species require the same treatment as other stove and greenhouse shrubs; a mixture of loam, sand, and peat, is the best soil for them; and they are readily increased by ripened cuttings, in sand under a hand-glass; those of the stove species should be placed in a moist heat.

II. EMBRYO'PTERIS (*εμβρυον, embryon*, an embryo, and *πτερυξ, pteryx*, a wing; in reference to the embryo being winged.)

Gærtn. fruct. 1. p. 145. t. 29. Roxb. cor. 1. p. 49. t. 70. —Cavaníllea, Lam.—Diospy'ros species of authors.

Lin. syst. *Polygàmia, Dioècia.* This genus differs alone from *Diospyros*, in the stamens of the male flowers being 4 or 6 times the number of the segments of the corolla.—Trees with entire leaves; male peduncles 3-4-flowered, and the female ones 1-flowered.

1 E. gelatinífera (Roxb. cor. 1. p. 49. t. 70. Willd. spec. 4. p. 836.) leaves lanceolate; stamens 16-20 in the male flowers, and 1-4 in the female flowers; flowers quadrifid; styles 4; berry 8-seeded. ♄. S. Native of the East Indies. Embry. peregrìna, Gærtn. fruct. 1. p. 145. t. 29. Cavaníllea Philippénsis, Lam. dict. 3. p. 636. See Juss. ann. mus. 5. p. 418. Diospyros Embryópteris, Pers. ench. 2. p. 624. Ker. bot. reg. t. 499. D. glutinòsa, Kœn. A middle-sized tree, with long leaves. Flowers whitish. Stigma cruciate, sessile. The fruit is eaten by the natives when ripe, but cannot be said to be palatable, on account of its strong astringency. Sir W. Jones says the tree is generally known in Bengal by the name of *Gaub;* and that the Sanscrit name is *Tindooka;* and that the astringent, viscid juice of the fruit is used all over that country for paying the bottoms of boats. The unripe fruit contains a very large proportion of tannin. The infusion is employed to steep fishing nets in, to make them more durable, and probably adds to their strength. The wood is but of indifferent quality, and not much used.

Glue-bearing Embryopteris. Fl. Jul. Clt. 1818. Tr. 25 ft.

2 E. díscolor; leaves oblong-lanceolate, acute, rounded at the base, of a silky glaucous colour beneath, and downy; flowers quadrifid; stamens 24. ♄. S. Native of the Philippine Islands. Diospyros díscolor, Willd. spec. 4. p. 1108. Stigma sessile. Perhaps only a variety of the preceding. Branches and corolla villous. Leaves almost a foot long. Berry 4-6-seeded.

Two-coloured-leaved Embryopteris. Clt. 1823. Tree 20 feet.

3 E. racemòsa; leaves from oblong to lanceolate, obtuse, glossy; both male and female flowers in axillary comose racemes, the former with 20-30 stamens, the latter with 12-16; stigma 4-cleft; berry round, smooth, 4-seeded. ♄. S. Native of Silhet, where it is called *Goolul*, and where the fruit is eaten by the natives. Diospyros racemòsa, Roxb. fl. ind. 2. p. 536.

Racemose-flowered Date Plum. Tree small.

4 E. Loureiria'na; leaves broad-lanceolate; flowers quadrifid; stamens 20; berries pea-shaped, 8-seeded. ♄. G. Native of Cochinchina. Diospyros dodecándra, Lour. coch. p. 228. Corolla white, with a sub-globose tube. Berry pale, with a sweetish, astringent, edible, but pleasant pulp. The wood is like that of the false Ebony, *Diospyros Ebenáster*, but has not the black veins. The trees are much used as supports to the Black Pepper plants.

Loureiro's Embryopteris. Tree large.

5 Ka'ki (Lin. syst. 918. Thunb. jap. 157. Lour. coch. 226. Roxb. fl. ind. 2. p. 527.) leaves bifarious, ovate-elliptic, acuminated, elliptic-oblong, or obovate, cordate at the base,

downy on both surfaces; branches tomentose; male peduncles usually 3-flowered; male flowers with about 20 stamens, and female 8; flowers quadrifid; style 4-cleft; stigmas bifid. ♄. G. Native of China, Cochinchina, and Japan; and is also cultivated in those countries, as also in Bengal. D. Chinénsis, Blum. cat. hort. buit. p. 110. and act. soc. batav. 9. p. 167. Kouis or Kaki, Kæmpf. amœn. t. 106. Fruit globose, 8-celled, size of a small orange, yellow when ripe, abounding in yellow, fleshy, edible pulp; it is tolerably pleasant, but by no means equal to a good apple; eaten plentifully occasions diarrhœa. They are preserved in the same manner as the fig, by sprinkling meal or sugar over them. There is a variety of this species with an ovate fruit.

Kaki Embryopteris. Clt. 1789. Tree 12 to 20 feet.

Cult. See *Diospyros*, p. 41., for culture and propagation.

III. PARA'LEA (*Parala* is the Caribbean name of the tree). Aubl. guian. 1. p. 576. t. 231. R. Br. prod. p. 526.

Lin. syst. *Polygàmia, Dioècia.* Flowers polygamous. Calyx 4-toothed; teeth acute. Corolla fleshy, with a short tetragonal tube, and a 4-parted limb; segments acute. Stamens 18, inserted within the tube of the corolla at its base; anthers small, roundish. Ovarium wanting in the male flowers, but in place of it there is a villous, rufous corpuscle. Fruit and seeds unknown.—A tall tree, with a branched top. Leaves alternate, quite entire, glabrous, but tomentose along the margins. Flowers disposed in axillary fascicles: with villous rufescent scales.

1 P. Guiane'nsis (Aubl. guian. l. c.). ♄. S. Native of Guiana. Branches downy. Leaves ovate-oblong, acute. Flowers sweet-scented. Corolla fulvous.

Guiana Paralea. Tree tall.

Cult. For culture and propagation see *Diospyros*, p. 41.

IV. ROYE'NA (named by Linnæus in honour of Adrian Van Royen. He and his son David were successively professors of botany at Leyden). Lin. gen. no. 555. Gærtn. fruct. 2. p. 80. t. 94. Juss. gen. 156. R. Br. prod. p. 526.

Lin. syst. *Decándria, Digýnia.* Flowers hermaphrodite. Calyx 5-cleft. Corolla with a 5-parted revolute limb. Stamens 10, length of the tube of the corolla; filaments simple; anthers oblong, acute. Ovarium usually 4-celled, but sometimes 6-8-celled; cells 1-seeded. Berry fleshy. Seeds triangular or plano-convex.—Shrubs, natives of the Cape of Good Hope, with entire leaves; and axillary or lateral, solitary or aggregate, 1-flowered pedicels. Flowers white.

1 R. lu'cida (Lin. spec. 568.) leaves ovate, roughish, shining above. ♄. G. Native of the Cape of Good Hope. Lam. ill. t. 370. f. 1.—Herm. par. 232. t. 232.—Comm. hort. 1. p. 187. t. 96.—Pluk. phyt. t. 63. f. 4. and t. 317. f. 5. Berry globular, red above and pale below, containing a firm, whitish flesh, almost like that of an apple.

Lucid-leaved African Bladder-nut. Fl. May, June. Clt. 1690. Shrub 5 to 10 feet.

2 R. villòsa (Lin. spec. 568. Thunb. prod. 83.) leaves cordate-oblong, tomentose beneath; branches villous. ♄. G. Native of the Cape of Good Hope. R. scàbra, Burm. prod. 13.

Villous African Bladder-nut. Fl. June, July. Clt. 1774. Shrub 5 to 10 feet.

3 C. gla'bra (Lin. spec. 568. Thunb. prod. 80.) leaves lanceolate, glabrous. ♄. G. Native of the Cape of Good Hope. —Comm. hort. 1. p. 125. t. 65.—Plukn. phyt. t. 321. f. 4. Fruit roundish, purple.

Glabrous African Bladder-nut. Fl. Sept. Clt. 1731. Sh. 4 to 6 feet.

4 R. pa'llens (Willd. spec. 2. p. 632.) leaves oblong-obovate, obtuse, glabrous. ♄. G. Native of the Cape of Good Hope.

Pale African Bladder-nut. Fl. June, July. Clt. 1789. Sh. 4 to 6 feet.

5 R. cunea'ta (Lam. dict. 6. p. 322.) leaves somewhat obovate-oblong, downy, nerveless; branches villous. ♄. G. Native of the East Indies, ? but probably of the Cape of Good Hope. Flowers solitary. Calyx white. Corolla purple. R. pubéscens, Willd. enum. p. 457. Ker. bot. reg. 500. Flowers whitish green.

Cuneated-leaved African Bladder-nut. Fl. July, Aug. Clt. 1752. Shrub 4 to 6 feet.

6 R. hirsu'ta (Lin. spec. 568.) leaves oblong-lanceolate, villous. ♄. G. Native of the Cape of Good Hope. Lam. ill. t. 370. f. 2. Jacq. coll. suppl. 110. t. 13. f. 1.—Lin. hort. cliff. 163.—Boerh. lugdb. 2. p. 235. Leaves an inch long. Flowers of a worn out dirty purple colour.

Hairy African Bladder-nut. Fl. July, Aug. Clt. 1752. Shrub 6 to 8 feet.

7 R. angustifòlia (Willd. spec. 2. p. 633.) leaves lanceolate, acute at both ends, rather pilose beneath. ♄. G. Native of the Cape of Good Hope.

Narrow-leaved African Bladder-nut. Fl. June, July. Clt. 1789. Shrub 4 to 6 feet.

8 R. latifòlia (Willd. enum. suppl. p. 23.). This species has not yet flowered in the gardens; consequently nothing more is known of the plant than the name.

Broad-leaved African Bladder-nut. Fl. June, July. Clt. 1816. Shrub 4 to 6 feet.

Cult. The species thrive in a mixture of loam, peat, and sand; and slips, taken from ripened wood, strike root readily in sand, under a hand-glass.

V. DIPLONE'MA (from διπλοος, *diploos*, double, and νημα, *nema*, a filament; filaments double). Royèna polyándra of authors.

Lin. syst. *Polygàmia, Dioècia.* This genus differs from *Royèna* in the flowers being polygamous, in the stamens of the male flowers being 4 times the number of the segments of the corolla, in the filaments being double, and in the anthers being bearded. Ovarium 4-6-celled.—Shrubs with entire leaves and axillary 1-flowered pedicels.

1 D. ellíptica; leaves elliptic, glabrous; flowers quinquefid.? ♄. G. Native of the Cape of Good Hope. Royèna polyándra, Lin. suppl. 240.

Elliptic-leaved Diplonema. Fl. June, July. Clt. 1774. Sh. 4 to 6 feet.

2 D. ambígua; leaves obovate, rather villous, coriaceous; corolla 6-7-cleft, with obtuse segments. ♄. G. Native of the Cape of Good Hope. Royèna ambígua, Vent. malm. t. 17. Flowers yellowish, with reflexed segments. Branchlets hairy.

Ambiguous Diplonema. Fl. June, July. Clt. 1815. Shrub 4 to 6 feet.

Cult. For culture and propagation see *Royèna*, above.

VI. DICLIDANTHE'RA (from δικλις, *diklis*, double doors, and ανθηρα, *anthera*, an anther; in reference to the anthers dehiscing by two valves). Mart. nov. gen. bras. 2. p. 139.

Lin. syst. *Pentándria, Monogýnia.* Flowers hermaphrodite. Calyx 5-parted. Corolla funnel-shaped, with a 5-cleft limb. Anthers 5, sessile in the throat, 2-valved from the base. Ovarium sub-5-celled; cells 1-seeded. Stigma capitate, depressed. Berry 5-seeded or 2-3-seeded from abortion.—Small shrubs or trees, with hard wood, and elongated, often pendulous branches; with scattered, petiolate, quite entire, thickish leaves; racemose, bracteate flowers; and cream or milk-coloured co-

rollas, which become purplish on drying. Calyx sub-globose at the base; segments bluntish. Corolla not widened at the throat, but naked; with narrow, bluntish, imbricate segments.

1 D. penduliflòra (Mart. nov. gen. bras. 2. p. 140. t. 196.) branches pendulous; petioles biglandular; leaves oblong, glabrous; calyxes smoothish, 3 times shorter than the corolla, which is villous inside; calycine segments linear. ♄. S. Native of Brazil, in the province of Rio Negro, along the river Solimoes. Habit of *Celástrus scándens*.

Pendulous-flowered Diclidanthera. Tree 10 to 20 feet.

2 D. laurifòlia (Mart. l. c. p. 141. t. 197.) branches loose; petioles glandless, downy; leaves oblong, downy along the middle nerve; calyxes downy, twice shorter than the corolla, which is glabrous; calycine segments oblong. ♄. S. Native of Brazil, in the province of Rio Janeiro, near Sebastianople.

Laurel-leaved Diclidanthera. Shrub 5 feet.

Cult. For culture and propagation see *Diospyros*, p. 41.

VII. CARGI'LLIA (named in memory of James Cargill, M. D., of Aberdeen, who lived in the time of Caspar Bauhin, and who described, for the first time, some marine Algæ in his Theatrum Botanicum, particularly the *Fùcus esculéntus*, *F. palmàtus*, *F. digitàtus*, and *U'lva pavònia*). R. Br. prod. p. 526.

Lin. syst. *Polygàmia, Dioècia.* Flowers polygamous. Calyx semi-quadrifid. Corolla with a 4-cleft limb. Male flowers having the stamens inserted in the base of the corolla, but sometimes also hypogynous, double the number of the segments of the corolla; filaments double. Hermaphrodite or female flowers having fewer stamens than the male, and these barren. Ovarium 4-celled; cells 2-seeded. Berry globose, girded by the adpressed cup-shaped calyx at bottom.—Evergreen trees, with entire, glabrous leaves: and axillary, 1-flowered pedicels.

1 C. la'xa (R. Br. prod. 526.) leaves oblong, a little undulated, glabrous, almost of the same colour on both surfaces; calyxes of the male flowers 4-toothed, one half shorter than the tube of the corolla; style 3-4-parted; branchlets loose. ♄. G. Native of New Holland, within the tropic.

Loose-branched Cargillia. Clt. 1827. Tree.

2 C. austra'lis (R. Br. prod. p. 527.) leaves oblong, glabrous, obtuse at the apex, acute at the base, pale beneath; calyx in the male flower 4-cleft, equal in length to the tube of the corolla; style undivided. ♄. G. Native of New South Wales. Hook. bot. mag. 3274. Corolla white.

Southern Cargillia. Clt. 1816. Tree 15 feet.

Cult. For culture and propagation see *Royèna*, p. 42.

VIII. MA'BA (the vernacular name of *M. elliptica* in Tongatabu). Forst. gen. t. 16. Juss. in ann. mus. 5. p. 418. Juss. gen. 418.—Ferrèola, Kœnig. and Roxb.

Lin. syst. *Dioècia, Triándria.* Flowers dioecious. Calyx semi-trifid. Corolla urceolate, trifid. Male flowers with hypogynous stamens, double in number to the segments of the corolla, rarely equal that number: with simple and double filaments alternating with each other. Female flowers without any stamens. Ovarium 3-celled; cells 2-seeded. Berry oval, rarely globose, girded by the cup-shaped calyx at the base.—Shrubs or trees with entire leaves: and axillary, 1-flowered pedicels.

1 M. ellíptica (Forst. gen. p. 122. t. 16. fl. austr. 366.) leaves elliptic, glabrous; flowers triandrous, by threes. ♄. S. Native of the Friendly Islands. Lam. ill. t. 803. Young leaves and branches villous. Calyxes downy.

Elliptic-leaved Maba. Shrub.

2 M. laurìna (R. Br. prod. p. 517.) leaves oval-oblong, veiny, bluntish at the base, shining, and are, as well as the branches, glabrous; male and female flowers solitary; alternate filaments double. ♄. S. Native of New Holland, within the tropic.

Laurel-like Maba. Fl. July, Aug. Clt. 1824. Shrub.

3 M. obova'ta (R. Br. l. c.) leaves obovate, rather retuse, opaque and glabrous in the adult state: but the young ones, petioles, and branches are downy; calyxes downy; alternate filaments double; berries sessile, solitary, oval. ♄. S. Native of New Holland, within the tropic.

Obovate-leaved Maba. Shrub.

4 M. buxifòlia (Juss. ann. mus. 5. p. 418. Pers. ench. 2. p. 606.) leaves obovate, glabrous in the adult state; calyxes downy; flowers solitary or aggregate, hexandrous; filaments all simple. ♄. S. Native of the East Indies, on the mountains. Ferrèola buxifòlia, Roxb. cor. 1. p. 35. t. 45. Flowers yellowish.

Box-leaved Maba. Clt. 1810. Shrub.

5 M. hu'milis (R. Br. l. c.) leaves oval-obovate, rather retuse, attenuated at the base, glabrous, as well as the branchlets, even in the young state; berries solitary, oval, about equal to half the length of the leaves, and are, as well as the calyxes, glabrous. ♄. S. Native of New Holland, within the tropic.

Humble Maba. Shrub.

6 M. gemina'ta (R. Br. l. c.) leaves oval or obovate, marginate, rather veiny, somewhat attenuated at the base, quite glabrous, even in the young state, as well as the branchlets; berries oval, twin, 4-5 times shorter than the leaves, and are, as well as the calyxes, clothed with fine down. ♄. S. Native of New Holland, within the tropic.

Twin-berried Maba. Shrub.

7 M. littòrea (R. Br. l. c.) leaves oval-oblong, rather retuse, attenuated at the base, shining; branchlets glabrous; berries solitary, oval-oblong, 4 times longer than the calyx, which is obsoletely lobed, and 4 to 5 times shorter than the leaves. ♄. S. Native of New Holland, within the tropic, on the shore.

Shore Maba. Shrub.

8 M. reticula'ta (R. Br. l. c. p. 528.) leaves obovate or oval, retuse, reticulately veined, with sub-recurved edges, glabrous in the adult state, as well as the branchlets; alternate filaments double; berry depressedly globose. ♄. S. Native of New Holland, within the tropic.

Reticulated-leaved Maba. Shrub.

9 M. compa'cta (R. Br. l. c.) leaves obovate and oval, rather retuse, compact, reticulated, flat, and are, as well as the branches, glabrous; berries depressedly globose; calyx of the fruit obsoletely lobed, reflexed, silky inside. ♄. S. Native of New Holland, within the tropic.

Compact Maba. Shrub.

10 M.? Ebenóxylon; leaves small, lanceolate, hard, flat, glabrous as well as the branches; peduncles terminal, many-flowered; berry ovate, acutish; calyx wanting, and nectarium stellate (ex Lour.). ♄. S. Native of Cochinchina, in vast woods. Ebenóxylon, Lour. coch. p. 613. Caju-arang. Rumph. amb. 3. p. 1. t. 1. Wood hard, heavy, with a black heart, and is the ebony of Cochin-china. Berry reddish yellow (ex Lour.), small, 1-celled, 3-seeded. Flowers triandrous.

Ebony-wood Maba. Tree large.

Cult. See *Royèna*, p. 42. for culture and propagation.

Order CXLVII. OLE'INÆ (so called on account of its containing plants agreeing with *O'lea* in important characters.) Hoffm. et Link, fl. port. p. 1806. R. Br. prod. p. 522. Jasmíneæ, part. Juss. gen. p. 104. Lilàceæ, Vent. tabl. 1. p. 306.

Flowers hermaphrodite, sometimes dioecious. Calyx 1-leaved, divided, permanent. Corolla hypogynous, monopetalous,

4-cleft (f. 8. *b.*, f. 9. *a.*); sometimes 4-petalled: petals connected by pairs to the middle of the filaments, rather valvate in æstivation; sometimes wanting. Stamens 2, alternating with the segments or petals of the corolla. Anthers 2-celled; cells dehiscing lengthwise. Ovarium simple, girded by no glandular disk, 2-celled; cells 2-seeded. Ovula pendulous, collateral. Style simple, or wanting; stigma bifid, or undivided. Fruit drupaceous, baccate, or capsular, often 1-seeded by abortion. Seeds with dense copious albumen. Embryo middle-sized, longitudinal, straight. Cotyledons foliaceous, half free; radicle superior; plumule inconspicuous.—Trees and shrubs. Leaves opposite, simple, rarely pinnate. Flowers racemose or panicled, terminal or axillary, with opposite unibracteate pedicels.

The bark of the ash is so bitter, as to be highly celebrated as a febrifuge, and is even compared with quinquina for effect. The sweet purgative called manna is a discharge from the bark of several species of *O'rnus* and *Fráxinus*. The sweetness of this substance is not due to the presence of sugar, but to a distinct principle called mannite. Olive oil is expressed from the pericarp of *O'lea Europæ'a*.

Synopsis of the genera.

TRIBE I.

OLIE'Æ. *Corolla short, monopetalous, campanulate or urceolate, 4-cleft. Stamens 2, with short filaments, and erect anthers. Fruit drupaceous.*

1 LIGU'STRUM. Corolla funnel-shaped, having the tube exceeding the calyx. Stamens inclosed. Style very short; stigma bifid. Berry globose, containing 2 chartaceous nuts.

2 PHYLLY'REA. Corolla short, campanulate. Stamens a little exserted. Stigma thickish. Berry globose, having one of the cells usually abortive.

3 O'LEA. Calyx tubular, 4-toothed. Segments of corolla ovate. Stamens a little exserted. Style very short; stigma bifid, with emarginate segments. Drupe 2-celled, one of the cells abortive; nut oblong.

4 NORÓNHIA. Corolla globular, thick, deeply 4-parted. Anthers lying in the substance of the corolla. Style wanting. Drupe containing a two-celled putamen; one of the cells abortive. Albumen none?.

5 PACHYDE'RMA. Corolla globose, coriaceous, with a semi-4-cleft border. Stamens inserted above the base of the corolla. Ovarium 2-celled. Stigma almost sessile, obtuse. Berry only 1-seeded. Albumen fleshy.

6 MYXOPY'RUM. Corolla globose, coriaceous, plicate inside, with a 4-cleft border. Stamens inserted in the middle of the tube, with very short filaments. Ovarium 2-celled. Drupe 1-2-celled, containing 1-4 angular 1-seeded nuts.

7 CHIONA'NTHUS. Calyx 4-parted. Segments of corolla elongated, linear. Stamens inclosed. Style short; stigma trifid. Drupe containing a striated, 1-seeded nut.

8 CHONDROSPE'RMUM. Calyx 4-toothed. Segments of corolla linear, clavate, vertical; throat closed by the anthers. Style short; stigma trifid. Fruit 2-celled, 1 seeded.

TRIBE II.

SYRÍNGEÆ. *Corolla funnel-shaped, or campanulate, 4-5-parted. Stamens 2, short. Fruit capsular, 2-celled.*

9 SYRÍNGA. Calyx tubular, short, 4-toothed. Corolla funnel-shaped, with an elongated tube, and a 4-parted limb. Stamens inclosed. Style filiform; stigma thickish, bifid. Capsule oblong, 2-celled, 2-valved; valves contrary to the dissepiment. Seeds solitary, compressed; with membranous margins.

10 FORSY'THIA. Calyx 4-parted. Corolla sub-campanulate, 4-cleft. Stamens equal in length to the calyx, as well as the style; stigma 2-lobed. Fruit capsular.

11. FONTANE'SIA. Calyx 4-parted. Corolla of 2 petals. Stamens elongated, and stigma bifid. Capsule papery, indehiscent; cells 1-seeded.

TRIBE III.

NOTELÆ'IÆ. *Calyx 4-parted, or 4-cleft. Corolla of 4 petals. Stamens 2. Fruit drupaceous.*

12 NOTELÆ'A. Calyx 4-cleft. Petals ovate, connected by pairs to the filaments at the base. Drupe containing a single chartaceous 1-seeded putamen.

13 LINOCIE'RA. Calyx 4-toothed. Petals linear, connected by pairs to the filaments at the base. Drupe 2-celled.

TRIBE IV.

FRAXINIE'Æ. *Flowers polygamous. Calyx 4-parted, or wanting. Corolla of 4 petals, 4-parted, or wanting. Stamens 2, short; anthers dehiscing externally. Stigma nearly sessile, bifid. Fruit 2-celled, compressed, winged at the top, usually 1-seeded.*

14 FRA'XINUS. Flowers polygamous. Petals wanting. Samara 1-celled.

15 O'RNUS. Flowers hermaphrodite or polygamous. Calyx 4-parted. Petals 4. Samara 2-celled.

Tribe I.

OLIE'Æ. Calyx 4-toothed or 4-cleft. Corolla short, monopetalous, campanulate, urceolate, or funnel-shaped. Stamens 2, with short filaments and erect anthers. Fruit drupaceous.

I. LIGU'STRUM (said to be from *ligo*, to tie, in reference to its flexible branches.) Tourn. inst. t. 367. Lin. gen. no. 9. Schreb. gen. no. 23. Gærtn. fruct. 2. p. 72. t. 92. Juss. gen. p. 106. Lam. ill. 1. t. 7.

LIN. SYST. *Diándria, Monogy'nia.* Calyx short, tubular, 4-toothed. Corolla funnel-shaped, with the tube exceeding the calyx, and the limb 4-parted. Stamens 2, with short filaments, inserted into the tube of the corolla. Style very short; stigma obtuse, bifid. Berry globose, containing 2 chartaceous 1-seeded nuts. Albumen hardish. Embryo inverted.—Shrubs with opposite leaves; and terminal, compound, thyrsoid racemes of white flowers.

1 L. VULGA'RE (Trag. hist. 1005. Lin. spec. 1. p. 10.) leaves elliptic-lanceolate, glabrous; racemes compound, coarctate. ♄. H. Native of Europe, in hedges and woods; common in many parts of Britain. Smith, engl. bot. 764. Curt. lond. t. 300. Œd. fl. dan. 1141. Smidth, æst. baumz. 3. t. 147.

Lam. ill. 1. t. 7. Bull. herb. t. 295. Mill. fig. 162. L. Germánicum, Bauh. hist. 475. The flowers are sweet scented, white at first, but soon changing to a reddish brown. Berries dark purple, almost black.

The common privet, in old English authors, is also called Prim, Print, Primprint, from its regular appearance when clipped. In German, Dutch, Danish, and Swedish, it is called *Liguster;* in French, *Troene;* in Italian, *Ligustro;* in Spanish, *Alhena;* in Portuguese, *Alfena.*

In point of utility and ornament, few shrubs exceed the privet. Its chief use is to form such hedges as are required in divided gardens, for shelter or ornament; and for this purpose the Italian or Evergreen Privet is usually preferred. It bears clipping well, and is not liable to be disfigured by insects; and having only fibrous roots, it robs the ground less than almost any other shrub. It is one of the few plants that will thrive in the smoke of London; it also grows well under the drip of trees. The wood is hard, and fit for timber. From the pulp of the berries a rose-coloured pigment may be prepared. With the addition of alum they dye wool and silk of a good durable green; for this purpose they must be gathered as soon as they are ripe; they continue on the shrub till spring, and in times of scarcity are eaten by different sorts of birds, particularly the bulfinch. The following varieties are in the gardens.

Var. α, leucocárpum. The white-berried Privet.

Var. γ, xanthocárpum. The yellow-berried Privet.

Var. δ, sempervírens. L. Itálicum, Mill. The Italian or Evergreen Privet.

Var. ε, variegàtum. The variegated-leaved Privet. The leaves are edged with white or yellow.

Var. ι, angustifòlium. The narrow-leaved Privet.

Common Privet. Fl. June, July. Britain. Shrub 6-10 feet.

2 L. Sine'nse (Lour. coch. 19.) leaves lanceolate, tomentose; racemes coarctate. ♄. H. Native of China, near Canton. Vahl, enum. 1. p. 35. Branches diffuse. Flowers white. Calyx cup-shaped. Berries very small, brown.

Chinese Privet. Shrub 6-8 feet.

3 L. Japónicum (Thunb. fl. jap. p. 17. t. 1.) leaves oblong-ovate, somewhat acuminated, glabrous; racemes compound; peduncles and pedicels spreading. ♄. H. Native of Japan. Vahl, enum. 1. p. 35. L. latifòlium, Vitm. summ. 1. p. 21. Lin. syst. 56. Branches wrinkled, glabrous. Calyx tubular, truncate. Flowers white. Leaves grooved along the middle above, with a corresponding raised line beneath.

Japan Privet. Shrub 6-8 feet.

4 L. spica'tum (Hamilt. mss. ex D. Don, prod. fl. nep. p. 107.) leaves elliptic, acute, hairy beneath, as well as the branchlets; flowers crowded, almost sessile, spicate, disposed in a thyrse, having the axis very hairy; bracteas minute. ♄. H. Native of Nipaul, on the mountains. Hook. bot. mag. 2921. L. Nepalénse, Wall. in Roxb. fl. ind. 1. p. 151. pl. rar. asiat. 3. p. 17. t. 231. L. lanceolàtum, herb. Lamb. Flowers white. L. vestìtum, Wall. appears to be nothing but a variety of this species; the thyrse is more crowded, more densely hairy, as well as the young leaves, branchlets, &c.

Spicate-flowered Privet. Fl. June, July. Clt. 1823. Shrub 6-8 feet.

5 L. pube'scens (Wall. cat. no. 1742. pl. rar. asiat. 3. p. 44.) leaves lanceolate, acutish, rather glabrous; branches without dots, downy at tops; berries oblong, pruinose, panicled. ♄. H. Native of the Burmese Empire, on Mount Taong Dong.

Downy Privet. Shrub.

6 L. bracteola'tum (D. Don, prod. fl. nep. 107.) leaves ovate-lanceolate, acute, glabrous as well as the branches; flowers disposed in bracteate panicles; peduncles very hairy; bracteoles linear lanceolate. ♄. H. Native of Nipaul. L. Japónicum, Hamilt. mss. Phillýrea bracteolàta, Herb. Lamb. The *L. Japónicum*, Thunb. differs from this, in the leaves being ovate and bluntish, in the flowers being pedicellate, and in the peduncles and pedicels being glabrous.

Bracteolate-flowered Privet. Shrub.

7 L. lu'cidum (Ait. hort. kew. 1. p. 19.) leaves ovate-oblong, acuminated, shining above; panicles thyrsoid, spreading much. ♄. H. Native of China. Sims, bot. mag. 2565. Leaves broad. Flowers white. This tree affords a kind of waxy matter.

Shining Privet, or Wax Tree. Fl. Sept. Oct. Clt. 1794. Tree 10 to 20 feet.

Cult. All species of Privet are of easy culture, and will grow in any kind of soil. Cuttings root without difficulty. *L. lùcidum* requires some protection in severe weather.

II. PHILLY'REA (from *φυλλον, phyllon*, a leaf; shrubs leafy.) Dioscor. Tourn. inst. 367. Lin. gen. no. 19. Vaill. acad. sc. p. 197. t. 13. f. 35-37. Juss. gen. 106. Gærtn. fr. 2. p. 11. t. 92. Vent. tabl. 2. p. 313. Lam. ill. 1. t. 8.

Lin. syst. *Diándria, Monogy'nia.* Calyx small, tubular, 4-toothed, permanent. Corolla short, campanulate, rotate, 4-cleft, deciduous. Stamens a little exserted; with short filaments. Style simple; stigma thickish. Drupe globose, containing a 2-celled nut; one of the cells usually abortive. Seed solitary in each cell. Albumen rather farinaceous or fleshy.—Evergreen shrubs and trees. Leaves opposite. Racemes axillary. Flowers greenish-white. Drupes black, globose.

1 P. angustifòlia (Lin. spec. 1. p. 10. Vahl, enum. 1. p. 36.) leaves linear-lanceolate, quite entire. ♄. H. Native of Italy and Spain. Lam. ill. t. 8. f. 3. P. oblìqua, Tenore, syll. p. 9. P. mèdia, Tenore. fl. nap. 3. p. 6. Branches beset with elevated dots. Leaves obsoletely veined.

Var. α, lanceolàta (Ait. hort. kew. 1. p. 11.) leaves lanceolate; branches erect. ♄. H. P. no. iv. Clus. hist. 1. p. 52.

Var. β. rosmarinifòlia (Ait. hort. kew. 1. p. 11.) leaves lanceolate-subulate, elongated; branches straight. ♄. H. P. no. v. Clus. hist. 1. p. 52. *Rosemary-leaved Phillyrea.*

Var. γ, brachiàta (Ait. hort. kew. 1. p. 11.) leaves oblong-lanceolate, shorter than in the other varieties; branches divaricate. ♄. H. *Dwarf Phillyrea.*

Narrow-leaved Phillyrea. Fl. May, June. Clt. 1597. Shrub 8-10 feet.

2 P. me'dia (Lin. spec. p. 10.) leaves lanceolate, quite entire, or a little serrated in the middle, triple-nerved, veiny. ♄. H. Native of the south of Europe. Kerner, t. 774. P. latifòlia, var. ε, mèdia, Lapeyr. pl. pyr. p. 4. P. ligustrifòlia, Mill. dict. no. 4. P. læ'vis, Tenore, syll. p. 9. P. latifòlia, var. α, ligustrifòlia, Poll. pl. ver. 1. p. 7.

Var β, virgàta (Ait. hort. kew. 1. p. 11.) leaves lanceolate, branches erect. ♄. H.

Var. γ, buxifòlia (Ait. hort. kew. 1. p. 11.) leaves oval-oblong, bluntish. ♄. H.

Intermediate or Lance-leaved Phillyrea. Fl. May, June. Clt. 1597. Shrub 10-15 feet.

3 P. ligustrifòlia (Ait. hort. kew. 1. p. 11.) leaves oblong-lanceolate, sub-serrated in the middle, obsoletely-veined; branches erect. ♄. H. Native of the south of Europe, as of Spain and the south of France. P. virgàta, Willd. enum. 1. p. 12. P. mèdia var. α, Willd. spec. 1. p. 42. Phillýrea, iii. Clus. hist. p. 52.—Lob. icon. 2. p. 131. Very like *P. péndula*, Ait.

Privet-leaved Phillyrea. Fl. May, June. Clt. 1596. Shrub 10-15 feet.

4 P. pe'ndula (Ait. hort. kew. 1. p. 11.) leaves oblong-lanceolate, acute, obsoletely serrated at the apex, veiny; branches

drooping. ♄. H. Native of the south of Europe. P. mèdia, γ, Willd. spec. 1. p. 43.

Drooping Phillyrea. Fl. May, June. Clt. 1597. Shrub 10-15 feet.

5 P. oleæfòlia (Ait. hort. kew. 1. p. 11.) leaves oblong-lanceolate, almost quite entire, obtuse, narrowed at the base, veiny. ♄. H. Native of the south of Europe. P. mèdia, δ, Ait. hort. kew. 1. p. 11. P. racemòsa, Link. jahrb. 1. p. 160. —Plukn. t. 310. f. 5. Branches erectish.

Olive-leaved Phillyrea. Fl. May, June. Clt. 1597. Shrub 10-15 feet.

6 P. læ'vis (Ait. hort. kew. 1. p. 12.) leaves elliptic-oblong, almost entire, veiny, bluntish. ♄. H. Native of the south of Europe, and north of Africa. P. latifòlia, var. α, Willd. spec. 1. p. 43.—Lob. icon. 132. f. 2.—Duh. arb. t. 125. P. latifòlia, Mill. dict. no. 1. Leaves an inch or more long, a little narrowed at the base, blunt, with a small mucrone at the apex.

Smooth Phillyrea. Fl. May, June. Clt. 1597. Shrub 10 to 20 feet.

7 P. latifòlia (Lin. spec. 10.) leaves ovate, rounded at the base, serrated, veiny. ♄. H. Native of the south of Europe. Smith, fl. græc. t. 2. P. latifòlia, β. serràta, Poll. fl. ver. 1. p. 7. P. latifòlia, β, Ten. fl. nap. 3. p. 6. P. spinòsa, Ten. syll. p. 9. no. 2. P. latifòlia, β, spinòsa, Seg. ver. 2. p. 273. Young leaves subcordate at the base.

Broad-leaved Phillyrea. Fl. May, June. Clt. 1597. Tree 23 to 30 feet.

8 P. oblìqua (Ait. hort. kew. 1. p. 12.) leaves lanceolate-oblong, serrated, acute at both ends, veiny, bent obliquely. ♄. H. Native of the south of Europe. P. latifòlia, γ, Willd. spec. 1. p. 43. P. coriàcea, Link. jahrb. 1. p. 155. Phillýrea, ii. Clus. hist. l. c. Leaves like those of *Myrìca*.

Oblique-leaved Phillyrea. Fl. May, June. Clt. 1597. Shrub 10 to 20 feet.

9 P. spinòsa (Mill. dict. no. 3. Ait. hort. kew. 1. p. 12.) leaves ovate-oblong, rounded at the base, acute, sharply and cuspidately serrated, glabrous, flat, veiny. ♄. H. Native of the south of Europe. P. ilicifòlia, Willd. enum. 1. p. 13. P. latifòlia, β, spinòsa, Willd. spec. 1. p. 43. P. latifòlia, longifòlia, Link. jahrb. 1. p. 54. Phillýrea, i. Clus. hist. 51.—Pluk. phyt. t. 310. f. 4.

Spiny or Holly-leaved Phillyrea. Fl. May, June. Clt. 1597. Shrub 10 to 20 feet.

10 P. strícta (Bertol. fl. ital. p. 43.) leaves all flat, elliptic; superior ones bluntly serrated; extreme branches twiggy; racemes dense-flowered, drooping; peduncles shorter than the leaves; drupe obtuse, umbilicate. ♄. H. Native of Bononia. P. latifòlia, Maur. cat. 13. p. 36. P. latifòlia, Ten. fl. nap. 3. p. 6. syll. p. 9. no. 1.

Straight Phillyrea. Shrub.

Cult. The species of this genus were cultivated very early in our gardens; these were formerly either planted against walls, to which they were trained, to cover them; or, if they were placed as standards, their branches were clipped into various forms, like other evergreen trees of that day; but they are now used to form clumps in parks, to plant round the borders of woods, or to stand singly on lawns, where they have a very fine effect in winter, when other trees are destitute of leaves. They are generally increased by layering down branches in autumn.

III. O'LEA (ελαια, *elaia*, the olive, which is itself, from λειος, *leios*, smooth. Olea is commonly used for the tree; Oliva for the fruit; and Oleum for the oil of the fruit; but this is not constant.) Tourn. inst. t. 370. Lin. gen. no. 20. Vaill. mem. par. 1722. Juss. gen. 105. Gærtn. fruct. 1. t. 93. Lam. ill. 1. t. 8. Vent. tabl. 2. p. 312. and 4. p. 101. t. 9. f. 1.

Lin. syst. *Diándria*, *Monogy'nia*. Calyx small, tubular, 4-toothed, permanent. Corolla funnel-shaped, with a short tube, and 4 ovate segments, deciduous. Stamens 2, a little exserted. Style short; stigma bifid, with emarginate or entire segments. Drupe containing a 1-2-celled, 1-2-seeded, oblong nut; one of the cells often abortive. Albumen fleshy.—Evergreen trees, with opposite leaves; and axillary and terminal panicles of small white flowers.

1 O. olea'ster (Hoffmansegg, fl. port. 1. p. 387.) leaves oblong, mucronate, quite entire, hoary beneath while young; branches spinescent. ♄. F. Native of Portugal, in the vicinity of Lisbon, and other parts of that kingdom; south of France, Spain, and Italy. O. Europæ'a, var. α, Lin. spec. 1. p. 11. Vahl. enum. 1. p. 44. Sibth. et Smith, fl. græc. 1. t. 3. Stev. and Church, med. bot. 1. t. 15. O. Europæ'a commùnis, Ait. hort. kew. 1. p. 13. Lin. hort. cliff. 4. O. sylvéstris, Mill. dict. no. 3. —Blackw. icon. t. 213. Branches rather quadrangular, hoary. Leaves green above, and with a few scattered scales beneath. The leaves are shorter and stiffer than the cultivated olive; and the fruit small, and of no value.

Wild Olive. Fl. June, Aug. Clt. 1821. Shrub 4 to 5 feet.

2 O. satìva (Hoffmansegg. fl. port. 1. p. 388.) leaves lanceolate, mucronate, quite entire, hoary beneath; branches angular, but not spinescent. ♄. H. Native of the south of Europe. O. Europæ'a, Lin. spec. 1. p. 11. Vahl. enum. 1. p. 39. Brot. fl. lus. 1. p. 10. All. pedem. 1. p. 121. no. 449. Wulf. in Rœm. arch. 3. p. 311. Woodv. med. bot. p. 369. t. 136. Plenck, icon. t. 11. O. Europæ'a longifòlia, Lodd. bot. cab. 456. O. lancifòlia, Mœnch. O. polymórpha, Risso. Leaves long-lanceolate, green above; and hoary from small scales beneath.

The cultivated olive is said to have come originally from Asia, and grows abundantly about Aleppo and Lebanon. It is naturalized in different parts of the south of France, Spain, and Italy; and is found in hedges and woods. The var. *longifòlia* is that chiefly cultivated in the south of France and Italy; var. *latifòlia* is chiefly cultivated in Spain; its fruit is near twice the size of the common Olive of Provence or Italy, but the oil is so rank of flavour as to be too strong for most English palates. The oil, and fruit in a pickled state, are chiefly from Languedoc. Leghorn, and Naples, to England; the best oil is from Leghorn, and the best pickles from Genoa and Marseilles. The tree is branchy, and of so great longevity, that some plantations in Italy, as at Terne, are supposed to have existed from the time of Pliny. It delights in schistous, calcareous steeps, and does not thrive in elevated situations, or at a distance from the sea. The best oil is produced from fruit grown in calcareous soils. Olive oil may be said to form the cream and butter of Spain and Italy; and the tree has been celebrated in all ages, as the bounteous gift of heaven, and as the emblem of peace and plenty. In Gibbon's Decline and Fall, chap. i. he quotes Pliny for the following fact. The Olive, in the Western World, followed the progress of peace, of which it was considered as the symbol. Two centuries after the formation of Rome, both Italy and Africa were strangers to that useful plant; it was naturalized in those countries, and at length carried into the heart of Spain and Gaul. Its usefulness, the little culture it requires, and the otherwise barren situations which it renders productive, quickly spread it over the western face of the Appenines. The suckers are removed from the parent tree at all seasons, but is best done in spring and autumn, when the grounds are ploughed, and sometimes if the trees are thinly scattered, sown with corn and lupines, otherwise the earth is merely loosened round the roots, and, in some cases, manure is then laid round them. The young Olive plant bears at 2 years

old; in 6 years it begins to repay the expense of cultivation, even if the ground is not otherwise cropped; after that period, in good years, the produce is the surest source of wealth to the farmer, as the tree rivals the oak in longevity; so that the common proverb here is, that if you want to leave a lasting inheritance to your children, plant an Olive. There is an old Olive tree near Gerecomio, which last year yielded 240 English quarts of oil; yet its trunk is quite hollow, and its empty shell seems to have barely enough hold in the ground to secure it against mountain storms. *Maria Graham's Three Months near Rome*, p. 49. The culture of the Olive abroad may be said to resemble that of grass orchards in Britain. It is propagated by suckers, large cuttings, or truncheons, planted in trenches, four feet deep, into which it is still the custom to deposit stones for encouraging moisture about the roots, as described by Virgil (Georg. ii. 346.) It is also propagated by chips of the root, in the following manner. An old tree is cut down, and the stock is cut into pieces of nearly the size and shape of a mushroom, and which, from that circumstance, are called novoli. Care is taken that each novolo shall have a small portion of bark. After being dipped in manure, the novoli are planted thick in a bed, and covered with earth to the depth of three inches; they soon throw up shoots, and are transplanted at the end of one year, and in three more are fit to be finally removed to the Olive plantation. With protection against frost, it may be maintained against a wall in the latitude of London. In Devonshire some trees have stood many winters as standards, though without ripening their fruit.

Olive oil is drawn from the Olives in Provence and Italy, by presses or mills. The fruit is gathered, when at the utmost maturity, in November, when it begins to redden. They are put under the mill as soon as gathered; and care is taken that the mill-stones are set at such a distance, that they do not crush the nut of the olives. The pulp covering the stone, and containing the oil in its cells, being thus prepared, is put into bags made of rushes, and moderately pressed; and thus is obtained, in considerable quantity, a greenish, semi-transparent oil, which, from its superior excellence, is called Virgin oil. The marc remaining after the first pressure is broken to pieces, is moistened with water, and returned to the press, upon which there flows out a mixture of oil and water, which spontaneously separates from the rest. This oil, though inferior to the former, is of good quality, and fit for the table. The marc is again broken to pieces, soaked in water, and fermented in large cisterns, and is again submitted to the press, by which is obtained a third oil, that is valuable to the soap-boiler and other manufacturers. The Spanish Olives, instead of being gathered, are beaten down, so that the ripe and unripe ones are mixed; and to these are added such as have fallen of themselves, and are, therefore, more or less decayed. All these are thrown together in a heap, and soon ferment. The olives in this state are ground and pressed, and thus is produced, with little trouble, a large quantity of oil, of a rank and disagreeable flavour. It is possible that the Spaniards derive the process from the Moors. We find the same method described in Jackson's History of Morocco. The best oil comes from Provence; but that which we have in this country is generally from Lucca and Florence. When recently drawn, virgin oil has a bland, almost mucilaginous taste, with a slight, but agreeable flavour; it freezes at about 36 or 38° Fahr., and this disposition to freeze, renders it improper for lamps. The oil is sometimes adulterated with the oil of poppy-seed, and soon becomes rancid.

Pickled Olives are prepared from unripe fruit, by repeatedly steeping them in water, to which quicklime, or any alkaline substance, is sometimes added, to shorten the operation. Afterwards they are soaked in pure water, and then taken out and bottled in salt and water, with or without an aromatic. They are eaten abroad as a whet before, and during the principal meals, and in this country chiefly as a dessert. They are supposed to excite appetite, and promote digestion. The finest kind of the prepared fruit is called by the merchants Picholini, after one Picholino, an Italian, who first discovered the art of pickling Olives.

Medical properties and uses.—The medicinal properties of olive oil are those of a demulcent, emollient, and laxative. In catarrh, and other pulmonary affections, it has been used as a demulcent, in the form of an emulsion; but the oil of almonds is more generally employed. It is occasionally recommended to be internally administered for worms, and to lubricate and sheath the mucous membrane of the stomach from the action of acid poisons. Olive oil enters into the composition of plasters, liniments, cerates, ointments, and enemas. It is applied externally to prevent the contagious influence of the plague.

Var. β, *longifòlia* (Ait. hort. kew. 1. p. 13.) leaves linear-lanceolate, flat, silvery beneath. ♄. F. Native of the south of Europe. Lodd. bot. cab. t. 456. O. Gállica, Mill. dict. no. 1. The inhabitants of the south of France chiefly cultivate this variety, from which they make the best oil. The young fruit is also most esteemed when pickled. Of this there are several sub-varieties. The long-leaved European Olive.

Var. γ, *ferrugínea* (Ait. hort. kew. 1. p. 13.) leaves lanceolate, acute at both ends, shining and rusty beneath; panicles lateral. ♄. F. Native of the Cape of Good Hope and the Mauritius. Perhaps a distinct species.

Var. δ, *latifòlia* (Ait. hort. kew. 1. p. 13.) leaves oblong, flat, hoary beneath. ♄. F. Native of the south of Europe. O. Hispánica, Mill. dict. no. 2. O. satìva, Bauh. pin. 472.—Blackw. t. 199. O'lea, Dodon. pempt. 821. This variety is chiefly cultivated in Spain. The fruit is almost twice the size of the Provence olive, or *Var.* β, *longifòlia*, but of a strong rank flavour; and the oil is too strong for most English palates.

Var. ε, *oblìqua* (Ait. hort. kew. 1. p. 13.) leaves oblong, bent obliquely, pale beneath. ♄. F. Native of the south of Europe.

Var. ζ, *buxifòlia* (Ait. l. c.) leaves oblong-ovate; branches spreading, divaricate. ♄. F. Native of the south of Europe.

Var. η, *Cajetàna* (Pentagn. istit. 2. p. 19.) leaves ovate-lanceolate; flowers racemose. ♄. F. Native of the south of Europe.

* *The following are the varieties of olive cultivated in Spain, and described in Herrera agricult. gen.* 1818. *p.* 351. *by Don Roxas Clemente y Rubio.*

Var. 1. *ovàta* (Clem. l. c.) leaves small; fruit small, obovate.

Var. 2. *ovàlis* (Clem. l. c.) leaves small; fruit oval, small, very black. Ol. Eur. ovàta, Gouan.

Var. 3. *tènax* (Clem. l. c.) leaves narrow, hardly silvery on the back; fruit tough.

Var. 4. *argéntea* (Clem. l. c.) leaves middle-sized, silvery beneath, but green and shining above; fruit globose, middle-sized, very black. O. Europ. præ'cox. Gouan.

Var. 5. *Arolénsis* (Clem. l. c.) leaves obtuse, narrow, less intensely green and shining above, and narrower than in no. 8. Fruit rounder, black, mottled with white and violaceous marks.

Var. 6. *pomifórmis* (Clem. l. c.) fruit globose, larger than any other variety, very black. Leaves broader and smoother than in no. 9. O. Europ. sphæ'rica, Gouan.

Var. 7. *regàlis* (Clem. l. c.) branches less vertical than in no. 9.; leaves larger, having the nerves more prominent. Fruit form of a filbert, black, more globose than in no. 9. Ol. Europ. Hispánica, Roz.

Var. 8. *Hispalénsis* (Clem. l. c.) wood less hard and more white than in no. 1., and the leaves are more lucid beneath, and broader, and the branches are longer and more erect. Fruit of a dark violet colour, cherry shaped. O. Europæ'a règia, Roz.

Var. 9. *máxima* (Clem. l. c.) trunk and branches as in no. 7. Leaves larger than any of the other varieties, not very green, but with manifest veins. Fruit large, acuminated. O. Europ. amygdalìna, Gouan.

Var. 10, *ceratocárpa* (Clem. l. c.) fruit more or less arched, sometimes semicircular, an inch and more long, but never thick. O. Europ. odoràta, Gouan.

Var. 11, *rostràta* (Clem. l. c.) branches and leaves as in no. 9. Fruit not much acuminated, nor very black; long and middling thick.

Var. 12, *empéltre* (Arias) trunk dwarf, with smooth bark. Leaves pale green, rather broad.

Var. 13, *hérbequin* (Arias.) dwarf, with pendulous branches.

Cultivated Olive. Fl. Ju. Aug. Clt. 1570. Tr. 20 to 30 ft.

2 O. la'ncea (Vahl, enum. 1. p. 40. Lam. ill. 1. p. 29.) leaves narrow-lanceolate, acuminated, quite entire, of the same colour on both surfaces; racemes panicled, terminal. ♄. S. Native of the Isle of France. Branches dotted. Drupe oblong, acute. Blum., in his bijdr. p. 682., says the leaves have depressed glands in the axils of the veins beneath. O. exasperàta, Willd. enum. suppl. hardly differs from this, unless in the leaves being less acute and a little larger.

Lance-leaved Olive. Fl. Jul. Aug. Clt. 1819. Tr. 20 ft.

3 O. America'na (Lin. syst. 57. mant. 24. Vahl. enum. 1. p. 41.) leaves elliptic-lanceolate; thyrse rather compound, axillary, narrow; bracteas ovate, permanent, connate. ♄. H. Native of Carolina, Florida, &c. Michx. hist. arb. amer. 3. t. 6.—Catesb. car. 1. t. 61. Branches rather tetragonal. Leaves 4 inches long, rather coriaceous, shining. Flowers by threes, almost sessile. Fruit purple, globose, containing an edible nut. Corolline segments revolute. Perhaps a distinct genus.

American Olive. Fl. June. Clt. 1758. Tree.

4 O. Cape'nsis (Lin. spec. 11. Thunb. fl. cap. 1. p. 39.) leaves oblong; flowers disposed in racemose, terminal panicles. ♄. G. Native of the Cape of Good Hope. Ker. bot. reg. 613. O. buxifòlia, Mill. dict. Branches rather tetragonal, from decurrent lines. Leaves coriaceous, dense, and rigid, decussate, always paler beneath. Corollas white. Drupe rather wrinkled, size of a pea.

Var. β, *coriàcea* (Ait. hort. kew. 1. p. 13.) leaves ovate-oblong, stiff, flat; petioles red. ♄. G.—Dill. hort. elth. 193. t. 160. f. 194.—Burm. afr. p. 234. t. 81. f. 2.

Var. γ, *undulàta* (Ait. l. c.) leaves elliptic, waved; petioles green. ♄. G. O. undulàta, Jacq. hort. schœnbr. 1. t. 2. Lodd. bot. cab. 379. O. laurifòlia, Lam. ill. 1. p. 29.—Burm. afr. 233. t. 81. f. 1.

Cape Olive. Fl. June, Sept. Clt. 1730. Tree tall.

5 O. exce'lsa (Ait. hort. kew. 1. p. 14. ed. 2. 1. p. 22.) leaves elliptic, acute; bracteas perfoliate: lower ones cup-shaped and permanent, superior ones large, foliaceous, and deciduous. ♄. F. Native of Madeira. Vahl, symb. 3. p. 3. enum. 1. p. 42. O. exasperàta, Jacq. hort. schœnbr. 3. t. 252. Branches rough from small tubercles. Leaves 2-3 inches long and 1½ broad, sometimes 3 in a whorl, paler beneath. Panicles trichotomous, many-flowered. Flowers rather large. Drupe oval, size of a pea, purplish brown.

Tall Olive. Fl. May. Clt. 1784. Tree.

6 O. ape'tala (Vahl, symb. 3. p. 3. but not of Andr. Endlicher, prod. fl. ins. norf. p. 56.) racemes axillary, shorter than the leaves. ♄. G. Native of Norfolk Island. Bauer, ill. pl. ins. norf. t. 172.

Apetalous Olive. Shrub.

FIG. 8.

7 O. fra'grans (Thunb. fl. jap. p. 18. t. 2.) leaves elliptic-lanceolate, a little serrated; pedicels 1-flowered, axillary, and lateral, aggregate from scaly buds. ♄. G. Native of Japan, China, and Cochinchina. Vahl, enum. 1. p. 43. Sims. bot. mag. t. 1552. Osmánthus frà-grans, Lour. coch. p 29. Moksei, Kæmpf. amœn. 5. p. 844. Quaifa, Osb. itin. engl. ed. 2. p. 14. Branches and branchlets trichotomous. Leaves 2 inches long, acuminated, shining above and pale beneath. This tree is cultivated much in China, Cochinchina, and Japan in the gardens, for the sake of its sweet-scented flowers, which are said to be put into teas to give them flavour. Flowers yellowish or almost white. (f. 8.)

Fragrant Olive. Fl. June, Aug. Clt. 1771. Sh. 6 to 10 ft.

8 O. panicula'ta (R. Br. prod. p. 528.) leaves lanceolate-elliptic, acuminated, quite entire; ultimate peduncles of the panicle 3-flowered. ♄. G. Native of New South Wales; and of New Holland, within the tropic.

Panicled-flowered Olive. Fl. July. Clt. 1825. Tree 10 ft.

9 O. Heynea'na (Wall. cat. no. 2823.) leaves broad, oblong, acuminated, attenuated at the base, repandly toothed; peduncles lateral and axillary, solitary, trichotomous, each fork or branch bearing almost sessile flowers at the apex; fruit oblong. ♄. G. Native of the East Indies.

Heyne's Olive. Shrub or tree.

10 O. compa'cta (Wall. cat. no. 2819.) leaves elliptic, acuminated, glabrous, quite entire; panicle thyrsoid, terminal, glabrous; flowers crowded. ♄. G. Native of Kamaon and Sirmore. Tube of corolla hardly longer than the calyx. Perhaps a species of *Ligústrum*.

Compact Olive. Shrub or tree.

11 O.? grandiflòra (Wall. cat. no. 2820.) leaves ovate, acuminated, quite entire, glabrous; branchlets warted; panicles thyrsoid, terminal, downy; corolla funnel-shaped. ♄. G. Native of Nipaul. Phillýrea grandiflòra, Wall. herb. Perhaps a species of *Ligústrum*.

Great-flowered Olive. Tree.

12 O. salicifòlia (Wall. cat. no. 2821.) glabrous, leaves lanceolate, acuminated, quite entire, rather glaucous; panicles axillary and terminal. ♄. G. Native of Silhet, on the mountains.

Var. β; leaves broader, obovate-lanceolate, acuminated, sometimes furnished with 1 or 2 teeth on each side. ♄. S. Native along with the species.

Willow-leaved Olive. Shrub or tree.

13 O. Lindle'i (Wall. cat. no. 6305.) glabrous; branches warted; leaves lanceolate, attenuated at both ends; panicles thyrsoid, terminal, downy. ♄. G. Native of Silhet. Calyx small, obsoletely toothed. Corolla funnel-shaped, with a longish tube.

Lindley's Olive. Shrub.

14 O. attenua'ta (Wall. cat. no. 2839.) glabrous; leaves ovate-oblong, entire, acuminated, or obovate, coriaceous, pale beneath; panicles terminal, divaricate; corolla spreading, 4-petalled; fruit oblong. ♄. G. Native of the Burman empire, on the banks of the river Martaban.

Attenuated-leaved Olive. Shrub or tree.

15 O. clava'ta; leaves ovate-oblong, entire, smooth; branches drooping; panicles terminal. ♄. G. Native of China. Phillýrea paniculàta, Roxb. fl. ind. 1. p. 100. O.

Roxburghiàna, Spreng. 1. p. 34, but not of Rœm. et Schultes. Leaves glaucous beneath. Drupe obliquely obovate, size of a French bean, containing a solitary nut and the rudiment of another. Stigma entire, clavate. Corolla funnel-shaped, small, white. Very like a species of *Ligústrum*.

Clavate-stigmaed Olive. Tree 20 feet.

16 O. CUSPIDA'TA (Wall. cat. no. 2817.) glabrous; leaves oblong-lanceolate, attenuated at both ends, cuspidate at the apex, rusty beneath; panicles terminal and axillary. ♄. G. Native of Kamaon.

Cuspidate Olive. Shrub or tree.

17 O. MARÍTIMA (Wall. cat. no. 2813.) glabrous; leaves ovate, acuminated, coriaceous, sometimes repandly toothed; panicles terminal, thyrsoid. ♄. S. Native of Singapore and Malacca.

Sea-side Olive. Shrub or tree.

18 O. ROBU'STA (Wall. cat. no. 2822.) leaves ovate-oblong, entire, acuminated, glabrous; panicles terminal, large and spreading, villous. ♄. S. Native of Silhet, where it is called *Bhooee-moora* by the natives, whom it furnishes with very hard durable wood. Philly'rea robústa, Roxb. fl. ind. 1. p. 101. Young roots dotted with whitish specks. Panicle villous. Stigma emarginate. Berries subcylindrical.

Robust Olive. Fl. June, July. Clt. 1824. Tree large.

19 O. GLANDULÍFERA (Wall. cat. no. 2811.) glabrous; leaves elliptic-oblong, long-acuminated, entire; panicles terminal and axillary. ♄. G. Native of Nipaul and Kamaon, &c.

Gland-bearing Olive. Shrub or tree.

20 O.? PAUCIFLÒRA (Wall. cat. no. 2812.) leaves broad-elliptic, rounded at both ends, or attenuated at the base, rather rusty beneath; panicles axillary and terminal: having the outer divisions of the panicle 2-flowered. ♄. S. Native of Penang. Leaves sometimes attenuated at both ends, and acuminated.

Few-flowered Olive. Tree.

21 O. ACUMINA'TA (Wall. cat. no. 2809.) glabrous; leaves oblong-lanceolate, acuminated, quite entire, attenuated at both ends; fascicles of flowers axillary; pedicels 1-flowered, rising from scaly buds; petals narrow. ♄. S. Native of Sirmore, Penang, Nipaul, Silhet, &c. Fruit oblong. Perhaps a species of *Notelæ'a*.

Acuminated-leaved Olive. Tree 20 feet.

22 O. MICROCA'RPA (Vahl, enum. 1. p. 43.) leaves elliptic, acuminated, serrated; racemes terminal. ♄. G. Native of Cochin-china. Philly'rea I'ndica, Lour. coch. p. 19. *O. rígida*, Hort. cels. A middle-sized, much-branched tree, with spreading, twisted branches. Leaves small, glabrous, reflexed. Drupe small, round, black.

Small-fruited Olive. Shrub or tree.

23 O. ROXBURGHIA'NA (Rœm. et Schultes, syst. 1. p. 77.) leaves oblong, quite entire, glabrous; panicles axillary and extra axillary; bracteas deciduous; lobes of stigma divaricate. ♄. G. Native of the Circar mountains. O. paniculàta, Roxb. fl. ind. 1. p. 104. but not of R. Br. Leaves waved. Segments of corolla oblong, concave: with sharp, incurved points. Leaves 5 inches long and 2 broad.

Roxburgh's Olive. Fl. Aug. Sept. Clt. 1820. Tree small.

24 O. DIOÍCA (Roxb. fl. ind. 1. p. 105.) leaves oblong, serrated; panicles axillary; flowers dioecious. ♄. G. Native of Silhet and Chittagong; in the former country it is called *Atta-jam*. Tetrapìlus brachiàtus, Lour. coch. p. 611.? Leaves tapering to both ends, smooth, 4-8 inches long, and 2-4 broad. Female flowers without a corolla. Drupe, in size and colour, much like a common sloe. This olive grows to a pretty large tree, the timber of which is reckoned excellent, and put to many uses by the natives.

Dioecious Olive. Fl. Mar. Clt. 1818. Tree 30 to 40 feet.

25 O. WIGHTIA'NA (Wall. cat. no. 2815.) leaves elliptic, attenuated at both ends, acuminated at the apex, distantly toothed from below the middle, glabrous; panicles terminal and axillary, divaricate, glabrous. ♄. S. Native of the East Indies. O. dioíca, var. Wight. herb. Leaves broad, very like those of *O. dioíca*.

Wight's Olive. Tree or shrub.

26 O. VERRUCÒSA (Link. enum. 1. p. 33.) branchlets warted; leaves lanceolate, white beneath; fruit nearly globose. ♄. G. Native of the Cape of Good Hope. O. Europæ'a, Thunb. prod. p. 2. fl. cap. 1. p. 37. O. satìva, var. *a*, verrucòsa, Rœm. et Schultes, syst. 1. p. 69. O. Africàna, Mill. dict.—Burm. afr. p. 237. t. 83. f. 2. Branches somewhat tetragonal at the top. Leaves obtuse, with an acumen, entire, greyish beneath. Panicle ternately compound. Bracteas opposite, deciduous. Drupe size of a pea, hardly fleshy.

Warted-branched Olive. Fl. April, May. Clt. 1814. Tree 40 feet.

Cult. Most of the species of olive are admired for the fragrance of their flowers in our greenhouses. The soil best suited to them is a mixture of peat and loam. Ripened cuttings strike root readily in sand, under a hand-glass, those of the stove species in heat. They may also be increased by grafting on the common privet. *O. oleáster* and *O. satìva* will endure our winters against a south wall.

IV. NORO'NHIA (in honour of C. Noronha, a traveller in Madagascar, Isle of France, &c.). Pet. Th. gen. mad. no. 7. Poir. in nouv. dict. des sc. nat. Bojer, in Hook. bot. misc. 2. p. 167.—O'lea species, Vahl.

Lin. syst. *Diándria, Monogýnia.* Calyx small, 4-cleft, Corolla globular, thick, deeply 4-cleft. Anthers 2, at the bottom of the tube of the corolla, and lying in its substance. Ovarium small, conical, 2-celled, 4-seeded. Style none. Drupe oblong or roundish, containing a 2-celled nut; testa solid. Seed solitary, with a superior radicle? and thick cotyledons, without albumen.—Small trees, with opposite leaves and axillary racemes of flowers.

1 N. CE'RNUA; glabrous; leaves oblong-lanceolate, very blunt, sometimes emarginate; racemes simple, axillary, solitary, twin or tern; flowers drooping. ♄. S. Native of the Mauritius. O'lea cérnua, Vahl, symb. 3. p. 3. O. obtusifòlia, Lam. ill. 1. p. 28. Branches marked with elevated dots. Leaves with reflexed edges. Bracteas ovate, solitary at the base of the pedicels, and twin under each calyx. Flowers twice the size of those of the common olive.

Drooping-flowered Noronhia. Clt. 1816. Tree 20 feet.

2 N. EMARGINA'TA (Poir. l. c. Hook. l. c. t. 88.) leaves obovate, emarginate; racemes axillary. ♄. S. Native of Madagascar. N. chartàcea, Stadm. mss. N. Bìnia, Pet. Th. gen. med. no. 7. O'lea emarginàta, Vahl. enum. 1. p. 42. Lam. dict. 4. p. 545. ill. t. 8. f. 2. Branches glabrous. Leaves 2-4 inches long, glabrous, shining. It is grown in the gardens of the Mauritius, under the name of *Ponai des Indes*. Fruit size of a walnut, edible. There appear to be two species confused under this name, one with coriaceous emarginate leaves, and terminal panicled racemes of flowers; and another with chartaceous emarginate leaves, and axillary racemes of flowers.

Emarginate-leaved Noronhia. Fl. Aug. Sept. Clt. 1825. Tree 20 feet.

Cult. See *O'lea*, above, for culture and propagation.

V. PACHYDE'RMA (from παχυς, *pachys*, thick, and δερμα, *derma*, a skin; berries). Blum. bijdr. p. 682.

Lin. syst. *Diándria, Monogýnia.* Calyx obsoletely 4-toothed. Corolla globose, coriaceous, with a half 4-cleft border. Stamens 2, very short, inserted above the base of the corolla.

Ovarium 2-celled; cells biovulate. Stigma almost sessile, obtuse. Berry nearly dry, 1-seeded. Albumen fleshy. Embryo inverted-—This genus is nearly allied to *O'lea*, but it differs from that genus in the globose corolla, undivided stigma, and baccate fruit.—A tree with opposite leaves, and terminal panicles of flowers.

1 P. Java'nicum (Blum. l. c.) leaves oblong-lanceolate, acuminated, acutish at the base, quite entire, glabrous, rather veiny, on short petioles; panicles terminal, brachiate, length of leaves. ♄. S. Native of Java, in woods on mount Salak, where it is called *Patjar-gunung*.

Java Pachyderma. Tree.

Cult. See *O'lea*, p. 49. for culture and propagation.

VI. MYXOPY'RUM (from *μυξα*, *myxa*, mucus, and *πυρην*, *pyren*, a nut; nuts covered with mucilage). Blum. bijdr. p. 683.

Lin. syst. *Diándria*, *Monogýnia*. Calyx small, quadrifid. Corolla globose, coriaceous, plicate inside; limb quadrifid. Stamens 2, inclosed; filaments very short, inserted in the middle of the tube. Ovarium 2-celled; cells 3-ovulate. Stigma thick, sessile, angular at the side, and bicuspidate at the apex. Drupe coriaceous, 1-2-celled, containing 1-4 angular, 1-seeded nuts, which are covered with mucilage. Albumen horny. Embryo erect.—A climbing shrub, with tetragonal branches; opposite elliptic-oblong, 3-nerved, glabrous leaves, which are sometimes serrated at the apex; and axillary and lateral panicles of flowers. Nearly allied to *Norónhia*.

1 M. nervòsum (Blum. l. c.). ♄. ◡. S. Native of Java, in calcareous places near Kuripan, and at the foot of mount Salak.

Nerved-leaved Myxopyrum. Shrub cl.

Cult. See *O'lea*, p. 49. for culture and propagation.

VII. CHIONA'NTHUS (from *χιων*, *chion*, snow, and *ανθος*, *anthos*, a flower; in reference to the snow white flowers of the species). Lin. gen. no. 21. Juss. gen. 105. Gærtn. fruct. 1. t. 39. Lam. ill. t. 9. f. 2.

Lin. syst. *Diándria*, *Monogýnia*. Calyx small, 4-parted, or 4-toothed. Corolla with a short tube and a 4-parted limb; segments of the limb long and linear. Style hardly any; stigma 2-lobed. Anthers almost sessile. Drupe baccate, containing a striated nut. Seeds albuminous.—Trees, having the branchlets compressed at top. Leaves opposite, simple, entire. Racemes simple or compound, terminal or axillary. Flowers snow white. This genus differs principally in the figure of the segments of the corolla from *O'lea*.

1 C. Virgínica (Lin. spec. p. 11.) racemes terminal; peduncles 3-flowered; flowers pedicellate; leaves lanceolate, glabrous. ♄. H. Native of North America. Lodd. bot. cab. 1204. Duh. arb. 1. p. 165. t. 63.—Catesb. car. 1. t. 68. Leaves resembling those of a laurel; the flowers come out in May, hanging in long bunches, from whence the inhabitants call it *Snow-drop-tree*; and from the corolla being cut into narrow segments they also give it the name of *Fringe-tree*. Drupe purplish.

Var. α, *latifòlia*; leaves ovate-elliptic, having the nerves downy beneath. ♄. H. Native of Carolina.—Catesb. car. t. 69.—Kern. t. 607. Leaves oval-lanceolate, coriaceous, glabrous; panicles dense; drupes oval. Pursh, fl. amer. sept. 1. p. 8.

Var. β; *angustifòlia* (Ait. hort. kew. ed. 2. vol. 1. p. 23.) leaves lanceolate, glabrous. ♄. H. Ch. trífida, Mœnch.

Var. γ, *marítima* (Pursh. fl. amer. sept. 1. p. 8.) leaves obovate-lanceolate, membranous, pubescent; panicles very loose; drupes elliptic. ♄. H. Native of North America, by the seaside.

Virginian Fringe-tree. Fl. May, July. Clt. 1796. Tree 10 to 30 feet.

2 C. axilla'ris (R. Br. prod. p. 523.) spikes axillary, very short; leaves oblong-elliptic, acute. ♄. G. Native of New Holland, within the tropic. Flowers white.

Axillary-flowered Fringe-tree. Fl. May, July. Clt. 1810. Shrub.

3 C. incrassa'ta (Swartz, prod. 13. fl. ind. occ. 1. p. 24.) branches of panicle decussate or fastigiate; flowers pedicellate; corollas tetragonal, with erect, thickened segments; leaves oblong. ♄. G. Native of Jamaica, in woods on the mountains. Leaves rather coriaceous, with a short, obtuse acumen. Ultimate peduncles 3-flowered. Corollas white, with terete, subclavate segments.

Thickened Fringe-tree. Tree tall.

4 C. pube'scens (H. B. et Kunth, nov. gen. amer. 3. p. 233.) panicles terminal, short, trifid: with 3-flowered peduncles; corollas red, with linear segments; leaves elliptic-oblong, bluntish, coriaceous, clothed with soft down beneath. ♄. G. Native of New Granada, near Gonzanama, Llanos de Trigo-Bamba, and Salto del Frayle, where it is called *Arupo* by the natives. Panicles rising before the leaves, downy, corymbformed.

Downy Fringe-tree. Fl. Oct. Tree 20 feet.

Cult. The *Ch. Virgínicus* is a fine large ornamental shrub. It thrives best in a moist light loamy soil. It is generally increased by seed received from America; by layering it is difficult, if the soil be not moist. By grafting or budding it on the common ash it succeeds very well. The greenhouse kinds grow freely in a mixture of sand, loam, and peat; and ripened cuttings of them will strike root in sand, under a hand-glass, in a little heat.

VIII. CHONDROSPE'RMUM (from *χονδρος*, *chondros*, a lump, and *σπερμα*, *sperma*, a seed; form of seed). Wall. cat. 2837. and 2838.—Chionánthus species, Wall. in Roxb. fl. ind. 1. p. 108.

Lin. syst. *Diándria*, *Monogy'nia*. Calyx urceolate, 4-toothed; teeth lanceolate, acute, with purple edges. Corolla funnel-shaped, rather fleshy, having a large obscurely 4-sided tube, which is longer than the calyx; and a 4-parted spreading limb, which is longer than the tube; segments linear-clavate, blunt, vertical, and thickened at their apexes; throat closed by the anthers. Stamens 2, inserted above the base of the tube; anthers fleshy, with 2 marginal cells; situated between the 2 opposite fissures of the border, hardly elevated above the tube. Ovarium ovate, 2-celled. Ovulum solitary, inserted by its base?—A rambling evergreen shrub, with ash-coloured, separating bark; large, opposite, 3-nerved leaves; and axillary and terminal, brachiate panicles of small, greenish yellow flowers.

1 C. smilacifòlium (Wall. cat. no. 2837.). ♄. ◡. S. Native of the forests of Chittagong, where it is called *Chunalata*; also of the Burmese empire, on mount Taong Dong, if C. coriàceum, Wall. cat. no. 2838. be the same. Chionánthus smilacifòlia, Wall. fl. ind. 1. p. 108. Ligústrum laurifòlium, Roxb. hort. beng. p. 32. Branches and peduncles 4-sided. Leaves 5-7 inches long, and 3 broad, 3-nerved, coriaceous, pale beneath, undulated, and bullated between the principal nerves; nerves and veins much elevated beneath, and uniting a little above the base. Flowers small, almost scentless. The erect position of the ovula seems to indicate its belonging to the order *Jasmíneæ*. The æstivation of the corolla is valvate.

Smilax-leaved Chondrospermum. Shrub cl.

Cult. For culture and propagation see *O'lea*, p. 49.

Tribe III.

SYRI'NGEÆ. Corolla funnel-shaped or campanulate, 4-parted. Stamens 2, short. Fruit capsular, 2-celled.

IX. SYRI'NGA (*συριγξ*, *syrinx*, a pipe; the branches are long and straight, and are filled with medulla; hence the old name of the lilac, pipe-tree. Linnæus places it among poetical names. The story of the nymph Syrinx in Ovid is well known. The English name of the genus is from lilac or lilag, the Persian word for a flower). Lin. gen. no. 22. Gærtn. fruct. 1. t. 49. Lìlac, Tourn. inst. t. 372. Juss. gen. p. 105. Lìla, Flieder.

Lin. syst. *Diándria*, *Monogýnia*. Calyx small, 4-toothed. Corolla funnel-shaped, with a 4-parted limb. Stamens 2, inclosed. Stigma bifid. Capsule ovate, compressed, 2-celled, 2-valved, 2-seeded; valves navicular, with a narrow dissepiment in the middle.—Shrubs with simple leaves; and thyrsoid terminal panicles of flowers, which are oppositely branched. Flowers purple or white.

1 S. vulga'ris (Lin. spec. 11.) leaves ovate-cordate, acuminated. ♄. H. Native of Persia, and of Hungary, in chalky precipices in the Cverna valley, and mount Domoglet, as well as the whole group of rocks along the Danube. Lam. ill. t. 7. Schmidt, œstr. baum. t. 77. Duham. arb. 2. t. 138. Schkuhr, handb. 1. t. 2. Lìlac vulgàris, Gærtn. Leaves glabrous, shining, broad. The common lilac, now so plentiful in every plantation, was a great rarity in the year 1597.

Var. α, *cærùlea*. The common blue lilac.—Ger. emac. 1399. f. 2.—Clus. hist. 1. p. 56.—Besl. eyst. t. 1. f. 2.—Park. par. 407. t. 409. f. 4. theat. 1467. f. 1.

Var. β, *violàcea*. The common purple lilac. Curt. bot. mag. 183. Mill. fig. t. 163.

Var. γ, *álba*. The common white lilac.

Common Lilac. Fl. May. Clt. 1590. Shrub 8 to 10 feet.

2 S. Emòdi (Wall. cat. no. 2831.) leaves elliptic-oblong, glaucous beneath, attenuated at the base, and acuminated at the apex. ♄. H. Native of Kamaon, towards the Himalaya. Branches warted. Thyrse terminal, panicled. Capsules almost cylindrical. Bud scales permanent at the base of the year's shoots. Flowers apparently purple.

Emodi Lilac. Shrub 8 to 10 feet.?

3 S. Josikæ'a (Jacq. in bot. zeit. 1831. t. 67. Rchb. pl. crit. no. 1049. t. 780.) leaves elliptic-lanceolate, acute, ciliated, wrinkled, glabrous, on short petioles, white beneath. ♄. H. Native of Transylvania. Hook. bot. mag. t. 3278. Lindl. bot. reg. 1733. Flowers purple.

Josika's Lilac. Fl. April, May. Clt. 1832. Sh. 6 to 8 ft.

4 S. Chine'nsis (Willd. spec. 1. p. 48. berl. baum. 498.) leaves ovate-lanceolate. ♄. H. Native of China. S. dùbia, Pers. ench. 1. p. 9. Lilàceum Rothamagénse, Renault, fl. de l'orn. p. 100. S. mèdia, Dum. Cours. 1. p. 709. Flowers purple. An intermediate plant between *S. vulgàre* and *S. Pérsica*. In Belgium there is a hybrid between this and *S. vulgàre*, called *Lilac de Merli*, which is probably *S. Rothamagénsis*, Turp. et Poit. fl. de Par.

FIG. 9.

Chinese Lilac. Fl. May, Ju. Clt. 1795. Sh. 4 to 5 ft.

5 S. Pe'rsica (Lin. spec. 11.) leaves small, lanceolate, entire. ♄. H. Native of Persia. Curt. bot. mag. 486. Mill. fig. 164. f. 1. Lìlac mìnor, Mœnch. Lìlac Pérsica, Lam.—Munting. t. 57.—Pluk. phyt. 227. f. 8. Flowers purple. (f. 9.)

Var. β, *álba*; leaves lanceolate, entire; flowers white.

The White Persian Lilac.

Var. γ, *laciniàta* (Mill. dict. no. 3. fig. t. 164. f. 2.) leaves jagged or pinnatifid; flowers purple. ♄. H. Lin. hort. cliff. 6. Lodd. bot. cab. 1107. Munting, t. 56.—Tourn. inst. 602. S. capitàta, Gmel. itin. 3. p. 304. t. 32. f. 1.—Schmidt, arb. 2. p. 79. The cut-leaved Persian Lilac.

Persian Lilac. Fl. May, June. Clt. 1640. Sh. 4 to 6 ft.

6 S. villòsa (Vahl, enum. 1. p. 38.) leaves oblong, acute at both ends, villous beneath. ♄. H. Native of China, on mountains about Pekin. Thyrse terminal. Perhaps the same as Ligústrum Sinénse, Lour.

Villous Lilac. Shrub.

Cult. The species of *Lilac* are well known elegant shrubs. They are very proper for shrubberies, and are increased very readily by layers, or by suckers from the root.

X. FORSY'THIA (named after William Forsyth, his Majesty's gardener at Kensington; author of Observations on the Diseases of Trees, with an account of a particular method of cure. London, 1791, &c.) Vahl, enum. 1. p. 39.—Syrínga species, Thunb.—Lìlac species, Lam.

Lin. syst. *Diándria*, *Monogýnia*. Calyx 4-parted. Corolla sub-campanulate, quadrifid. Stamens equal in length to the calyx, with short filaments and oblong anthers. Style length of calyx; stigma 2-lobed.—An ascending depending shrub, with tetragonal branches: and oval, serrated, simple, or ternate leaves. Flowers 1-2-3 together, yellow. Calycine segments lanceolate.

1 F. suspe'nsa (Vahl. enum. 1. p. 39.). ♄. F. Native of Japan, where it is often cultivated for the elegance of its flowers. Syrínga suspénsa, Thunb. fl. jap. 19. t. 3. Lìlac perpénse, Lam. dict. 3. p. 515. Réngio, Kœmpf. amœn. 5. p. 907.

Suspended Forsythia. Shrub hanging.

Cult. For culture and propagation see *Bolivaria*, p. 58.

XI. FONTANE'SIA (named after M. Renè Louiche Desfontaines, author of Flora Atlantica, 2 vols. 4to. Paris. 1798-1799, and several other works). Labill. pl. syr. dec. 1. p. 9. t. 1. Lam. ill. 1. t. 22.

Lin. syst. *Diándria*, *Monogýnia*. Calyx 4-6 parted, permanent. Corolla 4-6-parted, deciduous. Stamens 2, elongated. Stigma bifid, hooked. Capsule a 2-4-winged, 2-celled, papery, indehiscent samara; cells 1-seeded.—An evergreen shrub, with lanceolate leaves, and axillary racemes of whitish-yellow flowers. Habit of *Philly'rea mèdia*. This genus seems to be a connecting link between the tribe *Fraxinièæ* and *Olièæ*.

1 F. phillyreoìdes (Labill. syr. dec. 1. p. 9. t. 1.). ♄. F. Native of Syria, between Laodicea and mount Cassius, and of Sicily. Lodd. bot. cab. 1308. Leaves acute at both ends.

Phillyrea-like Fontanesia. Fl. Aug. Clt. 1787. Shrub 10 to 14 feet.

Cult. This shrub will stand in the open air, in a sheltered situation, such as against a south wall, with a little protection in severe winters, although it is generally treated as a greenhouse plant. It may either be increased by cuttings, under a hand-glass, or by layering.

Tribe IV.

NOTELÆ'IÆ. Calyx 4-parted or 4-cleft. Corolla of 4 petals. Stamens 2. Fruit drupaceous or capsular.

XII. NOTELÆ'A (from *νοτος*, *notos*, south, and *ελαια*, *elaia*, an olive; in reference to the genus being allied to *O'lea*, and from its native country). Vent. choix. t. 25. R. Br. prod. p. 527.—Rhyzospérmum, Gærtn. fruct. 3. p. 232. t. 224.

Lin. syst. *Diándria, Monogýnia.* Calyx 4-toothed. Corolla of 4 petals; petals ovate, connected by pairs to the filaments at the base. Stigma bifid. Drupe containing a chartaceous, 1-seeded putamen. Albumen wrinkled.—Small evergreen trees or shrubs, with the habit of olive. Leaves quite entire. Flowers white, in axillary racemes.

1 N. longifòlia (Vent. choix. t. 25.) leaves lanceolate, reticulately veined on both surfaces, more or less downy beneath, dotless; calycine segments unequal; stigma bifid. ♄. G. Native of New South Wales. O'lea apétala, Andr. bot. rep. 316. There are varieties of this shrub with lanceolate, acuminated, and elliptic leaves, which are either smoothish beneath or clothed with copious soft down.

Long-leaved Notelæa. Fl. Mar. June. Clt. 1790. Shrub.

2 N. punctà'ta (R. Br. prod. p. 528.) leaves lanceolate, attenuated at the base, veiny above, quite glabrous, but dotted beneath and obsoletely veined. ♄. G. Native of New Holland, within the tropic.

Dotted-leaved Notelæa. Fl. June, July. Clt. 1826. Sh.

3 N. ova'ta (R. Br. l. c.) leaves ovate, glabrous, without dots; calycine segments equal; stigma sessile, undivided. ♄. G. Native of New South Wales.

Ovate-leaved Notelæa. Fl. June, July. Clt. 1824. Shrub.

4 N. ligu'strina (Vent. choix. t. 456.) leaves narrow-lanceolate, elongated, petiolate, quite glabrous, with simple margins, dotted beneath, having the veins on both sides obsolete. ♄. G. Native of Van Diemen's Land. Racemes length of leaves.

Privet-like Notelæa. Fl. July, Aug. Clt. 1807. Shrub.

5 N. microca'rpa (R. Br. prod. p. 524.) leaves linear-lanceolate, elongated, attenuated at the base, almost sessile, quite glabrous, obsoletely dotted beneath, and having the veins manifest above. ♄. G. Native of New Holland, within the tropic. The drupe in this species is smaller than a pea, while in *N. ligústrina* it is larger.

Small-fruited Notelæa. Shrub.

6 N. Posu'a (D. Don, prod. fl. nep. p. 107.) leaves elliptic-oblong, acuminated; pedicels axillary, drooping, glomerate, 1-flowered; calycine teeth equal; stigma capitate. ♄. G. Native of Nipaul, at Narainhetty. O'lea Posùa, Hamilt. mss. O'lea Buchanàni, Herb. Lamb. Leaves 4-5 inches long, and $1\frac{1}{2}$ or 2 broad.

Posua Notelæa. Shrub.

† *A doubtful species.*

7 N. rígida (Desf. arbr. 1. p. 120.) leaves stiff, broad-lanceolate, quite entire; racemes axillary. ♄. G. Native of Van Diemen's Land, where it was collected during the expedition of Baudin.

Stiff-leaved Notelæa. Fl. July, Aug. Clt. 1821. Shrub.

Cult. The species of this genus thrive well in a mixture of loam and peat; and ripened cuttings root freely under a handglass, in sand.

XIII. LINOCIE'RA (named by Swartz, after Geofroy Linocier, a physician at Tournon, in the Vivaraes; author of L'Histoire des Plantes, Paris, 1584. 12mo.). Swartz in Schreb. gen. no. 1709. p. 178. fl. ind. 1. t. 2. Gærtn. fruct. t. 215. Thouínia, Swartz, prod. 14.—Chionánthus, spec. Jacq. Lin. and Swartz.—Mayèpea, Aubl.—Ceránthus, Schreb. gen. 1. p. 14.

Lin. syst. *Diándria, Monogýnia.* Calyx 4-toothed. Corolla of 4 linear petals, much longer than the calyx, which are connected by pairs to the filaments at the base. Anthers 2, elongated; filaments short. Stigma 2-cleft. Drupe 2-celled; cells 1-seeded.—Evergreen trees, with entire leaves, and trichotomous panicles of white or yellow flowers.

* *Species natives of South America.*

1 L. ligu'strina (Swartz, fl. ind. occ. 1. p. 49.) flowers panicled, pedicellate; petals reflexed; leaves lanceolate. ♄. S. Native of Jamaica and Hispaniola. Vahl, enum. 1. p. 46. Thouínia ligústrina, Swartz, prod. 15. Branches beset with elevated dots. Leaves 2-3 inches long, shining, obtuse at top. Petals obtuse, concave, white.

Privet-like Linociera. Clt. 1820. Tree.

2 L. latifòlia (Vahl 1. p. 46.) flowers panicled, axillary; peduncles 3-flowered; flowers sessile; leaves elliptic, acuminated. ♄. S. Native of St. Domingo and the Antilles. Chionánthus Domingénsis, Lam. ill. 1. p. 30. It differs from the preceding in the leaves being broader, firmer, and less shining and acuminated; in the petals being broader and thinner. Drupe oblong, size of a pea.

Broad-leaved Linociera. Tree.

3 L. glomera'ta (Pohl, pl. bras. 2. p. 98. t. 164.) racemes compound; peduncles many-flowered; flowers sessile; petals linear-lanceolate, hardly broader at the base; leaves oblong, acuminated, glabrous above, but densely clothed with yellowish tomentum beneath in the axils of the nerves. ♄. G. Native of Brazil, in the province of Minas Geraes, in the district of the New Mines, or Minas Novas, among bushes in dry mountainous places. Flowers yellow.

Glomerate-flowered Linociera. Shrub 5 to 8 feet.

4 L. compa'cta (R. Br. prod. p. 523. Ait. hort. kew. ed. 2. vol. 1. p. 23.) racemes compound and decompound; peduncles 3-flowered; flowers almost sessile; petals attenuated, subulate. ♄. S. Native of the West Indies. Chionánthus compácta, Swartz, prod. p. 13. Vahl, enum. 1. p. 44. Chionánthus Caribæ'a, Jacq. coll, 2. p. 110. t. 6. f. 1. Swartz, fl. ind. 1. p. 22. Ceránthus, Schreb. gen. 1. p. 14. Ceránthus Screbèri, Gmel. syst. 1. p. 26.—Pluk. alm. 224. f. 2. Leaves lanceolate-elliptic, acuminated, often a hand long. Calyxes villous. Petals snow white. Anthers acute.

Compact Linociera. Clt. 1793. Tree 15 to 20 feet.

5 L. ? tetra'ndra (R. Br. prod. p. 523.) panicles trichotomous, axillary; flowers pedicellate, tetrandrous; petals ovate, attenuated, subulate; leaves elliptic-lanceolate, acute. ♄. S. Native of Guiana. Chionánthus tetrándra, Vahl, enum. 1. p. 45. Mayèpea Guianénsis, Aubl. guian. 1. p. 81. t. 31. Chionánthus incrassàta, Willd. spec. 1. p. 47. Chion. Guianénsis, Pers. ench. 1. p. 5. Calyx villous. Anthers obtuse. Petals white, concave, terminated by a thread. Fruit size of an olive, violaceous, 1-seeded, bitter. The flowers exhale a grateful scent. Perhaps a genus of *Rhámneæ*.

Tetrandrous Linociera. Shrub 6 to 7 feet.

** *Species natives of Asia.*

6 L. dichótoma (Wall. cat. no. 2825.) racemes axillary, composed of 3-flowered peduncles; leaves large, cuneate-lanceolate, recurved, entire, glabrous. ♄. S. Native of Coromandel. Chionánthus dichótomus, Roxb. fl. ind. 1. p. 107. A smooth, dichotomous shrub. Racemes solitary, shorter than the leaves. Flowers small, white, scentless. Calyx villous. Segments of corolla hardly joined at the base. Drupe ovate or obovate, purple, size of a currant. Albumen none.

Dichotomous Linociera. Shrub 7 to 10 feet.

7 L. ramiflòra (Wall. cat. no. 2824.) panicles ovate, below the leaf-bearing shoots, smooth; leaves broad-lanceolate or oblong, entire, acute, glabrous. ♄. S. Native of the Moluccas. Chionánthus ramiflòrus, Roxb. fl. ind. 1. p. 106. Leaves about 6 inches long. Flowers numerous, small, yellow. Segments of the corolla lanceolate, with incurved edges. Drupe oblong.

Branch-flowered Linociera. Fl. March, April. Tree.

8 L. macrophy'lla (Wall. cat. 2826.) racemes compound, axillary, composed of 3-5-flowered branches or peduncles; leaves elliptic, tapering to both ends, on long subalate petioles, entire, glabrous. ♄. S. Native of Silhet. Leaves 8-10 inches long, and 4-6 broad. Very like *L. ramiflòra*.

Large-leaved Linociera. Tree or shrub.

9 L. Malaba'rica (Wall. cat. no. 2828.) peduncles compound, axillary, aggregate, downy as well as the calyxes, with 3-flowered branches; leaves elliptic, obtuse, short-acuminated, sometimes tapering to the base, coriaceous, glabrous. ♄. S. Native of Malabar. Chionánthus Malabáricus, Herb. Heyne.

Malabar Linociera. Tree or shrub.

10 L. monta'na; racemes compound, axillary, crowded, much shorter than the leaves; leaves elliptic-oblong, acuminated, entire, glabrous. ♄. S. Native of Java, in woods on the mountains of Parang and Salak, where it is called *Kiburiet*. Chionánthus montànus, Blum. bijdr. p. 681.

Mountain Linociera. Tree.

11 L. oblónga (Wall. cat. no. 2843.) peduncles lateral and axillary, trichotomously branched; leaves oblong-lanceolate, acuminated, tapering to the base, pale beneath, glabrous. ♄. S. Native of the Burmese empire, on mount Taong Dong.

Oblong-leaved Linociera. Tree or shrub.

12 L. terniflòra (Wall. cat. no. 2845.) leaves oblong-lanceolate, acuminated, glabrous: having the veins converging at top: acumen obtuse; peduncles racemose, branched, lateral, and axillary: with 3-flowered branches. ♄. S. Native of the Burmese empire, on the banks of the Saluen river.

Tern-flowered Linociera. Tree or shrub.

13 L. cotinifòlia (Vahl, enum. 1. p. 47.) racemes sub-compound; peduncles 3-flowered; flowers pedicellate; leaves villous beneath. ♄. S. Native of Ceylon. Chionánthus cotinifòlia, Willd. spec. 1. p. 47. Chionánthus Zeylánica, Lam. ill. 1. p. 30. t. 9. f. 2. Houtt. syst. 1. p. 204. t. 5. f. 1. Very nearly allied to *L. latifòlia*. Flowers reddish.

Cotinus-leaved Linociera. Clt. 1818. Tree.

14 L. purpu'rea (Vahl, enum. 1. p. 47.) racemes axillary, usually compound; peduncles 3-flowered, drooping; bracteas ovate; petals channelled; leaves obovate-lanceolate or elliptic, tapering at both ends, and are, as well as the calyxes, glabrous. ♄. S. Native of Ceylon. Chionánthus purpùrea, Lam. Chionánthus Zeylánica, Lin. fl. zeyl. no. 14. spec. 11. exclusive of the synonymes. Roxb. fl. ind. 1. p. 107. Thouínia nùtans, Lin. suppl. 89.—Pluk. alm. t. 241. f. 4.—Burm. zeyl. 31. Branches covered with elevated black dots. Leaves $1\frac{1}{2}$-2 inches long, a little attenuated at the base, with a short acute acumen. Petals shorter than in the rest, purplish.

Purple-flowered Linociera. Tree.

15 L.? fla'vicans (Willem. herb. maur. p. 3. Vahl, enum. 1. p. 47.) panicles axillary; petals ovate; leaves obovate, retuse. ♄. S. Native of the Mauritius. Thouínia flávicans, Willemet. Pedicels thickened at top, furnished with 2 minute bracteas at the forks. Calycine segments triangular. Corolla coriaceous, yellow. Petals erect, concave.

Yellowish-flowered Linociera. Shrub.

Cult. See *Notelæ'a* for culture and propagation, p. 52.

Tribe V.

FRAXINIE'Æ. Flowers polygamous. Calyx 4-parted, or wanting. Corolla of 4 petals, 4-parted, or wanting. Stamens 2, short; anthers dehiscing externally. Stigma nearly sessile, bifid. Fruit a 2-celled, compressed samara, winged at the top, usually 1-seeded.

XIV. FRA'XINUS (from φρασσω, *phrasso*, to hedge or enclose; the ash was formerly used for forming hedges). Tourn. inst. 343. Lin. gen. no. 1160. Mich. gen. 107. Juss. gen. 105. Schkuhr, handb. t. 375. Lam. ill. t. 858. Gærtn. fruct. 1. t. 49.

Lin. syst. *Polygàmia, Dioècia.* Flowers polygamous. Calyx none, or 4-parted or 4-toothed. Corolla none. Stamens 2, in the male flowers. Anthers sessile or on short filaments, dehiscing outwardly. Female flowers the same, except that they have no stamens. Stigma bifid. Fruit or samara 2-celled, compressed, winged at top; cells 1-seeded.—Trees with opposite, unequally pinnate, rarely simple leaves; and lateral racemes of greenish-yellow flowers.

* *Flowers naked.*

1 F. exce'lsior (Lin. spec. p. 1509.) leaflets almost sessile, lanceolate-oblong, acuminate, serrated, cuneated at the base; flowers naked; samara obliquely emarginate at the apex. ♄. H. Native of Europe. Willd. spec. 4. p. 1099. Fl. dan. 969. Smith, engl. bot. 1692. Svensk, bot. 175. F. apétala, Lam. fl. fr. Lam. ill. 858. f. 1. F. rostràta, Guss. pl. rar. p. 374.—Blackw. t. 328.—Dodon, penph. 771.—Lob. icon. 2. t. 107. f. 2. F. órnus, Scop. carn. no. 1249. F. apétala, Lam. fl. fr. F. eròsa, Pers. F. crìspa, Bosc. The leaves have generally 5 pairs of leaflets, from 4 to 6. The flowers are produced in loose spikes, from the sides of the branches. There are not only female flowers, and hermaphrodite ones, but also male ones.

The Ash, in German and Dutch, is called *Esche* or *Asche*; in Danish and Swedish, *Ask;* in French, *Le Frene;* in Italian, *Frassino;* in Spanish, *Fresno;* in Portuguese, *Freixo;* in Russian, *Jas*, *Jasen*, or *Jassen*. The English name is from the Saxon Æsa. Ray says it has its name from the colour of the bark. Its usual time of flowering is March and April; of leafing, from April 22d to May 15th. The timber of the ash is next in value to the oak, and in some places equal to it: it is hard and tough, and of excellent use to the coachmaker, wheelwright, and cartwright, for ploughs, axle-trees, fellies, harrows, and many other implements of husbandry; for ladders, oars, blocks for pulleys, &c. Anciently it was in great request for spears. Being not apt to split and scale, it is excellent for tenons and mortises; also for the cooper, turner, and thatcher. Nothing is like it for palisade-hedges, hop-yards, poles and spars, handles and stocks for tools, &c. When curiously veined, the cabinet-makers use it, and call it green Ebony. Of all timber it is the sweetest fuel. If a wood of ash-trees be managed well, it will turn greatly to the advantage of its owner; the underwood will be fit to cut every seven or eight years for hoops, or every 14 years for hop-poles, &c. and still there will be a stock preserved for timber. The best season for felling the ash is from November to February; but, for lopping pollards, the spring is preferable for all soft woods. The ashes of the wood afford a very good potash. The bark is used for tanning cat-skin and nets. In the north of Lancashire they lop the ash, to feed the cattle, in autumn, when the grass is upon the decline. The leaves have been gathered to mix with tea. An infusion of them is an aperient; and a decoction of 2 drachms of the bark, or 6 of the leaves, has been used in the cure of agues. If cows eat the leaves or shoots, the butter from their milk is said to be rank; but this is doubtful, for there is no taste in ash-leaves to countenance the assertion, and this is the next tree, after the elm, which the Romans recommended for fodder. The ash is, however, a very improper tree for hedge rows, and the borders of arable land; the drip of it is very unfavourable to all other vegetable productions; it exhausts the soil much, and the roots spread widely near the surface, so that it injures the hedge, and impoverishes the crop sown near it.

Though the ash be a handsome tree, it should not by any means be planted for protection or ornament, because the leaves

come out late, and fall early. The fertile trees also generally exhaust themselves so much in bearing keys or fruit, that their foliage is scanty, and their appearance unsightly. The trees, however, which bear male flowers only, have a full and verdant foliage, and make a handsome figure, though late in the season. It is well calculated for standards and clumps, in large parks and plantations, and for groves and woods. It will grow in very barren soils, and in the bleakest and most exposed situations. It is so hardy as to endure the sea winds, and may therefore be planted on the coast, where few trees will prosper. If planted by ditch sides, or in low, boggy meadows, the roots act as under-drains, and render the ground about them firm and hard; the timber, however, is in this case of little value. It was natural that our remote ancestors, when the island was overrun with wood, should value trees rather for their fruit than their timber; it is no wonder, then, that by the laws of Howel Dda, the price of an oak or a beech should be 120 pence, while the ash, because it furnished no food for swine, was valued only at fourpence. The Edda or Woden, however, holds the ash in the highest veneration; and man is described as being formed from it. Hesiod, in like manner, deduces his brazen race of men from the ash; and in his Theogony has nymphs of the name of Μελιαι. It is probably owing to the remains of Gothic veneration for this tree, that the country people, in the south-east part of the kingdom, split young ashes, and pass their distempered children through the chasm, in hopes of a cure. They have also a superstitious custom of boring a hole in an ash, and fastening in a shrew mouse; a few strokes with a branch of this tree is then accounted a sovereign remedy against cramps and lameness in cattle, which are ignorantly supposed to proceed from this harmless animal. In many parts of the highlands of Scotland, at the birth of a child, the nurse or midwife puts one end of a green stick of this tree into the fire, and, while it is burning, receives into a spoon the sap or juice, which oozes out at the other end, and administers this as the first spoonful of liquor to the new born babe.

The facility with which the ash is propagated, and adapts itself to any soil or situation, even the worst; the quickness of its growth; and the general demand for the timber, in every part of the country, for a variety of rural and economical purposes; recommend this tree very much to the planter.

The following are the most remarkable varieties of the Common Ash.

Var. β, *péndula;* branches pendulous. ♄. H. Ait. hort. kew. ed. 2. vol. 5. p. 475. The Weeping Ash.

Var. γ, *aúrea;* (Willd. enum. p. 1059.) branches yellow, dotted; leaflets sessile, lanceolate, unequally serrulated, acuminated, cuneated at the base, glabrous. ♄. H. F. aúrea, Pers. ench. 2. p. 604. The yellow-barked Ash.

Var. δ, *críspa;* leaflets dark green, curled. ♄. H. F. críspa, Bosc. F. atrovírens, Desf. arb. 1. p. 104.

Var. ε, *jaspídea* (Willd.) bark and wood marked with veins.

Var. ζ, *argéntea* (Desf. arb.) leaves variegated with white. The silver-striped-leaved Ash.

Var. η, *lùtea;* leaves edged with yellow. The golden-striped-leaved Ash.

Var. ϑ, *eròsa* (Pers. ench. 1. p. 604.) leaflets erosely toothed.

Var. ι, *horizontàlis* (Desf. Pers. l. c.) branches horizontal. The horizontal-branched Ash.

Var. κ, *verrucòsa* (Desf. Pers. l. c.) branches warted. The warted-barked Ash.

Var. λ, *striàta.* The striped-barked Ash.

Var. μ, *fungòsa.* The spongy-barked Ash.

Var. ν, *verticillàta.* The whorled-leaved Ash.

Taller or Common Ash. Fl. March, April. Britain. Tree 50 to 80 feet.

2 F. na'na (Willd. enum. 1068) leaflets sessile, usually 5 pairs, ovate-oblong, acute, unequally serrulated, roundly cuneated at the base. ♄. H. Native of Europe. F. excélsior, var. nàna, Hortul. Branches grey. Buds brownish, black. Leaflets 5-6 pair, 1½ inch long, and hardly ½ inch broad, glabrous.

Dwarf Ash. Fl. April, May. Clt.? Shrub 6 to 10 feet.

3 F. polemoniifòlia (Poir. in Duh. ed. nov. 4. p. 66. dict. suppl. 2. p. 671.) leaflets usually 4-5 pairs, quite glabrous, sharply-toothed, ovate, nearly sessile; petioles a little winged. ♄. H. Native country unknown. F. nàna, Desf. hort. par. et arb. 1. p. 104. F. nàna (appendiculàta), Pers, ench. 2. p. 605. F. appendiculàta, Lodd. cat. A humble-branched Shrub. Branches of a livid lead colour. Leaflets approximate, 6-7 lines long, and 3 lines broad, acute. Common petioles winged.

Greek-Valerian-leaved Ash. Fl. April, May. Clt.? Sh.

4 F. heterophy'lla (Vahl. enum. 1. p. 53.) leaves simple or ternate, dentately serrated; samara oblong-lanceolate, an inch long, obtuse and emarginate at the apex. ♄. H. Native of Europe. In England, in woods, but rare. F. simplicifòlia, Willd. spec. 4. p. 1098. berl. baumz. p. 121. t. 3. f. 3. Smith, engl. bot. t. 2476. F. monophy'lla, Desf. arb. 1. p. 102. F. excélsior, var. simplicifòlia, Hort. F. excélsior, β, diversifòlia, Ait. F. excélsior, ε, Lam. dict. 2. p. 554. F. excélsior, β, heterophýlla, D. C. F. integrifòlia and diversifòlia, Hort. Leaves usually simple, but sometimes ternate and quinate, 3-4 inches long, ovate, sub-cordate, or acuminate at the base and apex. Branches dotted. Buds black. Perhaps only a variety of *F. excélsior.*

Various-leaved Ash Tree. Fl. April, May. England. Tree 30 to 40 feet.

5 F. parvifòlia (Willd. spec. 4. p. 1101.) leaflets 5-7 pairs, sessile, roundish-ovate and oblong, attenuated at the base, quite entire at the base, but sharply serrated at the apex, mucronate; flowers naked. ♄. H. Native of the Levant. Willd. berl. baumz. p. 155. t. 2. f. 2. Tenor. syll, p. 9. no. 5. Branches purplish, trigonal at the top. It differs from *F. rotundifòlia* in the leaflets being more copious, in the bases not being unequal, and the buds being brown. The juice of this tree is the manna of Sicily. It is called Frassino mistino, and Frassino lentisco, in Sicily.

Small-leaved Ash-tree. Fl. April, May. Clt. 1822. Tree 20 to 30 feet.

6 F. tamariscifòlia (Vahl. enum. 1. p. 52.) leaflets petiolate, oblong and lanceolate, sharply serrated: serratures mucronate. ♄. H. Native about Aleppo. Fr. lentiscifòlia, Desf. cat. hort. par. p. 52. Willd. spec. 4. p. 1101. F. parvifòlia, Lam. dict. 2. p. 540. F. Aleppénsis, Plukn. phyt. 182. f. 4. Branches dark purple. Buds brown. Leaflets 4-5 pairs, ex Vahl. 6-7 pairs, ex Willd. ½ inch long, terminal one smaller than the lateral ones. Flowers naked. Samara narrow, gradually widening to the apex, and retuse.

Tamarisk-leaved Ash-tree. Fl. May, June. Clt. 1710. Tr.

7 F. arge'ntea; leaves with usually 3 pairs of rather coriaceous, elliptic-ovate, shortly cuspidate, bluntly-toothed leaflets, on short petiolules. ♄. H. Native of Corsica, in the fissures of rocks. Fráxinus argéntea, Lois. fl. gall. 697. Leaves silvery grey. Nearly allied to O'rnus Europæ'a.

Silvery-leaved Ash. Fl. April, May. Clt. 1825. Tree.

8 F. sambucifòlia (Vahl. enum. 1. p. 51.) leaflets sessile, ovate-lanceolate, serrated, having the axils of the veins villous beneath. ♄. H. Native from Canada to Carolina. Willd. spec. 4. p. 1099. Muhl. nov. act. scrut. berol. 3. p. 393. Pursh. fl. sept. amer. 1. p. 8. Michx. fig. arb. icon. F. nìgra, Mœnch. F. críspa, Hort. Young branches green, beset with black dots. Buds brown. Leaflets 3 pairs, 3-4 inches long, acute at both ends. Flowers like those of the Common Ash.

Elder-leaved Ash-tree. Fl. May. Clt. 1800. Tree 30 feet.

9 F. Schiedea'na (Schlecht. et Chamiss. in Linnæa. 6. p. 391.) glabrous; leaves with 3 pairs of sessile, lanceolate, bluntish, quite entire leaflets, or with a few obsolete serratures in front; the odd one the longest, and attenuated at the base: all thin, shining above, and paler beneath; rachi of leaves channelled; samara nearly linear, with the wing hardly dilated in front, elliptic-oblong, obtuse at the apex, ending in an oblique little point. ♄. H. Native of Mexico, near Hacienda de la Laguna, in warm situations. Fagàra dùbia, Rœm. et Schultes, syst. 3. p. 288. Calyx deeply 5-parted. Stigmas 2, thick.

Schiede's Ash-tree. Tree 10 to 15 feet.

10 F. Bóscii; leaves with 3 pairs of glabrous leaflets; leaflets oblong, acuminate, toothed; common petioles winged at the base; buds blackish; branches cinereous. ♄. H. Native of North America. F. nàna, Bosc. but not of Willd. Flowers naked.

Bosc's Ash-tree. Fl. May, June. Clt.? Tree.

11 F. Chine'nsis (Roxb. fl. ind. 1. p. 150.) leaflets from 3 to 7, lanceolate, serrated; panicles axillary and terminal; flowers apetalous. ♄. H. Native of China. Branches erect. Leaves glabrous: lateral leaflets on short petioles, and smaller than the terminal one, which is protruded on a winged petiole. Panicles drooping. Style long and curved.

China Ash. Fl. April. Clt.? Tree 12 to 20 feet.

12 F. oxyca'rpa (Willd. spec. 4. p. 1100.) leaflets almost sessile, lanceolate, acuminated, serrated, glabrous; flowers naked; samara lanceolate, attenuated at both ends, mucronate. ♄. H. Native of Caucasus. F. oxyphýlla, Bieb. fl. taur. 2. p. 450. F. órnus, Pall. ind. taur. Branchlets green, with white dots. Buds brown. Leaflets 2 to 3 pairs.

Sharp-fruited Ash-tree. Fl. May. Tree.

13 F. angustifòlia (Bauh. hist. 1. pt. 2. p. 177.) leaflets sessile, lanceolate, remotely denticulated; samara lanceolate, entire at the apex, acute. ♄. H. Native of Spain. Vahl. enum. 1. p. 52. Willd. spec. 4. p. 1100. Branches brownish purple. Branchlets green, dotted with white. Buds brown. Leaflets 3-4 pairs, $1\frac{1}{2}$ to 2 inches long. Peduncles below the leaves, solitary, 2 inches long. Samara obtuse at the base. Flowers naked. Said by some to be nearly related to *F. O'rnus;* but by Vahl. to *F. excélsior.*

Narrow-leaved Ash-tree. Fl. May. Tree.

* * *Flowers calyculate.*

14 F. juglandifòlia (Lam. dict. 2. p. 543.) leaflets stalked, elliptic-lanceolate, serrated, glaucous beneath; branches and petioles glabrous; flowers calyculate. ♄. H. Native from Canada to North Carolina. Willd. spec. 4. p. 1104. Branches and buds greyish brown. Leaflets 2-4 pairs, 3 inches long, membranous, glabrous, but not shining, canescent beneath, downy in the axils of the veins. Calyx 4-toothed. Corymbs pendulous. Samara linear.

Var. β, subintegérrima (Vahl. enum. 1. p. 50. l. c.) leaflets almost quite entire. ♄. H. F. juglandifòlia, β, subserràta, Willd. l. c. Fr. Caroliniàna, Wangenh. amer. p. 81. ex Willd. Du Roi, ed. 2d vol. 1. p. 400. ex Vahl. Fr. Nòva-A'ngliæ, and F. Caroliniàna, Mill. dict. no. 5, 6.?

Walnut-leaved Ash-tree. Fl. May. Clt. 1724. Tree 30 to 50 feet.

15 F. Carolinia'na (Lam. dict. 2. p. 543.) leaflets petiolate, lanceolate, serrated, and are, as well as the branches, glabrous; flowers calyculate. ♄. H. Native from Pennsylvania to Carolina. Vahl. enum. 1. p. 51. Willd. spec. 4. p. 1103. F. excélsior, Walt. fl. car. p. 254. F. serratifòlia, Michx. fil. arb. p. 33. F. lanceolàta, Borkh. Branches and buds brownish. Leaflets 3 pairs, shining above. Racemes loose, $1\frac{1}{2}$ inch long, often twin from the same dot; pedicels numerous, umbellate. Calyx small, campanulate.

Carolina Ash-tree. Fl. May, June. Clt. 1783. Tree 30 to 50 feet.

16 F. pube'scens (Walt. fl. car. p. 254.) leaflets petiolate, elliptic-ovate, serrated, downy or tomentose beneath, as well as the petioles and branches; flowers calyculate. ♄. H. Native of North America. Vahl. enum. 1. p. 51. Willd. spec. 4. p. 1103. F. nìgra, Du Roi, ed. 2. vol. 1. p. 398. F. tomentòsa, Michx. arb. t. 33. Leaflets 3-4 pairs. Racemes rather compound. Calyx campanulate. Samara narrow-lanceolate, obtuse, with a short mucrone at the apex, 2 inches long. Stamens 2-3-4.

Var. β, longifòlia (Willd. spec. 4. p. 1103.) leaflets ovate-lanceolate, attenuated, somewhat serrated. ♄. H. F. subvillosa, Bosc.? F. Pennsylvánica, Marsh.

Var. γ, latifòlia (Willd. l. c.) leaflets ovate, broad. ♄. H.

Var. δ, sub-pubéscens (Pers. ench. 2. p. 605.) leaflets petiolate, elliptic-oblong, acuminated, sharply serrated, downy beneath; common petioles glabrous. ♄. H. Perhaps a distinct species. F. subvillòsa, Bosc.?

Downy Ash-tree. Fl. May. Clt. 1811. Tree 30 feet.

17 F. epìptera (Michx. l. c. p. 256.) leaflets lanceolate-elliptic, sub-serrated; samara cuneated, obtuse and emarginate at the apex, and terete at bottom. ♄. H. Native from Canada to Carolina, frequent. Vahl. enum. 1. p. 50. Willd. spec. 4. p. 1102. F. díscolor, Michx. fil. arb. t. 33. F. Canadénsis, Gærtn. fruct. 1. p. 222. t. 49. F. láncea, Bosc. Young branches green, covered with white dots. Bark chinky. Leaflets opaque, downy beneath on the veins. Flowers calyculate. Buds brown.

Wing-topped-seeded or Two-coloured Ash-tree. Fl. May. Clt. 1823. Tree 30 feet.

18 F. quadrangula'ta (Michx. fl. bor. amer. 2. p. 255.) leaflets almost sessile, elliptic-lanceolate, serrated, downy beneath; samara blunt at both ends. ♄. H. Native of Ohio, Kentucky, and Tennessee. Mich. abr. with a figure. Willd. spec. 4. p. 1104. Vahl. enum. 1. p. 50. F. tetragòna, Cels. ex Dum. Cours. Branches quadrangular. Samara obtuse.

Quadrangular-branched Ash-tree. Fl. May. Clt. 1822. Tree 30 to 40 feet.

19 F. platyca'rpa (Vahl. enum. 1. p. 49. Michx. fl. bor. amer. 2. p. 256.) leaflets almost sessile, serrated on the outside, elliptic-lanceolate; samara elliptic-lanceolate. ♄. H. Native of Virginia and Carolina. F. Caroliniàna, Catesb. car. t. 80. Michx. arb. with a figure. Leaflets 2 inches long, and an inch broad, having the larger veins villous beneath. Samara 2 inches long, acute at both ends.

Broad-fruited Ash-tree. Fl. May. Clt. 1724. Tree 30 to 50 feet.

20 F. expa'nsa (Willd. berl. baumz. p. 150.) leaflets ovate-oblong, unequally serrated, glabrous, petiolate; branches glabrous; flowers calyculate. ♄. H. Native of North America. F. Caroliniàna, Hort. Worlitz. Young branches green, smooth. Buds brown. Leaflets 5 pairs, 3 inches long, acuminated, glabrous, but not shining.

Expanded Ash-tree. Fl. May. Clt. 1824. Tree 30 to 50 feet.

21 F. míxa (Bosc. ex Spreng. syst. 1. p. 96.) leaves with 5 pairs of leaflets, glabrous on both surfaces; leaflets oblong, almost sessile, unequally toothed. ♄. H. Native of North America.

Mixed Ash. Fl. May. Clt. 1824. Tree.

22 F. pulverule'nta (Bosc. l. c.) leaves with 6 pairs of leaflets, tomentose beneath; leaflets on long petioles, oblong, acute, sinuated; petioles powdery. ♄. H. Native of North America.

Powdery Ash-tree. Fl. May. Clt. 1824. Tree.

23 F. rubicu'nda (Bosc. l. c.) leaves with 3 pairs of coriaceous leaflets, rather tomentose beneath; leaflets oblong, acute, a little toothed: having the veins and petioles reddish beneath; buds and branchlets grey. ♄. H. Native of North America.

Reddish-veined Ash-tree. Fl. May. Clt. 1824. Tree.

24 F. longifòlia (Bosc. l. c.) leaves with 3 pairs of leaflets, shining above, but tomentose beneath and on the petioles; leaflets oblong-lanceolate, acuminated, a little toothed; branches hairy. ♄. H. Native of North America.

Long-leaved Ash-tree. Fl. May. Clt. 1824. Tr. 30 to 40 ft.

25 F. víridis (Bosc. l. c.) leaves with 3 pairs of leaflets, shining above, but the veins are downy beneath; leaflets oblong, acute, sharply and unequally serrated; branches green. ♄. H. Native of North America.

Green Ash-tree. Fl. May. Clt. 1824. Tree.

26 F. cine'rea (Bosc. l. c.) leaves with 3 pairs of glabrous leaflets, but the veins are rather pilose beneath; leaflets lanceolate, unequally toothed; buds linear, grey, pilose. ♄. H. Native of North America.

Grey Ash-tree. Fl. May. Clt. 1824. Tree.

27 F. a'lba (Bosc. l. c.) leaves with 3 pairs of leaflets, hairy beneath, and on the petioles; leaflets lanceolate, unequally and sharply toothed, acuminated; branches grey. ♄. H. Native of North America.

White Ash-tree. Fl. April, May. Clt. 1823. Tree.

28 F. Richa'rdi (Bosc. l. c.) leaves with 3 pairs of glabrous leaflets: but the veins are rather pilose beneath; leaflets oblong, acute, toothed; branches cinereous, pilose at the base. ♄. H. Native of North America.

Richard's Ash-tree. Fl. April, May. Clt.? Tree.

29 F. ova'ta (Bosc. l. c.) leaves with 3 pairs of leaflets, pilose beneath; leaflets ovate, acute, equally toothed; buds fulvous. ♄. H. Native of North America.

Ovate-leaved Ash-tree. Fl. April, May. Clt.? Tree.

30 F. nìgra (Bosc. l. c.) leaves with 3 pairs of glabrous leaflets; leaflets oblong, acuminated, somewhat sinuately toothed; branches blackish. ♄. H. Native of North America.

Black Ash-tree. Fl. April, May. Clt. 1825. Tree.

31 F. ellíptica (Bosc. l. c.) leaves with 3 pairs of leaflets, pilose beneath; leaflets oblong, mucronate, a little toothed; buds fulvous; branches brownish black. ♄. H. Native of North America.

Elliptic-leaved Ash-tree. Fl. April, May. Clt. 1824. Tree.

32 F. fu'sca (Bosc. l. c.) leaves with 3 pairs of leaflets, glabrous above, but the veins are villous beneath; leaflets oblong, mucronate, unequally toothed; branches brown. ♄. H. Native of North America.

Brown-branched Ash-tree. Fl. April, May. Clt. 1823. Tr.

33 F. ru'fa (Bosc. l. c.) leaves with 2 pairs of leaflets, beset with rufous pili beneath; leaflets lanceolate, acuminated, cuspidate, unequally toothed. ♄. H. Native of North America.

Rufous-haired Ash-tree. Fl. April, May. Clt. 1822. Tr.

34 F. pa'llida (Bosc. l. c.) leaves with 3 pairs of glabrous leaflets; leaflets almost sessile, ovate-lanceolate, toothed; branches yellow. ♄. H. Native of North America.

Pale-barked Ash-tree. Fl. April, May. Clt.? Tree.

35 F. acumina'ta (Lam. dict. 2. p. 542.) leaflets petiolate, oblong, shining, quite entire, glaucous beneath; flowers calyculate. ♄. H. Native from Canada to Carolina, in woods. F. Americàna, Willd. spec. 4. p. 1102. F. cóncolor, Michx. fil. arb. p. 33. icon. Leaflets 7.

Acuminated-leaved Ash. Fl. May. Clt. 1723. Tree.

36 F. pannòsa (Vent. and Bosc. l. c.) leaves with 3 pairs of leaflets, villously tomentose beneath; leaflets petiolate, ovate, quite entire, attenuated at both ends; buds fulvous; petioles glabrous. ♄. H. Native of Carolina.

Cloth-leaved Ash. Fl. May. Clt. 1820. Tree.

37 F. tríptera (Nutt. gen. amer. 2. p. 232.) leaflets obovate, entire, tomentose beneath, oblique at the base; samara broad, elliptic-obovate, mostly 3-winged, attenuated at the base, 1-seeded; seed 3-sided. ♄. H. Native of South Carolina, in oak forests.

Three-winged-fruited Ash-tree. Tree.

Cult. Most of the species of *Fráxinus* are large forest trees, and are generally raised in quantities from seed, which do not vegetate till the second spring after sowing, if kept out of the ground all winter; but if sown in the autumn immediately after gathering, they vegetate in the following spring. Any of the kinds may be increased by budding or grafting on the common ash; and the younger the stock on which they are grafted the better. In grafting the species of *Fráxinus*, as well as other trees which do not readily take, it is best to graft at the side, allowing the top to remain until the scion is fixed and the wound healed, as the top, when allowed to remain, draws up the sap to the scion, while on the contrary, if taken off, it stagnates the free circulation of the sap to the graft.

XV. ORNUS (*Oren*, Hebrew; *ορεινη μελια, oreine melia*, from *ορος, oros*, a mountain, Greek; *Ornus*, Latin; the names for the wild ash). Pers. ench. 1. p. 8. Pursh, fl. amer. sept. 1. p. 6. Nutt. gen. amer. 1. p. 6.—Fráxinus species of authors.

Lin. syst. *Diándria, Monogýnia*, or *Polygàmia, Dioècia*. Flowers hermaphrodite, or of different sexes. Calyx 4-parted or 4-toothed. Corolla 4-parted; segments long, ligulate. Stamens with long filaments. Stigma emarginate. Samara 1-celled, 1-seeded, winged.—Trees with impari-pinnate leaves and terminal or axillary panicles of flowers.

1 O. Europæ'a (Pers. ench. 1. p. 9. Sav. trat. ed. 2. t. 1.) leaves with 3-4 pairs of lanceolate or elliptic, attenuated, serrated, stalked leaflets; peduncles axillary, solitary, shorter than the leaves; flowers complete or hermaphrodite. ♄. H. Native of the south of Europe. Fráxinus O'rnus, Lin. spec. 1510. Smith, fl. græc. 1. t. 4. Mill. fig. t. 1. Lam. ill. 9. t. 858. f. 2. Woodv. med. bot. 1. p. 104. t. 36. Church et Stev. med. bot. 2. t. 53. F. O'rnus and F. paniculàta, Mill. diet. no. 3. and no. 4. F. florífera, Scop. carn. no. 1250. F. botryoìdes, Mor. prælud. 265. F. vulgàtior, Segu. ver. 2. p. 290. —Duham. arb. 4.—Bauh. hist. 1. p. 177. f. 1. Young branches purplish or livid, with yellow dots. Buds cinereous. Leaflets entire at the base, villous or downy beneath. Flowers greenish white. Scopoli observed hermaphrodite flowers on one tree and female ones on the other. Mr. Miller's *F. paniculàta* has chiefly male flowers. Manna is obtained from this tree, as well as from *O. rotundifòlia*.

Manna is yielded by different trees, but principally from the species of *O'rnus*, *Fráxinus*, and *Júglans*. The manna is generally of two kinds; not on account of the intrinsic quality of them being different, but only because they are got in a different manner. In order to obtain manna, those who have the management of the woods of the *Orni*, in the months of July and August, when the weather is very dry and warm, make an oblong incision, and take off from the bark of the tree about 3 inches in length and 2 in breadth; they leave the wound open, and by degrees the manna runs out, and is almost suddenly thickened to its proper consistence, and is found adhering to the bark of the trees. The manna, which is collected in baskets, and goes under the name of *Manna grassa*, is put in a dry place, because moist and wet places will soon dissolve it again. This first kind of manna is often in large irregular pieces of a brownish colour, and is frequently full of dust and other impurities. But when the people want to have a very fine manna, they apply to the incision of the bark thin straw, or bits of shrubs, so that the manna, in coming out, runs upon those bodies, and is collected in a sort of regular tubes, which give it the name of *manna-canali*, or manna in tubes; this second

kind is more esteemed and always preferred to the other, because it is free and clear from impurities. There is still a third kind in Calabria, which is as white as the finest sugar, but is seldom met with. The two first kinds of manna undergo no preparation whatever before they are exported. When the summer is rainy the manna is always scarce and bad. Manna likewise exudes spontaneously, and concretes into granules; this kind is known in the markets by the name of manna in tear. Manna is sweet, but leaves a nauseous impression on the tongue. It is a mild cathartic, for which purpose it was formerly much used in practice; it is now seldom given alone to adults, but combined with senna, neutral salts, and other purgatives, are frequently used to cover its taste.

Var. β, latifòlia (Ait. hort. kew. 3. p. 445.) leaflets oval-oblong, serrated, stalked.

European Flowering Ash or Manna Ash. Fl. May, June. Clt. 1730. Tr. 20 to 30 feet.

2 O. rotundifòlia (Pers. ench. 2. p. 605.) leaves with 3-5 pairs of roundish-ovate, bluntly serrated, almost sessile leaflets, which are narrow at the base; petioles channelled; flowers with petals, polygamous; peduncles axillary. ♄. H. Native of Calabria and the Levant, &c. Fráxinus rotundifòlia, Ait. hort. kew. 3. p. 445. Vahl, enum. 1. p. 49. Willd. spec. 4. p. 1105. wild baum. p. 145. t. 2. f. 1. F. mannífera. Hort.—Pluk. alm. 182. f. 4.—Bauh. hist. 1. p. 177. f. 2. Branches and buds brown. Leaflets rather small, glabrous. Flowers purplish. The flowers come out in the spring before the leaves, like the other species of the genus, as well as of *Fráxinus*. The lower parts of the mountains of Calabria abound with this, the manna-ash, which grows spontaneously and without any culture, except that the woodmen cut down all the strong stems that grow above the thickness of a man's leg. Towards the end of July the gatherers of manna make a horizontal gash, inclining upwards, in the bole of the tree. As the liquor never oozes out the first day, another cut is given on the second, and then the woodmen fix the stalk of a maple leaf in the upper wound, and the end of the leaf in the lower one, so as to form a cup to receive the gum as it distils from each gash. The season continues about a month. The men have only 3 carlines (1*s*. 1½*d*.) for every rotolo; which quantity, containing 33⅓ ounces, is sold for 24¾ carlini, or somewhat more than 10*s*.; if it be in tubular pieces the price rises one third. The tubular pieces are called manna in cannoli, and these regular tubes are produced by applying to the incision thin straw, or small bits of shrub, upon which the manna runs as it oozes out. The trees succeed best in an eastern exposure, in order to warm the juices in the morning, and to inspissate those which the heat has sweated out in the evening.

Round-leaved Flowering Ash or Manna Ash. Fl. April. Clt. 1697. Tree 16 to 20 feet.

3 O. America'na (Pursh, fl. amer. sept. 1. p. 9. Nutt. gen. amer. 1. p. 6.) leaves with 2-5 pairs of oblong or ovate-acuminated, shining, serrated leaflets, glaucous beneath, the odd one rather cordate; flowers with petals, disposed in terminal panicles. ♄. H. Native of North America, in Maryland and Virginia, but rare. F. Americàna, Lin. spec. 1510.? Branches brownish grey. Buds brown. Leaflets 3-5 inches long and 2 broad, paler beneath, and having the larger veins rather villous. Samara narrow, obtuse, mucronate.

American Flowering Ash. Fl. April, May. Clt. 1820. Tree 30 to 40 feet.

4 O. floribu'nda (G. Don, in Loud. hort. brit. p. 12.) leaves with 2-3 pairs of elliptic-oblong, acuminated, serrated, glabrous, stalked leaflets, and an odd one; panicles terminal, compound, thyrsoid; petals linear, clavate (ex Wall.), oval-oblong, obtuse (ex D. Don); samara linear, or narrow-spatulate, obtuse, entire. ♄. H. Native of Nipaul, where it is called *Kangu, Tahasee,* and *Thaup.* Fráxinus floribúnda, Wall. fl. ind. 1. p. 150. pl. rar. asiat. 3. t. 277. D. Don, prod. fl. nep. p. 106. Bark ash-coloured, dotted. Branchlets compressed. Leaflets varying much in figure, the terminal or odd one the largest. Flowers white.

Bundle-flowered Flowering Ash. Fl. April. Clt. 1822. Tree 30 to 40 feet.

5 O. xanthoxyloìdes; leaves pinnate; leaflets 5, small, oblong, tapering to the base and apex, crenated, almost sessile; flowers lateral, aggregate; fruit lateral, aggregate; samaræ with emarginate wings. ♄. H. Native of Sirinaghur. Fráxinus xanthoxyloìdes. Wall. cat. no. 2833.

Xanthoxylon-like Flowering Ash. Tree.

6 O. Moorcroftia'na; leaves pinnate; leaflets 5, oblong, acuminated at both ends, glabrous, almost sessile, paler beneath, finely denticulated: odd one the largest; fruit disposed in simple, aggregate, lateral racemes; samara with an emarginate wing, furnished with a little point in the centre of the notch. ♄. H. Native of Luddac, in the East Indies. Fráxinus Moorcroftiàna, Wall. cat. no. 2834.

Moorcroft's Flowering Ash. Tree.

7 O. urophy'lla; leaves pinnate, on long petioles; leaflets 5-7, on long petiolules, membranous, ovate-oblong, long-acuminated, serrated; peduncles panicled, axillary. ♄. H. Native of Silhet, on the Pundua mountains. Fráxinus urophýllus, Wall. cat. no. 2835. Flowers much smaller than those of *O. floribúnda.*

Tail-leaved Flowering Ash. Tree.

8 O. stria'ta (Sweet, hort. brit. p. 256.) leaves with 7 pairs of leaflets, villous beneath as well as the petioles; leaflets oblong, petiolulate, acute, toothed; buds green; branches striated. ♄. H. Native of North America. Fráxinus striàta, Bosc. ex Spreng. syst. 1. p. 95.

Striated Flowering Ash. Fl. April, May. Clt. 1818. Tree 30 feet.

Cult. The species of this genus are raised from seeds, like those of *Fráxinus,* and may be increased by budding or grafting on the common ash.

Order CXLVIII. COLUMELLIE'Æ (this order contains plants agreeing with *Columéllia* in important characters). D. Don, in edinb. phil. journ. dec. 1828.

Calyx 5 or many-parted, permanent, adnate to the ovarium. Corolla inserted in the upper part of the tube of the calyx, rotate or funnel-shaped; limb spreading, 5-lobed; lobes equal, entire, convolutely imbricate in æstivation. Stamens 2, inserted in the thickened part of the throat, opposite the angles of the calyx; filaments short, dilated; pollen resinous. Ovarium inferior, or half inferior, 2-celled, many-ovulate. Style declinate, seated on a flat fleshy disk. Stigma capitate, convex at top. Capsule 2-celled, woody, 2-valved, closely combined with the tube of the calyx, dehiscing at top by a cross-like chink, therefore the valves are bifid at the apex; dissepiment contrary to the compression of the peduncle; cells many-seeded. Albumen fleshy or wanting.—Trees or shrubs. Leaves opposite, petiolate, entire. Flowers terminal, yellow, or white, very like those of the species of *Jasmínum.* Peduncles bibracteate?

This order corresponds with *Jasmineàceæ* in the structure and æstivation of its corolla, in its bilocular ovarium, and erect ovula, and it agrees both with it and *Syrínga* in the structure and dehiscence of its capsule. A comparison of the

calyx and corolla of *Menodòra*, with those species of *Jasmìnum* wherein the number of segments are indeterminate, will display more clearly the intimate affinity existing between these two families. It differs, however, essentially from *Jasmineàceæ* by having an adherent ovarium, by the presence of a perigynous disk, by the undivided stigma, and lastly by having an inferior capsule with polyspermous cells. The imbricate æstivation of the corolla, and adherent ovarium, with erect ovula, the presence of a perigynous disk, and a capsule with polyspermous cells, are characters sufficiently numerous and important to prevent its ever being confounded with *Olèinæ*, and to establish it as an osculant group between that family and *Jasmineàceæ*. It appears also to be nearly related to *Halesiàceæ*, a small group forming the connecting link between *Olèinæ* and *Ebenàceæ*; this group is principally distinguished from *Columellièæ* by the indefinite number of its stamina, and its simple stigma.

Synopsis of the genera.

1 Colume'llia. Calyx compressedly 2-edged; with a 5-lobed limb. Corolla rotate. Anthers convolute. Capsule turbinate; cells many-seeded. Albumen fleshy.

2 Boliva'ria. Calyx 5-parted. Corolla funnel-shaped; with a 5-parted limb. Capsule cartilaginous; cells 2-seeded. Albumen none, but the seeds are inclosed in a peculiar integument.

3 Menodòra. Calyx many-parted, half inferior. Corolla salver-shaped: with a 5-parted spreading limb. Capsule 2-celled, many-seeded.

I. COLUME'LLIA (named in honour of L. J. M. Columella, who flourished 42 years before Christ). Ruiz et Pav. fl. per. 1. p. 28. syst. p. 8. Pers. ench. 1. p. 13. H. B. et Kunth, nov. gen. amer. 2. p. 388. D. Don, in edinb. phil. journ. dec. 1828.—Ulúxia, Juss. gen.

Lin. syst. *Diándria, Monogýnia.* Calyx turbinately tubular, compressed, 2-edged. Corolla rotate: with a 5-lobed concave equal limb. Stamens opposite the angles of the calyx; filaments short, flat; anthers convolute or replicate; one of the cells very narrow, continuous through all the convolutions of the anther: containing angular, resinous pollen. Style declinate, flattened. Capsule turbinate, woody, 2-celled; cells many-seeded. Seeds obovate, compressed, ascending: with a basilar umbilicus. Albumen fleshy, yellowish. Embryo erect, slender. Plumule inconspicuous.—Evergreen trees or shrubs, natives of Peru. Flowers terminal, on short peduncles, yellow. Peduncles bibracteate at the base.

1 C. oblónga (Ruiz et Pav. fl. per. 1. p. 28. t. 8. f. a. syst. 1. p. 8.) leaves oblong, veiny, toothed at top; flowers corymbose. ♄. G. Native of Peru, in woods at Pillao. C. arboréscens, Pers. ench. 1. p. 13. Tree having the habit of *Kálmia*, with deciduous bark. Branchlets clothed with silky down, compressed between the internodes. Leaves attenuated at the base, shining and green above, but silky and glaucous beneath, 1-2 inches long. Corymbs leafy. Calycine segments lanceolate, silky beneath, furnished with a horny mucrone at the apex.

Oblong-leaved Columellia. Tree 20 to 25 feet.

2 C. obova'ta (Ruiz et Pav. fl. per. 1. p. 28. t. 12. f. b. syst. 1. p. 9.) tomentose; leaves obovate, mucronulate, quite entire, veinless; flowers usually solitary. ♄. G. Native of Peru, on arid hills about the town of Tarma. C. frutéscens, Pers. ench. 1. p. 13. Shrub with the habit of a species of *Leptospérmum*. Branchlets clothed with hoary down, which at length becomes blackish. Leaves crowded, green and shining above, but tomentose beneath, from ¼ to ½ an inch long. Petioles connate at the base, hardly distinct from the leaves. Flowers rarely twin or tern. Calycine segments ovate, obtuse.

Obovate-leaved Columellia. Shrub 8 feet.

3 C. serícea (H. B. et Kunth, nov. gen. amer. 2. p. 388.) leaves oblong, quite entire, silky beneath; peduncles 2-3-flowered. ♄. G. Native of the province of Quito, in woods. Young branches obsoletely tetragonal, clothed with silky down. Leaves obtuse, mucronate, green and shining above, and silky white beneath. Pedicels, bracteas, and calyxes silky.

Silky Columellia. Tree 15 to 20 feet.

Cult. For culture and propagation see *Bolivària*, below.

II. BOLIVA'RIA (named after Bolivar, the liberator of South America). Cham. et Schlecht. in Linnæa. 1. p. 207. t. 4. f. 1.

Lin. syst. *Diándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped: with a 5-parted limb. Filaments capillary; anthers erect, fixed by the middle, elliptic, mucronate. Style exceeding the stamens; stigma obscurely 2-lobed. Capsule cartilaginous, didymous, circumcised; cells 2-seeded. Seeds inclosed in a peculiar integument, without albumen.—Glabrous shrubs. Flowers pedunculate, solitary, terminal, and lateral, constituting an incomplete, leafy panicle.

1 B. integrifòlia (Cham. et Schlecht. l. c. p. 208.) leaves lanceolate, quite entire. ♄. G. Native of Brazil, in the province of Cisplatine, frequent. Flowers white or yellow, size of those of *Jasmìnum frùticans*.

Entire-leaved Bolivaria. Shrub 1 to 2 feet.

2 B. trífida (Cham. et Schlecht. l. c. p. 209.) leaves linear, trifid, or entire. ♄. G. Native of Brazil, in the province of Cisplatine, and of Chili. Flowers yellow.

Trifid Bolivaria. Fl. July. Clt. 1828. Shrub 1 to 2 feet.

Cult. A mixture of loam, peat, and sand is a good soil for the species; and cuttings will strike root readily in the same kind of soil, under a hand-glass.

III. MENODO'RA (from μενος, *menos*, courage, and δωρον, *doron*, a gift; a vegetable which gives force to animals). Humb. et Bonpl. pl. æquin. 2. p. 98. t. 110. D. Don, in edinb. phil. journ. dec. 1828.

Lin. syst. *Diándria, Monogýnia.* Calyx campanulate, with a many-parted limb; segments 10-11, subulate. Corolla with a very short tube, a villous throat, and 5-8-parted concave limb; lobes ovate, acuminated. Filaments capillary; anthers sagittate, 2-celled, erect, mucronulate at the apex. Ovarium emarginately 2-lobed. Style declinate, slender; stigma truncate, pruinose. Capsule 2-celled, with a septicidal dehiscence, many-seeded.—A small, suffruticose, hairy plant, with numerous decumbent stems; oval-lanceolate, almost sessile, entire leaves: and solitary, pedunculate, yellow flowers.

1 M. helianthemoìdes (Humb. et Bonpl. l. c.). ♄. G. Native of Mexico, between Actopan and the village of Magdalena. Stems tetragonal.

Sun-rose-like Menodora. Shrub ½ to 1 foot.

Cult. For culture and propagation see *Bolivària* above.

Order CXLIX. JASMINEA'CEÆ. Jasmíneæ, R. Br. prod. p. 520.—Jasmíneæ, part. Juss. gen. p. 104.

Calyx monophyllous, tubular, divided or toothed (f. 11. *a.*), permanent. Corolla monopetalous, hypogynous, regular, salver-shaped (f. 11. *b.*), with a 5 (f. 11. *b.*) -8 (f. 10. *a.*) -cleft limb; segments lying over each other laterally, imbricate and twisted in æstivation. Stamens 2, epipetalous, inclosed. Ovarium not

girded by any disk, 2-celled; cells 1-seeded; ovula erect. Style 1; stigma 2-lobed. Fruit a didymous berry or a bipartible capsule. Albumen sparing or wanting. Embryo straight, with an inferior radicle.—Usually twining shrubs. Leaves opposite, simple, but often compound, either ternate or imparipinnate; having the petioles in most of the species articulated. Flowers opposite, disposed in corymbs.

This order differs sufficiently from *Olèinæ* in the situation of the ovula, structure of the seeds, as also in the division and æstivation of the corolla; but it agrees with it in the corolla being regular and diandrous, and in the fruit being either baccate or capsular, but scarcely in habit. In *Nyctánthes* the mature seeds have hardly any albumen, while it is copious in the immature seeds. Fragrance is the predominant property of the Jasmine tribe, and has made it for ages the favourite of poets and of the people: this fragrance arises from an oil, which can be extracted so as to retain its perfume.

Synopsis of the genera.

1 JASMI'NUM. Corolla 4-8-cleft (f. 11. *b.* f. 10. *a.*). Berry didymous. Seeds without albumen.

2 NYCTA'NTHES. Calyx entire. Corolla 5-lobed. Capsule bipartite. Seeds albuminous.

I. JASMI'NUM (Linnæus derives this name from *ια*, *ia*, a violet and *οσμη*, *osme*, smell; but the scent of the flowers has no resemblance to that of the violet.) Forskoel. ægyp. arab. p. 59. says that the Arabs call it *Jasmin* (ysmym).) Dodon. pempt. p. 1557. Tourn. inst. 368. Lin. gen. no. 17. Juss. gen. 106. R. Br. prod. p. 521. Gærtn. fruct. 1. p. 196. t. 42. Lam. ill. t. 7.—Mogòrium, Lam.

LIN. SYST. *Diándria*, *Monogýnia*. Calyx tubular, 5-8-toothed or 5 (f. 11. *b.*) -8 (f. 10. *a.*) -cleft. Corolla 5 (f. 11. *b.* f. 10. *a.*) -8-cleft. Stigma 2-lobed or bifid. Berry didymous, having one of the lobes usually abortive. Seeds without albumen.—Usually twining shrubs. Leaves simple or compound; petioles articulated. Flowers white or yellow.

* *Leaves simple. Calyx cleft.*

1 J. SA'MBAC (Ait. hort. kew. 1. p. 8.) twining; leaves almost sessile, membranous, from cordate to oblong, acute or obtuse, glabrous; calycine segments 5-9, subulate; berries globular; branches, petioles, and peduncles downy. ♄. ◠. S. Native of the East Indies. Desf. ann. mus. 4. p. 20. Sims, bot. mag. 1785. Ker. bot. reg. t. 1. Mogòrium, Sámbac. Lam. dict. 4. p. 210. J. gímea, Zucc.? Nyctánthes Sámbac, Lin. spec. 1. p. 8.—Burm. zeyl. p. 128. t. 58. f. 2. Leaves waved, and sometimes scolloped, smooth, except while young, but there are generally tufts of down in the axils of the veins beneath. Flowers generally forming small trichotomous umbellets, white, fragrant. Berries black. From this species we have the common double, and rose or great flowered, and full Moogaries (Arabian or Tuscan jasmines.) These are always raised from layers, even in India, and have been improved by culture. The plant that bears the common double sort still retains its twining habit, but it is lost in the great rose, or full-flowered sort: here the branches are erect or spreading, but never twining. The *Nyctánthes undulàta*, Willd. spec. 2. p. 8. is probably nothing but a variety of *J. Sámbac*.

Var. α, *Single-flowered Arabian jasmine.* J. undulàtum, Willd. spec. 1. p. 36. Mállica and Asphòta, Asiat. res. 4. p. 245.—Rheed. mal. 6. p. 97. t. 55.

Var. β, *Double-flowered Arabian jasmine.* J. Sámbac, var. flore pleno, Andr. bot. rep. 497.—Rheed. mal. 6. p. 87. t. 50.—Burm. zeyl. 128. t. 58. f. 2.—Rumph. amb. 5. p. 52. t. 30.

Var. γ, *Great double Arabian or Tuscan jasmine.* J. Sámbac, Ker. bot. reg. 497.—Rheed. mal. 6. p. 89. t. 51.

Var. δ, *trifoliàtum;* leaves 3 in a whorl; flowers double. Nyctánthes grandiflòra, Lour. coch. p. 21. Nyct. trifoliàta, Vahl. enum. 1. p. 26.

Sambac or Arabian Jasmine. Fl. year. Clt. 1665. Sh. tw.

2 J. QUINQUEFLÒRUM (Heyne, herb. ex Wall. cat. no. 2878.) branches, peduncles, calyxes, and petioles downy; leaves oblong, sometimes short-acuminated, always mucronate; calycine segments 8, long-subulate; corolla almost semi-double, of many lanceolate segments; peduncles terminal, 3-5-flowered. ♄. ◡. S. Native of the East Indies, at Gongachora and Patna. J. sanjùrium, Hamilt. mss. Flowers white. Nearly allied to *J. Sámbac*.

Var. β, *pubéscens;* leaves rounded; plant more downy; corolla with fewer segments. ♄. ◡. S. Native of the East Indies, at Mongger. J. pubéscens, Hamilt. mss. ex Wall. cat. no. 2880.

Five-flowered Jasmine. Shrub cl.

3 J. SCA'NDENS (Vahl. symb. bot. 3. p. 2. enum. 1. p. 27.) twining, glabrous; leaves cordate, ovate-oblong, entire, acuminated, shining; corymbs globular, terminal, trichotomous; calycine segments 6-7, bristle-shaped, hairy; segments of corolla 6-8, lanceolate, very acute, almost the length of tube. ♄. ◠. S. Native of the East Indies, particularly in Bengal, Chittagong, and Java. Nyctánthes scándens, Rets. obs. 5. p. 9. Mogòrium scándens, Lam. dict. 4. p. 210. Peduncles and pedicels short, villous as well as the calyxes. Flowers pure white, delightfully fragrant.

Climbing Jasmine. Fl. July. Clt. 1820. Shrub twining.

4 J. GLA'BRUM (Horsfield ex Link. jahrb. 1-3. H. p. 31. Blum. bijdr. p. 679.) scandent; leaves ovate-oblong, acuminated, downy on the margins and the ribs beneath, as well as the petioles and branchlets; peduncles axillary; calycine segments subulate, downy. ♄. ◡. S. Native of Java, about Batavia. Corolla of 9 narrow segments. Branches terete.

Glabrous Jasmine. Shrub cl.

5 J. ELONGA'TUM (Vahl. enum. 1. p. 28. Willd. spec. 1. p. 37.) climbing, villous; leaves opposite or alternate, lanceolate or ovate-oblong; corymbs trichotomous; segments of corolla 8-12, linear; calyx 5-6-cleft: segments subulate. ♄. ◡. S. Native of the East Indies, in forests near the mouth of the Hoogly, in Bengal, and of Java. Nyctánthes elongàta, Lin. syst. 56. suppl. 82. Berg. act. angl. 1772. p. 290. t. 11. J. Roxburghiànum, Wall. cat. no. 2870. Flowers pretty large, pure white, fragrant. Pedicels clavate. Corolla having the tube much swelled towards the mouth, and with the edges of the segments revolute.

Var. β; leaves all somewhat cordate at the base, smoothish above. ♄. ◡. S. Native of Java, about Linga Jattie, at the foot of Mount Tjerimai, among bushes. Blum. bijdr. p. 678.

Elongated Jasmine. Fl. April, May. Clt. 1820. Shrub cl.

6 J. GLABRIU'SCULUM (Blum. bijdr. p. 679.) subscandent; leaves opposite, rarely alternate, ovate, acuminated, rounded at the base, glabrous, downy on the ribs beneath, as well as the branchlets; cymes terminal, undivided; calycine segments subulate. ♄. ◡. S. Native of Java, about Linga Jattie, among bushes, in the province of Cheribon. Nearly allied to *J. elongàtum*.

Smoothish Jasmine. Fl. year. Shrub cl.

7 J. PUBE'SCENS (Willd. spec. 1. p. 37.) sarmentose, downy; leaves cordate, mucronate, tomentose beneath and on the petioles, at length naked above: the upper ones forming an involucrum round the umbel; umbels terminal, sessile; calyx of 6-8 plumose, filiform segments; segments of corolla 6-9, lanceolate,

cuspidate. ♄. G. Native of the East Indies, in Bengal and Nipaul, but originally from China. Vahl. symb. 1. p. 26. Nyctánthes multiflòra, Burm. fl. ind. p. 5. t. 3. f. 1. Nyct. pubéscens, Retz. obs. 5. p. 9. J. multiflòrum, Andr. rep. 8. t. 496. Nyct. hirsùtum, Lin. spec. p. 8. J. hirsùtum, Lin. syst. p. 56. Smith, exot. bot. 2. p. 117. t. 118. Ker. bot. reg. 51. Sims. bot. mag. 1991. Mogòrium pubéscens, Lam. dict. 4. p. 213.—Rheed. mal. 6. p. 95. t. 54. Flowers large, pure white, fragrant. (f. 10.)

FIG. 10.

Downy Jasmine. Fl. May, Aug. Clt. 1759. Shrub straggling.

8 J. LAURIFÒLIUM (Roxb. fl. ind. 1. p. 91.) climbing, glabrous; leaves ovate-lanceolate, lucid, 3-nerved; flowers axillary and terminal, from 1-5 together, on long pedicels; calycine segments 6-7, filiform: those of the corolla 9-12, linear, length of tube. ♄. ◡. S. Native of the mountains east of Bengal. Ker. bot. reg. t. 521. Flowers white, fragrant.

Laurel-leaved Jasmine. Fl. May, Sept. Clt. 1819. Shrub cl.

9 J. PUNCTA'TUM (Hamilt. herb. ex Wall. cat. no. 2877.) puberulous while young; leaves ovate-lanceolate or oblong-lanceolate, acuminated, feather-nerved, glabrous in the adult state; peduncles terminal, trichotomous; calyx downy, with linear segments; segments of the corolla 8-10, acute; bracteas subulate. ♄. ◡. S. Native of Patna. Flowers white.

Dotted Jasmine. Shrub cl.

10 J. COARCTA'TUM (Roxb. fl. ind. 1. p. 91.) erect, glabrous; leaves oblong, smooth, acute; corymbs terminal, pedunculate, crowded with ternate, nearly sessile flowers, bracteate; calyx 5-cleft. ♄. S. Native of the East Indies, on the hills near Chittagong. May be known from all the other simple-leaved East Indian species by the erect habit, and by the great number of flowers, which form the little dense corymbs.

Coarctate-flowered Jasmine. Fl. April, May. Shrub erect.

11 J. CORDIFÒLIUM (Wall. cat. no. 2858.) leaves broad, ovate-cordate, acuminated, with 3 principal nerves, glabrous in the adult state; flowers terminal, corymbose; corymbs thrice trichotomous, downy: bracteas subulate; calyx campanulate, with subulate segments; segments of corolla 8, elliptic, mucronate. ♄. ◡. S. Native of the East Indies, on the Nelligherry mountains. Flowers white.

Heart-leaved Jasmine. Shrub cl.

12 J. TRINE'RVE (Vahl, symb. 3. p. 2.) climbing, polished, glabrous; leaves ovate-lanceolate, long-acuminated, 3-nerved, polished; flowers axillary and terminal, 1-9 together; calycine segments 6-7, subulate; segments of corolla 6-8, nearly filiform, longer than the tube. ♄. ◡. S. Native of Silhet, in forests. J. acuminàtum, Pers. ench. 1. p. 7. Mogòrium acuminàtum, Lam. ill. p. 23. Flowers large, white, fragrant. Tube of corolla long, widening above the middle.

Three-nerved Jasmine. Fl. Mar. April. Clt. 1804. Sh. cl.

13 J. FINLAYSONIA'NUM (Wall. cat. no. 7126.) leaves ovate, acuminated, 3-5-nerved, glabrous; peduncles axillary, 3-flowered; calycine segments long, subulate. ♄. ◡. S. Native of the East Indies. Plant glabrous.

Finlayson's Jasmine. Shrub cl.

14 J. BRACTEA'TUM (Roxb. fl. ind. 1. p. 92.) twining, villous; leaves ovate-oblong, acute, villous; flowers in bracteate fascicles of 3, 5, or 11; calycine segments from 5-7, subulate; segments of corolla 5-8, oblong, with rounded acuminated tips; stigma entire. ♄. ◠. S. Native of Sumatra and Bencoolen. J. congéstum, Herb. Ham. ex Wall. cat. no. 2874. J. Rottleriànum, Wall. cat. no. 2865.? Flowers numerous, pretty large, white, fragrant, in fascicles embraced by bracteas. Berries black.

Bracteated Jasmine. Fl. April, May. Clt. 1818. Sh. tw.

15 J. BIFA'RIUM (Wall. cat. no. 2866.) branchlets, calyxes, and leaves while young downy; leaves disposed in two rows, ovate-lanceolate, acuminated, mucronate, glabrous in the adult state, on short petioles; peduncles axillary, branch-like, bearing each a head of flowers at top, which is involucrated by 2 large ovate leaves; pedicels short; teeth of calyx 6, subulate; corolla with a long, slender tube: and 6-8 lanceolate segments. ♄. ◡. S. Native of Penang. J. bracteàtum, Roxb. mss.

Bifarious-leaved Jasmine. Shrub cl.

16 J. AMPLEXICAU'LE (Herb. Ham. ex Wall. cat. no. 2875.) glabrous; leaves ovate, acute; peduncles axillary and terminal, 3-flowered: terminal ones corymbose; calycine segments 7, long, subulate; segments of corolla 7, lanceolate, acute. ♄. ◡. S. Native of the East Indies, at Goalpara.

Stem-clasping Jasmine. Shrub cl.

17 J. LATIFÒLIUM (Roxb. fl. ind. 1. p. 93.) twining, smooth; leaves cordate-oblong, pointed, smooth; corymbs trichotomous, diffuse; calycine segments 5-7, subulate; segments of corolla 8-10-12, linear, cuspidate; berries kidney-shaped. ♄. ◠. S. Native of the Circar mountains. Flowers large, white, fragrant.

Broad-leaved Jasmine. Fl. June, July. Clt. 1817. Shrub tw.

18 J. RETICULA'TUM (Wall. cat. no. 2869.) leaves oblong-lanceolate, acuminated, tapering at the base, glabrous in the adult state; flowers terminal, capitate, or corymbose; young branches and calyxes downy; segments of calyx 5, subulate; corolla with a long tube, and 8 linear segments. ♄. ◡. S. Native of the Pundua mountains and Silhet. Nearly allied to *J. arboréscens* and *J. latifòlium*. Heads of flowers bracteate.

Reticulate-leaved Jasmine. Shrub.

19 J. ARBORE'SCENS (Roxb. fl. ind. 1. p. 94.) arborescent; leaves opposite and 3 in a whorl, ovate, downy; flowers numerous, corymb-formed; calycine segments 5-6, subulate, incurved, villous; segments of corolla 10-12, linear, acute. ♄. S. Native of the more elevated parts of Bengal. Nyctánthes grandiflòra, Lour. coch. 21. Young shoots villous. Panicles trichotomous. Flowers large, white, and very fragrant. Very nearly allied to *J. latifòlium*.

Arborescent Jasmine. Clt. 1824. Shrub.

20 J. ANGUSTIFÒLIUM (Vahl, enum. 1. p. 29.) twining, polished; leaves ovate or oblong, smooth, of a shining deep green; flowers generally by threes; calycine segments acute; segments of corolla 8-9, lanceolate; berries single, ovate. ♄. ◠. S. Native of the Coromandel coast. J. vimíneum, Willd. spec. 1. p. 36. Nyctánthes triflòra, Burm. ind. 4. t. 2. J. triflòrum, Pers. ench. 1. p. 7. Nyctánthes vimínea, Retz. obs. 5. p. 9. Nyc. angustifòlia, Lin. spec. 8. Mogòrium triflòrum, Lam. ill. t. 6.—Rheed. mal. 6. p. 93. t. 53. Flowers large, white, with a faint tinge of red, star-shaped, having a peculiar but very pleasant fragrance. Stigma lanceolate. This species, being constantly covered with leaves of a bright shining deep green, sometimes as small as those of box, renders it always beautiful, and particularly well adapted for screening windows, covering arbours, &c. in warm climates.

Narrow-leaved Jasmine. Fl. year. Clt. 1816. Shrub tw.

21 J. TUBIFLÒRUM (Roxb. fl. ind. 1. p. 96.) climbing, glabrous; leaves nearly sessile, ovate-oblong, smooth; flowers from 3-5 together, on short peduncles; calycine segments 7-8, subulate, one-sixth the length of the very long slender tube of the corolla; segments of corolla 7-8, lanceolate; three times shorter than the tube; berries ovate. ♄. ◡. S. Native of the Malay Archipelago.

Tube-flowered Jasmine. Shrub cl.

22 J. CUSPIDA'TUM (Willd. act. am. N. C. berol. 4. p. 192.) climbing, glabrous; leaves ovate-lanceolate, attenuated at both ends, mucronate, on short petioles; peduncles axillary, 1-flowered: and terminal, 3-flowered. ♄. ◡. S. Native of the East Indies. J. mucronàtum and J. glaúcum, Herb. madr. Leaves stiff, almost 3-nerved. Calyx campanulate, with subulate segments. Segments of corolla 5-7, lanceolate, acute. Very nearly allied to *J. Sámbac*.

Cuspidate-leaved Jasmine. Shrub cl.

23 J. GUINEE'NSE; leaves simple, glabrous; flowers terminal. ♄. ◡. S. Native of Guinea, at Cape Coast, common among bushes. Flowers white, fragrant. Calyx toothed or cleft. ?

Guinea Jasmine. Shrub cl.

24 J. TRICHÓTOMUM (Heyne, ex Roth, nov. spec. p. 6.) leaves ovate-lanceolate, glabrous above, and clothed with rusty tomentum beneath; corymbs terminal, trichotomous, compound, pilose; calyx campanulate, about equal in length to the erect segments. ♄. ◡. S. Native of the East Indies. Calyx 6-8-cleft. Corolla usually 6-cleft, with linear-lanceolate segments.

Trichotomous Jasmine. Shrub tw.

25 J. UNDULA'TUM (Vahl, enum. 1. p. 27.) leaves oblong-cordate, shining; branches and peduncles hairy; peduncles usually 3-flowered; calycine segments setaceous; segments of corolla 8, oblong. ♄. ◡. G. Native of China. Ker. bot. reg. 436. J. Heyneànum, Wall. cat. no. 2865. Nyctánthes undulàta, Lin. spec. p. 8. syst. p. 56. Peduncles trichotomous, 3 or many-flowered. Flowers white. Perhaps only *J. pubéscens*, Lin.

Waved-leaved Jasmine. Fl. Jan. Clt. 1819. Shrub cl.

26 J. MONTA'NUM (Roth. nov. spec. p. 5.) leaves subcordate, obtuse, glabrous; young branches, petioles, peduncles, and calyxes hairy; corymbs terminal, trichotomous; calyx sub-campanulate: with erect, linear, obtuse segments; segments of corolla lanceolate, 8 in number, acuminated. ♄. ◡. S. Native of the East Indies. Flowers white. Berries globose, black, size of a pea.

Mountain Jasmine. Shrub cl.

27 J. MULTIFLÒRUM (Roth. nov. spec. p. 6.) leaves ovate, acuminated. and are, as well as the young branches, pilose; panicles lateral and terminal, elongated, corymbose, fastigiate; calyx campanulate, with reflexed segments; peduncles and calyxes hairy. ♄. ◡. S. Native of the East Indies. Peduncles naked, 3-6-flowered. Corolla 8-cleft, with lanceolate segments.

Many-flowered Jasmine. Shrub cl.

28 J. LANCEOLA'TUM (Ruiz et Pav. fl. per. 1. p. 6. t. 7. f. a.) erect, simple; leaves lanceolate-elliptic, nearly sessile, reflexed at the points; peduncles axillary and terminal, 1-flowered; corolline segments oblong-obovate. ♄. G. Native of Peru, in the woods of Puzuzo. Flowers white, tinged with purple.

Lanceolate-leaved Jasmine. Shrub 2 feet.

29 J. SESSILIFLÒRUM (Vahl, enum. 1. p. 29.) climbing, glabrous, much branched; leaves oblong-ovate, acute, shining; flowers terminal, sessile, by threes; segments of corolla 6, lanceolate, acute. ♄. ◡. S. Native of the East Indies. Leaves veiny above and veinless beneath. Flowers white.

Sessile-flowered Jasmine. Shrub cl.

30 J. GLAU'CUM (Vahl, enum. 1. p. 30.) climbing, glabrous; leaves lanceolate, mucronate, shining; calycine segments 5, subulate; corolla 6-7-cleft; peduncles terminal, usually 3-flowered. ♄. ◡. G. Native of the Cape of Good Hope. Vent. cels. t. 55. Thunb. fl. cap. 1. p. 42. J. rivulàre, Sal. stirp. rar. 15. t. 8. Nyctánthes glaúca, Lin. suppl. p. 82. Mogòrium myrtifòlium, Lam. ill. 1. p. 23. and J. ligustrifòlium, Lam. ill. 1. t. 25.—Comm. pl. rar. t. 5. f. 5. Panicle simple and compound, trichotomous. Corollas white, larger than those of *J. officinàle*.

Glaucous Jasmine. Fl. Aug. Clt. 1774. Shrub cl.

* * *Leaves simple. Calyx toothed.*

31 J. GLANDULÒSUM (Wall. cat. no. 2849.) glabrous; leaves ovate, acuminated; calyx tubular, 8-toothed; segments of corolla 8, lanceolate-linear, acuminated; bracteas setaceous; peduncles axillary, 3-flowered; flowers pedicellate. ♄. ◡. G. Native of Nipaul, on Sheopore. Corolla white.

Glandular Jasmine. Shrub cl.

32 J. OBLÓNGUM (Burm. ind. 4. t. 3. f. 2.) branches simple; leaves oblong, mucronate, glabrous; peduncles axillary, 1-flowered. ♄. ◡. S. Native of Java. Vahl, enum. 1. p. 29. Flowers yellow, smaller than those of *J. odoratíssimum*. Perhaps the same as *J. simplicifòlium*.

Oblong-leaved Jasmine. Shrub cl.

33 J. ACUMINA'TUM (R. Br. prod. p. 521.) leaves ovate, acuminated, glabrous; petioles 5-6 times longer than the superior joint; calyx campanulate, with very short teeth. ♄. ◡. S. Native of New Holland, within the tropic. Lindl. bot. reg. t. 1296. Panicles terminal, trichotomous, corymbose. Flowers white. Corolla 6-parted, with ovate segments.

Acuminate-leaved Jasmine. Fl. Nov. Clt. 1820. Shrub cl.

34 J. MO'LLE (R. Br. prod. p. 521.) leaves ovate, acute, or acuminated, downy, very soft beneath; peduncles terminal, trichotomous; teeth of calyx very short. ♄. ◡? G. Native of New Holland, within the tropic.

Soft Jasmine. Shrub cl.

35 J. CRASSIFÒLIUM (Blum. bijdr. p. 679.) scandent; young branchlets beset with glandular hairs; leaves alternate: floral ones for the most part opposite, oval, acute, triple-nerved, shining, of the consistence of parchment; peduncles axillary and terminal, crowded, 3-5-flowered; pedicels long; calyx tubular, obsoletely 5-toothed. ♄. ◡. S. Native of the western provinces of Java, in woods on the mountains.

Thick-leaved Jasmine. Fl. year. Shrub cl.

36 J. SIMPLICIFÒLIUM (Forst. prod. 3. no. 7. Vahl, enum. 1. p. 27. Willd. spec. 1. p. 39.) shrubby, spreading, glabrous; leaves oblong, polished; flowers from 3 to many, terminal; calyx campanulate, with a 5-toothed border; segments of corolla from 6-8, linear, acute, equalling the tube in length. ♄. S. Native of the Friendly Islands, and the Eastern Archipelago. Sims, bot. mag. t. 980. J. austràle, Pers. ench. 1. p. 8. Flowers terminal, from 3 to a decussate panicle, having its ramification trifid. Bracteas small, subulate. Corollas white, fragrant.

Simple-leaved Jasmine. Fl. June, July. Clt. 1808. Sh. cl.

37 J. LÆ'TUM (Wall. cat. no. 2859.) branches, calyxes, and young leaves downy; leaves ovate, acuminated, almost glabrous in the adult state; corymbs terminal, trichotomous; bracteas and calycine teeth subulate; calyx 7-toothed; segments of corolla 7, lanceolate, acute. ♄. ◡. S. Native of the Burman empire, in Pantang Creek on the Irrawaddy; and at Amherst, on the Martaban. Flowers white.

Pleasant Jasmine. Shrub cl.

38 J. GRA'CILE (Andr. rep. 127. R. Br. prod. p. 521.) twining, glabrous; leaves ovate, shining; calyx short, campanulate, with very short teeth. ♄. ◡. G. Native of New Holland, within the tropic, of New South Wales, Norfolk Island, and the islands in the South Seas. J. geniculàtum, Vent. choix, t. 8. J. lùcidum, herb. Banks, Poir. suppl. 3. p. 132. Peduncles terminal; pedicels 3, 1-flowered. Calyx 5-toothed. Corolla white, 5-8-cleft, fragrant; segments linear.

Slender Jasmine. Fl. year. Clt. 1791. Shrub cl.

39 J. HAMILTÒNII; leaves elliptic, acuminated, glabrous, shining; peduncles terminal, solitary, trichotomous, 3-flowered; calycine teeth short, subulate; limb of corolla 8-10-parted, with linear, obtuse segments. ♄. ◡. G. Native of Upper Nipaul, at Suembu. Mogòrium dichótomum, Hamilt. mss. J. dichótomum, D. Don, prod. fl. nep. p. 105. but not of Vahl.

Hamilton's Jasmine. Shrub cl. ?

40 J. VOLU'BILE (Jacq. hort. schœnbr. 3. t. 321. fragm. t. 44. f. 2.) twining, glabrous; leaves ovate, or ovate-lanceolate, glabrous; panicle terminal; calyx 4-6-toothed; corolla 6-8-cleft. ♄. ⌒. G. Native of the Cape of Good Hope. Peduncles many-flowered. Berries blue.

Twining Jasmine. Shrub tw.

41 J. DECUSSA'TUM (Wall. cat. 2860.) branches villous; leaves broad-ovate, acuminated, somewhat cordate at the base, downy on both surfaces, but especially beneath and on the nerves above; petioles short, villous; corymbs terminal, villous, trichotomous; calyx with a short tube, and subulate teeth; segments of corolla 6-8, linear-lanceolate, acuminated. ♄. S. Native of the Burman Empire, on the banks of the Martaban, at Amherst. Flowers white. Divisions of calyx between teeth and segments, like those of the following species.

Decussate-leaved Jasmine. Shrub erect?

42 J. SYRINGÆFÒLIUM (Wall. cat. no. 2861.) glabrous; leaves lanceolate or ovate-lanceolate, acuminated; peduncles trichotomous, axillary and terminal, corymbose; calyx campanulate, with 6 subulate teeth; segments of corolla lanceolate-linear, acute, 5-7. ♄. ◡. S. Native of the Burman empire at Amherst, on the banks of the Martaban, and at Tavoy.

Lilac-leaved Jasmine. Shrub cl.

43 J. DICHÓTOMUM (Vahl, enum. 1. p. 26.) climbing, glabrous; leaves ovate, quite glabrous; panicles di-trichotomous; calyx sub-campanulate, with subulate teeth. ♄. ◡. S. Native of Guinea. Corolla an inch long, white, sweet-scented. Berries blue.

Dichotomous Jasmine. Shrub cl.

44 J. HEYNEA'NUM; glabrous; leaves ovate-roundish, acuminated; peduncles axillary and terminal, trichotomous; calyx obsoletely 5-toothed; segments of corolla acute; berries twin, on clavate pedicels; bracteas minute. ♄. ◡. S. Native of the East Indies. J. undulàtum, Heyne, herb. ex Wall. cat. 7125. but not of Vahl. Flowers white.

Heyne's Jasmine. Shrub cl.

45 J. EXTE'NSUM (Wall. cat. no. 2862.) glabrous; leaves ovate-lanceolate or elliptic-oblong, bluntly acuminated, mucronate; corymbs terminal, trichotomous; calyx campanulate, with at first almost obsolete teeth, but which increase in size as well as the pedicels, as the fruit comes to maturity; segments of corollas oblong-lanceolate, mucronate. ♄. ◡. S. Native of the Burman empire, on Mount Taong Dong. Flowers white.

Extended Jasmine. Shrub cl.

46 J. ATTENUA'TUM (Roxb. herb. beng. ex Wall. cat. no. 2864.) glabrous; leaves oblong-lanceolate, coriaceous, with revolute edges, acuminated; peduncles axillary and terminal, forming a loose, terminal panicle; calyx campanulate, with short teeth; segments of corolla 5, lanceolate, acuminated. ♄. ◡. S. Native of Silhet. Leaves 5-6 inches long and 2-3 broad. The *J. lanceolàtum*, Roxb. fl. ind., is a variety of this, according to Wall. cat. l. c. Flowers white.

Attenuated-leaved Jasmine. Shrub cl.

* * * *Leaves ternate, opposite.*

47 J. AURICULA'TUM (Vahl, symb. 3. p. 1. enum. 1. p. 30.) leaves ternate, but those of the branchlets and flowers are simple; lateral leaflets small; calyx angular, with 5 minute gland-like teeth, and is, as well as the branchlets, which are terete, downy; corolla 7-cleft. ♄. ⌒. G. Native of the Isle of France and Malabar. Ker. bot. reg. 264. J. trifoliàtum, Pers. ench. 1. p. 7. Mogòrium trifoliàtum, Lam. ill. 1. p. 24. The whole shrub is clothed with greyish down. Panicle fastigiate; peduncles trichotomous. Calycine segments obtuse. Segments of corolla 5-8, ovate, obtuse, oblong. Berries globular. Flowers small, white, disposed in trichotomous corymbs. Stigma clavate.

Auricled-leaved Jasmine. Fl. Ju. Sept. Clt. 1790. Sh. tw.

48 J. FLE'XILE (Vahl, symb. 3. p. 1. enum. 1. p. 31.) climbing, glabrous; leaflets ovate-oblong, acuminated; racemes axillary, brachiate; calyx campanulate; with 5-6 minute, ovate teeth; segments of corolla 7, shorter than the tube. ♄. ◡. S. Native of the East Indies, and the Mauritius. J. Mauritiànum, Hort. J. Travancorénse, Herb. madr. Petioles twisted. Peduncles spreading, longer than the leaves; partial ones 3-flowered. Corolla with a very long tube.

Bent-petioled Jasmine. Fl. April, May. Clt. 1825. Sh. cl.

49 J. TORTUÒSUM (Willd. enum. hort. berol. 1. p. 10.) twining, glabrous; leaflets lanceolate, mucronate: odd one the largest; branches downy. ♄. ⌒. G. Native of the Cape of Good Hope. J. fléxile, Jacq. hort. schœnbr. 4. p. 46. t. 490. Leaves glabrous, but not shining, with a few hairs on the mid-rib beneath. Petioles downy. Corolla white, with lanceolate segments.

Twisted Jasmine. Fl. May, July. Clt. 1818. Shrub tw.

50 J. TRIFOLIA'TUM (Telfair, mss. ex Wall. cat. no. 2890.) branches, peduncles, petioles, and calyxes downy, as well as the leaves, in the young state; leaves alternate, trifoliate; leaflets ovate-roundish, obtuse: middle one on a longer petiole than the rest, glabrous in the adult state; peduncles terminal and axillary, trichotomous, corymbose; calyx 5-toothed; segments of corolla 7-8, oblong-lanceolate, obtuse. ♄. ◡. S. Native of the Mauritius. Bracteas of 2 forms: upper ones subulate.

Trifoliate Jasmine. Shrub cl.?

51 J. NOCTIFLÒRUM (Afz. ex Spreng. syst. 1. p. 31.) leaflets ovate-oblong, acuminated, 3-nerved, glabrous; peduncles by threes, 3-flowered, terminal; calyx denticulated. ♄. ◡. S. Native of Sierra Leone.

Night-flowering Jasmine. Shrub cl.

52 J. AZO'RICUM (Vahl, enum. 1. p. 31.) leaflets ovate and subcordate, undulated; branches terete; calyx campanulate; segments of corolla 5, equal in length to the tube. ♄. ⌒. G. Native of the Azores, and Madeira. Sims, bot. mag. 1889. Ker. bot. reg. 89. J. trifoliàtum. Mœnch. Nyctánthes Azòrica, Lin. spec. 1. p. 9.—Comm. hort. 1. p. 159. t. 82. Flowers white.

Azorian Jasmine. Fl. May, Nov. Clt. 1724. Shrub tw.

53 J. CAPE'NSE (Thunb. prod. p. 2. fl. cap. 1. p. 41. Vahl, symb. 3. p. 32.) branchlets angular, and are, as well as the petioles and leaves glabrous; leaflets ovate, sub-retuse, with an acumen; peduncles axillary, 3-flowered, shorter than the leaves; calyx tubular. ♄. G. Native of the Cape of Good Hope. J. angulàre, Willd. spec. 1. p. 38. Branches tetragonal. Leaves glabrous; margins of petioles pilose. Panicles terminal, trichotomous. Calyx 5-6-toothed, short; teeth short. Segments of corolla 6-7, much shorter than the tube.

Cape Jasmine. Fl. April, July. Clt. 1816. Shrub 5 feet.

54 J. DÍDYMUM (Forst. prod. no. 8. Vahl, symb. 3. p. 2.) leaflets ovate-lanceolate; racemes downy, axillary; integument of seed reticulated and chinky. ♄. G. Native of the Society Islands. Glabrous. Leaves 2 inches long, obscurely veined. Peduncles length of petioles. Calyx short, campanulate, with minute teeth.

Didymous-fruited Jasmine. Shrub.

55 J. LINEA'RE (R. Br. prod. p. 521.) leaves nearly opposite, downy; leaflets linear, acute; branches terete; panicles axillary, trichotomous. ♄. ◡. G. Native of New Holland, on the south coast.

Linear-leaved Jasmine. Shrub cl.

56 J. DIVARICA'TUM (R. Br. prod. p. 521.) glabrous in every part; leaflets sub-ovate; teeth of calyx obsolete; integument of seed imperforated. ♄. ◡. G. Native of New Holland, within the tropic. Lindl. bot. reg. 1291.

Divaricate Jasmine. Shrub cl.

57 J. CAMPANULA'TUM (Link, jahrb. 1. 3. H. p. 30. enum. 1. p. 32.) leaflets oval, acuminated, apiculated, glabrous; calyx campanulate, glabrous, with very short segments; panicle close; branches terete, and are, as well as the petioles, downy.

ħ . ◠. S. Native of? Leaflets unequal at the base, somewhat repand, having the veins confluent near the margin.

Campanulate-calyxed Jasmine. Clt. 1822. Shrub cl.

58 J. LANCEOLA'RIA (Roxb. fl. ind. 1. p. 97.) erect; leaves ternate; leaflets lanceolate; corymbs terminal. ħ . F. Native of Silhet, in the jungles and coppices.

Lanceolate Jasmine. Clt. 1826. Shrub erect.

59 J. PANICULA'TUM (Roxb. fl. ind. 1. p. 97.) erect, polished in every part; leaves ternate; leaflets oval, bluntly acuminated; panicles terminal. ħ . G. Native of China. Lodd. bot. cab. 469. Flowers small, white, numerous.

Panicled Jasmine. Fl. Jan. Clt. 1818. Shrub.

60 J. DISPE'RMUM (Wall. in Roxb. fl. ind. 1. p. 99. pl. asiat. rar. 3. t. 274.) scandent, glabrous; leaves opposite, pinnate, rarely ternate; leaflets 5, rarely 3, ovate-oblong or ovate-lanceolate, acuminated, cordate at the base, 3-5-nerved; corymbs terminal and lateral, brachiate; calyx campanulate, with subulate teeth; segments of corolla 5, oblong, lanceolate, obtuse; berries twin, 2-seeded. ħ . ◡. G. Native of Nipaul, where it is called *Goojee-soah*, as well as of Kamaon and Sirmore. J. latifòlium, Hamilt. mss. J. quinquenérve, Lamb. herb. Branches angular. Leaves membranous; lateral leaflets smaller. Flowers large, fragrant, white, with opposite subulate bracteas at their base. Pedicels short. Berries twin, 2-seeded.

Two-seeded Jasmine. Clt. 1825. Shrub cl.

* * * * *Leaves ternate, alternate.*

61 J. FRU'TICANS (Lin. spec. 1. p. 9. syst. ed. 14. Vahl, enum. 1. p. 33.) leaves alternate, ternate, and simple; leaflets obovate or cuneiform, obtuse; branches angular; calycine segments subulate. ħ . H. Native of the south of Europe, and throughout the Levant. Curt. bot. mag. 13. t. 461. Schmidt, æst. baumz. 3. t. 148. J. heterophýllum, Mœnch,—Lob. adv. p. 389. f. 390. Leaves glabrous. Peduncles terminal by threes. Corolla yellow: with oblong, obtuse segments. This *jasmine* is often planted against walls, pales, &c. It, however answers better for shrubberies than the common *jasmine*.

Shrubby Jasmine. Fl. May, Oct. Clt. 1570. Sh. 10 to 12 ft.

62 J. HU'MILE (Lin. spec. 1. p. 9. Vahl, enum. 1. p. 33.) leaves alternate, acute, ternate and pinnate; branches angular; calycine segments very short. ħ . H. Native of Madeira. Ker. bot. reg. t. 350.—Besl. eyst. 40. f. 2.—Knor. thes. 1. t. 1.—Schmidt, æstr. baumz. t. 149. Plant glabrous. Peduncles terminal, twin, or tern, 3-flowered. Corolla yellow: with oblong, obtuse segments.

Humble or Italian Yellow Jasmine. Fl. Ju. Sept. Clt. 1656. Sh. erect, 3 to 4 feet.

63 J. ODORATÍSSIMUM (Lin. spec. p. 10. Vahl, enum. 1. p. 33.) leaves alternate, bluntish, ternate, and pinnate; branches terete; calycine segments very short. ħ . ◡. H. Native of Madeira. Curt. bot. mag. 8. t. 285.—Barr. icon. t. 62. Plant glabrous. Peduncles terminal, by threes, 3-flowered. Corolla yellow: with 5 oblong, obtuse segments. (f. 11.)

Very sweet-scented or Indian Yellow Jasmine. Fl. July, Sept. Clt. 1656. Shrub cl.

FIG. 11.

64 J. HETEROPHY'LLUM (Roxb. fl. ind. 1. p. 99. and 164.) arboreous; leaves alternate, simple, or ternate, oblong-elliptic or broad-ovate, acuminated, waved, lucid, firm, glabrous; panicles terminal, trichotomous, fastigiate, corymbose, downy; calyx urceolate, with short, subulate teeth; segments of the corolla oblong, equal to the tube in length. ħ . H. Native of Nipaul, where it is called *Goojee* and *Javana*. Wall. pl. asiat. rar. 3. t. 275. J. arbòreum, Hamilt. mss. This species grows to a middle-sized tree, with long, terete branches, which have a tendency to become rambling. Leaves varying in size and form. Flowers very numerous, yellow, fragrant.

Various-leaved Jasmine. Fl. Jul. Aug. Clt. 1820. Tr. middle-sized.

65 J. CALLOPHY'LLUM (Wall. cat. no. 2889.) glabrous; leaves alternate, trifoliate, on long petioles; leaflets roundish-ovate, and ovate-lanceolate, shining, acuminated and mucronate, on long petiolules; peduncles terminal, compound, trichotomously branched, with almost sessile flowers in the extreme forks, somewhat racemose; calyx slightly 5-toothed; segments of corolla 5, acute, oblong-lanceolate. ħ . ◡. S. Native of the East Indies, on the mountains of Madura. Bracteas small, setaceous. Flowers white.

Beautiful-leaved Jasmine. Shrub cl.

* * * * * *Leaves pinnate, opposite.*

66 J. OFFICINA'LE (Lin. spec. 1. p. 9. Vahl, enum. 1. p. 34.) leaves opposite, pinnate; leaflets ovate, acuminated; buds erectish. ħ . ◡. H. Native of the south of Europe, in hedges. Curt. bot. mag. 1. t. 31. Lam. ill. t. 7. f. 1.—Bull. herb. t. 231.—Schmidt, æstr. baumz. 3. t. 150. Plant glabrous. Branches angular. Calycine segments 5, subulate. Corolla white, 4-5-cleft, sweet-scented. Terminal leaflet the longest. The common *jasmine* has been a favourite wall shrub from time immemorial. Its native country, as well as the date of its introduction, are unknown. Gerarde, in 1597, says it was in common use for covering arbours. There are golden and silver-edged-leaved varieties of the common jasmine, as well as a double-flowered variety.

Common Jasmine. Fl. June, Oct. Clt. 1548. Shrub cl.

67 J. GRANDIFLÒRUM (Lin. spec. 1. p. 9.) leaves opposite, pinnate; leaflets bluntish, outer 3-5 confluent; buds horizontal. ħ . ◡. S. Native of the East Indies. Ker. bot. reg. 91. J. Hispánicum, Hort.—Rheed. mal. 6. t. 52.—Merian. sur. t. 46.—Knor. thes. 1. t. 1. Very like *J. officinàle*, but differs in the equal size of the leaflets, and in the exterior ones being confluent, and in the flowers being larger, and rddish underneath.

Great-flowered or Catalonian Jasmine. Fl. June, Oct. Clt. 1629. Shrub cl.

68 J. AU'REUM (D. Don, prod. fl. nep. p. 106.) leaves opposite; leaflets 9-11, ovate, acute, almost sessile, 3-nerved, glabrous; panicles terminal and lateral, few-flowered, glabrous; branches 5-angled, glabrous. ħ . H. Native of Nipaul. Flowers yellow.

Golden-flowered Jasmine. Shrub.

69 J. BIGNONIA'CEUM (Wall. cat. no. 2886.) leaves opposite, pinnate; leaflets small, oblong, or oblong-obovate, or attenuated at both ends, glabrous: odd one usually acuminated; peduncles aggregate, 3-flowered, terminal; corolla funnel-shaped, with roundish-reniform short segments; calyx 5-toothed. ħ . G. Native of the Nellighery mountains, where it was collected by Noton. The leaflets are sometimes binate.

Bignonia-like Jasmine. Shrub.

* * * * * * *Leaves pinnate, alternate.*

70 J. NERVÒSUM (Lour. coch. p. 29.) scandent, glabrous; leaves pinnate; leaflets ovate, acuminated, 3-nerved, shining; calycine segments 5-8, subulate; segments of corolla 5-8, oblong, obtuse. ħ . ◡. H. Native of Cochinchina, in hedges. Flowers white, scentless. Branches terete. Flowers terminal.

Nerved-leaved Jasmine. Shrub cl.

71 J. revolu'tum (Ker. bot. reg. 178. Sims, bot. mag. 1731.) erect; leaves alternate, pinnate; leaflets 5-7, ovate-lanceolate, or elliptic, glabrous, on short petiolules; corymbs terminal, compound; calycine teeth very short, mucronate; branches angular, glabrous. ♄. F. Native of the mountainous countries north of Hindostan, and of Nipaul, &c. Lodd. bot. cab. 966. J. chrysánthemum, Roxb. fl. ind. 1. p. 93. Leaves shining. Flowers bright yellow, very fragrant. Segments of corolla 5, obtuse. Stigma clavate.

Revolute-leaved Jasmine. Fl. May, Oct. Clt. 1812. Sh. cl.

72 J pubígerum (D. Don, prod. fl. nep. p. 106.) leaves alternate, pinnate; leaflets 7, ovate-lanceolate or oblong, acuminated, sessile, downy while young; branches angular, downy; peduncles elongated, 1-flowered, terminal, sub-corymbose, downy; teeth of calyx short; segments of corolla 5-6, obtuse. ♄. F. Native of Nipaul, where it is called *Chimali-swa*. J. Wallichiànum, Lindl. bot. reg. t. 1409. Terminal leaflet longer and more attenuated than the lateral ones. Flowers yellow, smaller than those of *J. revolùtum*, to which it is very nearly allied.

Pubigerous Yellow Jasmine. Fl. May, Oct. Clt. 1827. Sh. cl.

Cult. The hardy species of *Jasmine* are well adapted for training against walls or trellis work; they will grow in any common soil, and are easily increased by ripe cuttings planted under a hand-glass. The greenhouse kinds grow freely in a mixture of loam, sand, and peat, and ripened cuttings are easily struck in the same kind of soil, or in sand, under a hand-glass, in a little heat.

II. NYCTA'NTHES (from *νυξ, νυκτος, nux, nuctos*, night; and *ανθος, anthos*, a flower; in allusion to the flowers opening at the approach of night, and falling off at the break of day; hence the name *árbor trístis*, which is given to the species.) Lin. gen. no. 21. Juss. 104.—Parílium, Gærtn. t. 51.—Scabrìta, Schreb. no. 154. Gærtn. 1. t. 138.

Lin. syst. *Diándria, Monogynia*. Calyx campanulate, slightly 5-toothed. Corolla salver-shaped. Stigma capitate, glandular. Capsule superior, obcordate, compressed, 2-celled, 2-valved; cells 1-seeded. Embryo erect, without albumen.—An erect, spreading shrub, with opposite simple leaves, and large terminal panicles of flowers

1. N. a'rbor-trístis (Lin. spec. p. 8. syst. 56.) ♄. S. Native of the East Indies. Ker. bot. reg. 399. Parílium árbor trístis, Gærtn. sem. 1. p. 234. t. 51. Scabrìta scàbra, Lin. syst. 115. ed. 12; Gærtn. fruct. 2. p. 265. t. 138. Scabrìta triflòra, Lin. mant. 1. p. 37. Mánga pùmerum, Rheed. mal. 1. p. 35. t. 21. Sephálica Asiat. res. 4. p. 244. Branches tetragonal. Leaves on short petioles, cordate, acuminated, entire, or coarsely serrated, scabrous. Inflorescence a large terminal, leafy, cross-armed panicle, composed of small, 5-flowered, terminal umbellets. Flowers numerous, middle sized, exquisitely fragrant, open at sunset, and fall off at sunrise. Involucra of the umbellets 4-leaved. Corolla with an orange-coloured tube, and a white border; segments of the limb 6-7, twisted, triangular, or obliquely lobed, having the outer margin scolloped. The flowers of this tree are exquisitely fragrant, partaking of the smell of fresh honey, and on that account the plant is much esteemed; for when destitute of flowers, it has but an indifferent appearance. The orange tubes of the flowers dye a most beautiful buff or orange colour, with the various shades between them, according to the preparation and mode of conducting the operation; but, unfortunately, no way has yet been discovered of rendering this elegant colour durable.

Sad-Tree. Fl. July. Clt. 1781. Tree 10-18 feet.

Cult. This tree grows freely in loam and peat, but seldom produces flowers in England. Cuttings, not too ripe, root readily in sand, under a hand-glass, in heat.

Order CL. STRYCHNA'CEÆ (this order only contains the genus *Strýchnos.*) Strýchneæ.

Calyx 4-5-parted. Corolla funnel-shaped; with a cylindrical tube, and a 4-5-parted border; segments narrow, imbricate in æstivation. Stamens 4-5; filaments very short; anthers subsagittate or oblong. Ovarium superior, 2-celled; ovula numerous, attached to fleshy receptacles down to the middle of the partition. Berries large, 2-celled, but in the more advanced state only 1 cell can be detected; covered by a hard, brittle rind. Seeds few, or numerous, flattened, peltate, broad, nestling in gelatinous pulp; integument double. Embryo straight, furnished with albumen, having the radicle pointing to the hilum, centripetal; and the cotyledons often 3-nerved.

Shrubs erect or rambling, either with or without tendrils. Leaves opposite, 3-nerved, or triple-nerved, rarely feather-nerved. Flowers small, white, or greenish white, disposed in terminal and axillary pedunculate corymbs. The well-known *Nux-vomica*, and the Clearing-nut of the East Indies, are species of *Strýchnos:* the fruit is remarkable for its bitterness, and acrid deleterious effects, which are indicated, not only when introduced into the stomach, but still more violently when introduced into the system by inoculation.

Synopsis of the genera.

1 Stry'chnos. Calyx 5-parted. Corolla funnel-shaped. Stamens 5, on short filaments, inserted in the top of the tube. Berry 1-2 celled. Seeds nestling in the pulp, flat, peltate.—Leaves 3 or triple-nerved.

2 Picrophlœ'us. Calyx 5-parted. Corolla funnel-shaped. Stamens 5, short, inserted at the base of the corolla. Berry 2-celled, many-seeded. Seeds variously angled.—Leaves veiny.

3 Cyrtophy'llum. Calyx 5-parted. Corolla funnel-shaped. Stamens 5, exserted, inserted in the upper part of the tube. Berry 2-celled, many seeded. Seeds peltate.

4 Lasióstoma. Calyx 4-parted. Corolla with a short tube, and a 4-cleft limb; lobes villous. Stamens 4, exserted, inserted in the tube. Capsule 1-celled, ex Kunth, 2-celled, ex Meyer, 1-2-seeded. Seeds convex on one side, and flat on the other.—Leaves triple-nerved.

5 Gardne'ria. Calyx 4-toothed. Corolla rotate, with a short tube, and a 4-parted limb. Stamens 4, inclosed. Berry 2-celled, 2-seeded. Seeds orbicular, compressed.—Leaves feather-nerved.

I. STRY'CHNOS (*στρυχνος* is the Greek name of Solanum, applied to this genus by Theophrastus.) Lin. gen. no. 253. Gærtn. fruct. 2. p. 476. t. 179. Juss. gen. 149. R. Br. prod. p. 469. Ignàtia, Lour. coch.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla tubular, funnel-shaped: with a 5-parted, spreading limb, valvate in æstivation. Stamens 5, inserted in the throat of the corolla. Ovarium 2-celled, many-seeded. Style one; stigma capitate. Berry globose, pulpy inside, with a crustaceous rind. Seeds fixed to a central placenta, peltate, with copious albumen. Embryo foliaceous, with a common radical.—Non-lactescent

trees or shrubs. Leaves opposite, usually nerved. Flowers corymbose.

* *Tendrils none.*

1 S. Nu'x-Vómica (Lin. spec. 271.) leaves 3-5-nerved, oval, shining; berries many-seeded. ♄. S. Native of the coast of Coromandel. Woodv. med. bot. 2. p. 29. t. 223. Church. et Stev. med. bot. 2. t. 52. Roxb. cor. 1. p. 8. t. 4. Gærtn. fruct. t. 179. f. 7. Hayne, darst. t. 17. Plenck, icon. 117. Canìram, Rheed. mal. 1. p. 67. t. 37. Blackw. t. 395. Canìram vomiquier, Pet. Th. dict. sc. no. 1. Colubrini ligni tertium, genus in Malabar, Bauh. pin. p. 301. The tree is called *Koochila* by the Bengalese, and *Musadi* by the Telingas. Leaves smooth, shining, from $1\frac{1}{2}$ to 4 inches long. Stipulas wanting. Flowers small, greenish white, collected into terminal corymbs. Anthers half within the tube, and half out. Berry round, smooth, size of a pretty large apple, orange-coloured, when ripe. The wood of this tree being hard and durable, is used for many purposes by the natives. It is exceedingly bitter, particularly that of the root, which is used to cure intermitting fevers, and the bite of venomous snakes, when that of Naga-Musadi, the *S. colubrìna*, cannot be had. The seeds are employed in the distillation of country spirits, to render them more intoxicating. The pulp of the fruit seems perfectly innocent, as it is greedily eaten by many sorts of birds.

Nux Vomica is one of the narcotic acrid class of poisons, and seems to have a direct power over the spinal cord. It produces laborious perspiration, which is followed by torpor, trembling, coma, convulsions, and death. M. Drapiez has ascertained, by numerous experiments, that the fruit of *Feuillea cordifòlia* is a powerful antidote against this, and other vegetable poisons. For a century *Nux Vomica* has been known as a powerful medicine, and is employed in a vast variety of diseases, with different degrees of success. M. Majendie discovered that the plant possessed the singular effect of strongly affecting the spinal marrow, without affecting, except indirectly, the function of the brain; and it was conjectured by him, that it might be turned to advantage in the cure of diseases. This conjecture has since been amply confirmed. M. Majendie, ignorant of Dr. Fouquier's published cases, succeeded in curing persons of paralysis; and has since given the alcaholic extract of *Nux Vomica*, not merely to palsies, both partial and general, but also to various other kinds of local and general debility. Strychnine is a preparation of *Nux Vomica*.

Vomit-Nut, or Poison Nut. Clt. 1788. Tree middle-sized.

2 S. potatòrum (Lin. spec. p. 227.) leaves opposite, from ovate to oval, glabrous, pointed; bark deeply cracked; berries 1-seeded. ♄. S. Native of the East Indies, in mountains and woods of great extent. Lin. suppl. p. 148. Roxb. cor. 1. p. 9. t. 5. Strýchnos Téttan-cótta, Retz. obs. 2. p. 12. Gærtn. fruct. 2. p. 477. t. 179. Canìram Tìtan-cótta, Pet. Th. dict. des. sc. no. 2. The Hindoo and Bengalese name of the tree is *Nirmulee;* it is called *Induga* by the Telingas, and *Tettan-Kotta* by the Tamuls. The leaves cannot be either said to be 3-nerved or triple-nerved. Stipulas connecting. Corymbs from the tops of the last year's shoots, round the base of the present year's, bearing, in a ternary order, many small, greenish yellow, fragrant flowers. Berry shining, black when ripe. The wood of this, like that of the former, is hard and durable, and is used for various economical purposes. The pulp of the fruit, when ripe, is eaten by the natives, although not very agreeable to Europeans. The ripe seeds are dried, and sold in every market, to clear muddy water. The natives never drink clear well-water, if they can get pond or river water, which is always more or less impure. One of the seeds is well rubbed, for a minute or two, round the inside of the vessel containing the water, generally an unglazed earthen one, which is then left to settle; in a very short time the impurities fall to the bottom, leaving the water clear, and perfectly wholesome. These seeds are generally carried about by the more provident part of our officers and soldiers, in time of war, to enable them to purify their water. They are easier to be obtained than alum, and are probably less hurtful to the constitution.

Drinkers' Strychnos or Clearing Nut. Clt. 1794. Tree 15 to 20 feet.

3 S. ovalifòlia (Wall. cat. no. 1592.) leaves oval, tapering to both ends, acuminated; peduncles axillary, corymbose; fruit size of a small cherry. ♄. S. Native of Penang. Leaves with three principal nerves. S. laurìna, Wall. cat. no. 1591, a native of Tavoy, does not appear to differ much from the present species, unless in the peduncles being branched and panicled.

Oval-leaved Strychnos. Shrub cl ?

4 S. Madagascarie'nsis (Pet. Th. ex Poir. dict. 8. p. 696.) leaves ovate, acute; corolla quadrifid, with a villous throat; fruit very large, 1-seeded. ♄. S. Native of Madagascar, about Foul-Point. Canìram de Madagascar, Pet. Th. l. c. no. 3. Flowers in axillary bracteate corymbs, at the tops of the branches. Very nearly allied to *S. potatòrum*.

Madagascar Strychnos. Clt. 1823. Tree.

5 S. spinòsa (Lam. ill. no. 2449. Poir. dict. 8. p. 697.) branches spiny; leaves obovate, acute or acuminated; corolla with a bearded throat, hardly longer than the calyx. ♄. S. Native of Madagascar, in sand, on the shore. Canìram, Voutac. Pet. Th. l. c. no. 4. Voutàca, Flacourt, mad. p. 121. no. 13.—Pluk. phyt. t. 170. f. 4. Leaves glabrous, 3 inches long, and 2 broad, 5-nerved. Spines (abortive tendrils) longer than the petioles, axillary. Corymbs axillary, at the top of the branches, with opposite peduncles. Corolla tubularly ventricose, small. Fruit globose, many-seeded, 8 inches in diameter, at length orange-coloured.

Spiny Strychnos. Clt. 1818. Tree 10 to 12 feet, cl.

6 S. lu'cida (R. Br. prod. p. 469.) leaves ovate, acutish, coriaceous, 3-nerved; nerves bipartite. ♄. G. Native of New Holland, within the tropic.

Shining-leaved Strychnos. Shrub.

7 S. Igna'tii (Berg. mat. med. p. 149.) leaves ovate, acute, glabrous; berry pear-shaped, many-seeded; peduncles axillary, about 4-flowered. ♄. ◡. S. Native of Cochinchina, and the Philippine Islands. Ignàtia amàra, Lin. suppl. p. 149. Gærtn. fruct. t. 179. f. 8. Ignatiàna Philippínica, Lour. coch. p. 125. Canìram de St. Ignatio, Pet. Th. l. c. no. 6. Camélli, Phil. trans. 21. t. 1. f. 46. Branches sarmentose, scandent. Leaves a span long, veiny. Panicles small, axillary, composed of 3-4-flowered peduncles. Flowers long, drooping, white, with the scent of jasmine. Fruit ovate, attenuated at the neck, size of a Bon Chretien pear. Loureiro, however, says that the fruit is rounded, attenuated at the neck, dry. Seeds ovate, trigonal, of a dry, very bitter substance.

St. Ignatius's Bean. Shrub cl.

* * *Tendrils present.*

8 S. colubrìna (Lin. spec. 271.) scandent; tendrils simple; leaves from oval to oblong, bluntly acuminated, triple-nerved, polished; berries many-seeded. ♄. ◡. S. Native of the coast of Coromandel, and of Silhet. Plenck, off. t. 118. Modìra Canìram, Rheed. mal. 8. t. 24. Caniram a Crochet, Pet. Th. l. c. no. 5. Arbor ligni Colubrìni, Rumph. amb. 2. t. 37. Tendrils lateral, becoming thick and woody. Corymbs terminal, small, composed of 2-3 pairs of villous branches. Stipulas none. Flowers small, greenish yellow. Leaves 3-6 inches long, and 2-3 broad. Berry often as large as an orange: rind yellowish. The tree is called by the Bengalese *Koochila-luta*, and by the Telingas *Naga-Musadi*. (Naga, or Tansoopaun,

in the Telinga language, means the *Cobra de Capella*, or *Coluber nàga*, Lin. *Tansoo* means dancing, and *paun*, a serpent, this sort being famous for erecting its head, and moving it from side to side, at the sound of music.) This species yields the real, or, at least, another kind of *Lignum Colubrìnum*. The wood of the sort is esteemed, by the Telinga physicians, an infallible remedy for the bite of the Naga, as well as for that of every other venomous snake. It is applied externally, and at the same time given internally. It is also given in substance, for the cure of intermitting fevers. Roxb. mss. in fl. ind. 2. p. 265.

Snake-wood, or Lignum Colubrinum. Clt. 1820. Shrub cl.

9 S. axilla'ris (Colbr. in Lin. trans. 12. p. 351-355. t. 15. Blum. bijdr. 1019.) leaves ovate, or oblong-lanceolate, acuminate; tendrils axillary, simple, thickened, downy; berry oval, 1-seeded. ♄. ◡. S. Native of the mountainous countries north and east of Silhet, in Bengal, where it is called *Hur-cuchila*, or *Har-cuchila;* and of the island of Nusa-Kambanga. Branches dichotomous, downy while young. Leaves glossy, villous while young, triple-nerved, sometimes also 3-nerved, twice as long as the interstices. Stipulas none, except a downy axillary margin, which connects the base of the petioles. Fascicles of flowers crowded, round, twice as long as the petioles. Axils of the principal nerves of the leaves, as also the petioles, downy.

Axillary-flowered Strychnos. Clt. 1824. Shrub cl.

10 S. Tieu'te (Leschen. ann. du mus. 16. p. 480. t. 23.) Blum, bijdr. 1019.) leaves elliptic, short-acuminate, 3-nerved, glabrous; tendrils simple, thickened, opposite the solitary leaves. ♄. S. Native of Java, where it is called *Tjettek*, or *Upas Tieute*. Bark of stem rufescent; wood cream-coloured, spongy. Branches green. Leaves 3-nerved, glabrous, green. Fruit globose, many-seeded. This tree is said to be very poisonous, and is probably the true Upas tree of Java.

Tieute Strychnos. Shrub cl.

11 S. bicirrhòsa (Lesch. in Roxb. fl. ind. 2. p. 267.) leaves elliptic, cuspidately acute, triple-nerved; tendrils bifid, opposite the leaves, with thickened divisions; berry globular, 1-seeded. ♄. ◡. S. Native in forests near Koudracotta, about 20 miles south of Tanjore. Tendrils with a pair of scale-formed bracteas under the divisions. Glabrous in every part.

Two-tendrilled Strychnos. Shrub cl.

12 S. nítida; leaves ovate-lanceolate or oblong, acuminate, with 3 principal nerves, and 2 small lateral ones; tendrils opposite the leaves, bifid at apex, having the lobes clavate and curved at top, without any small process between them, as in *S. bicirrhòsa*. Lesch. ♄. ◡. S. Native of the East Indies, on the Pundua mountains. Peduncles long, corymbose at top. S. lùcida, Wall. cat. no. 1590, but not of R. Br.

Shining-leaved Strychnos. Shrub cl.

13 S. brachia'ta (Ruiz. et Pav. fl. per. 2. p. 30. t. 157.) leaves ovate or oblong, acuminated, 5-nerved, glabrous; tendrils opposite the leaves; berry globose, many-seeded; stem brachiate, terete; flowers corymbose, axillary and terminal. ♄. ◡. S. Native of Peru, in woods. Branches pendant. Bracteas linear, subulate, deciduous. Calyx villous. Corollas white, villous outside. Berries large, globose, pendulous, greenish yellow.

Brachiate-stemmed Strychnos. Shrub cl.

Cult. A mixture of loam, peat, and sand, is a good soil for the species of *Strýchnos;* and cuttings of them will strike root in sand, under a hand-glass, in heat.

II. PICROPHLŒ'US (from *πικρος, picros*, bitter; and *φλοιος, phloios*, bark; the bark is very bitter.) Blum. bijdr. p. 1019.

Lin. syst. *Pentándria, Monogýnia*. Calyx 5-parted, imbricate. Corolla with a short tube; and a 5-parted limb, which is imbricate in æstivation. Stamens 5, inserted in the base of the corolla, short. Style short; stigma obtuse, emarginate. Berry with a crustaceous rind, 2-celled, many-seeded; receptacles or placentas twin in each cell, fleshy, rising from the inflexed edges of the dissepiments. Seeds minute, variously-angled, reticulated. Albumen rather cartilaginous.—A shrub, with bitter bark; opposite, oblong, coriaceous, rather veiny, quite glabrous leaves; and terminal, dichotomous corymbs of flowers.

1 P. Javane'nsis (Blum. bijdr. p. 1020.) ♄. S. Native of Java, in the higher woods on Mount Salak.

Java Picrophlœus. Fl. April, July. Shrub.

Cult. See *Stry'chnos*, above, for culture and propagation.

III. CYRTOPHY'LLUM (from *κυρτος, kyrtos*, a curved; and *φυλλον, phyllon*, a leaf; in reference to the leaves of the first species being convex on the upper side.) Reinwdt. herb. ex Blum. bijdr. p. 1022.

Lin. syst. *Pentándria, Monogýnia*. Flowers inferior, according to Blum.; but, according to Reinwdt, superior. Calyx 5-parted, imbricate, permanent. Corolla funnel-shaped; limb 5-parted. Stamens 5, exserted; filaments inserted in the upper part of the tube; anthers incumbent, emarginate at the base. Style filiform; stigma bluntish. Berry 2-celled, many-seeded; receptacle fleshy, fixed to the dissepiment.—Hardly lactescent trees; with opposite, coriaceous, glabrous leaves; and axillary and terminal corymbose inflorescence.

1 C. peregrìnum (Reinwdt. ex Blum. bijdr. p. 1022.) leaves oblong-lanceolate, acuminated at both ends, convex above, and concave beneath. ♄. G. Native of Japan and China.

Foreign Cyrtophyllum. Fl. year. Tree.

2 C. speciòsum (Blum. bijdr. p. 1022.) leaves broad-lanceolate, much acuminated, flat. ♄. S. Native of Java, in woods on Mounts Salak and Gede, where it is called Kiminjak.

Showy Cyrtophyllum. Fl. June, Aug. Tree.

Cult. See *Stry'chnos*, above, for culture and propagation.

IV. LASIO'STOMA (from *λασιος, lasios*, woolly; and *στομα, stoma*, a mouth; mouth of corolla.) Schreb. gen. no. 180. Meyer. ess. p. 83. H. B. et Kunth. nov. gen. amer. 7. p. 209.—Roúhamon, Aubl. guian. 1. p. 93. t. 36. Lam. ill. t. 81.

Lin. syst. *Tetrándria, Monogy'nia*. Calyx 4-parted, bibracteate at the base; segments acute. Corolla funnel-shaped; tube short; limb quadrifid: lobes acute, villous. Stamens 4, inserted in the tube, exserted; anthers oblong, 2-celled. Ovarium ovate. Style one; stigma ovate. Capsule orbicular, 1-celled, ex Kunth. 2-celled, ex Meyer, 2-seeded. Seeds ovate, convex on one side, and flat on the other.—Cirrhiferous, climbing shrubs, full of yellowish, poisonous juice; having the branches opposite: and the tendrils axillary, solitary, thickened, and spirally convolute at top. Leaves opposite, quite entire, triple-nerved. Corymbs axillary, opposite, bracteate. Flowers small, white. Capsules yellowish.

1 L. Cura're (H. B. et Kunth. nov. gen. 7. p. 210.) leaves oblong, triple-nerved; flowers corymbose. ♄. ◡. S. Native of South America, near Esmeraldo, in the missions of the Orinoco. Curare, or Bejuco de Mavacure, Humb. relat. hist. 2. p. 547.

Curare Lasiostoma. Shrub cl.

2 L. divarica'ta (Meyer, ess. p. 83.) leaves obovate-oblong, triple-nerved; flowers racemosely corymbose. ♄. ◡. S. Native of tropical America.

Divaricate Lasiostoma. Shrub cl.

3 L. cirrhòsa (Pers. ench. 1. p. 134.) leaves elliptic, 3-nerved; corymbs sessile. ♄. ◡. S. Native of Guiana. Roúhamon Guianénsis, Aubl. l. c. Lam. l. c.

Tendrilled Lasiostoma. Shrub cl.

Cult. For culture and propagation, see *Strýchnos*, above.

V. GARDNE'RIA (this genus is dedicated to Hon. Edward Gardner, late resident at the court of the Rajah of Nipaul,

by whose indefatigable exertions and liberality the Botanic Gardens at Calcutta, as well as those of Britain, have been enriched by many splendid additions of plants and seeds, the productions of Nipaul.) Wall. in Roxb. fl. ind. 1. p. 401 and 2. p. 318. D. Don, prod. fl. nep. p. 132. Cyathospérmum, Wall. mss.

Lin. syst. *Tetrándria, Monogy'nia.* Calyx small, 4-5-toothed. Corolla rotate, with a 4-5-parted limb, and a short tube; valvate in æstivation. Stamens 4-5; filaments very short, flat; anthers oblong, convex outside, flattish inside, 2-celled, closely combined into a cone: having the valves membranous and involute after dehiscence. Style subulate, straight, shorter than the stamens, with a furrow on each side; stigma acute. Ovarium superior. Berry 2-celled, 2-seeded. Seeds compressed, orbicular; testa simple, adhering closely to the albumen, which is copious, white and horny, pellucid and dotted. Embryo straight, basilar. Cotyledons ovate.—Climbing, much branched shrubs, glabrous in every part. Leaves opposite, ex-stipulate, elliptic, acuminated, rather coriaceous, quite entire, shining, petiolate. Peduncles axillary, opposite, trichotomous, 3-flowered, or simple 1-flowered, glabrous, shorter than the leaves. Flowers white, twice the size of those of the *Cynánchum vincetóxicum.*

1 G. ova'ta (Wall. in Roxb. fl. ind. 1. p. 400. 2. p. 318.) leaves elliptic, acuminate, acute at the base; peduncles trichotomous, 3-flowered; flowers tetrandrous; seeds concave inside. ♄. ◡. S. Native of Silhet, in Bengal. Wall. pl. rar. asiat. 3. p. 17. t. 231. Leaves pale beneath, having the nerves united by sub-marginal arches; petioles widening at the base, and surrounding the branches, concealing in their axils a few withering ciliæ. Placenta fleshy, short, originating from the centre of the dissepiment. Anthers combined.

Ovate-leaved Gardneria. Shrub cl.

2 G. angustifòlia (Wall. in Roxb. fl. ind. 2. p. 318.) leaves narrow-lanceolate, tapering into a narrow acumen; flowers solitary, axillary, pentandrous; anthers distinct. ♄. ◡. S. Native of Nipaul. Leaves 5 inches long, and 1 inch in breadth. Petioles as in the preceding. Flowers nodding in æstivation, tetrandrous and pentandrous. Stigma 2-lobed. Berry scarlet, as large as a marrow-fat pea, but in all other respects like that of *G. ovàta.*

Narrow-leaved Gardneria. Shrub. cl.

3 G. gla'bra (Wall. mss. ex D. Don, prod. fl. nep. p. 132.) leaves elliptic, acuminated, obtuse at the base; peduncles 1-flowered, simple: seeds flat inside. ♄. ◡. S. Native of Silhet. The flowers and seeds are larger than in *G. ovàta.* It is probably the same as *G. angustifòlia.*

Glabrous Gardneria. Shrub cl.

4 G. Wallíchii (Wight. herb. ex Wall. pl. rar. asiat. 3. p. 49. t. 281.) leaves oblong-lanceolate, acuminated; peduncles axillary, 3-flowered, or bifid, each division bearing 3 flowers; corollas densely villous above; anthers 4, combined. ♄. ◡. S. Native of the East Indies, on mountains at Salem, Wight.

Wallich's Gardneria. Shrub cl.

Cult. For culture and propagation, see *Stry'chnos*, p. 66.

† *A genus doubtful whether belonging to the present order.*

VI. DICA'RYUM (from *δις, dis*, double; and *καρυον, karyon*, a nut; drupe containing 2 nuts.) Herb. Willd. ex Rœm. et Schultes, syst. 4. p. 802.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-toothed, permanent. Corolla 5-toothed; with a pilose throat. Stamens 5, inserted in the throat. Style thick, subulate; stigma obtuse. Drupe containing 2 2-celled, 1-2-seeded nuts.—South American trees; with opposite leaves; and terminal, panicles, or axillary racemes of flowers. This genus is said by D. C. to belong to *Strychnàceæ*, but it is hardly known.

1 D. subdenta'tum (Willd. herb. l. c.) leaves elliptic, acutely toothed, shining above; racemes terminal. ♄. S. Native of South America, at Pichincha. Humb. et Bonp. Leaves coriaceous, with protuberances at the base of the petioles, reticulately veined, pale beneath.

Subdentate-leaved Dicaryum. Tree or shrub.

2 D. serrula'tum (Willd. herb. l. c.) leaves oblong, acuminated, serrulated; panicles axillary. ♄. S. Native of South America, on Mount Quindiu. Humb. et Bonp.

Serrulated-leaved Dicaryum. Tree or shrub.

Cult. For culture and propagation see *Stry'chnos*, p. 66.

Order CLI. POTALIA'CEÆ (so called in consequence of the order agreeing with the genus *Potàlia* in important characters.) Potalièæ, Mart. nov. gen. bras. 2. p. 133.

Flowers of unequal parts. Calyx 4-5-6-parted. Corolla tubular, with a nearly equal limb, which is from 5-12-cleft, twisted and imbricate in æstivation. Stamens rising from the tube of the corolla; pollen elliptic, simple. Style continuous: stigma simple. Berry 2-4-celled. Seeds numerous, peltate, fixed to the placentas, which are central. Testa double. Embryo heterotropus, in cartilaginous albumen.—Glabrous, somewhat lactescent shrubs or trees. Leaves opposite, quite entire, joined by interpetiolar sheathing stipulas. Flowers disposed in terminal panicled corymbs, bracteate.

This order is easily distinguished from *Apocy'neæ*, from which it is broke off, in the parts of the flowers being unequal, in the double testa to the seed, and especially in the petioles being joined by interpetiolar stipulas, as in *Rubiàceæ.*

Synopsis of the genera.

1 Pota'lia. Calyx 4-parted. Limb of corolla 10-parted, imbricate in æstivation. Stamens 10; filaments combined by an annular membrane. Berry 2-celled.

2 Anthoclei'sta. Calyx 4-parted. Limb of corolla 12-cleft, imbricate in æstivation. Stamens 12, combined. Berry 2-celled.

3 Fagræ'a. Calyx 5-parted. Limb of corolla 5-6-parted. imbricate in æstivation. Stamens 5, unconnected. Berry 2-celled.

I. POTA'LIA (Guiana name of the first species). Aubl. guian. 1. p. 396. t. 151. Mart. nov. gen. bras. 2. p. 89.—Nicándra, Schreb. gen. no. 714.

Lin. syst. *Decándria, Monogýnia.* Calyx coloured, turbinate, 4-parted. Corolla tubular; limb 10-cleft; segments imbricate in æstivation. Stamens 10, rising from the tube of the corolla; filaments combined by an annular membrane at the base; anthers linear. Style short; stigma capitately peltate, lobed. Berry 2-celled, many-seeded, umbonate, angular. Seeds angular, rising from 2 basilar placentas.—Nearly simple glabrous shrubs. Leaves opposite and decussate, large, entire, joined by an interpetiolar sheath at the base. Flowers of a beautiful colour, disposed in terminal corymbose panicles, furnished with scale-like bracteas.

1 P. ama'ra (Aubl. guian. 1. p. 396. t. 151.) leaves opposite, decussate, obovate, pointed; calyx yellow; corolla white. ♄. S. Native of Guiana, in extensive forests. Nicándra amàra, Gmel. syst. 677. Stem simple. Leaves 1½ foot long and 5 inches broad. Berry yellow, fleshy, size of a cherry. All parts of the plant are bitter; the leaves and tender twigs are used in venereal cases; and where there is suspicion of poison, it being highly emetic in large doses.

Bitter Potalia. Shrub.

2 B. resinífera (Mart. nov. gen. bras. 2. p. 90. t. 170.) leaves opposite, oblong-obovate; calyx yellow; corolla green. ♄. S. Native of Brazil, in the province of Rio Negro, at Villa Barra do Rio Negro. Stem simple. An infusion of the leaves is rather mucilaginous, and somewhat astringent; and is used as a lotion to weak eyes.

Resin-bearing Potalia. Shrub 6 to 8 feet.

Cult. For culture and propagation see *Fagræ'a*, p. 69.

II. ANTHOCLEI'STA (from ανθος, *anthos*, a flower, and κλειστος, *kleistos*, shut up; corolla shut up by the crown in the throat). Afz. ex R. Br.

Lin. syst. *Dodecándria, Monogýnia.* Calyx 4-parted. Corolla tubular; limb 12-cleft, imbricate in æstivation. Stamens 12, combined. Style filiform; stigma capitate, obtusely 2-lobed. Berry roundish or oblong, size of a cherry, 2-celled? 4-celled.?—Middle-sized branching trees; with broad, opposite leaves, which are combined at the base by interpetiolar sheaths; and terminal panicled corymbs of white flowers.

1 A. nòbilis; leaves broad, obovate, coriaceous, almost sessile. ♄. S. Native of Sierra Leone, on the mountains. Corolla white.

Noble Anthocleista. Tree 20 feet.

2 A. macrophy'lla (G. Don, in Loud. hort. brit. 471.) leaves broad-obovate, obtuse, membranous. ♄. S. Native of Sierra Leone, on the mountains. Berry 4-celled. Leaves as large as those of the common cabbage.

Large-leaved Anthocleista. Clt. 1820. Tree 20 feet.

Cult. For culture and propagation see *Fagræ'a*, p. 69.

III. FAGRÆ'A (so named by Thunberg in honour of Jonas Theodore Fagræus, M. D.). Thunb. nov. gen. 34. Schreb. gen. no. 276.

Lin. syst. *Penta-Hexándria, Monogỳnia.* Calyx 5-parted, imbricate. Corolla funnel-shaped: with an imbricate, 5-6-cleft limb: tube widening from the base. Stamens 5-6, inserted in the mouth of the tube, and protruding beyond it. Style filiform; stigma peltately orbicular. Berry small, 2-4-celled. Seeds angular.—Trees or shrubs, with opposite, broad, coriaceous leaves; with interpetiolar stipulas; and terminal flowers. Bracteas opposite.

* *Erect shrubs and trees.*

1 F. Zeyla'nica (Lin. syst. 198. Thunb. nov. gen. 35. and in act. holm. 1782. p. 132. t. 4.) shrubby, erect; stem subquadrangular; leaves crowded, obovate-oblong, obtuse; bracteas ovate, obtuse; flowers few, terminal, umbellate. ♄. S. Native of Ceylon. Willughbèia Zeylánica, Spreng. syst. 1. p. 672. Leaves a span long. Flowers large. Segments of corolla oblique, obtuse, entire. Seeds orbiculate.

Ceylon Fagræa. Fl. Dec. Shrub 2-4 feet.

2 F. fra'grans (Roxb. fl. ind. 2. p. 32.) arboreous; leaves lanceolate, bluntly acuminated; corymbs axillary, decompound; stamens ascending; corollas large. ♄. S. Native of China, but now cultivated in Pulo Penang. Leaves decussate, ½ foot long and 1½ inch broad. Petioles enlarged at the base into a stem-clasping ring, which, in the dried specimens, are incrusted with a clear yellow resin. Flowers small, numerous, whitish yellow. Corolla having a tube between campanulate and funnel-shaped: and ovate-oblong divisions. Berry size of a currant, red.

Fragrant Fagræa. Tree middle-sized.

3 F. lanceola'ta (Blum. bijdr. p. 1021.) arboreous; leaves oblong-lanceolate, acuminated at both ends, almost veinless; stipulas petiolar, rounded at the apex; peduncles terminal, solitary, twin, or tern. ♄. S. Native of Java, in mountain woods on the west side of the island, where it is called *Kiterong*; and of Penang. Wall. cat. no. 1599. Leaves smaller than in most of the species.

Lanceolate-leaved Fagræa. Fl. Nov. Dec. Tree.

4 F. ellíptica (Roxb. fl. ind. 2. p. 32.) leaves broad-elliptic, on short petioles, firm; corymbs terminal, supra-decompound; tube of corolla cylindrical. ♄. S. Native of the Moluccas.

Elliptic-leaved Fagræa. Tree or shrub.

5 F. obova'ta (Wall. in Roxb. fl. ind. 2. p. 33.) arboreous; leaves ovate or obovate, crowded, rounded, with a short broad point, petiolate; peduncles terminal, 3-flowered, sub-corymbose. ♄. S. Native of Silhet, and Singapore. Branches obscurely 4-sided. Leaves 5-6 inches long, thick. Petioles furnished with a few glandular ciliæ, connected by interpetiolar stipulas. Flowers white, fragrant, coriaceous, as large as those of *Plumièra acuminàta*, but much smaller than those of *F. Zeylánica*. Calycine segments ovate, obtuse. Berry 4-celled, many-seeded. Seeds immersed in soft pulp. Perhaps the same as *F. Zeylánica*.

Obovate-leaved Fagræa. Tree.

6 F. Malaya'na (Mart. nov. gen. bras. 2. p. 91.) leaves elliptic, rounded at both ends, with a short acumen at the apex; calyx 5-cleft, as in the rest; corolla tubular, 6-cleft; stamens 6. ♄. S. Native of the Prince of Wales's Island. Perhaps the same as *F. ellíptica*.

Malay Fagræa. Shrub or tree.

7 F. racemòsa (Jack, in Roxb. fl. ind. 2. p. 35.) shrubby, erect?; leaves broad, oval, rounded at both ends, almost sessile; racemes drooping, terminal, shorter than the leaves, consisting of opposite fascicles of sub-sessile flowers, ♄. S. Native of Penang. Leaves 6-7 inches long, and 4-5 wide, obtuse, or slightly pointed, united by interpetiolar stipulary processes. Calycine segments oval, obtuse. Segments of corolla obovate, crenulated. Stamens at first descending, afterwards ascending.

Racemose-flowered Fagræa. Shrub.

** *A climbing shrub.*

8 F. volu'bilis (Wall. in Roxb. fl. ind. 2. p. 36.) shrubby, climbing; leaves ovate or obovate, petiolate; racemes terminal, loose, longer than the leaves, composed of remote, small racemules of pedicellate flowers. ♄. ◡. S. Native of Bencoolen. Leaves rather remote, 8-12 inches long, and 4-7 wide at top. Stipulas as in *F. racemòsa*. Petioles furnished with a narrow margin on each side, which originates from the slightly decurrent base of the leaf. Berries as large as gooseberries, half the size of those of *F. obovàta*. Placentas oblong, broad, fleshy, convex and notched for the reception of the seeds; the inner side smooth and concave, fixed longitudinally by a narrow lamina to the sides of the thin dissepiment. Seeds angular, scabrous, with copious dots; integument simple, crustaceous. Albumen fleshy. Embryo cylindrical, occupying a great part of the axis of the albumen, with exceedingly small cotyledons, and a centrifugal radicle. This and *F. racemòsa* may probably form a distinct genus.

Twining Fagræa. Shrub cl.

*** *Parasitical shrubs.*

9 F. auricula'ta (Jacq. in Roxb. fl. ind. 2. p. 34. Blum. bijdr. p. 1020.) parasitic; leaves broad, cuneate-oblong, acute, veiny; interpetiolar stipulas, 2-lobed, recurved; peduncles terminal, usually by threes; corolla large. ♄. S. Native of Java, parasitical on trees about Buitenzorg, where it is called *Mengando-badak*; and of Singapore. Wall. pl. rar. asiat. 3. t. 222. Leaves coriaceous, 6-12 inches long, and 3-4 inches broad at top. Calycine segments roundish, obtuse, spreading. Flowers very large.

Auricled Fagræa. Fl. year. Shrub par.

10 F. littora'lis (Blum. bijdr. 1021.) parasitic; leaves oval, acute at both ends, almost veinless; stipulas petiolar, rounded at top; peduncles terminal, usually by threes. ♄. S. Native of the island of Nusæ-Kambanga. Parasitical on trees.

Sea-shore Fagræa. Fl. Oct. Shrub parasitical.

11 F. mìnor (Herb. Reinwdt. ex Blum. bijdr. p. 1021.) parasitic; leaves oval, acute, rounded at the base, veiny; stipulas petiolar, rounded at top; peduncles terminal, sub-corymbose, trifid. ♄. S. Native of Java, upon trees on the mountains, where it is called *Mengando*.

Smaller Fagræa. Fl. year. Shrub par.

12 F. Blu'mii; parasitic; leaves obovate-oblong, bluntish, almost veinless above; stipulas petiolar, emarginate at the apex; peduncles terminal, corymbosely 3-flowered. ♄. S. Native of Java, in mountain woods. F. obovàta, Blum. bijdr. p. 1021. but not of Wall.

Blume's Fagræa. Fl. Feb. Shrub par.

Cult. The species of *Fagræ'a* bear large foliage, and showy flowers, as the other genera of the order. A mixture of loam, peat, and sand, is a good soil for them; and cuttings strike root readily in sand, placed in heat, with a hand-glass over them.

Order CLII. APOCY'NEÆ (so named on account of its containing plants agreeing in particular characters with *Apócynum.*) Juss. gen. p. 160. R. Br. prod. p. 465.

Calyx 5-cleft, permanent. Corolla monopetalous, hypogynous, regular, 5-lobed, imbricate in æstivation, deciduous. Stamens 5, epipetalous, alternating with the segments of the limb of the corolla; anthers 2-celled: dehiscing lengthwise; pollen granular. Stigmas at first applied to each other. Ovaria solitary or twin, and therefore the styles are 1 or 2, and but always 1 stigma; ovaria for the most part many seeded. Fruit follicular, drupaceous or baccate, 1 or many-seeded, solitary or twin. Seeds usually albuminous. Embryo foliaceous, with an inconspicuous plumule.—Trees or shrubs usually full of acrid milky juice. Leaves opposite, sometimes verticillate, rarely scattered, quite entire, usually furnished with interpetiolar cilia or glands. Inflorescence sub-corymbose.

All the plants contained in this order are very natural. The structure of the anthers and stigmas easily distinguish them from *Asclepiàdeæ*, to which they are more nearly allied than to any other. The order *Strychnàceæ* is distinguished from this in the peltate seeds. The order is also closely allied to the *Rubiàceæ;* but is easily distinguished from it, in the want of interpetiolar stipulas, and in the superior ovarium, &c.

We now turn from the contemplation of plants endued with mild and agreeable properties, and fragrant flowers, and often bearing food for man, to others, which are among the most dangerous poisons, whose juices, though milky, are not a wholesome and delicious beverage, like those of *Sapotàceæ*, but, on the contrary, acrid, caustic, and bitter. They are readily known by the twisted direction of the corolla, which have been compared to the rays of St. Catherine's wheel, whence they were called, by Linnæus, *Contórtæ.*

By far the greatest part of the order consists of tropical trees and shrubs; a few *Apócynums*, *Amsònias*, and *Víncas*, are natives of the colder regions of the earth. Many are elegant climbers, as the different species of *Echìtes*, *Melodìnus*, &c. The splendid Oleander belongs to *Nèrium;* the different species of *Plumièra*, *Camerària*, *Strophánthus*, and *Carissa*, are stove plants of the greatest beauty.

The medicinal action of these plants is highly powerful. In general the *Apocy'neæ* are acrid, stimulating, and astringent: these principles, when in excess, act so powerfully on the nerves as to produce stupefaction. The root of *Ophióxylon* is very bitter and purgative. The bark of *Tanghinia Mánghas* is purgative; of *Echìtes antidysentérica*, and the *Wríghtia* of the same name, astringent and febrifugal. The leaves of the *Vinca* are so astringent, that they have been used successfully in tanning; those of *Nèrium Oleánder* are said to abound in gallic acid. The inspissated juice of the species of *Cérbera*, known in Mexico under the name of *Ycotli*, is a fatal poison. The fruit of *Tanghínia* is the famous ordeal of Madagascar.

Synopsis of the genera.

Tribe I.

Echitie'æ. *Fruit of 2 follicles, sometimes a 2-celled capsule. Seeds furnished with a tuft of hairs at the upper or umbilical end.*

* *Tube of corolla naked, not crowned, and without scales or teeth inside.*

1 Echìtes. Stamens inclosed; anthers adhering. Hypogynous scales 5, distinct, rarely combined. Corolla salver-shaped, with dimidiate segments. Follicles slender.

2 Chonemórpha. Stamens inclosed; anthers adhering. Hypogynous scales 5, distinct or combined. Corolla funnel-shaped, with dimidiate segments. Follicles slender.

3 Aganósma. All as in *Chonemórpha*, except the hypogynous scales, which are long and combined; and the style thick, not slender; and the stigma is conical, angular at the base, and mucronate at top, not emarginate.

4 Beaumóntia. Calycine segments foliaceous. Corolla funnel-shaped, with a short tube, and a large, swollen, campanulate limb, with equal lobes. Stamens exserted; anthers adhering. Stigma bidentate. Follicles combined, large, long.

5 Pachypòdium. Stamens inclosed; anthers nearly sessile, adhering.? Hypogynous scales none. Corolla salver-shaped; with equal, obtuse segments. Follicles ovate.

6 Ichnoca'rpus. Stamens inclosed; anthers free. Hypogynous corpuscula 5, filiform. Corolla salver-shaped, with dimidiate segments. Follicles slender.

7 Holarrhe'na. Stamens inclosed; anthers free. Hypogynous corpuscula wanting. Corolla sagittate, with equal segments. Follicles slender.

8 Isone'ma. Stamens exserted; anthers adhering; filaments simple at top. Hypogynous scales wanting. Corolla salver-shaped; limb 5-parted.

9 Valla'ris. Stamens exserted; anthers adhering; filaments each furnished with a fleshy gibbosity outside, at the apex. Hypogynous scales 5, combined at the base. Corolla salver-shaped; limb 5-parted. Ovarium 2-celled.

10 Hely'gia. Stamens exserted; anthers adhering; filaments filiform. Hypogynous scales 5. Stigma clavate. Corolla rotate, with dimidiate segments. Follicles combined, with adnate placentas.

11 Parsónsia. Stamens exserted; anthers adhering; filaments filiform, inserted near the base of the tube. Hypogynous scales 5, distinct or combined. Corolla funnel-shaped. Follicles 2, distinct or cohering.

12 Lyónsia. All as in Parsonsia, except the fruit, which is a 2-celled capsule, with parallel placentiferous dissepiments.

13 Thena'rdia. Stamens exserted; anthers adhering; filaments simple, inserted near the base of the tube. Hypogynous scales 5, distinct. Corolla rotate, with dimidiate segments. Follicles twin.

14 Ade'num. Stamens inclosed; anthers adhering, ending each in a pilose bristle. Hypogynous scales wanting. Corolla salver-shaped, with equal segments. Ovaria 2, globose.

* * *Tube of corolla furnished with 5 inclosed little scales, or teeth inside.*

15 Apócynum. Teeth, in the tube of the corolla, 5, small, acute, opposite the segments of the limb. Stamens inclosed. Styles wanting. Hypogynous scales 5. Corolla campanulate. Follicles slender.

16 Cryptole'pis. Scales in the tube of the corolla 5, obtuse, alternating with the segments of the limb. Stamens inclosed. Hypogynous scales 5. Corolla funnel-shaped. Style none.

17 Exothoste'mon. Scales in the throat of the corolla 5, opposite the segments of the limb. Stamens exserted. Hypogynous scales 5. Style filiform. Corollas funnel-shaped. Follicles torulose, slender.

18 Hæmadíctyon. Scales in the tube of the corolla 5, alternating with the segments of the limb. Stamens inclosed. Style filiform. Hypogynous scales 5. Corolla salver-shaped.

19 Cercocòma. Scales in the tube of the corolla 5?, alternating with the segments of the limb.? Stamens inclosed. Style filiform. Hypogynous scales 5. Corolla salver-shaped. Follicles horizontal.

* * * *Throat of corolla crowned by exserted scales, or little tubes.*

20 Prestònia. Corona double, exterior one annular, and quite entire; interior one of 5 scales, which alternate with the segments of the corolla. Urceolus hypogynous.

21 Balfou'ria. Corona simple, tubular, crenulated. Hypogynous scales none; but there are 10 scales seated at the base of the calyx, outside the corolla. Segments of corolla equal-sided. Anthers ending in a short mucrone.

22 Ne'rium. Corona simple, of one series of divided segments. Hypogynous scales wanting. Segments of corolla equal-sided. Anthers ending in a long awn each.

23 Stropha'nthus. Corona simple, of 10 undivided foliola. Hypogynous scales 5. Segments of corolla tailed.

Tribe II.

Wrightie'æ. *Fruit of 2 follicles. Seeds furnished with a tuft of hairs at the lower end of the seed, or that end opposite the umbilicus. Embryo with involute cotyledons.*

24 Wrìghtia. Throat of corolla crowned. Tuft of hairs at end of seed sessile.

25 Kibata'lia. Throat of corolla not crowned. Tuft of hairs at end of seed stipitate. Cercocòma, Wall.?

Tribe III.

Alstonie'æ. *Fruit of 2 follicles. Seeds peltate, ciliated. Cilia more elongated at both ends.*

26 Alstònia. Corolla salver-shaped, with a naked throat. Anthers inclosed, free. Hypogynous scales none.

Tribe IV.

Gelsemie'æ. *Fruit of 2 joined follicles, which are separable, furrowed in the middle, 2-valved, 2-celled; valves 1-celled, with inflexed seminiferous edges, which constitute the dissepiments.*

27 Gelse'mium. Corolla funnel shaped. Stigma trifid. Capsule ovate-oblong, rather compressed. Seeds imbricate, membranous at apex.

28 Plectane'ia. Corolla with a short ventricose tube, and a twisted or coarctate limb. Stigma capitate. Anthers sessile. Capsule follicular, very long, 2-celled; seeds compressed, winged.

Tribe V.

Tabernemonta'næ. *Fruit of 2 follicles, rarely solitary by abortion. Seeds neither tufted nor winged, usually nestling in the pulp of the fruit, albuminous. Stigma annular below, and bifid at top. Anthers free, connivent.*

29 Tabernemonta'na. Corolla funnel-shaped. Stamens inclosed. Glands at the base of the calyx outside the corolla. Seeds immersed in pulp.

30 Camera'ria. Corolla between funnel and salver-shaped. Stamens inclosed; anthers connivent, drawn out, each into a thread. Style hardly any; stigma obsolete. Follicles inflexed, emitting a lobe on each side. Seeds inserted into a peculiar membrane.

31 Va'hea. Corolla funnel-shaped, naked, Lam.; urceolate, Roxb. Stamens inclosed, inserted in the bottom of the corolla. Ovarium girded by an entire urceolus. Follicles twin. Seeds immersed in pulp.

32 Voaca'nga. Corolla funnel-shaped. Anthers sessile, inclosed. Stigma 3-lobed, seated on an annular disk. Follicles twin, baccate. Seeds imbedded in pulp.

33 Rejou'a. Corolla salver-shaped, naked. Stamens inclosed; anthers free. Stigma bicuspidate. Fruit solitary, elliptic, sub-umbilicate, indehiscent. Seeds compressed, nestling in pulp.

34 Orchipe'da. Corolla funnel-shaped, having the throat half closed by a tumid ring. Stamens inclosed; anthers connivent. Ovarium girded by a hypogynous ring. Follicles twin, fleshy, globose. Seeds wrinkled, imbedded in pulp. Albumen fleshy.

35 Plumie'ra. Corolla funnel-shaped. Stamens inclosed; anthers connivent. Stigma clavate, emarginate. Follicles twin, ventricose. Seeds furnished with a wing at bottom. Ovarium girded by a hypogynous ring.

36 Conophary'ngia. Corolla funnel-shaped. Stamens each rising from a scrobicle; anthers conniving into a cone. Stigma sub-bifid. Follicles twin, slipper-shaped. Seeds like grape stones, attached to a slender central column, or placenta.

37 Vínca. Corolla salver-shaped. Stamens inclosed; anthers connivent. Hypogynous scales 2. Stigma marginated below, and ciliated above. Follicles slender. Seeds disposed in 2 rows.

38 Catharán'thus. Corolla salver-shaped. Stamens inclosed; anthers connivent. Hypogynous scales 2.? Stigma marginated below, and pilose above. Follicles slender. Seeds disposed in 2 rows, tubercled on one side.

Tribe VI.

Alyxie'æ. *Ovarium double. Fruit sub-drupaceous. Albumen large, ruminated as in Annonaceous plants, or fleshy. Anthers free, connivent.*

39 Aly'xia. Corolla salver-shaped; throat naked. Stamens inclosed. Stigma obtuse, usually pencilled. Drupes 2, or solitary by abortion, containing a half 2-celled putamen.

40 Ce'rbera. Corolla funnel-shaped; throat 5-toothed. Anthers inclosed, conniving. Drupes twin, dry, containing a fibry, semi-bivalved, 1-seeded putamen. Albumen none.

41 Tanghínia. Corolla salver-shaped; throat pentagonal. Anthers hidden by an equal number of foliaceous scales from the throat, and furnished with an umbilicate tubercle under each stamen. Drupe solitary, containing a 1-celled, 1-seeded, fibry nut.

42 Rauwólfia. Corolla funnel-shaped; throat bearded. Stamens inclosed, or a little exserted; anthers free. Hypogynous ring surrounding the base of the ovarium. Drupes 2, combined, containing a 2-celled nut, or 2 1-seeded nuts; cells semi-bilocular.

43 Dissole'na. Corolla with a long tube, of 2 forms; lower part thick, pentagonal; upper part cylindrical; limb spreading. Stamens inserted below the mouth of the lower part of the tube. Stigma thick, scabrous. Drupe solitary, small, containing a compressed, scabrous, 1-celled, 1-seeded nut.

44 Ochròsia. Corolla funnel-shaped. Stamens inclosed; anthers free. Drupes twin or solitary, each containing a 2-celled nut, and each cell containing 2-3 flat, wing-edged seeds.

45 Ophióxylon. Corolla funnel-shaped. Anthers inclosed. Stigma capitate. Drupes twin, or solitary by abortion, each containing a wrinkled, 1-seeded nut.

46 Valle'sia. Corolla salver-shaped: throat bearded. Stamens inclosed. Stigma sub-clavate. Drupes clavate, twin, or solitary, containing each a wrinkled, 1-seeded nut.

Tribe VII.

Kopsie'æ. *Ovarium double. Fruit drupaceous. Albumen wanting.*

47 Kópsia. Corolla salver-shaped; throat villous. Stamens inclosed; anthers free. Stigma oblong, downy at top. Drupes twin or solitary, coriaceous, divided by an incomplete dissepiment inside, 1-seeded.

48 Calpica'rpum. Calycine segments each ending in a gland. Corolla funnel-shaped, with equal segments. Anthers inclosed, adhering. Stigma large, 2 lobed. Drupe, or rather capsule usually solitary, 1-celled, sub-bivalved, urn-shaped, 1-seeded.

Tribe VIII.

Melodíneæ. *Fruit baccate, solitary. Seeds many, compressed, imbedded in the pulp, usually albuminous, rarely exalbuminous.*

49 Melodìnus. Corolla salver-shaped. Corona in the throat of 5 bifid, or quadrifid, or undivided scales, or foliola. Stamens inclosed. Style bipartite. Stigma conical, acute. Berry globose, 2-celled. Seeds flattened, imbedded in pulp, albuminous.

50 Carpodìnus. Corolla salver-shaped, with reflexed segments; throat crowned. Anthers connivent, inclosed. Style simple; stigma capitate. Berry 2-celled, many-seeded. Seeds flattened, imbedded in pulp, albuminous.

51 Chiloca'rpus. Corolla salver-shaped; throat not crowned.? Anthers inclosed. Stigma capitate. Capsule large, corticate, 1-celled. Seeds arillate, flattened. Albumen horny.

52 Willughbe'ia. Corolla salver-shaped; throat not crowned. Anthers inclosed, free. Stigma obtuse. Berry large, 1-celled, or half 2-celled. Seeds flattened, imbedded in pulp, ex-albuminous, disposed in 2 rows.

53 Ambella'nia. Corolla salver-shaped; throat not crowned. Stigma bicuspidate at the apex, seated on a flat annular disk. Berry 2-celled, warted. Seeds compressed, immersed in the pulp, fixed to a slender receptable, albuminous.

54 Pacou'ria. Corolla salver-shaped; throat not crowned.? Anthers cuspidate, inclosed. Style and stigma as in *Ambellània*. Berry 1-celled.? Seeds angular, nestling in the pulp; albuminous.

55 Hancórnia. Calyx small, 5-parted. Corolla salver-shaped. Stamens inclosed. Stigma bifid. Berry 1-celled, many-seeded. Seeds albuminous.

56 Landólphia. Corolla salver-shaped; throat not crowned. Stamens inclosed. Ovarium with 10 stripes. Stigma sub-bifid, Berry nearly globose, compressed at top, 1-celled. Seeds nestling in pulp, ovate, compressed.

57 Cou'ma. Corolla funnel-shaped. Stamens short, inclosed; anthers sagittate. Disk hypogynous. Stigma bifid. Fruit globose, 4-5-seeded. Seeds immersed in pulp.

Tribe IX.

Allamandie'æ. *Fruit capsular, composed of 2 joined follicles, prickly or smooth outside. Seeds peltate, fixed to a central placenta. Albumen none.*

58 Allama'nda. Corolla funnel-shaped; with a wide, swollen, inflated, 5-lobed limb; throat furnished with 5 scales, which cover the anthers. Capsule prickly outside.

59 Aspidospe'rma. Corolla 5-cleft; segments lanceolate; throat without scales. Capsules smooth, solitary or twin, obovate, compressed, unequal sided.

Tribe X.

Carandie'æ. *Fruit baccate, solitary or twin. Seeds peltate, winged, naked. Albumen copious, rather horny.*

60 Caríssa. Corolla funnel-shaped; throat naked. Stamens inclosed. Stigma dilated from the base, bifid. Berry solitary, 2-celled; cells 1 or few-seeded.—Prickly shrubs.

61 Hunte'ria. Corolla funnel-shaped; throat naked. Stamens inclosed. Stigma ovate, 2-lobed. Berries twin, 1-2-seeded. Unarmed shrubs.

† *Genera hardly known.*

62 MONE'TIA. Corolla of 4 petals?; petals somewhat reflexed, alternating with the segments of the calyx. Stamens 4, hypogynous; anthers sagittate, incumbent. Stigma acute. Fruit rather fleshy, pea-formed, 2-celled; cells 1-seeded. Seeds compressed or peltate.—Prickly shrubs.

63 ALA'FIA. Corolla tubularly ventricose, with a 5-parted, twisted limb; segments plicately sinuated on one side. Anthers acute, distinct, connivent; filaments bound by the style, which is filiform, and furnished with 5 appendages. Stigma inclosed, capitate, acuminated.

64 LEUCONÒTIS. Calyx 4-parted. Corolla tubular; limb 4-lobed. Stamens 4, inclosed. Ovarium 2-celled; cells bi-ovulate. Stigma annular, conical at top. Berry 1-3-seeded. Seeds exalbuminous.

Tribe I.

ECHITIE'Æ. Seeds furnished with a tuft of hairs, at the superior or umbilical extremity. Fruit of 2 follicles.

I. ECHI'TES (so named from εχις, *echis*, a viper; perhaps on account of its deleterious quality, or from its twining habit; εχιτης, *echites*, is the serpent stone.) P. Browne, jam. p. 182. R. Br. in wern. soc. 1. p. 59.—Echìtes, spec. Lin. gen. no. 299. Jacq. amer. 29.

LIN. SYST. *Pentándria, Monogýnia.* Calyx small, 5-parted. Corolla salver-shaped, with a naked throat and tube; segments of the limb unequal-sided. Stamens inclosed; anthers sagittate, cohering by their middle to the stigma, having the hind lobes without pollen. Ovaria 2. Style 1, filiform. Hypogynous scales 5. Fruit of 2 slender follicles.—Twining shrubs. Leaves opposite, having the interpetiolar cilia glandular. Peduncles interpetiolar, many-flowered. Flowers showy, white, yellow, and purple.

§ 1. *Flowers umbellate or corymbose.*

1 E. UMBELLA'TA (Jacq. amer. p. 30. t. 22. ed. pict. t. 29. Lin. spec. 307.) leaves ovate-orbicular, cuspidately mucronate; glabrous, glandless at the base; umbels few-flowered; calycine segments lanceolate. ♄. ◠. S. Native of St. Domingo, Cuba, and Jamaica, among bushes, and in hedges. Apócynum oblìquum, Mill. dict. no. 8.—Sloane, hist. 1. p. 207. t. 131. f. 2. —Brown, jam. p. 182. Leaves $2\frac{1}{2}$ inches long. Interpetiolar cilia short, subulate. Corolla silky, villous inside the tube, large, with a white or pale yellow limb, and green tube.

Umbellate-flowered Echites. Fl. July. Clt. 1733. Shrub tw.

2 E. OBLONGIFÒLIA (Desf. herb. ex Hamilt. prod. fl. ind. occ. p. 30.) leaves ovate-oblong, auriculately cordate, bluntish, mucronate, shining above, quite glabrous on both surfaces, somewhat parallelly nerved; peduncles one half longer than the leaves; flowers large, umbellate. ♄. ◠. S. Native of Guiana.

Oblong-leaved Echites. Shrub tw.

3 E. LITTÒREA (H. B. et Kunth. nov. gen. amer. 3. p. 212.) leaves oblong, cuspidately mucronate, glabrous, glandless at the base; umbels 2 or 5-flowered; calycine segments ovate-lanceolate. ♄. ◠. S. Native of Cuba, by the sea side, near Guanavacoa. Branches filiform. Interpetiolar cilia subulate. Flowers white, like those of *E. umbellàta*.

Sea-shore Echites. Shrub tw.

4 E. CHRISTOPHORIA'NA (Hamilt. prod. fl. ind. occ. p. 31.) stems fuscescent, red, with bitter bark; leaves very bitter, turned to one side, on short petioles, roundish ovate, acute, pale green above, but paler beneath, with yellowish nerves; petioles incurvedly declinate, with axillary glands; peduncles axillary, interpetiolar, elongated, dichotomous, furnished with many bracteas beneath; pedicels crowded, 1-flowered. ♄. ◠. S. Native of St. Christopher, by the sea shore. Flowers yellow, glabrous, having the throat marked with rufescent lines.

St. Christopher Echites. Shrub tw.

5 E. CURU'RA (Mart. ex Linnæa. 6. p. 30.) stem arboreous, twining a little; leaves oblong, with a short acumen, acutish at the base, reticulately veined beneath; racemes corymbose, many-flowered, axillary, and terminal; calycine segments imbricate, ovate, obtuse; throat of corolla downy: segments obovate-roundish. ♄. ◠. S. Native of Brazil, on the banks of Rio Negro.

Curura Echites. Shrub tw.

6 E. SCA'BRA (Labill. sert. cal. p. 26. t. 31.) leaves elliptic, somewhat undulated, acuminated; cymes axillary and terminal; corollas hairy. ♄. ◠. S. Native of New Caledonia. Thenárdia scàbra, Spreng. syst. addend. p. 65. Stem pilose at top. Corollas scabrous outside, from hairs. Anthers linear-sagittate.

Scabrous Echites. Shrub tw.

7 E. BIFLÒRA (Jacq. amer. 38. t. 21. icon. pict. t. 28. Lin. spec. 307.) leaves oblong, obtuse, mucronate, glabrous; peduncles 2-flowered; calycine segments small, ovate. ♄. ◠. S. Native of most of the West India Islands, in salt marshes. Swartz. obs. p. 103.—Plum. amer. 82. t. 96. Leaves attenuated at the base, obtuse, with a small mucrone, 3 inches long. Corollas white, but with a yellow throat; tube narrow.

Two-flowered Echites. Fl. July. Clt. 1793. Shrub tw.

8 E. NUMMULA'RIA (Burm. ind. t. 28. f. 1.) leaves cordate, acuminated; peduncles 2-flowered, bifid in the middle. ♄. ◠. S. Native of the West Indies. Probably only a variety of *E. biflòra*.

Money-wort-leaved Echites. Shrub tw.

§ 2. *Flowers racemose.*

* *Leaves oblong.*

9 E. DOMINGE'NSIS (Swartz, prod. p. 52. fl. ind. occ. 1. p. 529.) leaves ovate-cordate, or ovate-oblong, acute, glabrous above, rather rusty, and somewhat downy beneath; peduncles 1-2-3-flowered; calycine segments subulate, hairy. ♄. ◠. S. Native of Jamaica and Hispaniola, among bushes by the sea side. Jacq. coll. 1. p. 73. icon. rar. 53. E. heterophýlla, Gmel. syst. 1. p. 437. Stems downy. Flowers large, yellow; throat villous, wide. Hypogynous glands yellow.

St. Domingo Echites. Fl. July, Aug. Clt. 1820. Shrub tw.

10 E. BARBA'TA (Desv. herb. ex Ham. prod. fl. ind. occ. p. 30.) stems weak; branches downy; leaves quite glabrous, obovate, mucronate, vaguely veined; peduncles elongated; flowers panicled; calycine segments subulate; corolla having the tube bearded with pili, contracted a short way at the base, and widened above the calyx. ♄. ◠. S. Native of the West Indies.

Bearded Echites. Shrub tw.

11 E. RE'PENS (Jacq. amer. 33. t. 28. icon. pict. t. 33.) leaves lanceolate-linear, or ovate-lanceolate, glabrous; peduncles racemose; calycine segments lanceolate. ♄. ◠. S. Native of St. Domingo, among rocks, and on the edges of woods. Stems glabrous sarmentose, when old procumbent and rooting, and when young erectish. Peduncles usually bifid. Flowers elegant, red. Hypogynous glands roundish.

Creeping Echites. Shrub tw.

12 E. CÓNCOLOR (Desv. herb. ex. Hamilt. prod. fl. ind. occ. p. 31.) stems weak; leaves thick, elliptic-lanceolate, rounded at the base, mucronate, of the same colour on both surfaces, almost veinless; flowers axillary and terminal, twin; calycine segments lanceolate, bluntish; tube of corolla inflated at top. ♄. ◠. S. Native of Hispaniola. Very nearly allied to *E. rèpens*.

One-coloured-leaved Echites. Shrub twining.

13 E. LINEARIFÒLIA (Desv. herb. ex Ham. prod. fl. ind. occ.

p. 31.) stems perennial, funicular, glabrous, lactescent; leaves linear, mucronate, on short petioles; peduncles axillary, filiform, bifid, shorter than the leaves; follicles torulose, linear. ♄. ◡. S. Native of St. Domingo. Flowers small, white. Nearly allied to *E. rèpens*, in which the flowers are red.

Linear-leaved Echites. Shrub cl.

14 E. ASPERU'GINIS (Swartz. prod. p. 53. fl. ind. occ. 1. p. 531.) leaves oblong, acute, glabrous beneath, and rather rough above; peduncles racemose. ♄. ◠. S. Native of Jamaica and Hispaniola, among bushes, in dry places. Apócynum scándens, &c. Plum. ed. Burm. icon. t. 26. E. lappulàcea, Lam. dict. 2. p. 340.—Plum. spec. mss. 2. t. 70. Stem purplish, hispid. Follicles rough, filiform. Flowers white.

Rough Echites. Shrub tw.

15 E. TORÒSA (Jacq. amer. 33. t. 27. ed. pict. t. 34.) leaves lanceolate, acuminate, glabrous; peduncles sub-racemose; calycine segments lanceolate. ♄. ◠. S. Native of Jamaica, in woods, on the mountains. Swartz. obs. p. 105. Lam. ill. t. 174. f. 1.—Browne, jam. 181. t. 16. f. 2. Leaves 2 inches long. Flowers small, yellow. Tube of corolla ventricose in the middle, obsoletely pentagonal; segments broad, and truncate at top. Follicles tomentose, long, erect. E. toròsa, Lam. ill. 2. p. 339. no. 5. f. 1. which is the plant figured in Plum. ed. Burm. t. 27: is probably *E. rèpens*, as the flowers are said to be white or red, and the follicles in that, as in this, are torulose.

Torose-follicled Echites. Fl. June, Aug. Clt. 1770. Shrub tw.

16 E. ACUMINA'TA (Ruiz. et Pav. fl. per. 2. p. 19. t. 134. f. a.) glabrous; leaves ovate and oblong, acuminated, furnished with 5 glands at the base of each; racemes short; pedicels twin. ♄. ◠. S. Native of Peru, in the woods of Chincao, at Macora. Leaves emarginate at the base, shining above. Stipulas truncate, furnished with a small tooth on each side. Bracteas small, trifid. Flowers white.

Acuminated-leaved Echites. Shrub tw.

* * *Leaves cordate at the base.*

17 E. RICHA'RDII (Rœm. et Schultes, syst. 4. p. 391.) leaves oblong-ovate, acutely mucronate, cordate at the base; corolla and fruit hairy. ♄. ◠. S. Native of Cayenne or Guiana. E. hirsùta, Richard, in act. hist. nat. par. p. 107. but not of Ruiz. et Pav.

Richard's Echites. Shrub tw.

18 E. HIRTE'LLA (H. B. et Kunth. nov. gen. amer. 3. p. 213.) hairy; leaves oblong, acutely mucronate, narrowed a little at the base, cordate, and furnished with one gland, hairy; peduncles racemose; calycine segments ovate, acuminated. ♄. ◠. S. Native of New Granada, near Mariquita and Santanna. Interpetiolar cilia obsolete. Corollas yellow, hairy outside, and dotted with silky pili inside. The specimens collected about Santanna differ from those collected about Mariquita, in the branches being smoothish, and in the leaves being lanceolate and smaller, &c. This is probably a species of *Prestònia*, the throat being furnished with a red ring, according to Bonpland.

Hairy Echites. Fl. June. Shrub tw.

19 E. TRÍFIDA (Jacq. amer. p. 31. t. 24. H. B. et Kunth. l. c.) leaves elliptic, short-acuminated, rounded at the base, and furnished with 2 glands; racemes trifid; calycine segments oblong, obtuse. ♄. ◠. S. Native of New Spain, in woods, near Cumana and Cumanacoa. E. cuspidàta, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 796. Stems glabrous, purplish. Glands on the petioles ovate, acuminated, bifid at apex, and rather concave. Corolla glabrous, milk-coloured; upper part of tube red inside.

Trifid-racemed Echites. Fl. Sept. Shrub tw.

20 E. GRANDIFLÒRA (Meyer, esseq. p. 131.) leaves obovate, attenuated at the base, quite glabrous; flowers corymbose; corymbs shorter than the leaves, branched; calycine segments roundish-ovate, 3 of which are larger than the other 2. ♄. ◠. S. Native of the Island of Arrowabisch, climbing on trees. E. insígnis, Spreng. syst. 1. p. 632. Pedicels sub-bracteate. Flowers large, reddish yellow; tube 5-angled.

Great-flowered Echites. Shrub tw.

21 E. RHYNCOSPE'RMA (Wall. pl. rar. asiat. 1. p. 43. t. 49.) leaves ovate-lanceolate, acuminated, glabrous; flowers loosely cymose; limb of corolla longer than the tube: with falcately obovate segments; follicles slender, very long, parallel, pendulous; seeds ending in a long beak, and a tuft of hairs at the top of the beak. ♄. ◠. S. Native of Martaban, along the rivers Saluen and Atran. Flowers large, sweet-scented, white; tube and limb red towards the throat. Corolla salver-shaped. Perhaps a species of *Kitabàlia*.

Beaked-seeded Echites. Shrub tw.

22 E. LA'XA (Ruiz. et Pav. fl. per. 2. p. 19. t. 134. f. b.) rather villous; leaves cordate, acute, furnished with many glands at the base; peduncles long, loose, racemose, few-flowered. ♄. ◠. S. Native of Peru, in woods. E. glandulòsa, Poir. suppl. 2. p. 557. Stem glabrous, angular, often granular. Branches rather villous. Stipulas toothed. Bracteas small, subulate. Corollas large, yellow.

Loose-flowered Echites. Shrub tw.

23 E. PUBIFLÒRA; leaves oblong-lanceolate, cordate at the base, acuminated, glabrous above, but tomentose beneath; racemes many-flowered; corolla hairy outside. ♄. ◠. S. Native of Maranham, in low bushy places. Flowers large, yellow.

Downy-flowered Echites. Shrub twining.

24 E. MONTA'NA (H. B. et Kunth. l. c.) leaves elliptic-oblong, acute, cordate, roughish above from hairs, but soft and canescent beneath, glandular at the base; peduncles racemose; calycine segments ovate-lanceolate, much shorter than the tube. ♄. ◡. S. Native of the Andes, about Pasto, in bushy places, in the valley of the river Guaytara. Leaves $2\frac{1}{2}$ inches long. Interpetiolar cilia obsolete. Calyx hairy at the base. Corolla glabrous outside and inside, yellow above, and white beneath. Follicles smooth.

Mountain Echites. Fl. Dec. Shrub tw.

25 E. RIPA'RIA (H. B. et Kunth. nov. gen. amer. 3. p. 214.) leaves ovate-oblong, acute, cordate, smoothish above, but clothed with soft, hair-like down beneath, and canescent, glandular at the base; racemes usually 6-flowered; calycine segments lanceolate, hardly one half shorter than the tube. ♄. ◠. S. Native of New Granada, in hot places, near Teneriffe, on the banks of the river Magdalena. Branches glabrous. Peduncles and calyxes downy. Corollas white, glabrous inside and outside. Very nearly allied to *E. montàna*, from which it chiefly differs in the form and size of the calyx, and in the colour of the flowers.

River-side Echites. Fl. May. Shrub tw.

26 E. CONGE'STA (H. B. et Kunth. l. c.) leaves roundish-ovate, short-acuminated, cordate, rather pilose above, clothed with soft down beneath, and canescent; flowers racemose, capitately crowded; calycine segments lanceolate-linear. ♄. ◠. S. Native of South America, in the province of Popayan. Branches hairy, and besprinkled with white warts. Leaves 3 to $3\frac{1}{2}$ inches long, and 2 or $2\frac{1}{2}$ broad. Flowers white, very like those of *Jasmìnum sámbac*. Corolla glabrous, but with the tube downy inside.

Crowded-flowered Echites. Shrub tw.

27 E. BOGOTE'NSIS (H. B. et Kunth. l. c. p. 215. t. 243) leaves oblong, acuminated, obsoletely cordate, glabrous above, but clothed with powdery down, and glaucescent beneath, furnished with 2 bifid glands toward the base; racemes bifid; calycine segments ovate-oblong, acutish. ♄. ◠. S. Native of

South America, near the town of Santa Fe de Bogota. Branches glabrous. Leaves $2\frac{1}{2}$ inches long. Flowers size of those of *Vínca*. Calyx smooth, furnished with 5 trifid scales inside, towards the base. Corolla white, glabrous, hairy inside.

Bogota Echites. Shrub tw.

28 E. CITRIFÒLIA (H. B. et Kunth. l. c. p. 216.) leaves ovate-oblong, acuminated, obsoletely cordate, quite glabrous, shining above; petioles furnished with 2 glands inside; racemes bifid; calycine segments lanceolate, acuminated. ♄ . ◠. S. Native of New Granada, near Santanna and Mariquita. Branches glabrous. Leaves 3 inches long. Corolla glabrous outside.

Orange-leaved Echites. Fl. June. Shrub tw.

29 E. DICHÓTOMA (H. B. et Kunth. l. c. p. 217.) leaves ovate-oblong, acuminated, cordate, glabrous, glandless?; racemes dichotomous, on long peduncles; calycine segments ovate-lanceolate. ♄ . ◠. S. Native of South America, in the province of Bracamoros, between Jaen and the river Amazon. Branches smoothish. Corolla blue or purple.

Dichotomous-peduncled Echites. Fl. Aug. Shrub tw.

30 E. MARANHAME'NSIS; leaves cordate, sub-sagittate-oblong, acuminated, glabrous above, but clothed with white tomentum beneath; racemes many-flowered; flowers almost sessile; corollas glabrous outside. ♄. ◠. S. Native of Maranham. Flowers large, yellow. Follicles long, smooth.

Maranham Echites. Shrub cl.

31 E. SUBSAGITTA'TA (Ruiz. et Pav. fl. per. 2. p. 19.) glabrous; leaves oblong, sub-sagittate, acuminated, with the hind lobes obtuse, ciliated, glandular at the base; peduncles short, racemose; calycine segments acute. ♄ . ◠. S. Native of Peru, in woods. E. subsagittàta, Pers. ench. 1. p. 271. Stems glabrous, granular, filiform, purplish. Petioles downy. Stipulas form of glands.

Sagittate-leaved Echites. Shrub tw.

32 E. NÍTIDA (Vahl. eclog. amer. 2. p. 19.) leaves oblong-lanceolate, subcordate at the base, glabrous, shining above; peduncles racemose; calycine segments linear-obtuse. ♄ . ◠. S. Native of South America. Leaves 3-4 inches long, acute, of a glaucous rust colour beneath. Petioles purplish. Pedicels sometimes twin. Corolla white, with the tube swollen at top. Anthers 8, beaked.

Shining-leaved Echites. Shrub tw.

33 E. TOMENTÒSA (Vahl. symb. 3. p. 44.) leaves cordate-oblong, acuminated, and are, as well as the stems, hairy; peduncles racemose, 3-4-flowered, pilose; calycine segments attenuated, glabrous. ♄. ◠. S. Native of Cayenne. Leaves 3 inches long. Corolla beset with grey hairs outside, yellow.

Tomentose Echites. Fl. July, Aug. Clt. 1824. Shrub tw.

§ 3. *Follicles united at top.*

34 E. SYMPHYOCA'RPA (Meyer, esseq. p. 132.) leaves elliptic-oval, sub-sagittate, tomentose beneath, roughish above; racemes downy; follicles joined at top; calycine segments subulate, acuminated. ♄. ◠. S. Native of the Island of Arrowabisch, in sandy groves. Stems glabrous, red. Tendrils simple, axillary. Corolla glabrous, yellow outside, but variegated with red and yellow inside. This, and *E. agglutinàta*, may probably form a distinct genus, from the follicles being joined at top.

Combined-fruited Echites. Shrub tw.

35 E. AGGLUTINA'TA (Jacq. amer. 31. t. 23. ed. pict. t. 30. Lin. spec. 1671.) leaves ovate, emarginate, with a mucrone, glabrous; peduncles racemose; calycine segments small, ovate. ♄ . ◠. S. Native of St. Domingo, among bushes on the mountains, about Cape Francais. Peduncles sometimes bifid. Flowers small, white. Tube of corolla 5-furrowed; segments narrow. Follicles agglutinate at the apex.

Agglutinate-follicled Echites. Shrub tw.

36 E.? CATESBÆ'I; leaves oblong, spiny, stiff, almost veinless, often involute; racemes 6-8-flowered, terminal and axillary; segments of the corolla truncate; follicles contiguous at the apex. ♄ . ◠. F. Native of Carolina. Vínca lùtea, Lin. amœn. 4. p. 307. spec. 305.—Catesb. car. 2. p. 53. t. 53. Follicles 8-10 inches long. Seeds pappose. Flowers yellow, double.? Perhaps a species of *Forsterònia*.

Catesby's Echites. Shrub tw.

† *Species natives of America, hardly known; the greater number of which probably do not belong to the genus.*

37 E.? SYPHILÍTICA (Lin. suppl. 167.) leaves ovate, acute, quite glabrous, ribbed; peduncles axillary, divided into two branches, and these branches again divided into 2 spikes, which are closely beset with flowers. ♄ . S. Native of Surinam. A lactescent tree. Leaves large. Corollas large, white; limb large, flat. Stigma of *Vínca*. Follicles twin, divaricate. A decoction of the leaves is noted, in Surinam, in the cure of syphilis. Perhaps a species of *Tabernemontàna*.

Syphilitic Echites. Tree.

38 E. SUBSPICA'TA (Vahl. eclog. amer. 2. p. 18.) leaves oblong, attenuated, somewhat cordate at the base, glabrous; peduncles racemose; pedicels very short; calycine segments lanceolate. ♄ . ◠. S. Native of South America. Shrub glabrous in every part. Leaves 4-5 inches long, shining above, purplish on the rib beneath. Petioles rather villous above. Bracteas linear-lanceolate. Perhaps a species of *Parsónsia*.

Subspicate-flowered Echites. Shrub tw.

39 E. RUBRICAU'LIS (Poir. suppl. 2. p. 535.) leaves ovate, acuminated, nerved beneath, and rather downy; flowers lateral, almost solitary; stem red. ♄ . ◠. S. Native of Guiana. Leaves glabrous, and almost shining above. Flowers hardly pedunculate.

Red-stemmed Echites. Fl. July, Aug. Clt. 1824. Shrub cl.

40 E. OVALIFÒLIA (Poir. suppl. 2. p. 535.) leaves oval, blunt at both ends, downy beneath; follicles very hairy; peduncles racemose, longer than the leaves; branches and peduncles pilose. ♄ . ◠. S. Native of St. Domingo. Branches stiff, brownish. Leaves an inch and more long. Bracteas subulate. Follicles slender, arched.

Oval-leaved Echites. Shrub tw.

41 E. GLOMERA'TA (Poir. suppl. 2. p. 536.) leaves membranous, ovate, acuminated, glabrous; flowers in axillary, nearly globose fascicles, almost sessile; stems scandent. ♄ . ◠. S. Native of St. Domingo. Leaves 2-3 inches long. Flowers middle-sized. Bracteas lanceolate.

Glomerate-flowered Echites. Shrub cl.

42 E.? PANICULA'TA (Poir. suppl. 2. p. 536.) leaves oval-lanceolate, acuminated, glabrous; panicles lateral, spicate; pedicels cymosely umbellate. ♄ . ◠. S. Native of South America. Pedicels downy. Perhaps a species of *Parsónsia*.

Panicled-flowered Echites. Shrub tw.

43 E. ANGUSTIFÒLIA (Poir. suppl. 2. p. 537.) leaves very narrow, acute; flowers axillary, usually solitary; follicles slender, somewhat tomentose. ♄ . ◠. S. Native of St. Domingo. Habit of a species of *Ceropègia*. Leaves 3 inches long, hardly petiolate, glabrous, with 3 longitudinal nerves, 2 of which are almost marginal. Follicles 6-8 inches long.

Narrow-leaved Echites. Shrub tw.

44 E. DIFFÓRMIS (Walt. fl. car. p. 98. Pursh. fl. amer. sept. 1. p. 178.) leaves oval-lanceolate, acute at the base: lower ones linear; flowers in fasciculate-corymbs. ♄ . ◠. F. Native of Lower Carolina, in woods. Leaves rather downy beneath. Flowers small, yellowish.

Two-formed-leaved Echites. Fl. July. Clt. 1806. Sh. tw.

45 E. PUNCTICULÒSA (Richard. in act. hist. nat. par. p. 107.)

branches rather scabrous from prominent dots; leaves ovate, with an obtuse acumen, very veiny beneath; corymbs compound. ♄. ⌒. S. Native of South America.

Dotted-branched Echites. Shrub tw.

46 E. RUGULÒSA (Richard, in act. hist. nat. par. p. 107.) leaves ovate, acutely acuminated, sub-emarginate at the base, wrinkled, with revolute edges: having the nerves above roughish from minute down; stem slender, roughish. ♄. ⌒. S. Native of Cayenne.

Wrinkled Echites. Shrub tw.

47 E. GALEGIFÓRMIS (Rudolph. ex Ledeb. pl. st. doming. no. 6.) peduncles many-flowered; leaves oblong, obtuse. ♄. ⌒. S. Native of St. Domingo. Very like *E. tomentòsa*, but differs in the leaves being obtuse and the flowers rose-coloured.

Galega-formed Echites. Shrub tw.

48 E.? SEMIDÍGYNA (Berg. act. vlissing. 3. p. 383. icone.) leaves ovate-oblong, attenuated at both ends. ♄. ⌒. S Native of South America.? Gmel. syst. p. 436. Peduncles oppositely racemose.

Semidigynous Echites. Shrub tw.

†† *East Indian species, hardly known, with small flowers. The species here enumerated will probably form a distinct genus.*

49 E.? GLANDULÍFERA (Wall. cat. no. 1659.) leaves oblong, coriaceous, glabrous, tapering to the base, and acuminated at the apex, on very short petioles; panicles terminal and axillary, composed of trichotomous peduncles; flowers crowded, corymbose; calyx and pedicels downy; follicles narrow, torulose. ♄. ⌒. S. Native of the Burmese empire, at Amherst. E. monilífera, Wall. cat. 1659., a native of Singapore, hardly seems to differ, unless in the more ovate leaves. Flowers small, white.

Gland-bearing Echites. Shrub tw.

50 E.? MICRA'NTHA (Wall. cat. no. 1667.) leaves oblong or ovate-oblong, acuminated, glabrous; panicles axillary and terminal, divaricate, composed of trichotomous peduncles; flowers crowded, corymbose, downy. ♄. ⌒. S. Native of Silhet. E. brachiàta, Wall. cat. no. 1668. is the same. Flowers very small. Follicles probably torulose, like the last species.

Small-flowered Echites. Shrub tw,

51 E.? LU'CIDA (Wall. cat. no. 1670.) leaves elliptic, obtuse at both ends, short-acuminated, coriaceous, glabrous, shining; panicles terminal and axillary, composed of trichotomous peduncles; flowers corymbose, downy; bracteas linear; follicles woody, ovate, acuminated, or cultriform. ♄. ⌒. S. Native of Penang. Flowers small. E. esculénta, Wall. cat. 1671. from Amherst does not appear to differ from the present species, but as there are no flowers on the specimens of that plant examined by us, its affinity cannot be ascertained.

Shining-leaved Echites. Shrub tw.

52 E.? PANICULA'TA (Roxb. fl. ind. 2. p. 17.) leaves broad-lanceolate, bluntly acuminated; panicles axillary and terminal, trichotomous throughout: the extreme divisions 3-flowered; follicles sub-clavate, few-seeded; hypogynous scales combined into a cup-shaped 5-toothed urceolus. ♄. ◡. S. Native of Silhet. Leaves 8 inches long and 1½ to 3 broad. Bracteas oval. Flowers very small, pale yellow. Corolla with a short gibbous tube; and woolly, edged, falcate segments.

Panicled-flowered Echites. Shrub cl.

53 E.? PARVIFLÒRA (Roxb. fl. ind. 2. p. 20.) leaves lanceolate; panicles terminal and axillary, brachiate; tube of corolla gibbous towards the base; segments of the limb linear, falcate. ♄. ⌒. S. Native of the northern Circars, and Silhet. E. macrocárpa, Wall. cat. no. 1663. Hypogynous scales combined into an entire ring. Follicles large, ovate, acuminated. E. polyántha, Wall. cat. no. 1664., a native of Chapedong, and Amherst, hardly differs, except in the more coriaceous leaves.

Small-flowered Echites. Shrub tw.

54 E.? ELLÍPTICA (Wall. cat. no. 1666.) leaves elliptic, or obovate-elliptic, acuminated, glabrous; peduncles axillary and terminal, trichotomous, corymbose, spreading; corolla salver-shaped, with obtuse segments. ♄. ⌒. S. Native of Silhet. Echìtes verticállis, Hamilt. mss. Very nearly allied to the preceding.

Elliptic-leaved Echites. Shrub tw.

††† *American species, hardly known.*

55 E. MYRTIFÒLIA (Willd. herb. ex Rœm. et Schultes, syst. 34. p. 795.) peduncles 1-flowered; leaves oblong-lanceolate, mucronate, shining. ♄. ⌒. S. Native of Cuba, about the Havanna. This is not to be confounded with Parsónsia myrtifòlia, Rœm. et Schultes, vol. 5.

Myrtle-leaved Echites. Shrub tw.

56 E. GEMINA'TA (Willd. l. c.) leaves elliptic, acutish; peduncles twin, 1-flowered. ♄. ⌒. S. Native of Brazil.

Twin-peduncled Echites. Shrub tw.

57 E. LU'CIDA (Willd. l. c.) peduncles 1-flowered, elongated; leaves elliptic-oblong, subcordate, obtuse, shining above. ♄. ⌒. S. Native on the banks of the Orinoco.

Shining Echites. Shrub tw.

58 E. CANE'SCENS (Willd. l. c.) peduncles 3-flowered, axillary; leaves oblong, acuminated, tomentose beneath. ♄. ⌒. S. Native of South America.

Canescent Echites. Shrub tw.

59 E. VERRUCÒSA (Willd. l. c.) corymbs axillary; leaves oblong, acuminated; branches warted. ♄. ⌒. S. Native of Brazil.

Warted Echites. Shrub tw.

60 E. HÍSPIDA (Willd. l. c.) racemes axillary; corollas hispid outside; leaves oblong-cordate, acuminated, hispid. ♄. ⌒. S. Native of Brazil.

Hispid Echites. Shrub tw.

61 E. SCA'BRA (Willd. l. c.) racemes axillary; leaves oblong, acuminated, cordate, scabrous. ♄. ⌒. S. Native of Brazil.

Scabrous Echites. Shrub tw.

62 E. GLAU'CA (Willd. l. c.) racemes terminal; leaves elliptic, acuminated, glaucous beneath. ♄. ⌒. S. Native of Brazil. Corolla funnel-shaped: having the tube thickened at top, and with the throat hardly pervious. Leaves coriaceous, glabrous. Perhaps a distinct genus.

Glaucous Echites. Shrub tw.

63 E. MACRA'NTHA (Rœm. et Schultes, syst. 4. p. 795.) corymbs axillary; leaves oblong, acute, glabrous, shining. ♄. ⌒. S. Native of Brazil. E. grandiflòra, Willd. herb. but not of others.

Large-flowered Echites. Shrub tw.

64 E. PUBE'SCENS (Willd. herb. ex Rœm. et Schultes. syst. 4. p. 796.) flowers sub-umbellate, axillary; leaves elliptic-ovate, cordate, acuminated, downy beneath. ♄. ⌒. S. Native of South America.

Downy Echites. Shrub tw.

65 E. NODÒSA (Willd. l. c.) racemes axillary; leaves lanceolate, acuminated; branches nodose. ♄. ⌒. S. Native of South America.

Knotted-branched Echites. Shrub tw.

66 E. MUCRONA'TA (Rœm. et Schultes, syst. 3. p. 769.) leaves lanceolate, cordate, acuminated, mucronate, downy beneath; racemes axillary. ♄. ⌒. S. Native of South America. E. acuminàta, Willd. herb.

Mucronate-leaved Echites. Shrub tw.

67 E. FRASE'RI (Rœm. et Schultes, l. c.) leaves crowded, linear, ciliated with pili, acute; panicle terminal, naked. ♄. ⌒. F. Native of Carolina.

Fraser's Echites. Shrub tw.

Cult. All the true species of this genus bear large, elegant, white or yellow flowers. They grow freely in a mixture of loam, sand, and peat; and cuttings strike root readily under a hand-glass, if planted in sand.

II. CHONEMO'RPHA (χωνη, *chone*, a funnel, and μορφη, *morphe*, form; form of corolla). Echìtes species, Wall. Roth. Roxb., &c.

LIN. SYST. *Pentándria*, *Monogýnia*. Calyx small, 5-parted. Corolla funnel-shaped, with a naked throat, and a twisted limb; segments of corolla equal-sided ?. Stamens inclosed; anthers sagittate or lanceolate, adhering to the stigma. Ovarium didymous. Style filiform; stigma somewhat conical, emarginate at apex. Hypogynous scales 5, distinct or connate. Follicles distinct, slender. Seeds furnished with a tuft of hairs at the upper extremity.—Erect or twining shrubs, natives of Asia, with opposite leaves; and interpetiolar glandular ciliæ ?. Peduncles interpetiolar, corymbose. Flowers showy, white or yellow.

* *Erect shrubs.*

1 C. CRISTA'TA; stems erect; leaves oval, mucronate, tomentose beneath, with horizontal ribs; corymbs axillary, dichotomous, divaricate, on short peduncles. ♄. S. Native of the East Indies. Echìtes cristàta, Roth. nov. spec. Bracteas minute, tooth-formed.

Crested Chonemorpha. Shrub.

2 C. DICHÓTOMA; stems erect, dichotomous; leaves ovate, acuminated, downy beneath, when young clothed with silky tomentum; corymbs axillary, dichotomous, on short peduncles, erect. ♄. S. Native of the East Indies. Echìtes dichótoma, Roth, nov. spec. Echìtes Héynii, Spreng. syst. 1. p. 632. Leaves a hand long, downy on the veins and nerves above. The flowers are said to be salver-shaped, but are probably funnel-shaped, very like those of *Jasmínum odoratíssimum*, but a little larger, with the tube downy.

Dichotomous Chonemorpha. Shrub.

3 C. GRANDIFLÒRA; stem erect; leaves oval, acuminated, glabrous above, and rather tomentose beneath; flowers terminal, by threes; peduncles as well as the calyxes downy; corolla glabrous. ♄. S. Native of the East Indies. Echìtes grandiflòra, Roth, nov. spec. but not of Meyer. Echìtes macrántha, Spreng. syst. 1. p. 632. Ribs of leaves almost horizontal, bifid at top. Flowers showy, size of those of *Oleánder*. Segments of corolla ovate, mucronate.

Great-flowered Chonemorpha. Shrub.

4 C. VESTÌTA; stem erect, downy; leaves oval-lanceolate, downy above and tomentose beneath; corymbs axillary, almost sessile, dichotomous, somewhat divaricate; corolla downy. ♄. S. Native of the East Indies. Echìtes vestìta, Rœm. et Schultes, syst. 4. p. 394. E. tomentòsa, Roth, nov. spec. Bracteas lanceolate, concave. The corolla is said to be salver-shaped, but is probably funnel-shaped, like the rest. Perhaps a species of *Aganósma*.

Clothed Chonemorpha. Shrub.

5 C. ANTIDYSENTE'RICA; stem erect? angular; leaves ovate-lanceolate, with obsoletely crenulated edges, glabrous on both surfaces; corymbs axillary, dichotomous; calyx and corolla downy. ♄. S. Native of the East Indies. Echìtes antidysentérica, Roth. nov. spec. Bracteas linear, downy. The corolla is said to be salver-shaped, but is probably funnel-shaped.

Antidysenteric Chonemorpha. Shrub.

* * *Twining shrubs.*

6 C. RETICULA'TA; stem twining, angular, roughish; leaves oval, mucronate, glabrous on both surfaces, reticulately veined; corymbs axillary, pedunculate; bracteas imbricate. ♄. ◠. S. Native of the East Indies. Echìtes reticulàta, Roth. nov. spec.

Var. β, *tomentòsa* (Roth. l. c.) leaves tomentose on the ribs and veins, especially beneath.

Reticulated-leaved Chonemorpha. Shrub tw.

7 C.? MALABA'RICA; stem scandent; leaves ovate, acuminated; flowers disposed in axillary cymose racemes, villous. ♄. ◡. S. Native of Malabar. Echìtes Malabárica, Lam. dict. 2. p. 343.—Pal-valli. Rheede, mal. 9. t. 12. Stem slender, kneed. Flowers light green, reddish outside, with a whitish neck. Follicles stiff, narrow, rather flattened.

Malabar Chonemorpha. Shrub cl.

8 C. MACROPHY'LLA; stems twining; leaves large, roundish, acuminated, downy beneath; cymes terminal. ♄. ◡. S. Native of Silhet. Echìtes grándis, Wall. cat. no. 1658. Echìtes macrophýlla, Roxb. fl. ind. 2. p. 13. Leaves from oval to roundish, 10-12 inches long, and 7-10 broad. Flowers very large, white. Calyx campanulate, 5-toothed. Filaments hairy. Follicles pendulous, about a foot long. Seeds spatulate. Embryo inverted. Habit of *Beaumóntia grandiflòra*.

Large-leaved Chonemorpha. Shrub cl.

9 C. DENSIFLÒRA (Blum. bijdr. p. 104. under *Echìtes*) leaves on short petioles, oblong-lanceolate, coriaceous, glabrous; corymbs axillary and terminal, fastigiate, subumbellate, many-flowered; corolla funnel-shaped: having the tube angular at bottom. ♄. ◡. S. Native of Java, about Kuripan, where it is called *Tjunkankan*. Flowers white. Hypogynous scales acute, distinct. Stamens inclosed.

Dense-flowered Chonemorpha. Fl. March. Shrub cl.

10 C. BANTAME'NSIS (Blum. bijdr. p. 1040. under *Echìtes*) leaves elliptic-oblong, acuminated, rather attenuated at the base, glabrous, reticulately veined beneath, tomentose on the midrib and veins beneath, as well as on the petioles and branchlets; corymbs axillary and terminal, trichotomous, on long peduncles; corolla funnel-shaped, hairy. ♄. ◡. S. Native of Java, among bushes, in the province of Bantam. E. ferrugínea, Horsfield, in Rœm. Schultes, syst. 4. p. 796. Hypogynous scales acuminated, distinct. Stamens inclosed.

Bantam Chonemorpha. Fl. Feb. Shrub cl.

11 C. CORIA'CEA (Blum. bijdr. p. 1039. under *Echìtes*) leaves lanceolate, coriaceous, glabrous; corymbs axillary or terminal, bifid or trifid; pedicels usually 3 together; corolla funnel-shaped, hairy inside. ♄. ◡. S. Native of Java, in mountain woods, where it is called *Ojot-tjum-pol-kikis*. Flowers small, yellowish. Stamens inclosed. Hypogynous scales connate.

Coriaceous-leaved Chonemorpha. Fl. year. Shrub cl.

12 C. INFLA'TA (Blum. bijdr. p. 1039. under *Echìtes*) leaves elliptic-lanceolate, bluntly acuminated, coriaceous, glabrous, full of parallel reticulated veins; corymbs axillary and terminal, bifid or trifid; pedicels 3 together; corolla funnel-shaped: having the tube widened and 5-angled downwards. ♄. ◡. S. Native of Java, at the foot of Mount Tjerimai. Flowers white, but the throat is yellow. Hypogynous scales roundish, distinct. Nearly allied to *E. reticulàta*, Roth., from which it differs in the anthers being inclosed, and in the tube of the corolla being 5-angled above.

Inflated-flowered Chonemorpha. Fl. August. Shrub cl.

13 C.? CONVOLVULOÌDES; leaves sagittately cordate, acuminated, glabrous, on long petioles; racemes terminal and axillary, 4-5-flowered, on short angular, thick peduncles; tube of corolla very long. ♄. ◠. S. Native of Africa, in the island of St. Thomas, on the banks of rivers. Corolla funnel-shaped, with a naked throat, white. Anthers conniving into a cone. Lobes at base of leaves distant. Follicles long.

Convolvulus-like Chonemorpha. Shrub tw.

Cult. See *Echìtes* above for culture and propagation.

III. AGANO'SMA (from *αγανης, aganes*, mild, and *οσμη, osme*, a smell; scent of flowers). Echìtes, sect. 2. Aganósma, Blum. bijdr. p. 1040. Echìtes species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx large, 5-parted, equal in length to the tube of the corolla, spreading. Corolla funnel-shaped, with an oblique 5-parted limb, and the tube gibbous at the base. Stamens inclosed; anthers sagittate, cohering with the stigma. Ovarium didymous, inclosed by 5 long combined hypogynous scales. Style thick; stigma conical, angular at the base, mucronate at top or bidentate. Follicles cylindrical, divaricate. Seeds large.—Showy Asiatic shrubs, with opposite leaves and terminal corymbs of flowers. Bracteas deciduous, at the base of the pedicels and calyxes.

1 A. caryophylla'ta; leaves oval, acutish at both ends, tomentose beneath as well as the branches; corymbs terminal. ♄. S. Native of the East Indies. Echìtes caryophyllàta, Blum. bijdr. p. 1041.—Rheed. mal. 7. t. 103. t. 55. Flowers pale yellow, tinged with red, very sweet scented.

Clove-scented Aganosma. Fl. Oct. Clt. 1812. Shrub tw.

2 A. Roxbu'rghii; leaves ovate-cordate, acuminated: having the petioles and veins red, glabrous, pale beneath and shining above; with the principal nerves running from the base to the apex of the leaves; corymbs terminal; segments of corolla triangular. ♄. ◠. S. Native of the East Indies, in mountainous tracks only. Echìtes caryophyllàta, Roxb. fl. ind. 2. p. 11. Sims, bot. mag. 1919. but not of Blume.—Rheed. mal. 9. t. 135. Perhaps *Echìtes costàta*, Willd. is the same. Flowers large, pure white, delightfully fragrant. Nectary tubular, 5-toothed. Calyx and corolla hoary outside.

Roxburgh's Aganosma. Fl. Oct. Clt. 1812. Shrub tw.

3 A. cymòsa; hairy; leaves elliptic, acuminated; cymes terminal, shorter than the leaves; segments of corolla oblique, ensiform; nectary cup-shaped, 5-toothed. ♄. S. Native of Silhet. Echìtes cymòsa, Roxb. fl. ind. 2. p. 16. Echìtes confèrta, Wall. cat. no. 1655. Leaves 3-4 inches long. Flowers small, dull white, fragrant. Calyx and corolla hoary outside.

Cymose-flowered Aganosma. Shrub.

4 A. Wallìchii; leaves elliptic-acuminated, shining above, and pale beneath, glabrous; veins parallel; corymbs terminal; nectary tubular, 5-toothed. ♄. S. Native of the East Indies. Echìtes calycìna, Wall. cat. no. 1653. Calyx and corolla downy outside. This species differs from *A. Roxbúrghii* in the veins of the leaves being parallel, not longitudinal, from the base to the apex. Flowers white, fragrant.

Wallich's Aganosma. Shrub tw.

5 A. e'legans; leaves elliptic, short-acuminated, glabrous; corymbs terminal, crowded; calycine segments lanceolate, linear, longer than the tube of the corolla. ♄. ◠. S. Native of the East Indies. Echìtes élegans, Wall. cat. no. 1656. Echìtes bracteàta, Herb. Heyne. Flowers small, apparently purple, being black in the dried state. Corolla downy outside, as well as the calyxes, bracteas, and pedicels.

Elegant Aganosma. Shrub tw.

6 A. acumina'ta; leaves from oblong to broad-lanceolate, acuminated, glabrous; panicles axillary, longer than the leaves, trichotomous, diffuse; segments of corolla linear, falcate, curled. ♄. ◠. S. Native of Silhet, where it is called *Pingoree* and *Bengeree*. Echìtes acuminàta, Roxb. fl. ind. 2. p. 15. Leaves 2-4 inches long. Panicles and bracteas smooth. Flowers large, white, fragrant. Calyx length of the tube of the corolla, smooth. Nectary cup-shaped, obscurely 5-toothed. Follicles very long, slender.

Acuminated-leaved Aganosma. Shrub cl.

7 A. margina'ta; leaves lanceolate, smooth: having the tops of the veins forming a waved line within the margin of the leaf; panicles terminal, lax, corymbose, at first sub-trichotomous, and then dichotomous, glabrous; segments of corolla linear, falcate; nectary annular. ♄. ◡. S. Native of Silhet, where it is called *Dood-luta*. Echìtes marginàta, Roxb. fl. ind. 2. p. 16. Flowers numerous, large, white, fragrant.

Marginate Aganosma. Shrub cl.

† *A species hardly known.*

8 A. affìnis; erect, tomentose; leaves oval, mucronate; corymbs terminal; segments of calyx equal in length to the limb of the corolla. ♄. S. Native of the East Indies. Echìtes caryophyllàta, Roth. nov. spec. E. affìnis, Rœm. et Schultes, syst. 4. p. 393. Leaves densely clothed with soft down above, and grey tomentum beneath. Corolla with a glabrous tube, which is said to be twice as long as the calyx, in the description by Roth; it is consequently not a true species of *Aganósma*.

Allied Aganosma. Shrub erect.

Cult. For culture and propagation see *Echìtes*, p. 76.

IV. BEAUMO'NTIA (named in compliment to the late Mrs. Beaumont, of Bretton Hall, Yorkshire). Wall. tent. fl. nep. p. 14. t. 7. Bot. reg. 911. Echìtes species, Roxb.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5, foliaceous, unequal, erect segments. Corolla with a short tube and a large campanulate 5-lobed limb; lobes erect, ovate, acute; throat destitute of scales. Stamens 5, inserted in the throat of the tube, exserted; anthers sagittate, beardless, cohering to the stigma: hind lobes without pollen; filaments free. Style twisted. Ovarium 2-celled, surrounded by a hypogynous 5-lobed ring. Stigma oblong, with a bifid point. Follicles 2, large, combined, but at length separating. Seeds furnished with a tuft of hairs at the umbilical end.—Large twining shrubs, with permanent opposite leaves: having the axillary and interpetiolar cilia subulate and sphaceolate. Corymbs axillary and terminal, many-flowered. This genus agrees wtth *Lyónsia* on one hand and *Parsónsia* on the other.

1 B. grandiflòra (Wall. l. c.) leaves broad, oblong-obovate; with a little point, tapering towards the base, smooth and shining above, but rather downy beneath; calyx downy. ♄. ◠. S. Native of Chittagong and Silhet. Echìtes grandiflòra, Roxb. fl. ind. 2. p. 14. Corolla large, white, greenish outside near the base, and dark throat. Young leaves and branches rusty.

Great-flowered Beaumontia. Fl. Ju. Clt. 1820. Shrub tw.

2 B. longifòlia (Lodd. bot. cab. p. 6. for 1830.) nothing more than the name is known of this species. ♄. ◠. S. Native of the East Indies.

Long-leaved Beaumontia. Shrub tw.

Cult. See *Echìtes*, p. 76. for culture and propagation.

V. PACHYPO'DIUM (from *παχυς, pachys*, thick, and *πους ποδος, pous podos*, a foot; in reference to the thick fleshy roots). Lindl. bot. reg. 1321.—Echìtes species, Thunb. and Haw.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted. Corolla salver-shaped; with a somewhat curved pentagonal tube; throat and tube scaleless; segments of the limb obtuse, equal. Stamens inserted in the middle of the tube; anthers sagittate, subsessile. Ovaria 2. Styles 2. Hypogynous scales none. Follicles twin, ovate.—Fleshy, lactescent, spiny shrubs, with the habit of some species of *Euphórbia*. Spines 2-3-lobed, infra-petiolar. Leaves scattered. Flowers axillary or terminal, solitary or aggregate. Peduncles 1-flowered.

1 P. gla'brum; leaves ovate-lanceolate, or obovate-lanceolate, glabrous. ♄. G. Native of the Cape of Good Hope, in arid places. Echìtes bispinòsa, Thunb. prod. 37. nov. act. petrop. 14. p. 505. Ait. hort. kew. ed. 2. vol. 2. p. 69. Lin. suppl. p. 167. Prickles connate. Leaves acute, paler beneath, hardly an inch long. Corolla with a somewhat curved, greenish rufescent tube, bearded with white hairs, and an inflated campanulate limb, which is reddish outside, and purplish inside at the base; segments ovate, obtuse, white.

Glabrous Pachypodium. Fl. July, Nov. Clt. 1795. Sh. 1 ft.

2 P. tomentòsum; leaves linear or lanceolate, tomentose beneath; glabrous above. ♄. G. Native of the Cape of Good Hope, in arid places. Echìtes succulénta, Thunb. prod. 37. nov. act. petrop. 14. p. 505. t. 9. f. 2. Lin. suppl. 167. Prickles filiform, setaceous. Leaves green above, but clothed with fine villi beneath, about an inch long. Corollas rufescent. Follicles ovate, acute.

Tomentose Pachypodium. Fl. Jul. Nov. Clt. 1820. Sh. 1 ft.

3 P. tuberòsum (Lindl. bot. reg. 1321.) stem tuberous at the base; leaves oblong, tomentose beneath, glabrous above. ♄. G. Native of the Cape of Good Hope, in barren plains. Echìtes tuberòsa, Haw. syn. pl. succ. p. 6.? Lodd. bot. cab. 1676. Prickles straight, subulate. Corolla red outside, and whitish on the upper surface of the limb, tinged with red.

Tuberous-rooted Pachypodium. Fl. June, Nov. Clt. 1813. Shrub 1 foot.

Cult. These are very pretty succulent shrubs. A mixture of lime-rubbish, sand, and loam is the best soil for them: and cuttings will strike root readily in sand, under a hand-glass. The plants should not get too much water, when not in a growing state.

VI. ICHNOCA'RPUS (ιχνος, *ichnos*, a vestige, and καρπος, *karpos*, a fruit; in reference to the slender follicles). R. Br. in mem. wern. soc. 1. p. 62.—Apócynum frutéscens, Lin.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla salver-shaped; segments of the limb dimidiate, twisted, hairy; throat and tube without any scales. Stamens inclosed; anthers sagittate, free from the stigma. Ovaria twin. Style 1, filiform; stigma ovate, acute. Hypogynous threads 5, capitate, alternating with the stamens. Follicles slender.—Climbing shrubs, with opposite leaves; branched, terminal panicles of small, white, inodorous flowers.

1 I. frute'scens (R. Br. hort. kew. ed. 2. vol. 2. p. 69.) stem twining; leaves oblong-lanceolate, tapering to both ends, glabrous; peduncles axillary, very long, racemose; pedicels fascicled; follicles variable. ♄. ⌒. S. Native of Ceylon, Sirmore, Silhet, Nipaul, and Kamaon. Apócynum frutéscens, Lin. fl. zeyl. 114. spec. p. 312. Pers. syn. exclusive of Quiribèlia, Lam. Lyàma, Roxb. in asiat. res. 4. p. 261.—Burm. fl. zeyl. p. 23. t. 12. f. 1. Echìtes frutéscens, Roxb. fl. ind. 2. p. 12. Leaves variable in shape, deep green above and pale beneath. Flowers small, purple. I. radìcans, Wall. cat. hardly appears to be distinct. The Quiribèlia Zeylánica, Lam. et Poir. dict. 6. p. 42., considered by them as Linneus's *Apócynum frutéscens*, must, from the description, be widely different, and perhaps does not belong to the same natural order.

Shrubby Ichnocarpus. Fl. July, Aug. Clt. 1759. Sh. tw.

2 I. fra'grans (Wall. cat. no. 1676.) leaves oblong-lanceolate, or oblong, acuminated, tapering to both ends, glabrous; peduncles axillary, trichotomous, spreading; segments of the corolla long. ♄. ⌒. S. Native of Nipaul. Flowers large. Follicles long, slender, terete.

Fragrant Ichnocarpus. Shrub tw.

3 I.? Afze'lii (Rœm. et Schultes, syst. 4. p. 399.) stems twining; lower leaves oval, acute; superior ones oblong or lanceolate; segments of corolla obtuse; throat nearly naked. ♄. ⌒. S. Native of Sierra Leone, and about the river Bascha, and along the sea shore on the coast of Lower Guinea, in woods and among bushes. Apócynum frutéscens, Afz. rem. guin. 4. p. 28. Shrub glabrous. Peduncles terminal, 2-flowered; Pedicels drooping. Corollas white, sweet-scented. Follicles combined at the base.

Afzelius's Ichnocarpus. Shrub tw.

4 I. Loureìrii (Spreng. syst. 1. p. 635.) stem frutescent, erectish; leaves ovate-oblong; peduncles lateral, usually 3-flowered. ♄. ◡. S. Native of Zanzebar. Apócynum Africànum, Lour. coch. 168. Branches scandent. Leaves small, glabrous. Flowers pale. Corolla campanulate, reflexed. Hypogynous scales subulate, alternating with 5 coloured glands. Stigma acute, bifid. Follicles conical.

Loureiro's Ichnocarpus. Shrub cl.

Cult. See *Echìtes*, p. 76. for culture and propagation.

VII. HOLARRHE'NA (ὁλος, *olos*, entire, and ἀρρην, *arrhen*, a male; in reference to the entire anthers). R. Br. in wern. soc. mem. 1. p. 62.—Carìssa, spec. Vahl.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted; segments subulate. Corolla salver-shaped, with equal-sided segments, and a scaleless throat and tube. Stamens inclosed, inserted in the bottom of the tube; anthers free from the stigma, lanceolate, entire, bearing the pollen longitudinally. Ovaria twin. Style very short; Stigma cylindrical. Hypogynous scales wanting. Follicles slender.—Erect glabrous shrubs. Leaves membranous. Cymes terminal and lateral.

1 H. mìtis (R. Br. l. c.) leaves lanceolate, attenuated. ♄. S. Native of the East Indies. Carìssa mìtis, Vahl, symb. 3. p. 44. t. 59. Leaves 2-3 inches long, shining, purplish beneath.

Mild Holarrhena. Shrub.

2 H.? Coda'ga; leaves ovate, acuminated, with oblique parallel nerves; peduncles terminal; segments of corolla oblong, oblique. ♄. S. Native of Malabar. Codàga-Pàla, Rheed. mal. 1. p. 85. t. 47. Flowers white, sweet-scented. Follicles a span long.

Codaga Holarrhena. Shrub 5 to 6 feet.

3 H. pube'scens (Wall. cat. no. 1673.) leaves ovate-oblong or elliptic-oblong, short-acuminated, downy beneath and on the upper surface while young, as well as the branches, peduncles, and calyxes; corymbs terminal. ♄. S. Native of Nipaul, Kamaon, Martaban, and Tavoy. Echìtes pubéscens, Hamilt. mss. Hardly distinct from *Echìtes antidysentérica*, Roxb.; a native of Silhet and Nipaul, the *H. antidysentérica*, Wall. cat. no. 1672.

Downy Holarrhena. Shrub.

Cult. For culture and propagation see *Echìtes*, p. 76.

VIII. ISONE'MA (from ισος, *isos*, equal, and νημα, *nema*, a filament). R. Br. in wern. soc. mem. 1. p. 63.

Lin. syst. *Pentándria, Monogýnia.* Corolla salver-shaped: limb 5-parted; throat and tube without scales. Stamens exserted. Filaments inserted in the throat, simple at apex. Anthers sagittate, cohering by their middle to the stigma. Ovaria twin. Style 1, filiform; stigma thick, obtuse. Hypogynous scales wanting. Follicles unknown.—An erect hairy shrub, with opposite leaves. Panicles terminal, brachiate; flowers corymbose. Segments of calyx furnished with a double scale inside at base. Corolla half an inch long; with a cylindrical tube, which is bearded inside in the middle.

1 I. Smeathma'nni (Rœm. et Schultes, syst. 4. p. 401.) ♄. S. Native of tropical Africa, on the west coast.

Smeathmann's Isonema. Shrub.

Cult. For culture and propagation see *Echìtes*, p. 76.

IX. VALLA'RIS (from *vallo*, to inclose; used for fences in Java.) Burm. ind. p. 51. R. Br. in mem. wern. soc. 1. p. 63. Blum. bijdr. p. 1042.—Emerìcia, Rœm. et Schultes, syst. 4. p. 401.—Pegulària species, Lin.—Peltanthèra, Roth.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla salver-shaped; with a 5-cleft obtuse limb; and a scaleless throat and tube. Stamens exserted; filaments inserted in the throat, very short, furnished with a fleshy swelling outside at the apex; anthers sagittate, cohering by their middle to the stigma. Ovarium 2-celled. Style filiform; stigma ovate-conical, furnished with a pearl-like gland on the back. Hypo-

gynous scales 5, connate at the base and ciliated at the apex.—Twining shrubs. Leaves opposite. Peduncles interpetiolar, or terminal. Flowers corymbose, sweet-scented. Corymbs trichotomous.

1 V. Pergula'na (Burm. ind. p. 51.) leaves ovate-elliptic, acute, glabrous; corymbs axillary, trichotomous, downy; segment of corolla roundish. ♄. ◠. S. Native of the East Indies. Pergulària glàbra, Lin. mant. p. 53. Willd. spec. 1. p. 1247. Houtt. Lin. pfl. syst. 3. p. 335. t. 20. f. 1. Echìtes hircòsa, Roxb. fl. ind. 2. p. 18. Flos Pergulànus, Rumph. amb. 5. p. 51. t. 29, Emerìcia Pergulària, Rœm. et Schultes, syst. 4. p. 401. Flowers large, pure white, with a goatish smell. Calycine segments lanceolate, acute.

Pergulana Vallaris. Fl.? Clt. 1818. Shrub tw.

2 V. laxiflòra (Blum bijdr. p. 1043.) leaves ovate-oblong, acuminated, glabrous; corymbs axillary and terminal, trichotomous, on long peduncles, glabrous. ♄. ◠. S. Native of Java, in shady mountain woods, in the province of Buitenzorg.

Loose-flowered Vallaris. Shrub tw.

3 V. dichótoma (Wall. cat. no. 1621.) leaves lanceolate-oblong, glabrous; racemes axillary, dichotomous; segments of corolla roundish; filaments bearded and woolly. ♄. ◠. S. Native of Bengal, in forests near Calcutta. Echìtes dichótoma, Roxb. fl. ind. 2. p. 19. Leaves on very short petioles, 3 inches long. Flowers large, pure white, fragrant. Calycine segments cordate, pointed. Follicles oblong, large, 6 inches long.

Dichotomous-racemed Vallaris. Shrub tw.

4 V.? clava'ta; dichotomous; leaves broad-lanceolate, entire, villous beneath; panicles axillary dichotomous; tube of corolla clavate; with the segments of the border falcate; anthers linear, inclosed. ♄. ◠. S. Native of the Moluccas. Echìtes clavàta, Roxb. fl. ind. 2. p. 20. This comes nearest to *V. dichótoma*, but differs sufficiently in the length of the tube, the segments of the border, and the stamina, to authorize its being considered as a distinct species. (Roxb.)

Clavate-tubed Vallaris. Shrub tw.

† *The seeds of the two following species being naked, they probably belong to the genus Strophánthus, or will form a nearly allied genus.*

5 V.? divarica'ta; stems nearly erect; leaves broad-lanceolate, glabrous, undulated; peduncles 2-flowered, divaricate, terminal. ♄. G. Native of China. Pergulària divaricàta, Lour. coch. p. 168. Periplòca divaricàta, Spreng. syst. 1. p. 836. Emerìcia divaricàta, Rœm. et Schultes, syst. 4. p. 401. Flowers yellow, suffused with red. Segments of calyx subulate. Corolla with a thick tube, and very long subulate segments. Scales 5, sagittate, seated in the mouth of the tube of the corolla. Ovarium ovate, 2-lobed. Style filiform, length of stamens; stigma acute, erect, bifid. Follicles 2, oblong, many-seeded. Seeds longish, naked. Perhaps a species of *Strophánthus*, or a new genus nearly allied to it.

Divaricate Vallaris. Shrub erectish.

6 V.? Sine'nsis; leaves ovate-oblong, obtuse, glabrous; peduncles many-flowered, axillary, and terminal. ♄. ◠. G. Native of China. Pergulària Sinénsis, Lour. p. 168. Emerìcia Sinénsis, Rœm. et Schultes, syst. 4. p. 402. Periplòca Chinénsis, Spreng. syst. 1. p. 836. Corollas yellow; with long, linear segments. Scales 5, sagittate, seated in the mouth of the corolla. Style filiform; stigma conical, 5-furrowed. Follicles oblong, many-seeded. Seeds naked, ovate. Perhaps a species of *Strophánthus*.

China Vallaris. Shrub tw.

Cult. For culture and propagation see *Echìtes*, p. 76.

X. HEYLY'GIA (meaning not explained by the author). Blum. bijdr. p. 1043.

Lin. syst. *Pentándria, Monogýnia.* Calyx quinquefid. Corolla rotate, with a short, ventricose tube, and oblique segments. Stamens exserted; filaments inserted in the tube of the corolla, surrounding the style in a spiral manner. Anthers sagittate, cohering to the stigma. Stigma clavate. Ovarium didymous, girded by 5 hypogynous scales. Seeds with a tuft of hairs at the upper extremity.—A twining shrub; with opposite, ovate-elliptic, glabrous leaves; and axillary, dichotomous, corymbs of flowers.

1 H. Java'nica (Blum. bijdr. p. 1043.). ♄. ◠. S. Native of Java, among bushes on the mountains, where it is called *Aroy Ferrung-utang*.

Java Heylygia. Fl. year. Shrub tw.

Cult. See *Echìtes*, p. 76. for culture and propagation.

XI. PARSO'NSIA (named in memory of James Parsons, M.D., author of an unfinished work, named The Microscopical Theatre of Seeds; and of a Dissertation on the Analogy between the Propagation of Animals and that of Vegetables). R. Br. in mem. wern. soc. p. 64. prod. p. 465. but not of P. Browne. Echìtes species, Jacq. et Swartz.

Lin. syst. *Pentándria, Monogýnia.* Corolla funnel-shaped; with a 5-parted recurved limb; segments of the limb equal-sided; throat and tube without scales. Stamens exserted; filaments filiform, inserted in the middle or nigh the base of the tube; anthers sagittate, cohering by their middle to the stigma: having the hind lobes destitute of pollen. Ovaria twin or solitary, 2-celled. Style 1; stigma dilated. Hypogynous scales 5, distinct or connate. Follicles 2, distinct or combined.—Twining shrubs. Leaves opposite. Flowers cymose or racemose; racemes usually compound, terminal, or interpetiolar.

* *Americànæ. Ovaria twin. Follicles distinct. Forsterònia, Meyer. ess.* 133.

1 P. corymbòsa (R. Br. l. c.) racemes corymbose; stamens elongated; leaves oval-lanceolate, glabrous. ♄. ◠. S. Native of St. Domingo, in woods. Echìtes corymbòsa, Jacq. amer. 34. t. 30. ed. pict. t. 37. Swartz, obs. p. 105. Forsterònia corymbòsa, Meyer. ess. 134. Leaves ovate or obovate, 2 inches long. Flowers small, red. Segments of calyx concave, connivent.

Corymbose-flowered Parsonsia. Fl. June, Aug. Clt. 1820. Shrub tw.

2 P. floribu'nda (R. Br. l. c.) racemes compound, corymbose; leaves ovate or elliptic, acuminated, glabrous; branches erectish. ♄. ◠. S. Native of Jamaica, among bushes on the mountains. Echìtes floribúnda, Swartz, prod. p. 52. fl. ind. occ. 1. p. 534. Leaves shining, stiffish. Racemes axillary. Flowers small, white. Corolline segments acuminated. Calycine teeth acute.

Bundle-flowered Parsonsia. Fl. Ju. Aug. Clt. 1820. Sh. tw.

3 P. spica'ta (R. Br. l. c.) spikes racemose, dense-flowered, axillary, short, opposite; stamens elongated; leaves nearly ovate or oblong-acuminated, bifarious, smoothish. ♄. ◠. S. Native of Carthagena, in woods. Echìtes spicàta, Jacq. amer. 34. t. 29. ed. pict. t. 36. Forsterònia spicàta, Meyer. ess. 135. Leaves ½ foot long. Flowers numerous, white, almost sessile. Calycine segments ovate, concave, white. Segments of corolla lanceolate, acute.

Spicate-flowered Parsonsia. Shrub tw.

* * *Australásicæ. Ovarium 2-celled. Follicles cohering lengthwise.*

4 P. Forste'ri; cymes axillary, diffuse; leaves lanceolate, glabrous. ♄. ◠. G. Native of New Zealand. Periplòca capsulàris, Forst. prod. no. 126. Willd. spec. 1. p. 1251.

Forster's Parsonsia. Shrub tw.

5 P. velutìna (R. Br. prod. p. 466.) cymes pedunculate. opposite; leaves cordate, ovate, acute or acuminated, downy, ♄ . ◠. S. Native of New Holland, within the tropic. Echìtes velutìna, Spreng. syst. 1. p. 634.

Velvety Parsonsia. Shrub tw.

6 P. móllis (R. Br. l. c.) cymes bifid; leaves lanceolate, acuminated, soft, downy. ♄ . ◠. S. Native of New Holland, within the tropic. Echìtes móllis, Spreng. syst. 1. p. 634.

Soft Parsonsia. Shrub tw.

7 P. lanceola'ta (R. Br. l. c.) cymes bifid; leaves lanceolate, acuminated, glabrous. ♄ . ◠. S. Native of New Holland, within the tropic. Echìtes lanceolàta, Spreng. syst. 1. p. 634.

Lanceolate-leaved Parsonsia. Shrub tw.

§ 3. *Asiáticæ. Ovarium 2-celled. Follicles cohering lengthwise? Natives of Asia.*

8 P. ova'ta (Wall. cat. no. 1630.) panicle terminal, diffuse; composed of trichotomous peduncles; flowers corymbose; leaves on long petioles, ovate-acuminated, somewhat cordate at the base, glabrous. ♄ . ◠. S. Native of Silhet. Cudícia trichótoma, Hamilt. herb.

Ovate-leaved Parsonsia. Shrub tw.

9 P. spira'lis (Wall. cat. no. 1631.) glabrous; peduncles axillary, dichotomous or trichotomous; flowers corymbose; leaves coriaceous, ovate, acute. ♄ . ◠. S. Native of the East Indies. Follicle ovate-lanceolate.

Spiral Parsonsia. Shrub tw.

10 P. oblónga (Wall. cat. no. 1632.) glabrous; peduncles axillary, trichotomous; flowers corymbose; leaves coriaceous, oblong, acuminated. ♄ . ◠. S. Native of Rangoon and Moalmeyne.

Oblong-leaved Parsonsia. Shrub tw.

11 P. Java'nica (Blum. bijdr. p. 1041.) leaves ovate or elliptic-oblong, acuminated, coriaceous, glabrous; corymbs terminal or axillary, trichotomous; throat of corolla naked; branches subsarmentose. ♄ . ◠. S. Native of Java, in mountain woods.

Java Parsonsia. Fl. year. Shrub tw.

12 P. barba'ta (Blum. bijdr. 1042.) leaves on short petioles, opposite, or 3 in a whorl, oblong, acuminated or bluntish, glabrous, tomentose in the axils of the veins beneath; corymbs axillary or terminal, trichotomous; throat of corolla bearded; branches climbing. ♄ . ◡. S. Native of Java, among bushes, at Kuripan, where it is called *Tjunkankan*.

Bearded-flowered Parsonsia. Fl. May, June. Shrub cl.

† *A species hardly known.*

13 P. myrtifòlia (Rœm. et Schultes, syst. 4. p. 403.) leaves ovate, acute at both ends, glabrous; flowers subumbellate, much shorter than the leaves. ♄ . ◠. S. Native of Madagascar. Echìtes myrtifòlia, Poir. suppl. 5. p. 637. Said by Poiret to be very nearly allied to *P. corymbòsa*. Flowers terminal. Segments of the corolla oblong, narrow.

Myrtle-leaved Parsonsia. Shrub tw.

Cult. For culture and propagation see *Echìtes*, p. 76.

XII. LYO'NSIA (in memory of Israel Lyons, author of Fasciculus Plantarum circa Cantabrigiam nascentium; and from whom Sir Joseph Banks received his earliest instructions in botany). R. Br. in mem. wern. soc. 1. p. 66. prod. p. 466.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla funnel-shaped; with a 5-parted recurved limb; segments of the limb equal-sided, valvate in æstivation; throat and tube without scales. Stamens exserted; filaments inserted in the middle of the tube, filiform; anthers sagittate, cohering by their middle to the stigma; with the hind lobes destitute of pollen. Ovarium 2-celled. Style 1, filiform, dilated at the apex; stigma somewhat conical. Hypogynous scales connate. Capsule cylindrical, 2-celled, with follicle-formed valves, and a free, parallel dissepiment, which is seminiferous on both sides, and adnate placentas.—Shrub twining. Leaves opposite. Cymes terminal, trichotomous. Flowers small, with bearded limbs. *Lyónsia* differs principally from *Parsónsia* in the fruit being a capsule.

1 L. stramínea (R. Br. prod. p. 466.). ♄ . ◠. G. Native of New South Wales, and Van Diemen's Land.

Straw-coloured Lyonsia. Shrub tw.

Cult. For culture and propagation see *Echìtes*, p. 76.

XIII. THENA'RDIA (named by Kunth after his friend L. J. Thenard, who has written on the chemical physiology of plants). H. B. et Kunth, nov. gen. amer. 3. p. 209.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, 5-parted. Corolla rotate, with a very short tube, and a 5-parted limb; segments of the limb equal-sided; throat naked. Stamens exserted, inserted in the base of the corolla; anthers sagittate, adhering by their middle to the stigma. Ovaria 2, girded by 5 hypogynous scales. Style filiform; stigma pentagonal, terminated by a clavate tubercle.—Shrubs twining. Leaves opposite. Peduncles interpetiolar, somewhat trichotomously branched. Flowers umbellately crowded on long pedicels, bracteate, with the appearance of those of *Solànum tuberòsum*. This genus differs from *Exothostèmon* in the corolla being rotate.

1 T. floribu'nda (H. B. et Kunth, nov. gen. amer. 3. p. 210. t. 240.) leaves ovate-oblong, acuminated, glabrous. ♄ . ◠. S. Native near the city of Mexico. Leaves $2\frac{1}{2}$ to 3 inches long. Flowers greenish white.

Bundle-flowered Thenardia. Clt. 1823. Shrub tw.

2 T. umbella'ta (Spreng. syst. 1. p. 636.) leaves ovate, acuminated, tomentose beneath; cymes terminal. ♄ . ◠. S. Native of Cayenne. Apócynum umbellàtum, Aubl. guian. 1. p. 275. t. 108. Flowers purplish, on bibracteate pedicels. Calycine segments oblong, obtuse.

Umbellate-flowered Thenardia. Shrub tw.

Cult. For culture and propagation see *Echìtes*, p. 76.

XIV. ADE'NUM (Aden is the Arabic name of the tree.) Rœm. et Schultes, syst. 4. p. xxxv. and 411.—Nèrium species, Forsk.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla salver-shaped, downy, furnished with 5 villous lines inside; segments of the limb roundish. Filaments short, inserted in the upper end of the narrower part of the tube; anthers sagittate, cohering with the stigma, ending in a pilose bristle at the apex, length of corolla. Ovaria 2, globose. Style length of anthers; stigma capitate, bidentate at apex, side quinquidentate. Hypogynous scales none. Throat of corolla naked.—A shrub, with a soft caudex, referrible to a bulb, of the size of a man's head. Branches thickness of a finger, same substance as the caudex, attenuated at top; floriferous branches woody, and full of cicatrices. Leaves approximate at the tops of the branches, 3 inches long, oblong, narrowed at the base, mucronate, veinless, villously tomentose beneath, when young soft on both surfaces, with some rigid bristles in the axils. Corymbs terminal, many-flowered; pedicels short, villous. Anthers yellow, with a brown mark inside.

1 A. obe'sum (Rœm. et Schultes, syst. 4. p. 411.) ♄ . G. Native of Arabia Felix, on Mount Melhan. Nèrium obèsum, Forsk. descr. p. 205. Vahl. symb. 2. p. 45. Camerària obèsa, Spreng. 1. p. 641.

Fat Adenium. Shrub.

Cult. See *Pachypòdium*, p. 78., for culture and propagation.

XV. APO'CYNUM (a name adopted by Dioscorides, from *απο, apo*, from, and *κυων κυνος, kyon kynos*, a dog; because it was sup-

posed to kill dogs). R. Br. in mem. wern. soc. 1. p. 67.—Apócynum species, Lin. and Juss.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla campanulate; tube inclosing 5 acute teeth, which are opposite the segments of the limb; throat naked. Stamens inclosed; anthers sagittate, cohering by the middle to the stigma; having the hind lobes without pollen. Ovaria 2. Styles almost wanting; stigma dilated, conical at top. Hypogynous scales 5. Follicles slender, distinct.—Perennial erect herbs; natives of North America and the south of Europe. Leaves opposite, membranous. Flowers cymose.

FIG. 12.

1 A. androsæmifòlium (Lin. spec. 311. R. Br. l. c.) leaves ovate, glabrous; cymes terminal and lateral; tube of corolla twice as long as the calyx. ♃. H. Native of Virginia and Canada. Pursh. fl. amer. sept. 1. p. 179. Lam. ill. t. 176. f. 1. Curt. bot. mag. t. 280.—Bocc. sic. 35. t. 16. f. 3.—Mor. hist. 3. p. 609. sect. 15. t. 3. f. 16. Leaves pale beneath. Corollas pale red, with darker stripes.

Androsæmum-leaved Dogs'-bane. Fl. July, Sept. Clt. 1688. Pl. 1 to 2 feet.

2 A. canna'binum (Lin. spec. 311. R. Br. l. c. p. 68.) leaves lanceolate, acute at both ends, glabrous; cymes panicled; calyx equal in length to the tube of the corolla. ♃. H. Native of Canada and Virginia, in fields and woods, where it is commonly called *Indian hemp.* Flowers yellowish-green, small. The Indians prepare the stems of this plant as we do hemp, and make fishing-nets, twine, bags, &c. of it.

Var. β; leaves oblong-oval, clothed with white down beneath; panicles downy. ♃. H. A. cannábinum, Michx. fl. bor. amer. 1. p. 122. Pursh, fl. amer. sept. 1. p. 179.—Pluk. alm. t. 13. f. 1.

Hemp Dogs'-bane. Fl. July, Sept. Clt. 1699. Pl. 2 to 3 ft.

3 A. pube'scens (R. Br. l. c.) leaves ovate-oblong, mucronate, obtuse at the base, downy on both surfaces, as well as the cymes; calyx about equal in length to the corolla. ♃. H. Native of Virginia.

Downy Dogs'-bane. Pl. 1 to 2 feet.

4 A. hypericifòlium (R. Br. in Ait. hort. kew. ed. 2. vol. 2. p. 74.) leaves oblong, glabrous, mucronate, on very short petioles, obtuse and somewhat cordate at the base; cymes shorter than the leaves: calyx about equal in length to the tube of the corolla. ♃. H. Native from New York to Virginia, on the gravelly shores of rivers. A. Sibíricum, Jacq. hort. 3. t. 66. Flowers small, white, or reddish.

St. John's-wort-leaved Dogs'-bane. Fl. June, July. Clt. 1758. Pl. 1 to 2 feet.

5 A. Sibíricum (R. Br. l. c. p. 68. Led. fl. alt. illust. t. 240.) leaves ovate-oblong or lanceolate, mucronate, glabrous, obtuse at the base; cymes alternate, pedunculate, disposed in a terminal panicle; tube of corolla exceeding the calyx; pedicels and calyxes clothed with powdery down. ♃. H. Native about Astrachan and Lotewsk, in salt marshy deserts, where it was collected by Pallas and Ledebour. A. venètum, Bieb. fl. taur. 1. p. 177. exclusive of the syn. of Falck and Hablitz. Asclèpias rùbra, Sievers, in Pall. fl. nord. beitr. There are 2 varieties of this species, a broader and a narrower leaved variety.

Siberian Dogs'-bane. Pl. 2 feet.

6 A. Vene'tum (Lin. spec. 311. R. Br. l. c.) leaves oblong-elliptic, glabrous, mucronate, somewhat attenuated at the base; cymes panicled, lateral and terminal; calyx about equal in length to the tube of the corolla. ♃. H. Native of the south of Europe, islands of the Adriatic sea, and in the sand along the Euxine sea, &c.—Falck, itin. 2. t. 4.—Lob. icon. 372. f. 1-2. Flowers red.

Var. β; leaves narrower; flowers white. Tourn. inst. p. 92.

Venetian Dogs'-bane. Fl. June, July. Clt. 1690. Pl. 2 ft.

† *Species not so well known as to be inserted in their proper genera in the order; they have been placed with Apocýnum by various authors, but certainly do not properly belong to the genus.*

7 A. reticula'tum (Lin. spec. 312.) stem twining; leaves cordate-ovate, veiny, glabrous. ♄. ◠. S. Native of the East Indies. Roy. lugdb. 412. O'lus crùdum, Rumph. amb. 5. p. 75. t. 40. f. 2. Loureiro's plant under this name is said to have hairy stems; ovate, acuminated, shining leaves; axillary umbels of small flowers, and the 5 fertile filaments alternating with sterile ones. Perhaps a species of *Ichnocárpus.*

Reticulated leaved Apocynum. Shrub tw.

8 A. tiliæfòlium (Lam. dict. 1. p. 214.) stems twining, suffruticose; leaves roundish-cordate, acuminated. on long petioles. ♄. ◠. S. Native of the East Indies.—Rheed. mal. 9. t. 15.—Rumph. amb. 5. t. 175. f. 2.? Leaves green on both surfaces, length of petioles. Flowers large, in axillary umbel-formed fascicles, shorter than the leaves. Corolla campanulate, villous inside. Perhaps a species of *Dæ'mia.*

Tilia-leaved Apocynum. Shrub tw.

9 A. panicula'tum (Lam. dict. 1. p. 212.) stem twining, shrubby; leaves ovate-lanceolate, acute, glabrous; flowers terminal, and axillary, panicled. ♄. ◠. S. Native of Guiana, in meadows about Sinemari. A. Acoúci, Aubl. guian. 1. p. 274. t. 107. Bark of stem white. Leaves 3 inches long. Flowers small, white, in corymbs of 3-5 flowers; with scaly bracteas at the base.

Panicled-flowered Apocynum. Shrub tw.

10 A. vincæflòrum (Burm. ind. p. 71.) stem erectish, perennial; leaves ovate-oblong; peduncles lateral, 2-flowered. ♄. S. Native of the East Indies. Asclèpias Javánica angustifòlia, Garcin, herb. Stems reddish. Leaves acuminated, rusty beneath.

Vinca-flowered Apocynum. Pl.

11 A. Canarie'nse (Lam. dict. 1. p. 215.) shrubby; leaves ovate, acuminated; tops of follicles recurved. ♄. G. Native of the Canary islands. Apocyn. arboresc. Canariénse, Elæagni facie, Tourn. p. 92.—Pluk, alm. 35. t. 260. f. 3. Flowers small, axillary, sub-cymose. Follicles long.

Canary-island Apocynum. Shrub.

12 A. cotinifòlium (Lam. dict. 1. p. 215.) leaves roundish, obtuse, green; flowers small, corymbose, terminal. ♄. S. Native of Java. Flowers campanulate, on bibracteate trichotomous peduncles, which are rather tomentose at top.

Cotinus-leaved Apocynum. Shrub.

13 A. agglomera'tum (Poir. dict. suppl. 1. p. 407.) stem climbing; leaves elliptic, obtuse, mucronate; flowers cymose, glomerate; corolla with a pilose throat. ♄. ◠. S. Native of St. Domingo. Leaves downy beneath and hairy; the veins confluent at the margins. Calycine segments ovate, obtuse, white, membranous, ciliated.

Glomerate-flowered Apocynum. Shrub cl.

14 A. juve'ntas (Lour. coch. p. 167.) stem twining; leaves ovate, pilose; racemes dichotomous, axillary. ♄. ◠. S. Native of Cochinchina, in fields. Branches red, hairy. Root large, fleshy, undivided. Flowers small, greenish yellow. Corolla campanulate. Hypogynous scales 5, combined. Anthers 5, scale-formed, adhering to the base of the nectarium; and 5 sterile, erect filaments. Stigma sessile, concave, bifid. Follicles

2. The Chinese physicians fancy the roots of this plant to refresh the animal spirits to such a degree as by a long use of it to endow old age with all the strength and vigour of youth.

Youthful Apocynum. Shrub tw.

15 A. sca'ndens (Mill. dict. no. 5.) leaves oblong, cordate, stiff; flowers lateral; stem fruticose, twining. ♄. ⌒. S. Native about Carthagena. A. scandens foliis citri, siliquis maculatis. Plum. cat. no. 2. Leaves quite glabrous. Racemes short. Flowers green.

Climbing Apocynum Shrub tw.

16 A. nervòsum (Mill. dict. no. 9.) stem fruticose, scandent; leaves ovate, nerved; cymes lateral; flowers yellow, large, with a very long tube. ♄. ◡. S. Native of Carthagena. Leaves mucronate. Follicles compressed, marginated on one side. Seeds striated.

Nerved-leaved Apocynum. Shrub cl.

17 A. corda'tum (Mill. dict. no. 10.) leaves oblong-cordate, mucronate, sessile; flowers lateral; stems scandent. ♄. ◡. S. Native of Vera Cruz. Houst. mss. fig. pl. no. 8. t. 44. f. 5. Flowers large, yellow. Probably a species of *Echìtes*.

Cordate-leaved Apocynum. Shrub cl.

18 A. villòsum (Mill. dict. no. 11.) leaves cordate, glabrous; flowers villous, sessile, longer than the petioles; stem scandent. ♄. ◡. S. Native of Vera Cruz. Houst. mss. pl. t. 44. f. 2. Flowers large, villous, yellow. Follicles tumid, angular. Perhaps a species of *Echìtes*.

Villous Apocynum. Shrub cl.

Cult. Common garden soil answers well for the species; and they are easily increased by suckers from the root, which in most of the species rise in great numbers. Some of the rarer kinds may be grown in a peat border with greater success.

XVI. CRYPTOLE'PIS (from κρυπτω, *krypto*, to hide, and λεπις, *lepis*, a scale; in reference to the scales in the tube of the corolla). R. Br. in wern. mem. soc. 1. p. 69.

Lin. syst. *Pentándria, Monogýnia*. Corolla funnel-shaped; tube inclosing 5 obtuse, wedge-shaped scales, which alternate with the segments of the limb; throat naked. Stamens inclosed, inserted in the bottom of the tube; anthers sagittate. Ovaria 2. Style wanting; stigma dilated, 5-sided, ending in a conical point. Hypogynous scales 5. Follicles lanceolate, horizontal.—Shrubs twining. Leaves opposite, of a different colour beneath, and veiny. Corymbs interpetiolar, almost sessile, very short.

1 C. Buchana'ni (Rœm. et Schultes, syst. 4. p. 409.) flowers small, yellow; leaves oblong, white and veiny beneath; corymbs interpetiolar, almost sessile. ♄. ⌒. S. Native of the East Indies. Nèrium reticulàtum, Roxb. fl. ind. 2. p. 9. C. Wightiàna, Wall. cat. no. 4457. and C. reticulàtum, Wall. cat. 1640. are only different states of *C. Buchanàni*.

Buchanan's Cryptolepis. Shrub tw.

2 C. e'legans (Wall. cat. no. 1639.) leaves oblong, mucronate, glaucous beneath, somewhat cordate at the base; peduncles terminal, panicled. ♄. S. Native of Silhet and Goalpara. Caméttia tenélla, Hamilt. mss.

Elegant Cryptolepis. Shrub tw.

Cult. See *Echìtes*, p. 76, for culture and propagation.

XVII. EXOTHOSTE'MON (εξωθω, *exotho*, to protrude, and στημων, *stemon*, a stamen; in reference to the exserted stamens).—Echìtes species, H. B. et Kunth, &c. and some other authors.

Lin. syst. *Pentándria, Monogýnia*. Calyx 5-parted; segments each furnished with a scale inside at the base. Corolla funnel-shaped; throat clothed with silky hairs; segments of the limb unequal-sided, roundish on one side and acuminated or angular on the other. Stamens exserted; filaments short, dilated at top, pilose inside; anthers oblong or oblong-linear, emarginately 2-lobed at the base, cohering with the stigma. Ovaria twin, girded by 5 hypogynous, fleshy scales. Style filiform. Follicles slender, torulose.—Twining shrubs, natives of South America. Leaves opposite, with interpetiolar glands at the base. Peduncles interpetiolar, racemose. Flowers showy, white, or yellow. This genus comes near to *Parsónsia* or *Fosterònia*, Meyer.

1 E. bractea'tum; leaves elliptic, mucronately cuspidate, cordate, downy above, but canescent from tomentum beneath; bracteas large, ovate, acuminated, coloured, much longer than the calyx. ♄. ⌒. S. Native of New Granada, near Mariquita, in the temperate regions of the mountains. Echìtes bracteàta, H. B. et Kunth, nov. gen. amer. 3. p. 217. Glands about 4, subulate, glabrous, situated at the base of the middle nerve of each leaf. Calycine segments lanceolate; with a subulate point, with ovate deltoid scales inside. Corollas orange-coloured, hairy outside.

Bracteate Exothostemon. Fl. June. Shrub tw.

2 E. mollíssimum; leaves oblong-cordate, downy above, but canescent from short hair-like tomentum beneath; bracteas lanceolate-subulate, about equal in length to the calyx. ♄. ⌒. S. Native of New Granada, between Honda and the mine of Santanna. Echìtes mollíssima, H. B. et Kunth, nov. gen. amer. 3. p. 218. Leaves without glands at the base? Calycine segments ovate, acuminated, furnished each with an ovate, lanceolate scale inside. Corollas yellow, hairy outside.

Very soft Exothostemon. Fl. July. Shrub tw.

3 E. macrophy'llum; leaves somewhat obovate-elliptic, cuspidate, cordate, clothed with adpressed hairs above, and subcanescent hair-like down beneath; bracteas ovate-lanceolate, about equal in length to the calyx. ♄. ⌒. S. Native of the banks of the Orinoco, near San Borja; and of the island of Panunama. Echìtes macrophýlla, H. B. et Kunth, nov. gen. amer. 3. p. 218. Echìtes móllis, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 795. Glands at base of leaves hardly seen. Corollas yellow, size of those of *Vínca ròsea*, downy outside. Segments of calyx lanceolate-oblong, acuminated, furnished each with a scale inside. Leaves 5 inches long and $2\frac{1}{2}$ broad.

Long-leaved Exothostemon. Fl. May. Shrub tw.

4 E. gra'cile; leaves oblong-lanceolate: superior ones lanceolate, acuminated, cordate, glabrous above and hairy beneath; bracteas lanceolate-subulate, about equal in length to the pedicels; calycine segments ovate-lanceolate, furnished each with an ovate deltoid scale inside. ♄. ⌒. S. Native on the banks of the river Orinoco, in humid places, between Maypure and Ature. Echìtes grácilis, H. B. et Kunth, nov. gen. amer. 3. p. 219. Leaves $2\frac{1}{2}$ inches long; with the glands at the base hardly visible. Corollas yellow, glabrous outside.

Slender Exothostemon. Fl. May. Shrub tw.

5 E. speciòsum; leaves oblong, acuminated, cordate, glabrous above, and hairy beneath; bracteas linear-subulate, minute; calycine segments ovate, acuminated, furnished each with a scale inside. ♄. ⌒. S. Native along with the preceding. Echìtes speciòsa, H. B. et Kunth, nov. gen. amer. 3. p. 219. Corollas yellow. Leaves $2\frac{1}{2}$ inches long, furnished with glands inside at the base.

Showy Exothostemon. Shrub tw.

6 E. Javite'nse; leaves elliptic-oblong, short-acuminated, rounded at the base, smoothish above and roughish beneath; spikes terminal, solitary; bracteas large, oblong, acuminated, coloured; calycine segments roundish-ovate, obtuse, furnished each with a scale inside. ♄. ⌒. S. Native in the Missions of the Orinoco, in shady places, on the banks of the river Temi, near Javita. Echìtes Javiténsis, H. B. et Kunth, nov. gen.

amer. 3. p. 220. Leaves 4-4½ inches long; with the glands at the base hardly visible. Spikes almost sessile, half a foot long. Flowers sessile. Corolla glabrous, with a green tube and a yellow limb, with reflexed segments. This species differs particularly from the rest in the flowers being disposed in terminal spikes, instead of interpetiolar racemes.

Javita Exothostemon. Fl. June. Shrub tw.

7 E. paludòsum; leaves oblong or oblong-linear, acute at both ends, glabrous; flowers 2-4 together, terminal, pedunculate; calycine segments oblong, acute. ♄. ⌒. S. Native of Cuba, and other parts of America, on the sea shore. Echìtes paludòsa, Vahl. eclog. 2. p. 19. t. 5. H. B. et Kunth, nov. gen. amer. 3. p. 221. Leaves 2 or 2½ inches long, without any glands at the base. Corollas white, glabrous outside.

Marsh Exothostemon. Fl. March. Shrub tw.

Cult. For culture and propagation see *Echìtes*, p. 76.

XVIII. HÆMADI'CTYON (from αἱμα, *haima*, blood, and δικτυον, *dictyon*, a net; in reference to the veins and nerves of the leaves being red). Lindl. in hort. trans. 6. p. 71. Echìtes species, Sims and Tussac.

Lin. syst. *Pentándria*, *Monogýnia*. Corolla salver-shaped; segments reflexed, equal, dilated; throat of the tube furnished with 5 inclosed scales. Stamens inclosed; anthers sagittate, cohering by their middle to the stigma. Ovaria twin. Style filiform; stigma capitate. Hypogynous glands 5, alternating with the calycine segments.—Twining shrubs, with opposite leaves, and axillary racemes of flowers.

1 H. venòsum (Lindl. l. c.) leaves lanceolate, glabrous, a little blistered, and beautifully traversed by crimson veins; racemes drooping. ♄. ⌒. S. Native of St. Vincent. Echìtes nùtans, Sims, bot. mag. 2473. Echìtes sanguinolénta, Tussac. fl. ant. Flowers of a yellow green colour, pale in the center.

Veined-leaved Hæmadictyon. Fl. June, Aug. Clt. 1821. Shrub tw.

2 H. suberé'cta; leaves rather ovate, downy beneath, mucronate; racemes many-flowered. ♄. ⌒. S. Native of Jamaica and St. Domingo. Echìtes suberécta, Swartz, obs. 101. Jacq. amer. 32. t. 26. icon. pict. t. 33. Andr. bot. rep. 187. Sims, bot. mag. 1064. Apócynum speciosíssimum, Mill. dict. Nèrium sarmentòsum, Browne, jam. 180.—Sloan. jam. p. 89. hist. 1. p. 206. t. 130. f. 2. Corollas large, with a cylindrical tube: hairy outside, yellow. Hypogynous scales concave, obtuse. Stems scandent, hardly twining. Calycine segments lanceolate.

Erectish Hæmadictyon. Fl. Ju. Aug. Clt. 1759. Sh. cl.

3 H. circina'lis; leaves elliptic, glabrous; racemes many-flowered: having the peduncles articulated; teeth of calyx acute. ♄. ⌒. S. Native of the Antilles, and St. Domingo. Echìtes circinàlis, Jacq. Swartz. prod. 52. fl. ind. occ. 1. p. 529. Flowers small, white, with undulated segments and villous throat. Calyx and corolla velvety outside.

Circinal Hæmadictyon. Shrub tw.

Cult. For culture and propagation see *Echìtes*, p. 76.

XIX. CERCOCO'MA (from κερκος, *kerkos*, a tail, and κομη, *kome*, a head of hair; in reference to the stipitate tuft of hairs at the top of the seed). Wall. cat. no. 1623.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx short, 5-toothed. Corolla salver-shaped; with a terete tube and a 5-lobed spreading limb. Stamens inclosed. Follicles 2, divaricate, horizontal, large, 9 inches long, acuminated, 2-valved, many-seeded. Seeds lanceolate, tapering to the top, where it ends in a long, stipitate tuft of white hairs.—Branches warted. Leaves opposite, glabrous, oblong, acuminated. Panicles corymbose, furnished with many opposite, ovate, acute small bracteas.

1 C. Singaporia'na (Wall. cat. no. 1623.). ♄. S. Native of the East Indies.

Singapore Cercocoma. Shrub.

Cult. For culture and propagation see *Echìtes*, p. 76.

XX. PRESTO'NIA (named after Charles Preston, M. D., a correspondent of Ray; and styled by him "Eruditissimus vir, et Curiosissimus stirpium Observator." Many of his observations, chiefly on the more minute plants, occur in Ray's "Methodus emendata." Blair also mentions him as an ingenious and expert botanist). R. Br. in mem. wern. soc. 1. p. 69. H. B. et Kunth, nov. gen. amer. 3. p. 221.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-parted. Corolla salver-shaped; throat crowned with an undivided annular tube, and 5 scales, which alternate with the segments of the limb. Anthers semi-exserted, sagittate, cohering by their middle to the stigma; with the hind lobes destitute of pollen. Ovaria 2. Style 1, filiform, dilated at top; stigma turbinate: with a narrower point. Hypogynous scales 5, distinct or joined. Follicles like those of *Echìtes*.—Twining shrubs. Leaves opposite. Corymbs or racemes crowded, interpetiolar. Calyx foliaceous: having the segments furnished each with a scale inside at the base.

1 P. tomentòsa (R. Br. l. c. p. 70.) tomentose; corymbs crowded; hypogynous scales combined into an urceolus. ♄. ⌒. S. Native of Brazil, near Rio Janeiro, where it was collected by Sir Joseph Banks. Flowers large, yellow.

Tomentose Prestonia. Shrub tw.

2 P. móllis (H. B. et Kunth, nov. gen. amer. 3. p. 221. t. 242.) leaves ovate-oblong, acute, subcordate, hairy above, but clothed with soft canescent down beneath; flowers racemose; hypogynous scales free. ♄. ⌒. S. Native on the banks of the river Amazon, near Tomependa, in the province of Jaen de Bracamoros. Flowers large, yellow: hairy, ventricose at the base, and downy.

Soft Prestonia. Fl. Aug. Shrub tw.

3 P. glabra'ta (H. B. et Kunth, nov. gen. amer. 3. p. 222.) leaves ovate-oblong, short-acuminated, cordate, glabrous; flowers racemose; hypogynous scales free. ♄. ⌒. S. Native of Quito, near Guayaquil, on the shore of the Pacific Ocean. Corollas yellow, size of those of *Vinca ròsea*. Pedicels hairy.

Glabrous Prestonia. Fl. Feb. Shrub tw.

4 P. hirsu'ta; leaves oblong-oval, acuminated, villous beneath; flowers racemose; hypogynous scales free. ♄. ⌒. S. Native of Peru, in forests. Echìtes hirsùta, Ruiz et Pav. fl. per. 2. p. 19. t. 136. Glands one or two at the base of each leaf. Calycine segments acute in the flowering state, but blunt in the fruiting state. Corollas yellow.

Hairy Prestonia. Shrub tw.

5 P. Peruvia'na (Spreng. syst. 1. p. 637.) leaves roundish, cordate, acuminated, tomentose, glanduliferous; peduncles racemose. ♄. ⌒. S. Native of Peru, in woods. Echìtes glandulòsa, Ruiz et Pav. fl. per. 2. p. 19. t. 135. Stems bearing glands at the joints, in the recesses at the base of the leaves, and along the petioles and stipulas. Leaves large, white beneath, with red or purplish veins. Pedicels reflexed. Corollas large, yellow. Perhaps a species of *Hæmadictyon*.

Peruvian Prestonia. Shrub tw.

6 P. quinquangula'ris (Spreng. syst. 1. p. 637.) leaves obovate or oblong-ovate, acuminated; peduncles racemose, generally 8-flowered; calycine segments with reflexed tops. ♄. ⌒. S. Native of South America, and the West Indies. Echìtes quinquangulàris, Jacq. amer. 32. t. 25. ed. pict. t. 32. Stems scabrous. Leaves 3 inches long. Corolla large, green, with a yellowish limb: and having the throat of the tube pen-

tagonal and white; segments of limb broad and truncate at the apex. Anthers length of tube. Said to be non-lactescent.

Five-angled-flowered Prestonia. Shrub tw.

7 P. annula'ris; leaves large; corolla furnished with a prominent ring; racemes pedunculate, bifid; hypogynous scales distinct. ♄. ⌒. S. Native of Surinam. Echìtes annulàris, Lin. suppl. 166. Leaves nearly a foot long. Segments of corolla emarginate. Stigma obtuse, girded by a ring.

Annular-flowered Prestonia. Shrub tw.

Cult. For culture and propagation see *Echìtes*, p. 76.

XXI. BALFOU'RIA (in memory of Sir Andrew Balfour, the founder of the Edinburgh Botanic Garden and Museum, of whose merits in natural history, especially in botany, an interesting account is given by his friend Sir Robert Sibbald, in a small volume entitled "Memoria Balfouriana."). R. Br. in mem. wern. soc. 1. p. 70. prod. p. 467.

Lin. syst. *Pentándria, Monogýnia.* Corolla salver-shaped, throat crowned by a little crenulated tube; segments of the limb straight, equal-sided. Stamens inserted in the throat, a little exserted: anthers sagittate, mucronate, cohering by their middle to the stigma. Ovarium 2-celled. Style 1, filiform, dilated at apex; stigma angular. Scales 10, inserted at the base of the calyx outside the corolla: hypogynous ones none. Follicles unknown.—A small tree, about 12 feet high. Leaves opposite, lanceolate-linear, falcate; furnished with interpetiolar teeth. Cymes trifid, lateral, and terminal.

1 B. salígna (R. Br. prod. 467.). ♄. S. Native of New Holland, within the tropic.

Willowy Balfouria. Tree 12 feet.

Cult. For culture and propagation see *Nèrium*, below.

XXII. NE'RIUM (from *νηρος, neros*, humid; habitat of species.) R. Br. in mem. wern. soc. 1. p. 71. Lam. ill. t. 174. f. 1.—Nerium, species of Lin. ed Juss.

Lin. syst. *Pentándria Monogýnia.* Calyx 5-cleft. Corolla salver-shaped; throat crowned by lacerated multifid segments; segments of the limb twisted, unequal-sided, tailless. Filaments inserted into the middle of the tube. Anthers sagittate, awned, cohering by their middle to the stigma. Ovaria 2. Style 1, filiform, dilated at top; stigma obtuse. Hypogynous scales wanting; but there are toothlets at the base of the calyx, outside the corolla. Follicles cylindrical.—Erect shrubs. Leaves 3 in a whorl, elongated, coriaceous, with numerous parallel veins. Flowers terminal, corymbose.

1 N. Olea'nder (Lin. spec. 805.) leaves lanceolate, 3 in a whorl, veiny beneath; segments of corona trifid or tricuspidate. ♄. G. Native of the East Indies, in humid places; but has now become apparently wild in many places of the south of Europe, by the sides of streams, and near the sea coast.—Blackw. t. 531.—Duham. arb. 2. p. 46. t. 12.—Lob. icon. t. 364. N. lauriförme, Fl. fr. 2. p. 209. Leaves 4-5 inches long, dark green. Flowers rather large, bright red. Like *Rhododéndron*, this shrub has the name of *Rose Bay*, and for the same reason; but it is more commonly known by the officinal name, Oleander, which is also adopted in all the European languages, except the French, in which it is *Laurose*, or *Laurier-Rose*, that is, *Rose Bay*. The Italians have adopted Nerio, or Rosa-laura, as well as Oleandro. Oil, in which the leaves are infused, was formerly recommended for cutaneous disorders, in preference to mercurial preparations, for weak constitutions.

Var. β, flòre albo; flowers white; leaves pale green. ♄. G. Lodd. bot. cab. t. 700.—Ger. emac. 1406. f. 2. Park. theatr. 1407. 1.

Var. γ, spléndens (Hort.) flowers large, showy, double, bright red. ♄. G. N. latifòlium, Mill. dict. no. 3.? Herm. lugdb. 447. t. 440. Nèrium grandiflòrum, Hort. Par.

Var. δ, variegàtum (Hort.) leaves edged with white or yellow; flowers red. ♄. G. Lodd. bot. cab. 666.

Common *Oleander*. Fl. June, Oct. Clt. 1596. Shrub 6-14 feet.

2 N. odòrum (Ait. hort. kew. 1. p. 297.) leaves linear-lanceolate, 3 in a whorl, coriaceous, veiny beneath, with revolute edges; segments of the crown multifid, filamentose at apex. ♄. G. Native of the East Indies, on the banks of rivers, and by the sea side. Heyne, term. bot. t. 22. f. 1. Sims, bot. mag. t. 2032. N. odoràtum, Lam. dict. 3. p. 456.—Rheed. mal. 9. t. 2. N. I'ndicum, Mill. dict. no. 2. N. Oleánder, Lour. coch. 115. Leaves light green, 6-10 inches long. Flowers pale red, with an agreeable musky scent. Bracteas lanceolate, mucronate, permanent. Calycine segments lanceolate mucronate. There is also a variety of this species with white flowers, and another with semi-double flowers. See Ker. bot. reg. t. 74.

Sweet-scented-flowered Oleander. Fl. June, Aug. Clt. 1683. Shrub 6-8 feet.

3 N. flave'scens (Di Spino, jard. de St. Sebastian, 1812.) leaves linear-lanceolate, 3 in a whorl, or opposite, veined beneath; flowers and peduncles yellowish. ♄. G. Native country unknown, but cultivated in Italian gardens. N. odòrum, var. *β*, lùteum, Targion Tazzet. obs. bot. dec. 1-2, p. 27.

Yellowish-flowered Oleander. Fl. July, Aug. Clt. 1817. Shrub 6-10 feet.

4 N. salícinum (Forsk. desc. 205. Vahl. symb. 2. p. 45.) leaves linear-lanceolate, 3 in a whorl, nerveless. ♄. G. Native of Arabia Felix. Said to differ from *N. Oleánder*, in the leaves being obtuse, and almost veinless beneath, not with copious parallel nerves. A large tree, with the habit of *Sàlix frágilis*. Leaves flat, shining, a span long.

Willowy Oleander. Tree.

† *A doubtful species.*

5 N.? reticula'tum (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 797.) leaves elliptic, mucronate, reticulated, stem scandent. ♄. ⌣. S. Native of the East Indies. Perhaps a species of *Wríghtia*.

Reticulated-leaved Oleander. Shrub cl.

Cult. All the species of *Oleander* are very showy when in blossom. They thrive well in a light rich soil; and cuttings strike root freely in any kind of soil, if kept moist; or by placing the ends of them in water. All require a good deal of heat, to flower freely in this country.

XXIII. STROPHA'NTHUS (from *στροφος, strophos*, a twisted thong; and *ανθος, anthos*, a flower; segments of corolla long, narrow, and twisted.) D. C. in bull. d. soc. philom. no. 64. p. 123. t. 8. f. 1. Desf. ann. mus. 1. p. 410. t. 27. R. Br. in mem. wern. soc. 1. p. 72.—Echìtes species, Lin.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted (f. 13. *a.*) Corolla funnel-shaped; throat crowned by 10 undivided scales; segments of the limb ending in a long tail each (f. 13. *e.*) Stamens inserted in the middle of the tube; anthers sagittate, awned (f. 13. *c. d.*) or mucronate. Ovaria 2. Style 1, filiform, dilated at the apex; stigma sub-cylindrical. Hypogynous scales 5. Follicles ovate, acuminated, many-seeded. — Sarmentose shrubs, with opposite leaves.

§ 1. *Anthers glabrous, drawn out into a thread (f. 13. c.)*

1 S. sarmentòsus (D. C. bull. philomat. no. 64. p. 123. t. 8. f. 1. Desf. ann. mus. 1. p. 410. t. 27.) glabrous, sarmentose; flowers glomerate, terminal and lateral, rising with the leaves; corollas sub-campanulate. ♄. S. Native of Sierra Leone,

rambling among bushes. Branches besprinkled with white tubercles. Leaves ovate, acute. Corolla red, ending in long tail each.

Sarmentose Strophanthus. Fl. May, July. Clt. 1824. Shrub rambling.

2 S. laurifòlius (D. C. l. c. Desf. l. c. p. 411.) erect; leaves opposite, and 3 in a whorl; flowers glomerate, terminal and lateral, rising after the leaves have fallen. ♄. S. Native of Sierra Leone, by the sea side. We have seen this species growing by the sea side, near Cape Shilling, where it forms a bush, about 6 or 8 feet high, covered with blossoms, before the leaves rise. Flowers red and white. Very nearly allied to *S. sarmentòsus*, but the stems are erect, and the corollas less spreading.

Laurel-leaved Strophanthus. Shrub 6 to 8 feet.

3 S. dichótomus (D. C. l. c. Desf. l. c.) branches dichotomous; leaves elliptic-oblong, acute at both ends, glabrous, mucronately acuminated; corolla funnel-shaped; tails of segments of corolla 3 inches long; scales of corolla curled. ♄. S. Native of the East Indies. Ker. bot. reg. 469. S. terminàlis, Blum. cat. hort. buitz. p. 56. Echìtes caudàta, Lin. mant. 52. Burm. ind. t. 26. Nèrium caudàtum, Roxb. fl. ind. 2. p. 9. Echìtes dichótoma, Carey, hort. beng. p. 20. Stems sarmentose, besprinkled with white tubercles. Corollas yellowish in this country, but are said to be red in their native country. (f. 13.)

FIG. 13.

Var. β, rotundàtus (Pers. ench. 1. p. 269.) leaves ovate-roundish. ♄. S. Native of the East Indies. Nèrium caudàtum, Lam. dict. 3. p. 458.

Dichotomous Strophanthus. Fl. Feb. March. Clt. 1812. Shrub 3-4 feet.

4 S. divarica'tus (Wall. cat. no. 1642.) branches and peduncles dichotomous; leaves lanceolate or oblong-lanceolate, acuminated, glabrous, pale beneath; flowers small, with short segments. ♄. ◡. S. Native of the East Indies.

Divaricate Strophanthus. Shrub cl.

5 S. Jackia'nus (Wall. cat. no. 1643.) leaves oblong-lanceolate, downy beneath while young; peduncles short, axillary, dichotomous; corolla campanulate, with short tails to the segments. ♄. S. Native of Penang. Follicles very long.

Jack's Strophanthus. Shrub.

6 S. Chine'nsis; branches erect, dichotomous; leaves nearly sessile, ovate-lanceolate, glabrous; peduncles terminal, few-flowered, becoming lateral, or in the forks of the branches; tails of the segments of the corolla ensiform; stamens inserted in the base of the tube. ♄. E. Native of China. Nèrium Chinénsis, Hunter, in Roxb. fl. ind. 2. p. 9. S. divérgens, Graham? S. dichótomus, Ker. bot. reg. 469? Dr. Roxburgh could not find any scales in the tube of the corolla.

Chinese Strophanthus. Shrub erect.

7 S.? sca'ndens (Rœm. et Schultes, syst. 4. p. 412.) stems scandent; peduncles terminal, many-flowered; leaves ovate-oblong, a little acuminated, glabrous; tails of the segments of the corolla long. ♄. ◡. S. Native of Cochinchina, among bushes. Nèrium scándens, Lour. coch. p. 116. Calyx tubular, with fleshy, erect segments. Corolla funnel-shaped; having the lower part of the tube cylindrical, and the superior part urceolate, white; limb red, having the segments long-linear and repand. Corona of the tube of many acute segments; anthers ending in a long, thread-like tail, each. Follicles thick, obtuse, horizontal.

Climbing Strophanthus. Shrub cl.

8 S. alterniflòrus (Spreng. syst. 1. p. 637.) scandent; leaves ovate, acuminated, glabrous; alternate axils umbelliferous. ♄. ◡. G. Native of China, in small islands near Canton. Apócynum alterniflòrum, Lour. coch. 168. Flowers pale. Corolla campanulate, crowned by 10 scales.

Alternate-flowered Strophanthus. Shrub cl.

§ 2. *Anthers hispid, mutic.*

9 S. híspida (D. C. l. c. Desf. l. c. p. 412.) corollas funnel-shaped: with long, acuminated segments; anthers acute. ♄. S. Native of Sierra Leone. Shrub hispid, almost with the habit of a *Justícia*. Leaves sessile, ovate-oblong. Flowers fasciculate, on peduncles, which are repeatedly trichotomous. Corollas red; having the tails of the segments 7 inches long.

Hispid Strophanthus. Shrub.

Cult. Shrubs of easy culture. A mixture of peat, loam, and sand, is the best soil for them; and cuttings strike root readily in sand, under a hand glass, in heat. The species are worth cultivating for the singularity as well as beauty of their flowers.

Tribe II.

WRIGHTIE'Æ. Fruit of 2 follicles. Tuft of hairs at the lower end of the seed, or at that end contrary to the umbilicus. Embryo with involute cotyledons.

XXIV. WRI'GHTIA (named after the late William Wright, M.D. F.R.S. F.L.S. and Edinb., whose ardour in the pursuit of botanical knowledge, even while engaged in extensive medical practice in the island of Jamaica, has long entitled him to this mark of distinction.) R. Br. in mem. wern. soc. 1. p. 73.—Nèrium species. Lin.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla salver-shaped; throat crowned by 10 divided scales. Stamens exserted; filaments inserted in the throat; anthers sagittate, cohering by their middle to the stigma. Ovaria 2, cohering. Style 1, filiform, dilated at top; stigma narrower. Scales 5-10, inserted at the base of the calyx, outside the corolla. Follicles distinct or combined, with adnate placentas.—Erect shrubs, or small trees. Leaves opposite. Corymbs almost terminal. Flowers white. Albumen none. Cotyledons longitudinally involute, white, but immersed in hot water they become rose-coloured.

1 W. antidysente'rica (R. Br. l. c. p. 74.) leaves obovate-oblong, short-acuminated, glabrous; corymbs nearly terminal; tube of corolla 6 times longer than the calyx; follicles distinct. ♄. S. Native of Ceylon. Nèrium antidysentéricum, Lin. spec. ed. 2d. p. 306. Lour. coch. p. 116.—Plenck. offic. t. 119.—Burm. zeyl. 167. t. 77. Codaga Pala, Rheed. mal. 1. p. 85. t. 47.? Flowers white, sweet-scented, form of a species of *Jasmìnum*. The wood being white, of a fine grain, is useful for the turner, and to make cabinets, and other elegant furniture. The bark is reputed to be a specific in dysentery, and most complaints of the bowels, and is the Conessi bark of the Materia Medica.

Anti-dysenteric Wrightia. Clt. 1778. Shrub 6 to 10 feet.

2 W. Zeyla'nica (R. Br. l. c.) leaves oblong-lanceolate, sub-acuminated, glabrous; corymbs terminal; tube of corolla 4-5 times longer than the calyx; follicles distinct. ♄. S. Native of Ceylon. Nèrium Zeylánicum, Lin. amœn. acad. 4. p. 309. Burm. zeyl. 23. t. 12. f. 2. W. divaricàta, Herb. madr. Very nearly allied to *W. antidysentérica*, from which it differs, in the figure of the leaves, which are also rather smaller.

Ceylon Wrightia. Shrub 6 to 10 feet.

3 W. tinctòria (R. Br. l. c.) leaves elliptic-lanceolate, and ovate-oblong, acuminated, glabrous; panicles terminal; branches and corymbs divaricate; tube of corolla twice longer than the calyx; follicles distinct, but united at the apex. ♄. S. Native of the East Indies. Lindl. bot. reg. 933. Nèrium tinctòrium, Roxb. fl. ind. 2. p. 5. Chite-ancaloo of the Telingas. Flowers white, fragrant, when expanded an inch and a half in diameter.

Dyer's Wrightia. Fl. June, July. Clt. 1812. Shrub 10 to 15 feet.

4 W. mollíssima (Wall. pl. rar. 2. p. 39. t. 146.) leaves ovate, acuminated, clothed with hoary villi beneath, as well as the branchlets; corymbs erect; tube of corolla twice longer than the calyx, downy; follicles parallel, beset with many callous dots, combined into a clavate cylindrical fruit. ♄. S. Native of Nipaul, on mountains, in the Great Valley; and of Kamaon. Habit of *W. tinctòria*. Corolla downy outside, yellow, tinged with red.

Very soft Wrightia. Shrub.

5 W. Ròthii; leaves oval-lanceolate; corymbs terminal, loose, flaccid; calyx and corollas downy. ♄. S. Native of the East Indies. W. tinctòria, Roth. nov. spec. Tabernæmontàna divaricàta, Roth.? and probably Rheed. mal. 1. t. 46. and 2. t. 54.

Roth's Wrightia. Shrub 10 to 15 feet.

6 W. du'bia (Spreng. syst. 1. p. 638.) leaves ovate-lanceolate, somewhat undulated; corona in the throat of the corolla 10-cleft, alternate segments shorter and obtuse; peduncles few-flowered in the forks of the branches. ♄. S. Native of the East Indies. Camerària dùbia, Hook. bot. mag. t. 1646. Lodd. bot. cab. 403. Flowers large, scarlet. Segments of corolla lanceolate, acuminated, yellow beneath.

Doubtful Wrightia. Shrub or tree.

7 W. coccí'nea (Sims, bot. mag. t. 2696. Lodd. bot. cab. 894. Wall. cat. no. 1626.) leaves almost sessile, ovate-oblong; flowers 3-4 together, terminal; corona in the throat 5-lobed; lobes crenulated; follicles distinct, rough; tube of corolla short. ♄. S. Native of Silhet. Nèrium coccíneum, Roxb. fl. ind. 2. p. 2. Flowers large, dull red. Corona scarlet. A large timber tree. Wood white, remarkably light, but firm, and much used by turners, to make palkies, &c.

Scarlet-flowered Wrightia. Fl. June. Clt. 1812. Tree.

8 W. pube'scens (R. Br. l. c. p. 75.) leaves elliptic-oblong, acuminated, and are, as well as the calyxes, downy; corymbs erect; tube of the corolla a little longer than the calyx; follicles cohering. ♄. S. Native of New Holland, in Arnhem's Land, on the north coast; and the Island of Timor, near Coepang; as well as of Java, among bushes. Zimm. reis. xi. 2. 1812. p. 132. with a figure. Roth. nov. spec. W. tomentòsa, Rœm. et Schultes, syst. 4. p. 414. Flowers white. The tube of the corolla is described both by Blume and Roth, to be twice as long as the calyx.

Downy Wrightia. Shrub.

9 W. tomentòsa; leaves oblong, acuminated, downy; corymbs terminal, small; tube of corolla longer than the calyx; corona fleshy, lacerated into obtuse segments; follicles scabrous; distinct. ♄. S. Native of the Circars. Nèrium tomentòsum, Roxb. fl. ind. 2. p. 7.—Nelam-Pala, Rheed. mal. 9. t. 3-4. Branches downy. Leaves 2-3 inches long. Flowers with a white corolla, and orange-coloured corona. Follicles 8-9 inches long, and 2 in circumference. With the yellow juice which flows from every part of this plant when wounded, diluted with water, pieces of cotton cloth were dyed a pretty good yellow.

Tomentose Wrightia. Tree.

10 W.? piscídia; leaves oblong, acuminated, shining; panicles terminal, bracteate, shorter than the leaves; tube of corolla longer than the calyx; corona of 5 bifid, villous segments; follicles swollen, oblong, obtuse. ♄. S. Native of Silhet, where it is called *Echaulut*. Nèrium piscídium, Roxb. fl. ind. 2. p. 7. Seeds with broad, membranous edges, crowned. The bark contains a quantity of fibrous matter, which the natives of the country where the plant grows use as a substitute for hemp. Dr. Roxburgh found, by steeping the roots in a fish-pond, in order to accelerate the removal of the bark, and cleansing the fibres, many, if not the whole, of the fish were killed: hence the specific name.

Fish-killing Wrightia. Shrub rambling.

Cult. For culture and propagation see *Strophánthus*, p. 85.

XXV. KIBATA'LIA (Kibatala is the name of the tree in Java.) Hasséltia, Blum. bijdr. p. 1047, but not of H. B. et Kunth.

Lin. syst. *Pentándria, Monogy'nia.* Calyx 5-parted, permanent. Corolla having the tube coarctate in the middle, the throat naked, and the limb campanulate, 5-parted, and twisted. Stamens 5, inserted in the throat of the corolla; anthers large, cuspidate, callose on the back, adhering to the stigma. Ovarium didymous, girded by a fleshy ring. Style didymous; stigma clavate. Fruit of 2 elongated, distinct follicles. Seeds furnished at the lower extremity, with a stipitate tuft of hairs. Embryo involute.—A beautiful tree; with opposite, oval leaves, which are acutish at both ends, glabrous above, paler and a little downy beneath; and axillary fascicles of large, whitish yellow flowers. *Kibatàlia* is distinguished from *Wrightia*, in the throat of the corolla being without scales; and in the tuft of hairs to the seed being furnished with a stipe.

1 K. arbòrea (Blum. bijdr. p. 1046, under *Hasséltia.*) ♄. S. Native of Java, about Tjampian, in the province of Buitenzorg, where it is called *Kibatala*.

Tree Kabatalia. Fl. June. Tree.

Cult. For culture and propagation see *Strophánthus*, p. 85.

Tribe III.

ALSTONIE'Æ. Fruit of 2 follicles. Seeds peltate, ciliated; having the cilia more elongated at both ends.

XXVI. ALSTO'NIA (in memory of Dr. Alston, the predecessor of Dr. Hope, of Edinburgh.) R. Br. in mem. soc. wern. 1. p. 75.—Echìtes species, Lin.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla salver-shaped; throat and tube without scales. Stamens inclosed; anthers lanceolate, bearing pollen their whole length, and free from the stigma. Ovaria twin. Style 1, filiform, dilated at top; stigma somewhat conical. Hypogynous, as well as calycine scales, wanting. Follicles terete.—Usually tall, lactescent trees. Leaves verticillate or opposite, ribbed, glabrous. Cymes terminal, panicled. Flowers usually white. Follicles for the most part very long.

1 A. schola'ris (R. Br. l. c. p. 76.) leaves 5-7 in a whorl, obovate-oblong, obtuse, ribbed, and having the veins approximating the margin; cymes on short peduncles; limb of corolla a little bearded; follicles very long. ♄. S. Native of the East Indies and the Moluccas. Echìtes scholàris, Lin. mant. 53. A. oleandræfòlia, Lodd. Nèrium tinctòrium, Hort. Pala, Rheed. mal. 1. p. 81. t. 45. Lignum scholare, Rumph. amb. 2. p. 246. t. 82. Flowers white. Segments of corolla roundish.

Var. β; leaves cuneate-oblong, obtuse; umbels effuse. ♄. S. Native of Java, at the foot of Mount Salak. Blum. bijdr. 1037.

School Alstonia. Fl. March, May. Clt. 1803. Tree.

2 A. specta'bilis (R. Br. l. c.) leaves 4 in a whorl, elliptic-

oblong, somewhat acuminated, ribbed, with simple edges; cymes pedunculate, shorter than the leaves; limb of corolla bearded; follicles very long. ♄. S. Native of the islands of Timor and Java. Flowers very nearly allied to the preceding.

Showy Alstonia. Fl. March, May. Clt. 1825. Tree.

3 A. SPATULA'TA (Blum. bijdr. p. 1037.) leaves on short petioles, opposite or 4 in a whorl, spatulate, rounded at the apex, and glabrous; flowers sub-umbellate, terminal; throat of corolla bearded a little; corolline segments obtuse, about equal in length to the tube. ♄. S. Native of Java, about Rompien, where it is called *Lameh*.

Spatulate-leaved Alstonia. Fl. April. Shrub.

4 A. VILLÒSA (Blum. bijdr. p. 1038.) leaves almost sessile, 4 in a whorl, elliptic-oblong, acutish at both ends, remotely ribbed, villous beneath; cymes effuse, terminal. ♄. S. Native of Java, on the calcareous mountains of Kuripan.

Villous Alstonia. Fl. Nov. Shrub.

5 A. SERÍCEA (Blum. bidjr. p. 1038.) leaves 3-4 in a whorl, lanceolate, much acuminated at both ends, lined transversely, clothed with silky down beneath; cymes crowded, terminal; throat of corolla bearded; segments of corolla lanceolate, acuminated. ♄. S. Native of Java, on the Salak mountains.

Silky Alstonia. Fl. April. Shrub or tree.

6 A. MACROPHY'LLA (Wall. cat. no. 1648.) leaves 3 in a whorl, oblong, short-acuminated, downy beneath; peduncles numerous, at the tops of the branches, trichotomously corymbose at the top. ♄. S. Native of Penang. Follicles linear, very long. A. costata, R. Br. in Wall. cat. no. 1649, does not appear to differ from *A. macrophýlla*, unless in the leaves being glabrous, narrower, and the veins more distinct.

Large-leaved Alstonia. Tree or shrub.

7 A. CUNEA'TA (Wall. cat. no. 1645.) leaves obovate, retuse at top, rusty beneath, 3 in a whorl. ♄. S. Native of Sirmore, where it was collected by Dr. Gowan. Follicles linear. Peduncles 3-flowered.?

Cuneate-leaved Alstonia. Shrub or tree.

8 A. NERIIFÒLIA (D. Don, prod. fl. nep. p. 131.) leaves 3-5 in a whorl, lanceolate, acuminated, feather-nerved, velvety beneath, cymes terminal, sessile, downy; throat of corolla downy: segments of the limb lanceolate, acute, twice shorter than the tube. ♄. G. Native of Nipaul.

Nerium-leaved Alstonia. Tree or shrub.

9 A. LU'CIDA (D. Don, prod. fl. nep. p. 131.) leaves opposite, elliptic, acuminated, glabrous, shining, reticulated; cymes terminal, pedunculate, trichotomous; throat of corolla bearded; segments of the limb oblong, obtuse, about equal in length to the tube. ♄. G. Native of Nipaul. Echìtes triangulàris, Hamilt. mss.

Shining-leaved Alstonia. Shrub or tree.

10 A. COSTA'TA (R. Br. l. c. p. 77.) leaves opposite, elliptic-oblong, acuminated, ribbed; cymes effuse; segments of the corolla beardless, lanceolate, longer than the tube; follicles very long. ♄. S. Native of the islands of Otaheite and Ulaietea, between the ranges of the mountain, where it is called *Attahé*. Flowers white.

Ribbed-leaved Alstonia. Tree.

11 A. PLUMÒSA (Labill. sert. cal. p. 28. t. 28.) leaves opposite, elliptic-oblong, obtuse, ribbed, attenuated at the base; floriferous cymes length of leaves, but the fruit bearing ones are much longer; segments of corolla oblong, obtuse, pilose; follicles very long. ♄. G. Native of New Caledonia. Corolla with a ventricose tube, and a pilose throat.

Feathered Alstonia. Shrub 8 feet.

12 A. VENENA'TA (R. Br. l. c.) leaves 4 in a whorl, oblong-lanceolate, acuminated, attenuated at the base; cymes dichotomous; tube of corolla widened upwards; limb acute, beardless; follicles attenuated at both ends, hardly equal in length to the leaves. ♄. S. Native of the East Indies. Flowers white.

Poisonous Alstonia. Tree.

Cult. See *Strophánthus*, p. 85, for culture and propagation.

Tribe IV.

GELSEMIE'Æ. Fruit of 2 joined follicles, which are at length separable, 2-valved, 2-celled; valves 1-celled, with inflexed, seminiferous edges, which constitute the dissepiment. Seeds flat, winged. This tribe seems to connect the *Gentiàneæ* with *Apocýneæ*, through *Crawfúrdia*.

XXVII. GELSE'MIUM (from Gelsemino, an Italian name of the Jasmine.) Michx. fl. amer. bor. 1. p. 120.—Gelsemìnum. Juss. gen. 168.

LIN. SYST. *Pentándria, Monogy'nia*. Calyx small, 5-lobed. Corolla large, funnel-shaped; with a 5-cleft, almost equal limb. Stigma trifid. Capsule ovate-oblong, rather compressed, 2-celled, composed of 2 joined follicles, which are separable, furrowed in the middle; 2-valved; valves keeled, with inflexed edges, which constitute the dissepiment. Seeds numerous, flat, imbricate, membranous at the apex, fixed to the edges of the valves.—An evergreen, lactescent, climbing shrub. Leaves opposite, furnished with small, axillary glands. Flowers axillary and terminal, yellow.

1 G. NÍTIDUM (Mich. fl. bor. amer. 1. p. 120.) glabrous; leaves lanceolate, shining: fascicles axillary, few-flowered. ♄. ◡. G. Native of North America, in the vicinity of rivers, from Virginia to Florida. Pursh. fl. sept. amer. 1. p. 184. G. sempervìrens, Pers. ench. 1. p. 267. Bignònia sempervìrens, Lin. spec. p. 869. Jacq. coll. 3. p. 258. Anònymos sempervìrens, Walt. fl. car. p. 98. Lisiánthus sempervìrens, Mart. Mill. dict. no. 5.—Catesb. car. 1. p. 53.—Plukn. alm. 359. t. 112. f. 5. Flowers sweet-scented, yellow. Called, in America, *Carolina Jessamine*.

Shining Gelsemium, or Carolina Jasmine. Fl. June, July. Clt. 1640. Shrub cl.

Cult. A pretty climbing shrub, of easy culture. The best soil for it is a mixture of loam and peat. Cuttings strike root readily under a hand-glass.

XXVIII. PLECTANE'IA (meaning unknown.) Pet. Th. gen. mad. no. 35. Rœm. coll. p. 203.

LIN. SYST. *Pentandria Monogýnia*. Calyx urceolate, 5-cleft, or 5-toothed. Corolla with a short ventricose tube, and a twisted, coarctate limb. Anthers sessile, sagittate. Ovarium solitary. Style short; stigma capitate. Capsule follicular, very long, sub-tetragonal, 2-celled, probably composed of 2 joined follicles; with introflexed, seminiferous edges. Seeds compressed, winged, fixed to the edges of the valves by slender funicles. Albumen thin. Embryo straight, with flat cotyledons. —A lactescent, twining shrub; with opposite leaves, and small corymbose flowers. Fruit like that of *Bignònia*. The genus is said to be nearly allied to *Gelsèmium* by some, and by others to *Plumièra*, but totally distinct from both.

1 P. THOUA'RSII (Rœm. et Schultz, syst. 4. p. 420.) ♄. ◠. S. Native of Madagascar.

Petit Thouar's Plectaneia. Shrub tw.

Cult. For culture and propagation see *Echìtes*, p. 76.

Tribe V.

TABERNÆMONTA'NEÆ. Fruit of 2 follicles, rarely solitary by abortion. Seeds neither tufted nor winged, usually nestling in the pulp of the fruit, usually albuminous.

XXIX. TABERNÆMONTA'NA (so named by Plumier, in honour of James Theodore, surnamed Tabernæmontanus, from Berg-Zabern, the place where he was born. He published

Kraeuterbuch, 1589, and Figures of Plants, 1590, in an oblong quarto form. He was physician to the Elector Palatine, and died in 1590.) Plum. gen. 30. Lin. gen. no. 301. Juss. 145. R. Br. prod. p. 467.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla salver-shaped; limb 5-parted; segments unequal-sided. Stamens inclosed; anthers sagittate, cohering to the stigma. Ovaria 2. Style filiform; stigma bifid, from the dilated base. Hypogynous glands wanting.? Follicles 2, ventricose. Seeds immersed in pulp.—Small trees. Leaves opposite. Stipulas interpetiolar, adnate at bottom, and loose at top. Cymes subdichotomous, interpetiolar. Calyx permanent.

* *Natives of New Holland.*

1 T. ORIENTA'LIS (R. Br. prod. p. 468.) leaves lanceolate-oblong, acuminated, glabrous, as well as the branches; bracteas subulate, slowly deciduous. ♄. S. Native of New Holland, within the tropic; and of Malabar, if Rheede's Curuta Pala, mal. 1. p. 83, t. 46, be the same which is T. alternifòlia, Lin. in which there is not a specimen in his herbarium. Flowers white, sweet-scented. Follicles yellow, ex Rheede.

Eastern Tabernæmontana. Shrub 6 feet.

2 T. PUBE'SCENS (R. Br. prod. p. 468.) leaves elliptic-oblong, sub-acuminated, downy beneath, as well as the branchlets; branches of cyme erect, and are, as well as the calyxes, pilose; bracteas very minute, caducous. ♄. S. Native of New Holland, within the tropic.

Downy Tabernæmontana. Shrub.

3 T. EBRACTEA'TA (R. Br. prod. p. 468.) leaves oval or elliptic, and are, as well as the cymes, downy; branches and peduncles spreading, bractless. ♄. S. Native of New Holland, within the tropic.

Bractless Tabernæmontana. Shrub or tree.

* * *Natives of South America, and the West India Islands.*

4 T. CITRIFÒLIA (Lin. spec. 210.) leaves ovate-lanceolate, glabrous; flowers in sub-umbellate, axillary fascicles, towards the tops of the branches. ♄. S. Native of Jamaica, and other West India Islands. Willd. spec. 1. p. 1244, exclusive of the syn. of Jacq. Lam. ill. t. 170. f. 1.—Plum. icon. t. 248. f. 2. Leaves 4-6 inches long. Flowers beautiful yellow, sweet-scented. Segments of corolla narrow, elongated, bluntish. Teeth of calyx acute. Follicles acuminated, recurved.

Citron-leaved Tabernæmontana. Clt. 1784. Tree 15 feet.

5 T. A'LBA (Mill. dict. no. 2.) leaves oblong ovate, acuminated, shining, glabrous; corymbs terminal, large. ♄. S. Native of Martinico, in woods, and the adjacent continent. T. citrifòlia, Jacq. amer. 38. Leaves 5 inches long, and 1½ inch broad. Flowers white, sweet-scented, like those of a *Jasmìnum*.

White-flowered Tabernæmontana. Fl. May, Aug. Clt. 1780. Shrub 10 to 12 feet.

6 T. LAURIFÒLIA (Lin. spec. 2. p. 210.) leaves ovate or oval, bluntish, glabrous; flowers lateral, subumbellate. ♄. S. Native of St. Domingo, Jamaica, on the banks of rivers. Jacq. amer. p. 39. pict. p. 25. Ker. bot. reg. 716.—Sloane, hist. 2. p. 62. t. 186. f. 2. Ait. hort. kew. ed. 2d. vol. 2. p. 72. Flowers small, yellow, sweet-scented. Leaves 4 inches long, and 2 broad. Linnæus cites under this species T. laurifòliam, flore albo, fructu rotundiore, Amm. herb. 212, which probably belongs to the preceding species.

Laurel-leaved Tabernæmontana. Fl. May. Clt. 1768. Shrub 5 to 10 feet.

7 T. ODORA'TA (Vahl. eclog. amer. 2. p. 22. Poir. dict. 7. p. 532.) leaves ovate-oblong or lanceolate-elliptic, acuminated, reticulately veined, glabrous; corymbs terminal, and in the forks of the branches. ♄. S. Native of Guiana and Surinam. Camerària Tamaquarìna, Aubl. guian. 1. p. 260. t. 102. Camerària lùtea, *a*, Lam. dict. 1. p. 566. Pedicels bractless. Calycine segments subulate. Segments of the corolla linear-lanceolate, ex Vahl. Flowers corymbose, in the forks of the branches, large, yellow, sweet-scented, ex Aubl.

Sweet-scented Tabernæmontana. Fl. Oct. Nov. Clt. 1793. Shrub 4 feet.

8 T. ECHINA'TA (Aubl. guian. 1. p. 263. t. 103.) leaves ovate-oblong, acuminated, somewhat undulated, clothed with fine white tomentum beneath; flowers terminal, almost sessile, 10-12 in each fascicle: each flower furnished with a small, scale-like bractea; follicles echinated by soft tubercles. ♄. S. Native of Guiana. Leaves 4-6 inches long, and 2 broad. Flowers sweet-scented. Calyx white, 5-toothed. Corolla seated on a yellow disk, with a red margin, and dotted with red; lobes of limb large, yellowish, undulated, acute. Follicles yellow, ovate. Teeth of calyx small, acute. Perhaps a distinct genus.

Echinated Tabernæmontana. Shrub 4-5 feet.

9 T. FASCICULA'TA (Poir dict. 5. p. 531. no. 14.) leaves ovate, acuminated, nerved, glabrous, shining above; flowers lateral towards the tops of the branches, axillary, numerous, in fascicles, inclining to a short, sub-umbellate corymb; branches opposite, articulated, sub-dichotomous; bracteas very short, caducous. ♄. S. Native of Cayenne. Leaves almost lanceolate, blunt at the apex, rufescent beneath, 2-3 inches long, with parallel nerves confluent to the margin. Teeth of calyx short, obtuse. Corollas small; segments of the limb narrow, obtuse. Allied to *T. muricàta*.

Fascicled-flowered Tabernæmontana. Shrub.

10 T. RIPA'RIA (H. B. et Kunth, nov. gen. amer. 3. p. 228.) glabrous; leaves oblong, acuminated, with undulated margins; peduncles dichotomous, few-flowered; calycine segments elliptic-oblong, obtuse, undulated, 3 times shorter than the tube of the corolla; segments of corolla obovate, roundish, oblique. ♄. S. Native of New Granada, on the banks of the river Magdalena, near El Peron, in shady places. Leaves membranous, glandless at the base, 4 to 4½ inches long. Corolla yellow. Ovaria girded by a fleshy ring.

River-side Tabernæmontana. Fl. May. Tree 20 feet.

11 T. LITORA'LIS (H. B. et Kunth. l. c.) glabrous; leaves elliptic-oblong, sub-acuminated; peduncles sub-dichotomous, few-flowered; calycine segments elliptic-oblong, obtuse, 4 or 5 times shorter than the tube of the corolla; segments of corolla dimidiately obovate, roundish. ♄. S. Native of Mexico, near Campeche, on the sea-shore. This species differs from *T. ripària*, in the flowers being twice the size, and in the structure of the calyx.

Shore Tabernæmontana. Tree.

12 T. HETEROPHY'LLA (Vahl. ecl. amer. 2. p. 22.) leaves elliptic-lanceolate, and somewhat cordate, sub-undulated, acuminated, glabrous; peduncles in the forks and tops of the branches, glabrous, 5-7-flowered, racemose; bracteas minute, twin at the base of each pedicel. ♄. S. Native of Cayenne. T. echinàta, Rohr. mss. from which name the follicles are probably echinated. Leaves petiolate and sessile. Pedicels alternate. Calycine segments linear lanceolate. Corolla ½ an inch long, with some silky hairs in the throat; segments of the limb lanceolate, obtuse.

Variable-leaved Tabernæmontana. Shrub or tree.

13 T. GRANDIFLÒRA (Jacq. amer. 40. t. 31. ed. pict. p. 25. t. 41.) leaves oval, attenuated at both ends, acute, glabrous, shining, unequal in size; peduncles irregular, 2-3-flowered at the sides of the ultimate bifurcations; calyxes unequal; stem dichotomous. ♄. S. Native of Carthagena, in woods. Lin. mant. p. 53. Lam. ill. t. 170. f. 2. Flowers white, scentless, larger than those of other species of the genus. Calycine seg-

ments unequal, flat, white; the outer 3 very large and cordate, and the inner 3 oblong, narrow. Corolla twisted above the calyx, with a very wide limb. Follicles roundish-ovate, acuminated.

Great-flowered Tabernæmontana. Clt. 1823. Shrub 6 to 8 feet.

14 T. cymòsa (Jacq. amer. 39. t. 181. f. 14. ed. pict. p. 25. t. 259. f. 10.) leaves ovate-lanceolate, acute, glabrous; cymes large, axillary, dense, convex. ♄. S. Native of Carthagena, in woods. An elegant tree, with beautiful cymes of whitish, scentless flowers. Calycine segments oblong-lanceolate. Corolla with a 5-angled, ventricose tube. Follicles reddish, oblong, obtuse, recurved.

Cymose-flowered Tabernæmontana. Fl.? Clt. 1820. Tree 10 to 15 feet.

15 T. amygdalifòlia (Jacq. amer. 39. t. 181. f. 15. ed pict. p. 25. t. 259. f. 11.) leaves ovate-lanceolate, shining; peduncles few-flowered; stamens exceeding the tube of the corolla. ♄. S. Native of Carthagena, in woods. Ker. bot. reg. 338. Flowers white, very sweet-scented. Follicles ovate or oblong, green, shining, acuminated.

Almond-leaved Tabernæmontana. Fl. May, Sept. Clt. 1780. Shrub 6 feet.

16 T. díscolor (Swartz, prod. p. 52. fl. ind. occ. 1. p. 535.) leaves ovate-lanceolate, glabrous; peduncles axillary, 2-flowered; branches terete, dichotomous; branchlets tetragonal. ♄. S. Native of Jamaica, among bushes. Pedicels longer than the peduncles. Corolla cream-coloured, having the tube ventricose in the base and middle; segments of the limb roundish, undulated. Calycine segments acute. Stigma capitate.

Two-coloured Tabernæmontana. Fl. April, May. Clt. 1822. Shrub 5 to 6 feet.

17 T. neriifòlia (Vahl, eclog. amer. 2. p. 21.) leaves lanceolate, acute at both ends, glabrous; peduncles solitary, few-flowered, sub-racemose; bracteas minute, linear, deciduous. ♄. S. Native of Porto Rico. Very nearly allied to *T. persicæfòlia*. Leaves 2-3 inches long, paler beneath. Calycine segments oblong, acute. Segments of corolla wedge-shaped, glabrous, hardly downy at the base, inside. Anthers beaked, exceeding the tube of the corolla.

Oleander-leaved Tabernæmontana. Shrub 10 feet.

18 T. arcua'ta (Ruiz. et Pav. 2. p. 22. t. 143.) leaves obovate-oblong, acuminated; corymbs by threes, many-flowered, lateral and axillary; bracteas small, ovate, acute. ♄. S. Native of Peru, in forests, at Pozuzo. Branches dichotomous. Calyx campanulate, with acute teeth. Corolla cream-coloured, with an inflated tube, which is globose at the base; segments of the limb large, ovate-roundish. Follicles arched, acuminated, rufescent. Seeds and pulp red.

Arched-follicled Tabernæmontana. Clt. 1824. Tree 30 to 40 feet.

19 T. Sana'nho (Ruiz. et Pav. fl. per. 2. p. 22. t. 144.) leaves oblong, acuminated, shining, glabrous; corymbs lateral and terminal, 4-5 times divided; bracteas roundish, cordate. ♄. S. Native of Peru, in forests. Leaves 6-8 inches long, undulated. Calycine teeth obtuse. Corolla large, cream-coloured: with a very long, angularly striated tube. Follicles obovate-roundish, acuminated, white, size of an Apricot.

Sananho Tabernæmontana. Tree 12 to 15 feet.

20 T. undula'ta (Vahl, eclog. amer. 2. p. 20.) leaves lanceolate-elliptic, acuminated, undulated, glabrous; peduncles first terminal, then axillary, bifid, sub-cymose. ♄. S. Native of Trinidad. Leaves 5 inches long. Calycine segments thick. Corolla orange-coloured, with a terete tube, widened at the top; segments of the limb linear, obtuse, incurved, conduplicate at the sides; throat glabrous. There is a hypogynous, glandular ring, girding the ovarium. Anthers linear, very narrow, almost sessile, inclosed. Stigma capitate, mucronate, girded by a minute membrane at the base. Follicles reflexed, a little incurved at both ends, oblong-triquetrous.

Undulated-leaved Tabernæmontana. Fl. June, July. Clt. 1824. Tree 10 to 20 feet.

21 T. Meye'ri; leaves oblong, ending in a linear, obtuse acumen, tapering into the petioles at the base, glabrous; flowers terminal; ovarium not girded by any scales, nor a glandular ring. ♄. S. Native of Essequibo. T. undulàta, Meyer, ess. p. 135. Calycine segments unequal, obtuse. Corolla with a downy throat.

Meyer's Tabernæmontana. Tree.

22 T. speciòsa (Poir. suppl. 5. p. 275.) leaves large, lanceolate, acuminated, nerved beneath; corymbs axillary, many-flowered. ♄. S. Native of Cayenne. In the leaves this species is like *T. macrophýlla*. Leaves membranous, 8-10 inches long, acute at the base. Calycine segments obtuse. Corolla red, with a cylindrical tube; segments of the limb ovate, much shorter than the tube.

Showy Tabernæmontana. Tree or shrub.

23 T. populifòlia (Poir. suppl. 5. p. 276.) leaves broad-ovate, acuminated, glabrous; flowers small, disposed in nearly terminal, panicled cymes; bracteas ovate, acute, upper ones subulate. ♄. S. Native of South America. Leaves 1½ to 2 inches long, acute at the base. Branches of panicle very short. Corollas white, small, hardly twice longer than the calyx, which is short.

Poplar-leaved Tabernæmontana. Shrub or tree.

24 T. macrophy'lla (Poir. suppl. 5. p. 276.) leaves ovate, obtuse, glabrous; flowers cymose; cyme trifid at bottom, sub-umbellate, axillary: bracteas small, scale-like. ♄. S. Native of Cayenne. T. Cestroïdes, Nees, in act. bonn. 11. p. 83. Leaves 2 inches long, and 3 lines broad, bluntly acuminated, with a small mucrone. Peduncles opposite. Corollas white, with linear-oblong, obtuse segments, which are longer than the tube. Calycine segments short, obtuse.

Long-leaved Tabernæmontana. Shrub or tree.

25 T. parviflòra (Poir. suppl. 5. p. 276.) leaves ovate-lanceolate, acute, glabrous; flowers small, terminal, cymosely umbellate; bracteas scale-like, scarious. ♄. S. Native of South America. Leaves 2 inches long, deep green above, but greenish yellow beneath. Pedicels furnished with a short, scarious scale at the base of each.

Small-flowered Tabernæmontana. Shrub.

26 T. coria'cea (Link, herb. ex Rœm. et Schultes, syst. 4. p. 431.) leaves glabrous, oval, obtuse, somewhat acuminated, furnished with impressed dots beneath; cymes dichotomous, in the forks of the branches. ♄. S. Native of Brazil. Branchlets bearing 2 leaves at the apex. Calycine teeth roundish, obtuse. Corolla having the tube nearly an inch long, and the segments obtuse.

Coriaceous-leaved Tabernæmontana. Shrub or tree.

27 T. multiflòra (Link, l. c.) leaves ovate-lanceolate, acuminated, sub-repand, glabrous; panicles dichotomous in the forks of the branches. ♄. S. Native of Brazil. Leaves 3-4 inches long, and 1½ broad. Tube of corolla 3 times longer than the calyx. Segments ovate, obtuse, much shorter than the tube.

Many-flowered Tabernæmontana. Shrub or tree.

28 T. murica'ta (Link. l. c.) leaves ovate-oblong, acuminated, with bullately elevated veins beneath, and impressed dots, and with sub-repand margins; flowers cymose. ♄. S. Native of Brazil. Leaves a span long. Calycine teeth short, obtuse. Corolla having the tube almost an inch long, filiform; and oblong segments. Follicles muricated.

Muricated Tabernæmontana. Shrub or tree.

29 T. FLAVÌCANS (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 797.) leaves lanceolate, acuminated, bluntish, glabrous, tapering at both ends; peduncles racemose, 3-4-flowered, scaly. ♄. S. Native of Brazil. Corolla $1\frac{1}{2}$ inch long.

Yellowish Tabernæmontana. Shrub or tree.

30 T. FLAVE'SCENS (Willd. herb. l. c.) leaves oblong, acuminated; flowers umbellate. ♄. S. Native of Brazil. Leaves broader, and less acuminated than those of *T. flavìcans*: having woody, scaly buds in the axils of the leaves, from which numerous 1-flowered pedicels rise.

Yellowish Tabernæmontana. Shrub or tree.

† *Calyx deciduous. Styles 2, distinct. The species contained in this division will probably form a new genus. Leaves glandless at the base.*

31 T. JASMINOÌDES (H. B. et Kunth, nov. gen. amer. 3. p 225.) glabrous; leaves oblong, sub-acuminated; corymbs dichotomous, many-flowered; calycine segments ovate, bluntish, 4 times shorter than the tube of the corolla; segments of corolla obovate-oblong, roundish, curled. ♄. S. Native of New Granada, near Turbaco, where it is called *Jasminillo;* and Cumana, where it is called *Lyrio del Monte*. Rauwólfia lævigàta, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 105. Leaves membranous, 3-4 inches long. Flowers size of those of Jasmine, white. Ovarium girded by glands.

Jasmine-like Tabernæmontana. Fl. June. Tree or shrub.

32 T. UMBRÒSA (H. B. et Kunth. l. c. p. 226.) glabrous; leaves elliptic-oblong, acute; corymbs sub-dichotomous; calycine segments lanceolate, acute, 5-6 times shorter than the tube of the corolla; segments of corolla dimidiately obovate, roundish. ♄. S. Native of New Andalusia, in shady places, near Bordones and Cumanacoa. Leaves membranous, $2\frac{1}{2}$ inches long. Flowers white. Ovaria girded by 5 scale-formed, parted glands. This differs from the preceding in the form of the leaves and calyx.

Shaded Tabernæmontana. Fl. Sept. Tree.

33 T. PSYCHOTRIOÌDES (H. B. et Kunth, l. c. p. 227.) glabrous; leaves obovate, acute; peduncles dichotomous, corymbosely crowded; calycine segments lanceolate, 6-7 times shorter than the tube of the corolla, recurved at the apex; segments of corolla half obovate, curled. ♄. S. Native along with the preceding. Branchlets whitish. Leaves $3\frac{1}{4}$ inches long. Flowers white, about the size of those of *Jasmìnum frúticans*. Ovaria lagenæform.

Psychotria-like Tabernæmontana. Tree?

34 T. TETRASTA'CHYA (H. B. et Kunth, l. c.) glabrous; leaves oblong, acuminated, with obsoletely repand, undulated edges; peduncles dichotomous, of 4 spikes; calycine segments somewhat orbicularly-ovate, rounded at apex, 4 or 5 times shorter than the tube of the corolla; segments of corolla obliquely oblong. ♄. S. Native of New Granada, on the banks of the river Magdalena, between Morales and Teneriffe. Leaves membranous, 6-7 inches long, and 2 or $2\frac{1}{2}$ broad. Flowers white, about the size of those of *Jasmìnum officinàle*. Scales many, in the bottom of the calyx. Said to be nearly allied to *T. Sanánho*, Ruiz. et Pav.

Four-spiked Tabernæmontana. Fl. April. Tree.

* * * *Species natives of the African Islands.*

35 T. PERSICARIÆFÒLIA (Jacq. coll. 4. p. 139. icon. t. 320.) leaves long, lanceolate, acuminated at both ends, glabrous; peduncles axillary, many-flowered, dichotomous; bracteas small, lanceolate, acute. ♄. S. Native of the Mauritius. Leaves linear-lanceolate, pale green, sub-undulated: with white veins. Calycine segments lanceolate, acute. Corolla cream-coloured, having the tube contracted in the middle, and the limb reflexed; segments of the limb wedge-shaped, undulated, oblique.

Persicaria-leaved Tabernæmontana. Clt. 1819. Tree 10 ft.

36 T. MAURITIA'NA (Poir. dict. 7. p. 530.) leaves ovate, obtuse, membranous, glabrous; flowers in axillary racemes; racemes articulated, brittle, very short, drooping a little, and a little branched; corolla funnel-shaped. ♄. S. Native of the Mauritius, and the East Indies. Branches beset with small white tubercles. Leaves rounded at both ends, shining above, and paler beneath, and hardly downy, soft to the touch, 3-4 inches long, and $2\frac{1}{2}$ broad. Calycine segments obtuse. Corolla cream-coloured; tube narrow in the middle, and inflated at both ends; lobes obtuse.

Mauritian Tabernæmontana. Shrub or tree.

37 T. TELFAIRIA'NA (Wall. in bot. reg. under no. 1273.) leaves oval, very blunt at both ends; peduncles sub-axillary, twice or thrice forked; calycine segments oval, bluntish; segments of corolla oblong, about equal in length to the tube. ♄. S. Native of the Mauritius. Probably different from *T. Mauritiàna*.

Telfair's Tabernæmontana. Shrub.

38 T. OBTUSIFÒLIA (Poir. suppl. 5. p. 276.) leaves oblong-lanceolate, cuneated at the base, and rounded at the apex; flowers racemose. ♄. S. Native of Madagascar. Leaves nearly 8 inches long, and 2 broad, glabrous, thin. Corolla tubular; segments ovate, acute, a little recurved.

Obtuse-leaved Tabernæmontana. Shrub or tree.

* * * * *Species native of New Guinea.*

39 T. PANDA'CQUI (Poir. dict. 7. p. 529.) leaves ovate-lanceolate, glabrous, acuminated; corymbs axillary, sub-umbellate. ♄. S. Native of New Guinea. Pandácqui, Sonn. voy. en guin. p. 49. t. 19. Leaves membranous, nearly 3 inches long, with arched yellowish nerves. Flowers white. Calycine segments obtuse. Corolla with a cylindrical tube, and short, linear segments. Style bifurcate at the base.

Pandacqui Tabernæmontana. Shrub or tree.

* * * * * *Natives of Asia.*

40 T. BUFALÌNA (Lour. coch. 117.) leaves lanceolate, shining; peduncles 1-flowered, pendulous. ♄. G. Native of Cochinchina. Corolla with a long, slender, cylindrical tube, which is ventricose at the base. Follicles rather ventricose, divaricate, acuminated, torulose, resembling buffalos' horns. Seeds imbedded in red pulp.

Buffalo's Tabernæmontana. Shrub 5 feet.

41 T. BOVÌNA (Lour. coch. 117.) leaves lanceolate, glabrous; peduncles axillary, solitary, many-flowered. ♄. G. Native of Cochinchina. Branches reclinate. Flowers white. Follicles horizontal, recurved, short, ventricose, acuminated, resembling oxen's horns. Seeds imbedded in red pulp.

Ox's Tabernæmontana. Shrub 4 feet.

42 T. CORONA'RIA (R. Br. in Ait. hort. kew. ed. 2d vol. 2. p. 72. Willd. enum. 1. p. 275.) leaves elliptic or oblong, bluntly acuminated, glabrous; peduncles from the forks of the branches twin, 1-3-flowered; bracteas deciduous; calycine teeth very short, rounded; anthers exserted; stigma undivided; follicles torulose. ♄. S. Native of the East Indies, every where, in gardens; but seemingly wild, according to Wallich, in the forests of Lower Nipaul, about the Hetounda; and of Singapore. Nèrium divaricàtum, Lin. fl. zeyl. 109. Willd. spec. 1236. Nèrium coronàrium, Ait. hort. kew. 1. p. 297. Jacq. icon. rar. 1. t. 52. coll. 1. p. 269. no. 8. Lodd. bot. cab. 406.—Burm. fl. zeyl. 129. t. 59.—Rumph. amb. 4. p. 87. t. 39.—Rheed. mal. 2. p. 105. t. 54, 55. Flowers pure white, very sweet-scented, with a yellowish tube. There is a double-flowering variety of it, see bot. mag. 1865. The Nèrium divaricàtum, Thunb. jap. p. 110, is very different from this, and does

not belong to the present genus, nor even probably to the order.

Garland Tabernæmontana. Fl. May, Sept. Clt. 1770. Shrub 4 to 6 feet.

43 T.? DIVARICA'TA; leaves ovate, undulated, shining; branches divaricate; flowers crowded, terminal. ♄. G. Native of Cochinchina. Nèrium divaricàtum, Lour. coch. p. 115., but not of Lin. Flowers reddish yellow. Corolla funnel-shaped, with a short tube, and a reflexed limb. Corona in the throat of the tube composed of short subulate segments. Anthers conniving into a cone in the throat. Stigma ovate. Follicles long, joined a little at the base, erect. Seeds pappose.

Divaricate-branched Tabernæmontana. Tree small.

44 T. RECU'RVA (Roxb. hort. beng. p. 2. fl. ind. 1. p. 26.) leaves oblong-lanceolate, undulated, glabrous; calycine teeth ovate; segments of corolla convex, of two forms, crenulated; cymes divaricate; flowers drooping. ♄. S. Native of the East Indies. T. gratíssima, Lindl. bot. reg. t. 1084. Flowers whitish-yellow, sweet-scented. Like *T. coronàrium*.

Recurved-flowered Tabernæmontana. Fl. May, Sept. Clt. 1824. Tree small.

45 T. DENSIFLÒRA (Wall. in bot. reg. t. 1273.) leaves lanceolate, acuminated, approximate, sometimes 3 in a whorl; cymes many-flowered, on short peduncles; calycine segments and bracteas linear-lanceolate, acute; limb of corolla about equal in length to the tube; follicles 1-seeded. ♄. S. Native of the East Indies. Flowers white, sweet-scented.

Dense-flowered Tabernæmontana. Fl. June. Clt. 1824. Shrub 4 to 6 feet.

46 T. CRÍSPA (Roxb. hort. beng. p. 20. fl. ind. 1. p. 24.) leaves oblong, undulated; peduncles few-flowered; pedicels elongated; calyx deeply 5-parted; segments broad-ovate, foliaceous. ♄. S. Native of the East Indies. Perhaps Curata-Pala, Rheed. mal.

Curled-leaved Tabernæmontana. Fl. May, Oct. Clt. 1818. Shrub 6 to 8 feet.

47 T. DICHÓTOMA (Roxb. hort. beng. p. 20. fl. ind. 1. p. 21.) leaves oblong, obtuse, coriaceous, shining, with many parallel nerves beneath; cymes elongated, dichotomous; calycine segments obtuse; segments of corolla oblong-falcate, about equal in length to the tube. ♄. S. Native of Ceylon and Malabar. Flowers yellowish, delightfully fragrant.

Dichotomous Tabernæmontana. Tree 12 to 16 feet.

48 T. PAUCIFLÒRA (Blum. bijdr. p. 1028.) leaves oblong-lanceolate, long-acuminated, membranous, glabrous; fascicles of flowers twin, bifid, few-flowered, furnished with setaceous bracteoles; segments of corolla obliquely rounded, flat. ♄. S. Native of Java, among bushes, about Rompien. Allied to *T. floribúnda*.

Few-flowered Tabernæmontana. Fl. year. Tree.

49 T. FLORIBU'NDA (Blum. bijdr. p. 1028.) leaves oblong, bluntish at the apex, acute at the base, membranous, glabrous; corymbs twin, dichotomous, divaricate, many-flowered, bractless; corolline segments obtuse, sub-undulated. ♄. S. Native of Java, on the mountains, where it is called *Susu-monding*. Allied to *T. divaricàta*.

Bundle-flowered Tabernæmontana. Fl. year. Tree.

50 T. CORYMBÒSA (Roxb. fl. ind. 1. p. 25. Wall. in bot. reg. under no. 1273.) leaves oblong-elliptic, bluntly acuminated, attenuated upwards; cymes many-flowered, on long peduncles; calycine segments ovate, acutish; segments of corolla somewhat obovate, and 3 times shorter than the tube, ♄. S. Native of Prince of Wales Island.

Corymbose Tabernæmontana. Tree or shrub.

51 T. HEYNEA'NA (Wall. l. c.) leaves ovate-lanceolate, acuminated; peduncles few-flowered; calycine segments obtuse; segments of corolla obovate-curled, about equal in length to the tube. ♄. S. Native of the East Indies. *T. corymbòsa* and *T. oblónga*, Heyne, mss.

Heyne's Tabernæmontana. Shrub or tree.

52 T. PEDUNCULA'RIS (Wall. l. c.) leaves oblong-lanceolate, ending in a very slender acumen, transversely nerved beneath; peduncles filiform, very long; pedicels sub-umbellate; follicles pedicellate, ovate, a little beaked. ♄. S. Native of Pulo-Penang.

Peduncular Tabernæmontana. Shrub or tree.

53 T. GRACILIFLÒRA (Wall. l. c.) leaves oblong, sub-caudately acuminated; peduncles axillary, very long; flowers sub-racemose; lobes of calyx ovate, acute; segments of corolla oblong, and 3 times shorter than the tube, which is very slender, ♄. S. Native of Martaban, in Moolmeyne; and Amherst.

Slender-flowered Tabernæmontana. Shrub or tree.

54 T. CALYCÌNA (Wall. l. c.) leaves lanceolate; peduncles few-flowered; flowers on short pedicels, sub-fasciculate; calycine segments and bracteas at length decaying or falling off, elongated and linear; lobes of corolla lanceolate, one half shorter than the tube. ♄. S. Native of Tavoy, on the coast of Tenasserin.

Large-calyxed Tabernæmontana. Shrub or tree.

55 T. ROSTRA'TA (Wall. l. c.) leaves lanceolate, with a very slender acumen; peduncles few-flowered; calycine segments sub-ligulate; tube of corolla slender, tumid, and bearing the stamens in the middle, longer than the limb; follicles oblong, bi-carinated above, and attenuately beaked. ♄. S. Native of the East Indies, on the lime hills of Segaen.

Beaked Tabernæmontana. Shrub or tree.

56 T. SUBCAPITA'TA (Wall. l. c.) leaves oblong-lanceolate; peduncles slender, with many crowded flowers at the apex; pedicels short; calycine segments ovate, acute; segments of corolla nearly ovate, about equal in length to the tube. ♄. S. Native of the East Indies.

Sub-capitate-flowered Tabernæmontana. Shrub or tree.

57 T. MICROCA'RPA (Wall. l. c.) leaves oblong, acuminated; peduncles few-flowered, in fascicles; follicles sessile, ovate, 1-seeded. ♄. S. Native of the Burmese Empire, on the mountains called Taong Dong, near Ava. This, with T. macrocárpa, Jack., may form a distinct genus, from the follicles being 1-seeded.

Small-fruited Tabernæmontana. Shrub or tree.

58 T. SALICIFÒLIA (Wall. l. c.) leaves linear-lanceolate, attenuately acuminated, with undulated edges, glaucous beneath; calycine segments lanceolate, acute. ♄. S. Native of the East Indies. T. parviflòra, Heyne, herb.

Willow-leaved Tabernæmontana. Shrub or tree.

59 T. MACROCA'RPA (Jack, in mal. misc. 2. no. 8. p. 80.) leaves ovate-elliptic, attenuated at the base; corymbs terminal, dichotomous; follicles large, nearly globose, 1-seeded. ♄. S. Native of Bencoolen.

Large-fruited Tabernæmontana. Tree large.

60 T. SPHÆROCA'RPA (Blum. bijdr. p. 1028.) leaves elliptic, oblong, obtuse, acute at the base, coriaceous, glabrous, one smaller than the other; corymbs twin, dichotomous, cymosely many-flowered, bracteolate; segments of corolla rounded, undulated; fruit apple-shaped. ♄. S. Native of Java, among bushes, about Linga Jattie, in the province of Cheribon, where it is called *Hampru-badak*.

Round-fruited Tabernæmontana. Fl. Oct. Tree.

61 T.? NERVÒSA (Desf. hort. par. Poir. suppl. 5. p. 275.) leaves oblong, obtuse, much nerved. ♄. S. Native of the East Indies. Flowers unknown.

Nerved-leaved Tabernæmontana. Shrub or tree.

62 T. PARVIFLÒRA (Nouv. ann. mus. 3. p. 379.) leaves unequal, lanceolate, acuminated, quite glabrous, on short petioles;

cymes sub-dichotomous, pedunculate, many-flowered; calycine segments ovate, obtuse; segments of corolla oblong, oblique; follicles 2-seeded, ovate, beaked, fulvous. ♄. S. Native of the Island of Timor. Corolla white. Cotyledons bipartite, as in the genus *Amsýnkia* in the order *Boragíneæ*.

Small-flowered Tabernæmontana. Shrub or tree.

† *The three following are doubtful species of the genus, in the glands at the base of the calyx girding the ovarium beyond the corolla and hypogynous ring.*

63 T. verrucòsa (Blum. bijdr. p. 1029.) stem climbing; branches warted; leaves oval-oblong, acuminated, glabrous; peduncles axillary, umbellately trifid at the apex. ♄. S. Native of Java, in woods, on Mount Salak.

Warted-branched Tabernæmontana. Fl. Dec. Shrub cl.

64 T. polya'ntha (Blum. bijdr. p. 1029.) climbing; leaves oblong-lanceolate, acuminated, glabrous; flowers disposed in panicled fascicles, axillary and terminal, small. ♄. ب. S. Native of Java, on Mount Salak, and the Seribu mountains, where it is called *Tjunkankan*.

Many-flowered Tabernæmontana. Fl. Nov. Shrub cl.

65 T. orienta'lis (Blum. bijdr. 1026.) stem sarmentose; leaves lanceolate, parallel-veined, glabrous; cymes compound, axillary; crown of the throat furrowed. ♄. S. Native of Java, on Mount Salak, in woods; and of the Island of Nusæ-Kambanga.

Eastern Tabernæmontana. Shrub straggling.

† † *Doubtful species.*

66 T.? lu'cida (H. B. et Kunth, nov. gen. amer. 7. p. 209.) glabrous; leaves oblong-lanceolate, rounded at the apex, cuneately narrowed at the base; corymbs dichotomous; calyx small, with ovate, obtuse segments. ♄. S. Native of South America. Psychótria? lùcida, Rœm. et Schultes, syst. 4. p. 189. Branches rather compressed. Leaves 3-3½ inches long. Corolla funnel-shaped, white; segments oblong, revolute at the apex. Berry edible, fleshy, 2-celled, 2-seeded. Seeds oblong, convex on one side, and flat on the other.

Shining-leaved Tabernæmontana. Tree 20 feet.

Cult. Shrubs and trees of easy culture; some of them very elegant when in flower; and the flowers of all are fragrant. The soil best suited for them is a mixture of loam, sand, and peat; and cuttings of them strike root readily in sand, under a hand-glass, in heat.

XXX. CAMERA'RIA (so named by Plumier, from Joachim Camerarius, a physician and botanist of Nuremberg, who published an edition of Matthiolus in Latin and German, with new figures and many observations). Plum. gen. 18. t. 29., Lin. gen. no. 300. Juss. 145. Lam. ill. 173.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, 5-toothed, acute. Corolla of a funnel-salver shape; tube long, cylindrical, ventricose at the base and apex; segments of the limb unequal-sided. Stamens inserted at the tube; anthers acuminated, connivent, drawn out into a thread. Style hardly any; stigmas obsolete. Follicles 2, reflexed, horizontal, obtuse, emitting a lobe on each side at the base. Seeds numerous, inserted in a peculiar membrane.—Trees or shrubs. Leaves opposite. Peduncles axillary, and in the forks of the branches 1 or many-flowered. Flowers beautiful yellow.

1 C. latifòlia (Jacq. amer. p. 37 t. 182. f. 86. edit. pict. p. 24. t. 39.) leaves ovate, acute, shining; flowers terminal, corymbose. ♄. S. Native of Cuba, Jamaica, and St. Domingo. Andr. bot. rep. t. 261. Tratt. tab. t. 715. Lam. ill. t. 173. f. 2. Plum. icon. t. 72. f. 1. An elegant tree, with forked branches. Corollas white, with a yellow base.

Broad-leaved Cameraria. Fl. Aug. Clt. 1733. Tr. 20 to 30 ft.

2 C. angustifòlia (Lin. spec. p. 308.) leaves linear. ♄. S. Native of South America. Lam. ill. t. 173. f. 3. Plum. icon. t. 72. f. 2. Mill. dict. no. 2. Flowers and fruit as in *C. latifòlia*, but smaller, as is the whole plant.

Narrow-leaved Cameraria. Fl. Sept. Clt. 1752. Sh. 8 ft.

3 C. Guiane'nsis (Aubl. guian. 1. p. 262.) leaves ovate, acuminated, glabrous; flowers small, axillary, sweet-scented. ♄. S. Native of Guiana. C. lùtea β, Lam. dict. 1. p. 573.

Guiana Cameraria. Shrub 3 to 4 feet.

Cult. For culture and propagation see *Tabernæmontàna*.

XXXI. VA'HEA (meaning unknown to us). Lam. ill. t. 169. Poir. suppl. 5. p. 409. Urceòla, Roxb. in asiat. res. 5. p. 167. but not of Vandelli.

Lin. syst. *Pentandria, Monogynia.* Calyx small, 5-parted. Corolla funnel-shaped, with an elongated tube, which is ventricose at the base, and a 5-cleft limb; segments twisted (ex Lam. ill. t. 169.) Corolla urceolate. Ovarium girded by a cylindrical entire urceolus. Stamens inserted in the bottom of the corolla; anthers sagittate. Follicles 2, 1-celled, 2-valved. Seeds numerous, imbedded in pulp. Roxb. asiat. res. 5. p. 167. Spreng. in Schrad. journ. bot. 1800. 2. p. 236.—A glabrous tree or shrub, with terete branches, opposite leaves, and terminal cymes of flowers.

1 V. gummífera (Poir. suppl. 5. p. 409.). ♄. ب.? S. Native of Madagascar and the East Indies. Urceòla elástica, Roxb. asiat. res. 5. p. 167. 175.? Tabernæmontàna elástica, Spreng. syst. 1. p. 639. Leaves coriaceous, elliptic-obovate, obtuse, shining, nerved, quite entire, 2 inches long. Bracteas small, at the base of the pedicels (ex Poir.). Shrub climbing. Leaves ovate, acuminated, ribbed. Flowers panicled. The juice which comes from this shrub is one of those which constitute India rubber or caoutchouc.

Gum-bearing Vahea. Shrub cl.?

Cult. For culture and propagation see *Tabernæmontàna*.

XXXII. VOACA'NGA (meaning unknown to us). Pet. Th. gen. mad. no. 32.

Lin. syst. *Pentándria, Monogy'nia.* Calyx of 5 involute segments. Corolla funnel-shaped, with a spreading, twisted limb, and broad segments. Anthers sessile, sagittate, inserted in the throat of the corolla. Ovarium didymous, seated on a fleshy receptacle. Style short; stigma double: lower one peltate: upper one 3-lobed; with 2 tubercles at top. Follicles 2, baccate, spherical, large. Seeds numerous, nestling in pulp.—A tree, with large, opposite leaves. Flowers disposed in terminal, corymbose panicles. Fruit variegated from warts.

1 V. Thoua'rsii (Rœm. et Schultes, syst. 4. p. 439.). ♄. S. Native of Madagascar.

Petit Thouars' Voacanga. Tree.

Cult. For culture and propagation see *Tabernæmontàna*.

XXXIII. REJOU'A (named in honour of M. Rejou, chief physician and professor of botany and chemistry of the Marine of France; author of many important mémoires on the secretion of vegetables). Gaud. in Freyc. voy. part. bot. p. 450. pl. 61.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, 5-parted. Corolla salver-shaped, with an elongated tube, which is inflated beneath the middle, bearing stamens every where inside; limb 5-parted, spreading much; segments obliquely ovate, equal, shorter than the tube. Stamens 5; filaments very short; anthers cordate-sagittate, fixed by their base, free, inclosed. Ovaria twin. Styles 2, combined; stigma sub-clavate, bicuspidate at apex. Fruit roundish-elliptic, sub-umbilicate, many-seeded, not dehiscent; rind membranous; pulp dry, cellular

shining. Seeds nestling in the pulp, ovate, compressed, wrinkled, bay-coloured externally.—An unarmed tree. Leaves opposite, oblong-lanceolate, membranous. Panicles terminal, pedunculate, bracteate. Flowers scattered, greenish white. Fruit large, of a reddish orange colour, and of the shape of an orange.

1 R. aurantìaca (Gaud. l. c. p. 451. t. 61.). ♄. S. Native of the Moluccas, in the island of Raddak. Tabernæmontàna aurantìaca, Gaud. gen. p. 50. and 55.

Orange-fruited Rejoua. Tree.

Cult. See *Tabernæmontàna*, p. 92. for culture and propagation.

XXXIV. ORCHIPE'DA (meaning unknown to us). Blume, bijdr. p. 1026.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx tubular, deciduous; limb bluntly 5-cleft. Corolla funnel-shaped: having the throat half closed inside by a tumid ring; tube length of calyx, inflated in the middle; limb spreading, 5-lobed. Stamens inclosed; anthers sagittate, cohering to the stigma. Ovarium didymous, girded by a ring. Style 1; stigma conical, 5-angled: with 2 notches at top. Drupes twin, fleshy, globose, 1-celled, pulpy inside, dehiscing at the side. Seeds numerous, wrinkled, convolutely 2-lobed at one side. Albumen fleshy. Cotyledons foliaceous.—A tree, with opposite, oblong, glabrous, leaves; and lateral and terminal, bifid, few-flowered peduncles.

1 O. fœ'tida (Blum. bijdr. p. 1027.). ♄. S. Native of Java, among bushes on the mountains, where it is called *Hamprubadak*.

Fetid Ochipeda. Fl. year. Tree.

Cult. See *Tabernæmontàna*, p. 92. for culture and propagation.

XXXV. PLUMIE'RA (so named by Tournefort, in honour of Charles Plumier, of Marseilles, a Franciscan traveller in South America, and author of several excellent works, as Plantæ Americanæ, 1693, and by Burmann in 1755.; Genera, 1703; Fougeres Americaines, 1705, &c.). Tourn. coral. t. 439. Lin. gen. 298. Juss. 45. Lam. ill. t. 173. f. 2.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx small, 5-parted, blunt. Corolla funnel-shaped, with a long, slender tube; segments of the limb oblong, unequal-sided: throat scaleless. Stamens inserted in the middle or base of the tube of the corolla, inclosed, free; anthers connivent. Style hardly any; stigma thick, emarginate; ovaria 2, immersed in a fleshy ring. Follicles 2, long, acuminated, ventricose, spreading or bent upwards. Seeds numerous, oblong, imbricated, ending in a peculiar membrane at the base.—Trees or shrubs, with thick, fleshy branches. Leaves alternate, forming tufts at the tops of the branches. Peduncles terminal, corymbose. Flowers showy.

1 P. ru'bra (Jacq. amer. p. 35. pict. p. 23. Lin. hort. cliff. p. 76. spec. 306.) leaves obovate-oblong, acute, with flat edges, glabrous; peduncles elongated, trifid; flowers crowded in fascicles; corollas red. ♄. S. Native of Jamaica, Surinam, and the main land of South America. Curt. bot. mag. t. 279. —Catesb. car. 2. t. 92.—Ehret. pict. t. 10. Trew. ehret. t. 41. —Sloan. hist. 2. p. 61. t. 185. f. 1. and t. 186. f. 1.—Merian, surin. t. 8.—Plukn. alm. 109. t. 207. f. 2. Peduncles downy. Corolla red, with a pilose throat, and obliquely obovate-oblong segments, which are rounded at the apex. The flowers are so sweet as well as beautiful, that the women of South America adorn themselves with them, and put them among linen to scent it, as we do lavender. It is called by the French in the West Indies *Frangipanie rouge*.

Red-flowered Plumiera. Fl. July, Aug. Clt. 1690. Tree 12 to 20 feet.

2 P.? arbore'scens; leaves ovate-oblong, flat; petioles biglandular; flowers twin, disposed in terminal spikes. ♄. S. Native of Jamaica.—Lin. hort. cliff. p. 76. Brown. jam. p. 181. Flowers red.

Arborescent Plumiera. Tree 10 to 12 feet.

3 P. purpu'rea (Ruiz et Pav. fl. per. 2. p. 20. t. 137.) leaves oblong-ovate, with revolute edges; flowers terminal, cymose; corollas reddish purple. ♄. S. Native of Peru, in gardens. Petioles biglandular. Corollas sweet-scented, purple, with a yellow hairy throat, smaller than the other species. Perhaps *P. incarnàta*, *P. carinàta*, and *P. trícolor* are only varieties of *P. purpùrea*, differing in the size and colour of the flowers. In Peru the corollas are used by the women to ornament their hair.

Purple Plumiera. Fl. July, Aug. Clt. 1820. Tr. 20 ft.

4 P. incarna'ta (Ruiz et Pav. l. c. t. 138.) leaves ovate-oblong, acute; flowers cymose; corollas flesh-coloured, with a fulvous disk. ♄. S. Native of Peru. Cymes subumbellate.

Flesh-coloured-flowered Plumiera. Fl. July, Aug. Clt. 1820. Tree 20 feet.

5 P. carina'ta (Ruiz et Pav. fl. per. 2. p. 21.) leaves oblong-ovate, acuminated, keeled: with flat, red edges; corollas large, 3-coloured. ♄. S. Native of Peru. Very nearly allied to *P. incarnàta*, but differs in the edges of the leaves being usually red. Corollas yellow, with the centre white outside in the middle, and reddish above. Calyx red.

Keeled-leaved Plumiera. Tree 25 feet.

6 P. trícolor (Ruiz et Pav. l. c. t. 139.) leaves oblong, acute, and acuminated: with flat, veiny edges; flowers corymbose; corollas tricoloured. ♄. S. Native of Peru. Leaves with red veins. Corolla with a red tube, a copper-coloured throat, and the limb white, tinged with red.

Tricoloured-flowered Plumiera. Tree 30 feet.

7 P. Ke'rrii; leaves obovate-oblong, tapering at both ends, entire, with parallel veins and flat edges; peduncles terminal, cymose; corollas with a yellow throat, white above the yellow part, and red round the margins of the segments. ♄. S. Native of Mexico. P. trícolor, Ker. bot. reg. 510. but not of Ruiz et Pav.

Ker's Plumiera. Fl. July, Oct. Clt. 1815. Tree 15 feet.

8 P. Mille'ri; leaves ovate-oblong; flowers corymbose; corollas flesh-coloured. ♄. S. Native of St. Christopher. P. incarnàta, Mill. dict. no. 2. but not of Ruiz et Pav. Very nearly allied to *P. rùbra*, but of more humble growth, and the leaves are thicker and more veiny. Flowers 10 or more in each corymb.

Miller's Plumiera. Fl. July, Aug. Clt.? Tree or shrub.

9 P. bícolor (Ruiz et Pav. l. c. t. 140.) leaves oblong, acuminated: with flat edges; flowers corymbose; corollas cream-coloured: with a curved tube, yellow throat, and milk white limb. ♄. S. Native of Peru.

Two-coloured-flowered Plumiera. Fl. July, Oct. Clt. 1815. Tree 25 feet.

10 P. lu'tea (Ruiz et Pav. l. c. t. 142.) leaves oblong-obovate, acuminated; flowers corymbose; corollas yellow, variegated with white. ♄. S. Native of Peru. Tube of corolla curved, yellowish.

Yellow-flowered Plumiera. Fl. July, Aug. Clt. 1815. Tr. 15 feet.

11 P. a'lba (Jacq. amer. 36. t. 174. f. 12. ed. pict. t. 38. Lin. spec. p. 307.) leaves lanceolate-oblong; with revolute edges, acuminated; peduncles thickened at top, corymbose; corollas white: with a yellow throat. ♄. S. Native of the West Indies, as of Jamaica and Martinico, and of the main land of South America.—Plum. icon. t. 231.—Commel. hort. 2. p. 47. t. 24. Corolla with a very long, thick, incurved tube, and obovate-oblong oblique segments. Follicles reflexed. Flowers spicate, ambrosiacal, exciting cephalalgia, Lin. Leaves

a foot long. Called by the French in Martinico *Frangipanie blanc*.

Var. β; fragrantíssima (H. B. et Kunth, nov. gen. amer. 3. p. 230.) leaves obovate-lanceolate, short-acuminated, with flat edges, glabrous except the nerve and veins, which are downy beneath; flowers paniculately spicate, very fragrant; corolla with a white limb and yellow throat. ♄. S. Native of New Granada, and Peru, in the gardens of the Indians. Tree 40 feet high. P. bícolor, Ruiz et Pav. fl. per. 2. p. 21. t. 141.? Tube of corolla green, and ventricose at the base; segments of the limb obovate-oblong, obtuse, equal: throat hairy.

Var. γ, inodòra; stem with very few branches, about 8 feet high; flowers white, scentless, large. ♄. S. Native of Carthagena, in woods. P. inodòra, Jacq. amer. p. 36. Leaves like those of *P. rùbra*.

White-flowered Plumiera. Fl. July, Aug. Clt. 1733. Tr. 15 feet.

12 P. móllis (H. B. et Kunth, nov. gen. amer. 3. p. 230.) creeping or procumbent, rarely erectish; leaves obovate, acute, flat, glabrous above, but clothed with soft down beneath; corolla white. ♄. S. Native in the Missions of the Orinoco, in the island of Panumana, in places formerly cultivated. Leaves membranous, 6 inches long. Corolla with a downy tube and funnel-shaped limb; and ovate, acutish, equal segments. Perhaps a variety of *P. álba*.

Soft Plumiera. Shrub procumbent.

13 P. obtu'sa (Lin. spec. 307.) leaves lanceolate, petiolate, obtuse; flowers racemosely panicled; corolla white. ♄. S. Native of South America. P. nívea, Mill. dict. no. 7.—Catesb. car. 2. t. 93.—Plum. icon. t. 232. Leaves like those of *Oleánder*.

Blunt-leaved Plumiera. Fl. July, Aug. Clt. 1733. Tree 10 feet.

14 P. dra'stica (Mart. reise. ex Linnæa. 5. p. 40.) leaves on short thick petioles, obovate-oblong, short-acuminated, cuneated at the base while young, but rounded in the adult state, glabrous, distantly ribbed; panicles corymbose, glabrous, many-flowered, shorter than the leaves, bracteate. ♄. S. Native of Brazil, in the province of Rio Negro. Corollas white.

Drastic Plumiera. Tree.

15 P. phageda'nica (Mart. reise ex Linnæa. 6. p. 30.) leaves cuneate-oblong, short-acuminated, or rounded, glabrous on both surfaces, shining above, and veined beneath; flowers racemosely corymbose, involucrated by keeled bracteas; corolla with a slender tube, and obliquely lanceolate segments. ♄. S. Native of Brazil, in the province of Rio Negro.

Phagedanic Plumiera. Tree.

16 P. pudìca (Jacq. amer. 37. ed. pict. 24.) leaves oblong, flat, veined; limb of corolla closed, as in *Achània malvavíscus*. ♄. S. Native of South America, in Curaçoa, where it is highly esteemed, and is there called *Donzelle*. Corolla yellowish, very sweet-scented. The flowers succeed each other for two months together, and have an odour much more agreeable than that of any other species, or even any other flower.

Chaste-flowered Plumiera. Fl. July, Aug. Clt.? Sh. 5 ft.

17 P. articula'ta (Vahl, eclog. amer. 2. p. 20.) leaves elliptic, glabrous, veiny; spikes disposed in fascicles, articulated. ♄. S. Native of Guiana. Leaves scattered towards the tops of the branches, attenuated at both ends, but also rounded, paler beneath. Universal peduncles twin, often terminal, glabrous, elongated: partial ones disposed in something like fascicles, 3-8 together, simple, 3-4 inches long, flexuous, composed of turbinate joints half an inch long, which are dilated on the upper margins, and furnished with many minute teeth at the base of each joint. Flowers alternate, sessile. This is a very doubtful species of *Plumièra*, and may probably form a new genus.

Jointed-spiked Plumiera. Shrub or tree.

18 P. Africa'na (Mill. dict. no. 5.) leaves linear-lanceolate, very long, thick, juicy; corollas yellow. ♄. S. Native of Senegal. Trunk red. Leaves 9-10 inches long, 2 broad.

African Plumiera. Shrub or tree.

19 P. acumina'ta (Ait. hort. kew. ed. 2. vol. 2. p. 70.) leaves scattered, lanceolate, acuminated, glabrous, flat; flowers corymbose, terminal. ♄. S. Native of Amboyna, China, and Cochinchina. Ker. bot. reg. 114. P. acutifòlia, Poir. suppl. 2. p. 667. P. obtùsa, Lour. coch. 117. Flos. convolùtus, Rumph. amb. 6. p. 35. t. 38. Leaves with many transverse veins. Flowers terminal, in compound, spreading upright racemes. Corolla sweet-scented, white, mixed with red outside, and yellow inside; tube curved; segments obovate. Follicles reflexed.

Acuminated-leaved Plumiera. Fl. June, Sept. Clt. 1790. Tree 20 feet.

20 P. Mexica'na (Lodd. bot. cab. t. 1024.) leaves elliptic-lanceolate, acuminated; corollas white, with a yellow throat. ♄. S. Native of Mexico. Perhaps the same as the following.

Mexican Plumiera. Fl. June, July. Clt. 1810. Tree.

21 P. Lambertia'na (Lindl. bot. reg. t. 1378.) leaves oblong, acuminated, flat; corollas white, with a yellow throat; segments of the limb broad-rhomboid, obtuse. ♄. S. Native of Mexico. P. Gouàni, D. Don, ex Loud. hort. brit. p. 68. It differs from *P. Kérrii*, in the flowers being inodorous, and in being a little larger, and in the segments being broader and rounder.

Lambert's Plumiera. Fl. May, Aug. Clt. 1824. Tree 10 to 20 feet.

22 P. tubercula'ta (Lodd. bot. cab. 681. Hamilt. prod. p. 26.) branches tuberculate, especially at the origin of the petioles; leaves coriaceous, narrow-oblong, obtuse, tapering a long way into the petioles, downy beneath; peduncles axillary, much shorter than the leaves, many-flowered. ♄. S. Native of St. Domingo. Flowers white, scentless.

Tubercled-stemmed Plumiera. Fl. Aug. Clt. 1812. Sh. 6 ft.

† *Species under the following names are in Lodd. cat.* 1830. *p.* 15. *and p.* 16., *but they are probably synonymous with those described above.*

1 *P. aurántia*, Lodd. cat. p. 15. 2 *P. Blandfordiàna*, Lodd. cat. p. 15. 3 *P. Jamaicénsis*, Lodd. cat. p. 15. 4 *P. leucántha*, Lodd. cat. p. 15. 5 *P. macrophýlla*, Lodd. cat. p. 15. 6 *P. Northiàna*, Lodd. cat. p. 16. 7 *P. tenuifòlia*, Lodd. cat. p. 16.

Cult. All the species of *Plumièra* are very showy when in blossom, and on that account are favourites with gardeners. Being of a rather succulent or fleshy nature, they require but little water when not in a free growing state. The best soil for them is a mixture of peat, loam, and sand. Large cuttings of them strike readily in the same kind of mould recommended for the plants, if kept dry.

XXXVI. CONOPHARY'NGIA (from κονος, *conos*, a cone; and φαρυνξ, *pharynx*, the throat; in reference to the anthers being combined into a cone, protruding from the throat of the corolla.) Plumièra species, Lam. dict. 2. p. 542.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-toothed. Corolla funnel-shaped; segments oblong, villous, convex outside, and concave inside, regularly twisted into a spire about the centre, opening by a small hole; tube widening gradually to the top. Stamens 5, in the throat of the tube, rising each from the inside of a scrobicle; anthers triangular, very acute, cohering at top, above the throat of the tube, in a cone which clasps the style. Style slender, but thickened at top; stigma subbifid at the apex. Follicles twin, slipper-shaped, thick, fleshy,

many-seeded. Seeds form of those of the grape, attached to a slender central column.—Glabrous shrubs or trees, with opposite leaves, and terminal corymbs of flowers. Juice caustic, milky.

1 C. retu'sa; leaves ovate-wedge-shaped, retuse; corymbs compound, pedunculate. ♄. S. Native of Madagascar, Isle of France, &c. Plumièra retùsa, Lam. dict. 2. p. 542. no. 5. Bois de lait. Leaves smooth above and nerved beneath, 6 inches long and 3 broad; petioles very short, stem-clasping. Scales small, acute, under the pedicels in the corymb. Flowers form and scent of jasmine.

Retuse-leaved Conopharyngia. Shrub or tree.

2 C. longifòlia; leaves oblong-narrow, flat; corymbs panicled, nearly sessile. ♄. S. Native of Madagascar. Plumièra longifòlia, Lam. dict. 2. p. 542. Leaves a foot long, on short, thick, stem-clasping petioles, keeled, without any manifest nerves. Under each division of the corymbs are 2 opposite, concave acute scales; ulterior peduncles of the corymb 3-flowered; the 2 lateral flowers pedicellate and the middle one sessile. Calycine segments concave, roundish.

Long-leaved Conopharyngia. Clt. 1819. Shrub.

Cult. For culture and propagation see *Plumièra*, p. 94.

XXXVII. VI'NCA (from *vinco*, to conquer; because the species subdue other plants by their creeping roots, or bind them by their runners). Lin. gen. no. 295. Juss. 141.—Pervínca, Tourn. t. 45.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft; segments linear or subulate, acute. Corolla salver-shaped; tube longer than the calyx; throat bearded; segments of the limb flat, oblique, truncate at the apex. Stamens 5, inserted in the throat, inclosed; filaments short; anthers ending each in a hairy membrane at apex, which connive over the stigma; stigma bearded, seated on a flat orbicular disk, which is grooved round the circumference. Glands 2, alternating with the ovaria; glabrous as well as them. Follicles 2, erect, terete, narrow, dehiscing lengthwise, few-seeded. Albumen fleshy. Seeds cylindrical, naked.—Creeping, suffruticose, or herbaceous plants. Leaves smooth, shining, opposite. Flowers axillary, solitary, alternate, pedunculate, blue, purple, and white.

1 V. mìnor (Lin. spec. 304.) stems procumbent; leaves elliptic-lanceolate, glabrous; calycine segments linear-lanceolate, bluntish; segments of corolla broadish at top. ♄. H. Native of Europe, as of Germany, Switzerland, France, Italy, &c. In Britain it has been found in many places, in hedges and woods, in rather damp situations. Smith, engl. bot. t. 917. Curt. lond. 3. t. 16. Plenck, icon. t. 113. Blackw. t. 59. Pervínca mìnor, Scop. carn. no. 273.—Pervínca vulgàris, Park. threatr. 381. f. 1. Clématis daphnoìdes, Dodon. pempt. 401. Flowering stems usually erect. Flowers void of scent. Corolla blue; with white throat, varying to purple and white, of a smaller size than those of *V. màjor*. This species varies much in the colour of the flowers; they are also sometimes double; and the foliage is sometimes variegated, either with white or yellow stripes.

Lesser Periwinkle. Fl. Mar. Sept. Brit. Pl. creeping.

2 V. ma'jor (Lin. spec. p. 304.) stems erectish; leaves ovate, acute, ciliated; calycine teeth linear-subulate, ciliated, usually with a small tooth on each side at the base; segments of corolla broad, obovate. ♄. H. Native of Europe, as of France, Spain, Italy, Switzerland, &c. With us it is more common than *V. mìnor*, in moist woods and hedges; but these are probably both escapes from gardens. Smith, engl. bot. t. 514. Curt. lond. 4. t. 19. Plenck, icon. t. 114. Vínca mèdia, Delile. Pervínca màjor, Scop. carn. no. 274.—Garid. aix. t. 81.—Lob. icon. t. 636. This species is larger in all its parts than the preceding. Corollas fine purplish blue. Flowering stems erect; barren ones creeping. There is a variety of this with variegated leaves.

Greater Periwinkle. Fl. Mar. Sept. England. Sh. 2 feet.

3 V. herba'cea (Waldst. et Kit. pl. rar. hung. 1. p. 8. t. 9. Hook, bot. mag. 2002.) stems herbaceous, procumbent, rooting; leaves oblong-lanceolate, minutely ciliated on the edges while young; calycine segments linear-subulate, acute, glabrous; segments of corolla lanceolate, falcate. ♃. H. Native of Hungary, in open, chalky, sandy hills. Flowers purplish blue. A most elegant plant when in blossom.

FIG. 13.

Herbaceous Periwinkle. Fl. June, July. Clt. 1816. Pl. creeping.

Cult. As these plants delight to grow under the cover of trees and bushes, they may be made ornamental, if they are planted in shrubberies, where they will spread and cover the ground; and as their leaves continue green all the year, they will have a good effect in winter, and their elegant and delicate flowers appearing a great part of summer will add to the variety. They are easily increased by separating the rooted trailing shoots.

XXXVIII. CATHARA'NTHUS (from *καθαρος, katharos*, pure, and *ανθος, anthos*, a flower; in reference to the neatness and beauty of the flowers).—Vínca species, Lin.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted; segments subulate. Corolla salver-shaped; segments nearly equal sided, obovate, mucronate; throat bearded; tube long, slender, clavate at top with 5 tubercles. Stamens inclosed, conniving over the stigma. Anthers mucronate, not membranous at top, sessile. Stigma capitate, marginate, bearded at top, and furnished with a cup-shaped membrane below, which sheaths the upper part of the style. Hypogynous glands 2, elongated like the ovaria. Follicles twin, small, terete, glabrous, 2-celled, dehiscing inside; dissepiment double, taking its rise from the suture, which is plaited inwards. Seeds 16-20 in each follicle, attached longitudinally to each side of the dissepiment, small, ovate-acuminated above, grooved and rugged from sharp tubercles on one side, and smooth on the other side. Albumen fleshy.—Small shrubs or herbs. Leaves opposite, evergreen, coriaceous. Flowers elegant, axillary, solitary, or twin.

1 C. ròseus; downy; branches terete; leaves elliptic, obtuse, mucronate; petioles bidentate or bistipulate at the base; flowers axillary, solitary, or twin, sessile. ♄. S. Native every where within the tropics, but probably originally from Madagascar. Vínca ròsea, Lin. spec. 305. Mill. fig. t. 186. Curt. bot. mag. 248. Gærtn. fruct. 2. p. 172. t. 117. f. 5. Flowers bright crimson, or peach or rose-coloured, paler on the under side, with a dark purple eye. Calycine segments ciliated.

Var. α, ròseus; flowers rose-coloured.

Var. β, albus; flowers white.

Var. γ, occellàtus; flowers white, with a purple circle.

Var. δ, villòsus; leaves villous, rounded at top, mucronate. Vìnca ròsea, Poir. dict. 5. p. 199.

Rose-coloured-flowered Catharanthus. Fl. Feb. Oct. Clt. 1726. Shrub 1 to 2 feet.

2 C. pusíllus; stem herbaceous, quadrangular, much branched; leaves lanceolate or ovate-lanceolate, glabrous; furnished with opposite stipulas at the base; flowers twin or solitary, axillary, pedunculate. ⊙. S. Native of Tranquebar. Vínca pusílla, Lin. suppl. 166. syst. 252. Murr. comm. goett. 1772. p. 66. t. 2. f. 1. Vínca parviflòra, Retz. obs. 2. p. 14. no. 33. Ait.

hort. kew. ed. 2. vol. 2. p. 67. Cupa veela, Rheed. mal. 9. p. 61. t. 33. Flowers size and colour of those of *Lithospérmum officinàle*. Follicles longer than those of *C. ròseus*.

Least Catharanthus. Fl. Aug. Clt. 1778. Pl. $\frac{1}{2}$ to 1 foot.

Cult. *C. ròseus* is a very elegant and delicate shrub, of easy culture; and is increased readily by cuttings or seeds. *C. pusíllus*, being annual, is only to be preserved by sowing the seeds in a pot full of light rich earth, and placing it in a hot-bed.

Tribe V.

ALYXIE'Æ (this tribe agrees with *Alýxia* in the fruit being drupaceous). Ovarium double. Fruit drupaceous. Albumen large, ruminated or fleshy.

XXXIX. ALY'XIA (from *αλυξις*, *alyxis*, anxiety, grief; gloomy appearance of the shrubs.) Banks, herb. ex R. Br. prod. p. 469. Cunningh. in bot. mag. no. 3312. Gynopògon, Forst. char. gen. p. 36. t. 18.

Lin. syst. *Pentándria Monogýnia*. Calyx 5-parted. Corolla salver-shaped, with a naked throat. Stamens inclosed. Ovaria twin, few-seeded. Styles sub-adherent. Stigma obtuse. Drupes 2, pedicellate, one of which is usually abortive, simple, containing a semibilocular 1-seeded putamen. Seed semibipartite. Albumen ruminated horny. Embryo erect, straight, or curved. Small, glabrous, lactescent trees or shrubs. Leaves verticillate or opposite, coriaceous, compact, evergreen. Flowers axillary or terminal, sometimes spicate, small, white, and usually sweet-scented. Habit and structure of flowers as in other Apocyneous plants, but differs in the albumen being ruminated, and easily separated into lobes.

* *Leaves verticillate.*

1 A. actinophy'llum (Cunningh. in bot. mag. no. 3313.) corymbs simple, axillary, pedunculate; pedicels 1-3-flowered; calyx bractless; leaves 4-6-8 in a whorl, petiolate, long-lanceolate, glabrous, with revolute edges, glaucous beneath: with obtuse-angled, parallel veins; peduncles only half the length of the leaves; stigma oblong, membranous, beardless; stem arborescent. ♄. S. Native of New Holland, on the shore within the tropic, as at Endeavour River and Montague Sound.

Ray-leaved Alyxia. Shrub.

2 A. spica'ta (R. Br. prod. 1. p. 470.) spikes axillary; flowers verticillate, almost sessile, unibracteate; leaves 3 in a whorl, oval-oblong; petioles shorter than the peduncles: with a simple base; stigma sub-conical, furnished with a short beard. ♄. S. Native of New Holland, on the east coast, within the tropic (R. Br.), Endeavour River (A. Cunningh.).

Spike-flowered Alyxia. Shrub.

3 A. tetragòna (R. Br. prod. p. 470.) spikes axillary; flowers verticillate, almost sessile, tribracteate; leaves 4 in a whorl, oblong; petioles longer than the peduncles: with a gibbous base. ♄. S. Native of New Holland, within the tropic; Lizard Island. A. Cunningh.

Tetragonal Alyxia. Shrub.

4 A. stella'ta (Rœm. et Schultes, syst. 4. p. 439.) umbels axillary, pedunculate, much shorter than the leaves; calyx bractless; leaves 3 in a whorl, lanceolate, somewhat acuminated, bluntish, attenuated at the base, smooth; stigma capitate, bearded (ex Spreng.). ♄. S. Native of the Society and Friendly Islands. Gynopògon stellàtum, Forst. prod. no. 117. char. gen. p. 36. t. 18. Labill. sert. cal. p. 30. t. 34. A. aromática, Reinwdt. A. Reinwárdtii, Blum. cat. hort. buitenz, p. 43.

Starry-leaved Alyxia. Shrub.

5 A. obtusifòlia (R. Br. prod. p. 470.) umbels axillary, pedunculate; calyx bractless; leaves 3 in a whorl, ovate or obovate, very blunt. ♄. S. Native of New South Wales, on the south coast.

Blunt-leaved Alyxia. Shrub.

6 A. laurìna (Gaud. in Freyc. voy. pt. bot. p. 451. t. 62.) peduncles terminal, usually by threes, 1-3-flowered; calyx bractless; leaves 3 in a whorl, oblong, rather coriaceous, terminating in a rounded, emarginate, taper point; stigma ciliated. ♄. S. Native of the Moluccas.—Rumph. amb. 5. p. 34. t. 20. (ex Gaud.)

Laurel-like Alyxia. Shrub.

7 A. olivæfórmis (Gaud. in Freyc. voy. pt. bt. p. 451.) peduncles axillary, solitary, 2-4-flowered; leaves 3 in a whorl, elliptic-oblong, acute at both ends, membranous; fruit olive-formed. ♄. S. Native of the Sandwich Islands.

Olive-formed-fruited Alyxia. Shrub.

8 A. Torresia'na (Gaud. in l. c.) peduncles axillary, solitary, 2-flowered, exceeding the petioles; leaves 3 in a whorl, elliptic, obtuse, sub-emarginate, running into the petioles at the base; fruit roundish elliptic. ♄. S. Native of the Marianne Islands.

Torres's Alyxia. Shrub.

9 A. gynopògon (Rœm. et Schultes, syst. 4. p. 440.) flowers almost sessile, axillary or terminal, solitary or twin; leaves 4-5 in a whorl, obovate, or ovate-oblong, bluntish, attenuated at the base, shining, veinless beneath; stigma beardless; branches twiggy, glabrous. ♄. S. Native of Norfolk Island, in shady humid parts of woods. Wall. cat. 1650. Endlicher, prod. fl. norf. p. 58. Bauer. ill. pl. norf. t. 119. A. Forstèri, Cunningh. mss. 1830. Gynopògon Alýxia, Forst. prod. no. 118.

Gynopogon Alyxia. Clt.? Shrub.

10 A. daphnoìdes (Cunning. in bot. mag. t. 3313.) flowers sessile, axillary, or terminal; leaves 4 in a whorl, obovate-oblong, elliptic, or rhomboid, obtuse, smooth, shining, veiny beneath; stigma tipped by a short, pencil-like beard; branches straight, tomentose, scabrous. ♄. S. Native of Norfolk Island, in dry shady woods.

Daphne-like Alyxia. Clt. 1831. Shrub.

11 A. ruscifòlia (R. Br. prod. p. 470.) flowers almost sessile, terminal; leaves 4 or 3 in a whorl, broad-elliptic or elliptic-lanceolate, acute, mucronate: the mucrone spiny; veins acute, angular; the surfaces and margins rather roughish; stigma truncate at apex, pencilled. ♄. S. Native of the south coast of New South Wales. Lodd. bot. cab. 1811. Cunningh. in bot. mag. 3312. A. Richardsònii, Sweet.

Var. β, *pugionifórmis* (Cunningh. mss. 1828. and l. c.) leaves narrow-lanceolate, mucronate. ♄. S. Native of Morton Bay.

Ruscus-leaved Alyxia. Fl. April, July. Clt. 1820. Shrub 4 to 6 feet.

* * *Leaves opposite.*

12 A. sulca'ta (Hook. ann. in Beech. voy. pt. bot. p. 90.) leaves opposite, ovate, obtuse, rather membranous, shining on both surfaces, obsoletely and parallelly veined; peduncles axillary, solitary, 3-flowered, one half shorter than the leaves; fruit olive-formed, furrowed longitudinally. ♄. S. Native of the Sandwich Islands.

Furrowed-fruited Alyxia. Shrub.

13 A. sca'ndens (Rœm. et Schultes, syst. 4. p. 440.) peduncles axillary, 3-flowered, longer than the petioles; leaves opposite, oval, oblong-elliptic, bluntly acuminated, shining, with parallel veins; branches climbing. ♄. ب. S. Native of the Society Islands. Gynopògon scándens, Forst. prod. no. 119.

Climbing Alyxia. Shrub cl.

14 A. buxifòlia (R. Br. prod. p. 470.) flowers usually twin, interpetiolar; leaves opposite, oval or obovate, smooth on both surfaces, terminating in a callous point; stigma much bearded. ♄. S. Native of New South Wales, on the east and south coasts; also of the island in Bass Straits, as also in the northern regions of Van Diemen's Land.

Box-leaved Alyxia. Shrub.

15 A. odora'ta (Wall. cat. no. 1606.) peduncles axillary, 3-flowered; leaves opposite, or 3 in a whorl, obovate-elliptic, tapering much to the base. ♄. S. Native of Chapedong.

Sweet-scented Alyxia. Shrub.

16 A. glauce'scens (Wall. cat. no. 1607.) leaves opposite, oblong, coriaceous, shining above, glaucous beneath; corymbs axillary, many-flowered; throat of corolla crowned. ♄. S. Native of the Straits of Malacca.

Glaucescent Alyxia. Shrub.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

XL. CE'RBERA (so named from Cerberus, on account of its poisonous qualities). Lin. gen. no. 294. Juss. 149. H. B. et Kunth, nov. gen. amer. 3. p. 223. Blum. bijdr. p. 1031.—Ahoúai, Tourn. inst. 434. Jacq. amer. 48. Thevètia, Juss. in ann. mus. 15. p. 346.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted; segments permanent. Corolla funnel-shaped; tube pilose inside at top; throat 5-toothed: teeth opposite the anthers; limb 5-cleft; segments oblique, or unequal-sided. Anthers seated on the top of the tube, almost sessile, inclosed, ovate, adhering to the stigma. Ovarium didymous, girded by 5 hypogynous scales or glands. Style filiform, didymous; stigma discoid: having the margin crenulated below, but convex and emarginate above. Drupes twin, one of them usually abortive, containing a fibry semi-bivalved, 1-celled putamen; cells divided into two divisions by the moveable dissepiment. Seeds usually solitary.—Lactescent trees or shrubs. Leaves scattered, quite entire. Peduncles extra-axillary at the tops of the branches. Flowers showy yellow or white.

1 C. Theve'tia (Jacq. amer. 48. t. 34. ed. pict. t. 47.) leaves linear, with sub-revolute edges, almost veinless, glabrous; peduncles generally 1-flowered; calycine segments ovate, lanceolate, acute, 3 times shorter than the tube of the corolla. ♄. S. Native of New Granada, in hot places; Mexico, Cuba, Martinico, &c. Lin. spec. 303. Lam. ill. t. 170. f. 2. Hook. bot. mag. 2309.—Plum. icon. t. 18.—Pluk. alm. p. 253. t. 207. f. 3.—Hern. mex. 443. f. 3. Axils of leaves furnished with some subulate scales. Corollas yellow. Drupe half orbicular, truncate at top, 2-celled, size of a bean; cells bipartite.

Thevet's Cerbera. Fl. June, July. Clt. 1735. Tree 12 ft.

2 C. thevetioìdes (H. B. et Kunth, nov. gen. amer. 3. p. 223.) leaves lanceolate-linear, acute, veiny, glabrous, with revolute edges: nerves and veins pilose beneath; flowers crowded at the tops of the branches, on short peduncles, sometimes 2 on a single peduncle; calycine segments oblong-lanceolate, acutish, 3 times shorter than the tube of the corolla. ♄. S. Native of New Spain, in temperate places, near the town of Tasco. Leaves $4\frac{1}{2}$ inches long. Segments of corolla dimidiately obovate. Drupe globose, size of an apple. Corollas yellow.

Thevetia-like Cerbera. Fl. April, July. Clt. 1800. Tree 12 ft.

3 C. Peruvia'na (Pers. ench. 1. p. 267.) leaves linear-lanceolate, crowded, glabrous; peduncles short, few-flowered. ♄. S. Native of Peru, in woods. C. Thevètia, Ruiz et Pav. fl. per. 2. p. 27. t. 153. f. b. C. Thevètia β, Poir. suppl. 1. p. 261.? According to Cav. descr. p. 108. this differs from *Thevètia* in the ovarium being tetragonal, not round, in the peduncles being few-flowered, not 1-flowered. Corollas yellow, with wedge-shaped, oblique, truncate segments, and a villous throat: having 5 subulate teeth, closing the tube.

Peruvian Cerbera. Tree 12 feet.

4 C. Ahou'ai (Lin. spec. 1. p. 303.) leaves ovate, acute, glabrous; peduncles terminal, short, 6-7-flowered; calycine segments reflexed; segments of corolla undulated. ♄. S. Native of Brazil. Curt. bot. mag. 737. Andr. rep. 231. Lam. ill. 2. p. 193. t. 170. f. 1. C. Thevètia, Lin. hort. cliff. p. 75. Ahouai, Thev. antarct. p. 66. Corollas pale yellow. The wood is very fetid; and the fruit is a deadly poison. The Indians are said to put small stones into the empty nuts, string them, and fasten them about their legs when they dance.

Ahouai Cerbera. Fl. June, July. Clt. 1739. Tree 10 to 20 feet.

5 C. ova'ta (Cav. icon. 3. p. 35. t. 270.) leaves oblong-ovate, green above, rather downy beneath, and yellowish; flowers terminal, usually 5 together; calycine segments ovate, acute, reflexed; segments of corolla arched. ♄. S. Native of New Spain. Corolla yellow. Fruit nearly globose, size of a walnut, compressed, bluntly truncate.

Ovate-leaved Cerbera. Shrub 3 to 6 feet.

6 C. cuneifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 224.) leaves oblong-cuneated, rounded at the apex, puberulous above and downy beneath; peduncles sub-dichotomous, few-flowered; calycine segments oblong, acute, hardly shorter than the tube of the corolla; segments of corolla dimidiately obovate. ♄. G. Native of Mexico, on the western declivities of the mountains, between Zumpango and Mescalo. Leaves 3 inches long, and an inch broad at top, with some scales in their axils. Peduncles hairy. Corollas yellow?

Wedge-leaved Cerbera. Fl. April. Tree.

7 C. nítida (H. B. et Kunth, nov. gen. amer. 3. p. 225.) leaves oblong-lanceolate, acuminated, with subrevolute edges, glabrous and shining above, but hairy beneath; flowers racemose; calycine segments ovate, acuminated, 4 times shorter than the tube of the corolla; segments of corolla rounded. ♄. S. Native of New Granada, at the mouth of the river Sinu, and near Turbaco. Leaves 8-10 inches long. Corollas white, about the size of those of *Vinca ròsea;* limb downy outside. Ovaria girded by 5 combined glands. Drupes combined, fleshy, 2-lobed, 4-celled? cells 1-seeded.

Shining Cerbera. Fl. March. Shrub.

† *Doubtful species.*

8 C. alliodòra (Willd. mss. ex Rœm. et Schultes, syst. 4. p. 798.) leaves roundish, obtuse, roughish. ♄. S. Native of South America. Humb. et Bonpl.

Garlic-scented Cerbera. Shrub or tree.

9 C. obova'ta (Willd. l. c.) leaves elliptic-obovate, tapering into the petioles, glabrous, parallelly veined beneath. ♄. S. Native of?

Obovate-leaved Cerbera. Shrub or tree.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

XLI. TANGHI'NIA (*Tanghen* or *Tanghin* is the Madagascar name of *T. venenéflua*, the juice of which is the ordeal water of that island). Pet. Th. gen. med. p. 10. Poir. suppl. 5. p. 283. Bojer. in Hook. bot. misc. 3. p. 290. t. 110.—Cérbera species of authors. Cynóctonum, Gmel. syst. veg. 1. p. 443.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft; segments spreading, deciduous. Corolla salver-shaped, longer than the calyx; with a pentagonal, dilated throat; limb spreading; segments unequal-sided. Stamens 5, inserted into the dilated part of the tube of the corolla; anthers thick, heart-shaped, hidden by as many foliaceous acuminated inflexed lamellæ or scales, which rise from the throat: having an umbilical tubercle under each anther. Ovarium solitary, 4-lobed, girded by a hypogynous ring. Stigma capitate, 2-lobed, inclosed in the dome formed by the anthers. Drupe ovate, containing a fibry nut, which is acute at both ends. Integument of seed membranous. Albumen none, ex Pet. Th.; concatenated, horny, ex Bojer. Cotyledons flat, slender, somewhat cordate, ex Bojer; thick, concave, ex Pet. Th. Embryo superior, inverted.—Glabrous trees, with the habit of *Mango*. Leaves alternate, approxi-

mate at the tops of the branches, coriaceous. Flowers disposed in terminal corymbose panicles. Peduncles and pedicels bibracteate, twice ternate. Corollas white, or pink: with a dark eye.

1 T. venene'flua (Poir. l. c. Bojer. l. c.) leaves elliptic-lanceolate, approximate, coriaceous, glabrous, shining: with revolute, cartilaginous edges; flowers disposed in terminal, corymbose panicles. ♄. S. Native of Madagascar. Cérbera Tánghin, Hook. bot. mag. 2968. Leaves 5-8 inches long. Corollas with a green tube, and pink or rose-coloured limb. This is the famous ordeal tree of Madagascar.

The custom of administering Tanghin as an ordeal, in Madagascar, has become far more universal during the present reign, than at any former period of the Huwa government. When her present majesty, in the beginning of 1830, came to the resolution of cleansing her lands from sorcerers, an ordeal was commanded in every town and village; and in Tannanarivoo scarcely any class of inhabitants escaped. On the 9th of May, 1830, in compliance with the sovereign's mandate, a notable administration of Tanghin took place. The accused persons amounted to about thirty, including some of the highest rank in the kingdom. All the nobility recovered; while the unknown plebeians, who, according to the common jugglery, had been compelled to drink with them, died. The former made the usual triumphant entry into the town, on the 17th, borne in open palanquins, amongst the shouting, dancing, and grimaces of the many thousands of people. In the following month, April, about an equal number of Malagassy ladies submitted to the same ordeal; but all survived, and, in due course, made a grand entry into town. The Tanghin is administered in private, as well as in public. A subject so deeply rooted in the minds of all the Malagassy people, from the sovereign down to the slave, is the belief in witchcraft; and so blindly are they led by this belief, that a whole nation may be considered as labouring under a spell, as powerful as the fascination which they attribute to the unfortunate sorcerers themselves. The fruit of the Tanghin is the part used, and is administered by means of some liquid, as broth, &c.

Poison-flowing Tanghinia. Fl. July. Clt. 1826. Tree 30 feet.

2 T. Ma'nghas; leaves oblong-lanceolate, acute, tapering downwards, approximate, shining; segments of corolla ovate, with an incurved, sub-retuse apex; panicle terminal, corymbose. ♄. S. Native of Singapore, and some of the adjacent islands, Ceylon, &c. Cérbera Mánghas, Lin. fl. zeyl. 106. Gærtn. fruct. 2. p. 192. t. 123-124. f. 1. Cérbera lactària, Hamilt. Arbor lactària, Rumph. amb. 2. p. 243. t. 81. Cérbera quaternifòlia, Roxb. hort. beng. 19.—Burm. zeyl. p. 150. t. 70. f. 1. Leaves dark green and shining above, and paler beneath, with capillary, sub-transverse nerves, which unite by means of a submarginal vein. Panicle large, open, with articulated dichotomous or trichotomous branches. Flowers white, by threes, scentless. Calycine segments lanceolate. Scales in the mouth of the corolla villous, pink-coloured. Drupe ovate-oblong, sometimes twin. The seeds in this and the following are said to be exalbuminous.

Manghas Tanghinia. Fl. July, Sept. Clt. 1800. Tree 20 ft.

3 T. Odóllam; leaves lanceolate, approximate, shining; corymbs terminal; calycine segments linear, revolute; segments of corolla sub-falcate. ♄. S. Native of various parts of India, on the shores, in salt swamps. Cérbera Odóllam, Gærtn. fruct. 2. p. 193. t. 124. Cérbera Mánghas, Sims, bot. mag. 1845. Odóllam, Rheed. mal. 1. p. 71. t. 39. Wood remarkably spongy, and white. Flowers large, white, fragrant. Stigma large and conical, 2-cleft at apex, resting in a saucer-shaped receptacle, the circumference fluted with 10 grooves.

Odollam Tanghinia. Fl. July, Sept. Clt. 1756. Tree 20 feet.

4 T. laurifólia; leaves lanceolate, obtuse, attenuated at the base, coriaceous, quite entire, glabrous, with dense parallel nerves. ♄. S. Native of the East Indies. Cérbera laurifòlia, Lodd. bot. cab. 989. Flowers white.

Laurel-leaved Tanghinia. Fl. May, Sept. Clt. 1818. Shrub.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

XLII. RAUWO'LFIA (so named by Plumier, in honour of Leonhard Rauwolf, physician at Augsburg, who travelled in France and Italy, 1560—1563; and through Palestine and other countries, in 1573—1575. His travels were published in German, in 1582 and 1583, and were translated into English by Nich. Staphorst, under the revision of Mr. Ray, with additions by him. John Fred. Gronovius published a catalogue of the plants which Rauwolf found in his travels to the East in 1775, under the title of Flora Orientalis, Lugdb. oct. He died in 1596.) Plum. gen. 40. Lin. gen. no. 293. Juss. gen. 148. Gærtn. fruct. t. 52. Jacq. amer. 47. Roxb. fl. ind. 2. p. 543. Blum. bijdr. 1033, but not of Ruiz. et Pav.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, permanent. Corolla funnel-shaped, with a bearded throat, a short tube, and a twisted, 5-lobed limb; segments unequal-sided. Stamens 5, inclosed, or a little exserted; anthers free, ovate-cordate. Ovaria 2, combined, girded by a hypogynous ring; 2-celled, bi-ovulate. Style didymous. Stigma sub-capitate, or peltate, emarginate. Drupe didymous, globose, containing 2 1-celled, 1-seeded nuts, or a 2-celled one; cells divided into 2 chambers. Seeds reflexedly conduplicate below, attached to the dissepiment, which is incomplete, and is perhaps a dilated placenta. Embryo uncinately recurved at the base, with a superior radicle. Albumen fleshy, conforming to the seed.—Lactescent shrubs, or small trees; with verticillate leaves; and interpetiolar corymbs of small flowers. Petioles furnished with subulate glands inside.

* *Species natives of South America.*

1 R. psychotrioìdes (H. B. et Kunth, nov. gen. amer. 3. p. 231.) leaves 4 in a whorl, elliptic-oblong, acuminated, glabrous, 2 of which are much smaller than the other 2, having the middle rib ciliated towards the base; corymbs on long peduncles. ♄. S. Native of the Spanish Main, in shady places, near Cumana. R. víridis, Willd. herb, ex Rœm. et Schultes, syst. 4. p. 805. Leaves membranous, shining above, but paler beneath, 4 or 4½ inches long. Bracteas lanceolate-linear. Corymbs small. Corollas white, downy outside. Calycine segments ovate, acute. Segments of corolla dimidiately oblong, obtuse. Perhaps the same as *R. nítida.*

Psychotria-like Rauwolfia. Tree 10 to 15 feet.

2 R. ternifòlia (H. B. et Kunth, l. c. p. 232.) leaves 3 in a whorl, oblong, acuminated, glabrous; peduncles few-flowered, sub-corymbose. ♄. S. Native of New Spain, on the banks of the river Magdalena, near Monpox. Hook. bot. mag. 2440. R. ligustrìna, Willd. herb. no. 5097. Rœm. et Schultes, syst. 4. p. 805. Leaves membranous, 2-4 inches long. Flowers like the preceding. Calycine segments ovate-lanceolate.

Three-leaved Rauwolfia. Fl. May. Clt. 1823. Shrub.

3 R. nítida (Jacq. amer. p. 47. Lin. spec. 303.) leaves 3 and 4 in a whorl, elliptic-lanceolate, acuminated, quite glabrous, shining, having the midrib rather villous beneath; corymbs few-flowered. ♄. S. Native of South America, and St. Domingo, in woods. Lam. ill. t. 172. f. 1. Lodd. bot. cab. 339. R. víridis, Herb. Willd. R. heterophýlla, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 805.—Plum. gen. 19. icon. 236. f. 1. Leaves approximate, unequal in size, 3 inches long, and one broad. Calycine teeth acute. Corollas white. Petals ciliated, with thick conical pili. Fruit at first yellowish, afterwards dark purple.

Shining-leaved Rauwolfia. Fl. June, Sept. Clt. 1752. Tree 12 feet.

4 R. Brazilie'nsis (Spreng. syst. 1. p. 834.) leaves 3 in a whorl, elliptic-oblong, acute, opaque, having the veins and nerves downy beneath; peduncles 1-flowered, axillary, thick, and are, as well the calyxes, silky. ♄. S. Native of Brazil.

Brazilian Rauwolfia. Shrub.

5 R. parviflòra (Bert. ex Spreng. syst. 1. p. 834.) leaves 3 in a whorl, oblong-lanceolate, rather unequal; peduncles 1-flowered, capillary, axillary, shorter than the leaves. ♄. S. Native of Brazil.

Small-flowered Rauwolfia. Shrub.

6 R. cane'scens (Lin. syst. 250.) leaves 4 in a whorl, oblong-obovate, acuminated, downy; corymbs few-flowered. ♄. S. Native of Jamaica, and other West India Islands. R. subpubéscens, Lin. spec. 303. R. hirsùta, Jacq. amer. p. 47. ed. pict. p. 259. f. 17.—Plum. gen. 9. icon. 236. f. 2.—Sloane, jam. 173. hist. 2. p. 107. t. 188. f. 1.—Pluk. phyt. 266. f. 2. Branches rather tomentose. Leaves more tomentose beneath than hairy. Calycine segments lanceolate. Segments of corolla nearly square, sub-emarginate. Drupes dark red. Flowers small, red.?

Canescent Rauwolfia. Fl. June. Clt. 1739. Shrub 2 to 8 feet.

7 R. tomentòsa (Lin. spec. 303.) leaves 4 in a whorl, oblong, attenuated at both ends, tomentose; corymbs few-flowered. ♄. S. Native on rocks and walls, of Carthagena, in South America. Jacq. amer. 48. obs. 2. t. 35. Flowers small, white. Calycine segments ovate. Fruit at length nearly black.

Tomentose Rauwolfia. Fl. April, Oct. Clt. 1823. Shrub 3 to 4 feet.

* * *Species natives of the East Indies.*

8 R. Sumatra'na (Jack, mal. misc. 1. no. v. p. 22. ex Roxb. fl. ind. 2. p. 543. Blum. bijdr. p. 1034.) leaves 3-4 in a whorl, cuneate-oblong, or obovate, glabrous; umbels or corymbs terminal, pedunculate, few-flowered; mouth of corolla shut by 5 fascicles of villi. ♄. S. Native of Java and Sumatra, frequent in the neighbourhood of Bencoolen. This shrub resembles the *Manggalaut*, or *Tanghinia Mánghas*, in habit and foliage. Leaves 6 inches long. Flowers small, white. Segments of corolla roundish. Stigma peltate. This species resembles *R. nítida*, but is sufficiently distinguished by its inflorescence. The wood, being light, is employed by the Sumatrans, for scabbards to their swords, and krises.

Sumatra Rauwolfia. Tree 12 to 15 feet.

* * * *A species native of Africa.*

9 R. vomitòria (Afz. rem. guin. ex Spreng.) leaves 4 in a whorl, oblong-lanceolate, on long petioles; branches tetragonal; flowers axillary, umbellate. ♄. S. Native of Guinea.

Vomit Rauwolfia. Shrub.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

XLIII. DISSOLE'NA (from *δις*, *dis*, double; and *σωλην*, *solen*, a tube; the lower part of the tube of the corolla is different from that of the upper.) Lour. coch. p. 138.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx tubular, 5-cleft; segments subulate, erect. Corolla with a long tube of two forms: lower part thick, pentagonal, and staminiferous; upper part cylindrical: limb spreading, 5-cleft. Stamens inserted beneath the mouth of the lower part of the tube. Style shorter than the stamens; stigma sub-ovate, thick, scabrous. Drupe small, ovate, containing a compressed, scabrous, 1-celled, 1-seeded nut.—An upright shrub, with spreading branches. Lower leaves opposite; upper ones 3-4 in a whorl. Racemes subdivided, terminal. Corollas white. Drupes black, glabrous. Nearly allied to *Rauwólfia* or *Ochròsia*.

1 D. verticilla'ta (Lour. coch. p. 138.) ♄. G. Native of China, in the province of Canton. Cérbera Chinénsis, Spreng. syst. 1. p. 643.

Whorled-leaved Dissolena. Fl.? Clt. 1812. Shrub 8 feet.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

XLIV. OCHRO'SIA (from *ωχρος*, *ochros*, pale yellow; colour of flowers.) Juss. gen. 144. Labill. sert. cal. 25. Cérbera species of authors.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx small, 5-toothed, or 5-parted. Corolla funnel-shaped; segments of the limb 2-lobed, spreading, oblique. Stamens 5, inserted in the throat. Anthers inclosed. Stigma thick, 2-lobed. Fruit twin, or solitary by abortion, drupaceous, each containing a 2-4-celled nut; each cell 1-2-3-seeded. Seeds oblong, unequal, flat, with membranous edges, albuminous?—Glabrous shrubs, with verticillate leaves, 4 in a whorl; and dichotomous corymbs of flowers.

1 O. Borbónica (Juss. gen. p. 145.) leaves 4 in a whorl; ovate-lanceolate, shining; corymbs terminal, and in the forks of the branches. ♄. S. Native of Bourbon, Isle of France. Ophióxylon Ochròsia, Pers. ench. 1. p. 266. Rauwólfia striàta, Poir. dict. 4. p. 85. no. 5. suppl. 4. p. 120. and p. 656. Dideròta amphicárpa, Comm. mss. Cérbera Borbónica, Spreng. syst. 1. p. 642. Habit of *Ophióxylon serpentìnum*. Stem yellowish. Leaves 2-5 inches long, greenish yellow beneath. Corymbs dense. Corolla cream-coloured. Drupes 2-celled.

Bourbon Ochrosia. Fl.? Clt. 1823. Shrub.

2 O. macula'ta (Jacq. coll. 4. p. 218. icon. rar. 2. t. 321, exclusive of the syn. of Forst. Dryander, in Lin. trans. 2. p. 227.) leaves 3-4 in a whorl, oblong-lanceolate, acuminated at both ends, undulated, veiny, spotted; corymbs terminal, and in the forks of the branches, or axillary. ♄. S. Native of the Island of Bourbon. Cérbera maculàta, Willd. spec. 1. p. 1223. Cerbèra undulàta, Andr. rep. t. 130. The leaves only spotted in the dried state, shining, 4 inches long. Corolla white, with a red throat. Fruit yellow, acuminated, containing a 2-celled nut.

Spotted-leaved Ochrosia. Shrub 4 to 6 feet.

3 O. ellíptica (Labill. sert. cal. p. 25. t. 30.) leaves elliptic, 3 in a whorl; drupe 4-celled. ♄. S. Native of New Caledonia. An erect shrub. Leaves emarginate, coriaceous; petioles furnished with papillæform or lamellose resin inside. Flowers sub-corymbose, interpetiolar and terminal. Follicles sub-triquetrous.

Elliptic-leaved Ochrosia. Shrub erect.

4 O. parviflòra; leaves 4 in a whorl, oblong, bluntish, parallelly-veined, flat; cymes pedunculate, sub-axillary, branched, divaricate. ♄. S. Native of the Sandwich Islands. Cérbera parviflòra, Forst. prod. no. 121. Hook. and Arn. in Beech. voy. pt. bot. p. 90. Very nearly allied to *O. maculàta*.

Small-flowered Ochrosia. Shrub 3 to 4 feet.

Cult. For culture and propagation see *Tabernæmontána*, p. 92.

XLV. OPHIO'XYLON (from *οφις*, *ophis*, a serpent; and *ξυλον*, *xylon*, wood; twisted root and stems.) Lin. gen. no. 142. Juss. gen. 321. Gærtn. fruct. 2. p. 129. t. 109. Roxb. fl. ind. 2. p. 530. Blum. bijdr. p. 1037.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-cleft, or 5-toothed, permanent. Corolla funnel-shaped, with a long tube, which is thickened in the middle, and a 5-cleft, oblique limb. Anthers almost sessile, inserted in the middle of the tube. Ovarium didymous; lobes 1-ovulate. Style filiform, inclosed; stigma capitate. Drupe baccate, black, size of a pea, twin, or solitary by abortion, each containing a 1-seeded, wrinkled nut. Embryo inverted, straight, nearly as long as the albumen, with round, cordate cotyledons, and a sub-cylindrical radicle. Albumen conforming to the seed, greenish white.—A glabrous, twining

or climbing shrub, with verticillate leaves; and axillary, peduncled fascicles of flowers.

1 O. serpentìnum (Lin. fl. zeyl. p. 398.) ♄. ب. S. Native of the East Indies, in many places; in rich soil it becomes a climber or twiner; but in poor soil it is a small, erect shrub. Wendt, in Rœm. arch. 1. p. 53. t. 7. f. 2. Jacq. hort. schœnbr. 3. t. 389. Sims. bot. mag. 784. O. trifoliàtum, Gærtn. fruct. 2. t. 129.?—Burm. zeyl. 141. t. 64.—Rheed. mal. 6. p. 81. t. 47.—Rumph. amb. 7. p. 29. t. 16. Leaves 3-4-5 in a whorl, cuneate-oblong, acute, waved, 4-5 inches long. Cymes axillary, on long peduncles, erect, and sometimes drooping; pedicels and calyxes red, which, with the white corollas, gives the cymes a pretty appearance. Dr. Wallich seems to think the *O. trifoliàtum*, Gærtn. to be a distinct species, although he knows nothing to be compared to it. In India the root of *O. serpentìnum* is employed for the cure of various disorders, by the Telinga physicians. First, in substance, inwardly, as a febrifuge. Secondly, in the same manner, after the bite of poisonous animals. The juice is also expressed, and dropped into the eye, for the same purpose. And, thirdly, it is administered, in substance, to promote delivery in tedious cases.

Serpentine Snake-Wood. Fl. May, June. Clt. 1690. Shrub.

Cult. For culture and propagation see *Strophánthus*, p. 85.

XLVI. VALLE'SIA (named by the authors of the Flora Peruviàna, after T. Vallesio, physician to Philip II. of Spain.) Ruiz. et Pav. fl. per. 2. p. 26. t. 151. f. B. H. B. et Kunth, nov. gen. amer. 3. p. 233. t. 241.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx small, 5-parted, permanent. Corolla salver-shaped: with a slender, elongated tube, and a widened hairy throat; segments oblique. Stamens inclosed; anthers ovate-sagittate, free. Ovaria two. Style didymous; stigma sub-clavate. Drupes 2, distinct, sub-clavate, containing each a 1-celled, 1-seeded, fibry, striated nut. Embryo straight, central: with oblong, obtuse, plano-convex, fleshy cotyledons: and an inferior, thick, terete, acutish radicle. Albumen thin, fleshy, white.—Small glabrous trees or shrubs. Leaves alternate, without glands. Peduncles opposite the leaves, dichotomous, many-flowered. Flowers small, white.

1 V. chiococcoìdes (H. B. et Kunth, nov. gen. amer. 3. p. 233.) leaves ovate-oblong, acuminated, somewhat conduplicate; peduncles opposite the leaves, dichotomous. ♄. S. Native of South America, in the province of Jaen de Bracamoros, on the banks of the river Amazon, near Tomependa, where it is called *Chuviringana*. Segments of corolla obliquely ovate, obtuse. Corollas white.

Chiococca-like Vallesia. Fl. May. Shrub 5 to 6 feet.

2 V. dichótoma (Ruiz. et Pav. fl. per. 2. p. 26. t. 151. f. *b*.) leaves ovate, acute, undulated, shining; peduncles corymbose, dichotomous, opposite the leaves. ♄. S. Native of Peru. Leaves 2-5 inches long. Corolla white, with a greenish tube. Nut oval-oblong.

Dichotomous Vallesia. Fl. May, June. Clt. 1822. Shrub 8 to 10 feet.

3 V. cymbifòlia (Ort. dec. p. 58.) leaves ovate-lanceolate, boat-shaped, incurved at top; peduncles opposite the leaves, dichotomous, corymbose, few-flowered. ♄. S. Native of New Spain. Rauwólfia glàbra, Cav. icon. 3. p. 50. t. 297. Vallèsia dichótoma, Poir. suppl. 4. p. 656. Calycine teeth small. Corolla white; segments obliquely-ovate, acute.

Boat-leaved Vallesia. Fl. June, July. Clt. 1821. Shrub 3 to 6 feet.

4 V. puncta'ta (Spreng. syst. 1. p. 642.) leaves alternate, petiolate, oblong-attenuated at both ends, full of pellucid dots; branches and petioles granular; fascicles of flowers pedunculate; corolla granular outside. ♄. S. Native of Brazil.

Dotted Vallesia. Shrub.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

Tribe VII.

KOPSIE'Æ. Ovarium double. Fruit drupaceous. Albumen wanting.

XLVII. KO'PSIA (meaning not explained by the author.) Blum. bijdr. p. 1030.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx small, 5-toothed, permanent. Corolla salver-shaped; tube ventricose at apex; throat coarctate, villous; segments of the limb spreading or reflexed. Stamens 5, inclosed, free. Style filiform, not exserted; stigma oblong, undivided, downy at top. Drupes two, or solitary by abortion, coriaceous, divided by an incomplete dissepiment inside, 1-seeded. Embryo inverted. Albumen none.—Lactescent trees or shrubs, with opposite leaves; and lateral and terminal pedunculate, bracteate cymes of flowers.

1 K. arbòrea (Blum. bijdr. p. 1030.) arboreous; leaves oblong-lanceolate; segments of corolla broad-lanceolate. ♄. S. Native of Java, in woods, on the mountains, where it is called *Kilutung*. Flowers white.

Tree Kopsia. Fl. year. Tree.

2 K. vincæflòra (Blum. bijdr. p. 1030.) shrubby; leaves oblong-lanceolate; segments of corolla oval. ♄. S. Native of Java, on the Salak mountains. Throat of corolla red.

Vinca-flowered Kopsia. Fl. year. Shrub.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

XLVIII. CALPICA'RPUM (from καλπις, *calpis*, an urn; and καρπος, *karpos*, a fruit; in reference to the shape of the fruit.) Cérbera species, Roxb. and Lam.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-cleft; segments lanceolate, permanent, each ending in a gland. Corolla funnel-shaped, with a slender tube, swelling at the throat; throat highly coloured and hairy, but neither furnished with teeth nor scales. Segments of limb obovate, oblong, equal-sided. Stamens 5, inserted round the bottom of the swelled part of the tube; anthers sagittate, inclosed. Ovaria twin, 2-celled; on the sides where they meet, there is a small subulate scale covering the fissure: cells 1-ovulate. Ovula attached to the middle of the partition. Stigma large, with a 2-lobed apex, hid by the converging anthers. Drupe, or rather capsule, usually solitary, oblique, urn-shaped, villous, with a slit down the middle, semi-bivalved, 1-celled, opening up the inside, and along the apex; pulp hardly any, the whole substance being thin, and rather fibrous. Seeds solitary, ovate-oblong; integument simple, white, pretty thick and soft. Albumen none. Embryo erect, with pale yellow cotyledons, conforming to the seed; and an ovate, superior radicle.—Glabrous shrubs, with dichotomous branches; broad, opposite, lanceolate leaves; and terminal corymbs of red flowers.

1 C. Roxbu'rghii; leaves opposite, remote, oblong to lanceolate, glabrous, acuminated; corymbs at first terminal, but afterwards in the forks, with sub-trichotomous, short divisions. ♄. S. Native of Pegu. Cérbera fruticòsa, Roxb. fl. ind. 2. p. 526. Ker. bot. reg. 391. Flowers size of those of *Vinca ròsea*, the mouth of a lively red, the rest of a bright pink, rather fragrant, and extremely ornamental.

Roxburgh's Calpicarpum. Fl. year. Clt. 1819. Shrub 4 to 6 ft.

2 C.? Lama'rkii; leaves opposite, ovate-oblong, rounded or blunt at the apex; panicles corymbose, short, in the forks of the branches; flowers small. ♄. S. Native of the East Indies; and the Moluccas, if Cérbera salutàris, Lour. be the same. Lactària salùbris, Rumph. amb. 2. p. 255. t. 84. Cérbera oppositifòlia, Lam. dict. 1. p. 62. suppl. 1. p. 262. Cérbera salutàris, Lour. coch. Blum. bijdr. 1033. Flowers red? Ca-

lycine segments small, connivent, ex Blume. Cymes on long peduncles, dichotomous, many-flowered.

Lamark's Calpicarpum. Shrub or tree.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

Tribe VIII.

MELODINIEÆ. Fruit baccate, 2-celled, solitary. Seeds naked, flattened, imbedded in pulp. Ovula attached to two elevated receptacles, which rise from the middle of the partition.

XLIX. MELODI'NUS (so named by Foster, from *μηλον, melon*, an apple; and *δινεω, dineo*, to turn round; in reference to the fruit being like an apple, and the stems twining.) Forst. gen. 23. Juss. gen. 148. Schreb. gen. no. 425. suppl. 23. Labill. sert. caled. p. 29.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-parted, imbricate. Corolla salver-shaped; segments of the limb oblique, twisted to the right: corona in the throat of 5 bifid or quadrifid segments, alternating with the segments of the corolla. Stamens 5, inserted in the tube, inclosed, with very short filaments, and ovate anthers. Ovarium ovate; placentas 2, fixed to the dissepiment. Style simple; stigma dilated, conical, with a bifid apex. Berry globose, 2-celled, pulpy inside. Seeds many, flattened a little, wrinkled, nestling in the pulp, albuminous.—Lactescent, erect, or climbing shrubs; with opposite leaves, and opposite axillary cymes of flowers.

§ 1. *Segments of corona bifid or quadrifid.*

1 M. PHYLLIRÆOIDES (Labill. sert. cal. p. 29. t. 33.) stem erect, cymes opposite, axillary; leaves rhomboid, coriaceous; corona of 5 quadrifid segments. ♄. G. Native of New Caledonia. Leaves rhomboid, or elliptic-oblong, obtuse, $1\frac{1}{2}$ to 2 inches long.

Phyllirea-like Melodinus. Shrub 6 feet.

2 M. BAUE'RI (Endlicher, prod. fl. ins. norf. p. 57.) leaves elliptic-oblong, acute, ribbed, shining; corymbs axillary, opposite, shorter than the leaves; corona of 5 bifid segments. ♄. ◡. G. Native of Norfolk Island. Bauer. ill. pl. ins. norf. t. 140. and t. 164. Leaves 4 inches long. Berry globose, yellow, warted, about the size of an orange.

Bauer's Melodinus. Shrub climbing.

3 M. SCA'NDENS (Forst. fl. austr. no. 125. Lin. syst. 256.) glabrous; stem climbing; leaves oblong-ovate; cymes opposite, axillary; corona of the corolla of 5 cloven, lacerated segments. ♄. ◡. S. Native of New Caledonia. Lam. ill. t. 179.

Climbing Melodinus. Fl. July, Aug. Clt. 1775. Shrub cl.

§ 2. *Segments of corona entire.*

4 M. MONÓGYNUS (Roxb. fl. ind. 2. p. 56. Ker. bot. reg. 834.) glabrous; climbing; leaves lanceolate, shining, acuminated; panicles axillary and terminal, sub-globular, brachiate, crowded; corolla 5-parted; segments sub-falcate; scales in the mouth of the tube, entire, ensiform; style short; stigma ovate, emarginate at top. ♄. S. Native of Silhet, where it is called *Sadul.* Corolla white, fragrant. Extreme divisions of panicles 3-flowered. Berry 4-cornered, yellow, size of an orange, containing edible pulp.

Monogynous Melodinus. Fl. July. Clt. 1820. Shrub cl.

5 M. EUGENIÆFÒLIA (Wall. cat. no. 1616.) petioles, branchlets, peduncles, and calyxes, clothed with rusty down; leaves elliptic, acuminated, with parallel, alternate veins, running into an almost marginal nerve; peduncles panicled, axillary; bracteas foliaceous. ♄. S. Native of Penang. Fruit size of a middling gooseberry. Scales in the throat of the corolla undivided. Perhaps a distinct genus.

Eugenia-leaved Melodinus. Shrub.

Cult. For culture and propagation see *Echìtes*, p. 76.

L. CARPODI'NUS (from *καρπος, karpos*, a fruit; and *δινεω, dineo*, to turn round; a name given to separate it from Melodinus.) R. Br. mss.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-toothed. Corolla funnel-shaped, hairy, 5-cleft; segments lanceolate, oblique, reflexed; anthers 5, sagittate, conniving. Style 1; stigma round. Fruit orange-formed, 2-celled? many-seeded. Seeds flattened, nestling in pulp.—Climbing, cirrhiferous shrubs; with opposite leaves: and twin, axillary, 1-flowered peduncles.

1 C. DU'LCIS; leaves ovate-lanceolate, glabrous; tendrils axillary; flowers almost sessile, twin, axillary. ♄. ◡. S. Native of Sierra Leone, in the neighbourhood of Freetown, where it is called *Sweet Pishamin*, a name introduced by the Nova Scotia settlers.

Sweet-fruited Carpodinus. Fl. June, July. Clt. 1822. Sh. cl.

2 C. A'CIDA; fruit rounder, and much smaller. ♄. ◡. S. Native of Sierra Leone.

Acid-fruited Carpodinus. Shrub cl.

Cult. For culture and propagation see *Echìtes*, p. 76.

LI. CHILOCA'RPUS (from *χειλος, cheilos*, a lip; and *καρπος, karpos*, a fruit; in reference to the fruit opening at one side.) Blum. bijdr. p. 1025.

LIN. SYST. *Pentándria, Monogýnia.* Calyx small, 5-parted. Corolla salver-shaped; tube thickened in the middle; segments of the limb 5, oblique. Anthers sagittate, almost sessile, inserted in the middle of the tube, inclosed. Stigma capitate, inclosed among the anthers. Capsule large, corticate, 1-celled, filled with granular pulp inside, dehiscing at the side when ripe. Seeds numerous, compressed, convolutely furrowed on one side, wrapped in membranes which rise from the parietes of the capsule. Albumen horny. Cotyledons foliaceous.—Climbing shrubs, with opposite, simple leaves, and axillary cymes of flowers. This genus is nearly allied to *Willughbèia*, but is easily distinguished from that genus, in the fruit being capsular, and in the seeds being albuminous.

1 C. SUAVE'OLENS (Blum. bijdr. p. 1025.) leaves oblong, glabrous, with five parallel veins; flowers sub-cymose, axillary; pedicels covered with imbricating bracteas. ♄. ◡. S. Native of Java, on the mountains, where it is called *Aroy Gambier;* and *Tjunkankan-lalan.*

Sweet-scented Chilocarpus. Shrub cl.

2 C. DENUDA'TUS (Blum. l. c.) leaves lanceolate-oblong, parallelly veined, glabrous; cymes axillary, few-flowered; pedicels bractless. ♄. ◡. S. Native of Java, in woods, on the Salak mountains.

Naked-pedicelled Chilocarpus. Fl. Aug. Shrub cl.

Cult. For culture and propagation see *Echìtes*, p. 76.

LII. WILLUGHBE'IA (named after Francis Willughby, F.R.S., a friend and pupil of Ray; author of Ornithologia, 1676; and Historia Piscium, 1678; published by Ray, after his death, which happened in 1672, at the age of 37 years.) Scop. Schreb. gen. no. 417. Roxb. fl. ind. 2. p. 57. Blum. bijdr. p. 1023.

LIN. SYST. *Pentándria, Monogýnia.* Calyx small, 5-parted. Corolla salver-shaped; tube thickened in the middle; limb of 5 oblique segments. Stamens inclosed; anthers ovate, free. Ovarium 2-celled. Style didymous; stigma conical. Ovula attached to 2 opposite, parietal placentas. Berry large, corticate, half 2-celled, many-seeded. Seeds in rows, exalbuminous, nidulent. Cotyledons plano-convex.—Climbing, usually cirrhiferous shrubs; with opposite, glabrous leaves; and axillary, pedunculate cymes of flowers.

1 W. EDU'LIS (Roxb. fl. ind. 2. p. 57. Blum. bijdr. p. 1024.) climbing, cirrhiferous; leaves elliptic-oblong, obtuse, acuminated, with parallel veins; peduncles cymose, axillary, shorter than the petioles. ♄. ◡. S. Native of the Mauritius, Chittagong, and Silhet. Flowers pale pink. Berry very large, globular, 1-celled. The milky, viscid juice, which flows from

every part of the plant, is changed into a bad kind of elastic rubber, or caoutchouc, on exposure to the air.

Edible Willughbeia. Fl. June, Aug. Clt. 1818. Shrub cl.

2 W. JAVA'NICA (Blum. bijdr. p. 1024.) climbing, cirrhiferous; leaves oblong-lanceolate, bluntish at the apex, with fine parallel veins; peduncles cymiferous, axillary, longer than the leaves. ♄. ◡. S. Native of Java, in woods, on the Seribu and Salak mountains, where it is called *Aroy Kibattarah.*

Java Willughbeia. Fl. March, July. Shrub cl.

3 W. CELE'BICA (Blum. bijdr. p. 1024.) climbing; leaves elliptic-oblong, acuminated, veiny; peduncles axillary, cymiferous, about equal in length to the petioles. ♄. ◡. S. Native of the Celebes.

Celebes Willughbeia. Fl. Aug. Shrub cl.

4 W. MARTABA'NA (Wall. pl. rar. asiat. 3. p. 45. t. 272.) cirrhiferous, scandent, glabrous; leaves ovate-oblong, acuminated, parallelly nerved; berries globose. ♄. ◡. S. Native of the province of Martaban, at Amherst, and Moalmeyne. Fruit yellow, about the size of an orange. This is very nearly allied to *W. edùlis.*

Martaban Willughbeia. Shrub cl.

5 W. CORIA'CEA (Wall. cat. no. 1620.) leaves coriaceous, shining above, and rusty beneath, elliptic, short-acuminated, obtuse, tendrils as in the last species. ♄. ◡. S. Native of Singapore.

Coriaceous-leaved Willughbeia. Shrub cl.

Cult. For culture and propagation see *Echìtes*, p. 76.

LIII. AMBELLA'NIA. (Ambellani is the Guiana name of the shrub.) Aubl. guian. 1. p. 266. t. 104. Juss. gen. 144. Fagræ'a species, Willd. Willughbèia species, Willd.

LIN. SYST. *Pentándria, Monogýnia.* Calyx short, 5-parted; segments acute. Corolla tubular, with a narrow throat; and a 5-cleft, oblique, undulated limb. Stamens 5, inclosed; anthers sagittate. Style tetragonal; stigma seated on a flat, orbicular disc; bi-cuspidate at the apex. Berry ovate, oblong, fleshy, large, 2-celled, many-seeded, warted. Seeds broad, compressed, muricate, fixed to the slender receptacle or dissepiment.—A small, lactescent tree. Leaves opposite. Peduncles axillary and terminal, 3-4-flowered, unibracteate.

1 A. A'CIDA (Aubl. guian. 1. p. 266. t. 104.) leaves ovate-oblong, glabrous, quite entire, undulated on the edges. ♄. S. Native of Guiana and Cayenne. Willoughbèia ácida, Willd. spec. 1. p. 1231. Leaves 7 inches long, and 3 broad, on short, half-embracing petioles. Flowers whitish. Berry citron-coloured, warted. Bracteas at the base, of each peduncle, and each flower. The fruit, macerated in water, has a pleasant acid flavour.

Acid-fruited Ambellania. Shrub 6 to 8 feet.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

LIV. PACOU'RIA (Pacouri-rana is the Guiana name of the tree.) Aubl, guian. 1. p. 279, t. 105. Juss. gen. 148. Willughbèia species, Willd.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-parted, permanent; segments obovate, roundish, acute. Corolla with a short tube, and a 5-cleft limb; segments oblique, undulated. Stamens short, inclosed; anthers cuspidate. Style tetragonal; stigma as in *Ambellània.* Berry large, pear-shaped, fleshy, pulpy, 1-celled, many-seeded. Seeds hard, angular, nestling in the pulp. —A lactescent shrub, with sarmentose, nodose branches. Leaves opposite at the nodi. Racemes axillary on long peduncles, twining by tendrils.

1 P. GUIANE'NSIS (Aubl. l. c.) leaves ovate, acute, undulated, glabrous, large, entire, having the nerves red and prominent beneath; petioles stem-clasping; flowers fascicled on the racemes, which are branched. ♄. ◡. S. Native of Guiana. Willughbèia scándens, Willd. spec. 1. p. 1231. Flowers yellow.

Guiana Pacouria. Shrub cl. or tw.

Cult. For culture and propagation see *Echìtes*, p. 76.

LV. HANCO'RNIA (meaning unknown to us.) Gomez in act. acad. Oliss. 1812. p. 51. with a figure. Mart. act. bonn. 11. p. 84. Mangàibo, Pis. med. bras. p. 76.

LIN. SYST. *Pentándria, Monogýnia.* Calyx small, 5-parted. Corolla salver-shaped; tube long, ventricose at top; segments of the limb ovate-acute, 3 times shorter than the tube. Stamens inclosed, pilose; anthers oblong, connivent. Stigma bifid, seated on a cylindre. Berry 1-celled, many-seeded. Albumen hard, fleshy.

1 H. SPECIÒSA (Gomez. l. c.) leaves elliptic, coriaceous, bluntly cuspidate, glabrous; peduncles terminal, usually 3-flowered. ♄. S. Native of Brazil.

Showy Hancornia. Tree 20 feet.

2 H. PUBE'SCENS (Mart. in act. bonn. 11. p. 85.) leaves oblong, acuminated, and are, as well as the branches, downy; cymes terminal, sessile, dichotomous. ♄. S. Native of Brazil.

Downy Hancornia. Shrub.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

LVI. LANDO'LPHIA (named by Beauvois, after M. Landolphe, a captain in the French navy, commander of an expediton to Waree, who was of great assistance to Palisot de Beauvois, during his stay in Africa.) Beauv. fl. d'ow. 1. p. 54. t. 34.

LIN. SYST. *Pentándria, Monogýnia.* Calyx permanent; 5-6-cleft; segments coriaceous, sub-imbricate. Corolla tubular, with oblique segments, and a villous throat. Stamens 5. Ovarium 10-striped. Style thickened at top; stigma sub-bifid. Berry fleshy, nearly globose, depressed at top, 1-celled. Seeds many, ovate, compressed.—A shrub, with straight, terete branches. Leaves opposite, ovate-lanceolate, quite entire, acute, petiolate, glabrous, 5-6 inches long. Flowers white, disposed in terminal, panicled corymbs, with opposite branches; and very short pedicels.

1 L. OWARIE'NSIS (Beauv. fl. d'ow. 1. p. 54. t. 34.) ♄. S. Native of Guinea, in the interior of the kingdom of Waree.

Waree Landolphia. Shrub.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

LVII. COU'MA (Couma is the Caribbean name of the tree.) Aubl. Guian. suppl. p. 39. t. 392.

LIN. SYST. *Pentándria, Monogýnia.*? Calyx, corolla, stamens, and pistil unknown. Berry globose, rusty, compressed at top, 3-4 or 5-celled. Seeds 3-4-5, orbicular, flat, covered with rust-coloured pulp.—A tree, with thick bark, bushy at top; branchlets trigonal, nodose. Leaves 3 in a whorl, at the nodi, stiff, glabrous, ovate, acuminated, pale green above, but paler beneath, on short petioles. Peduncles rising single from the nodi, short, bearing 4-5 berries on long pedicels, which are very palatable when ripe.

1 C. GUIANE'NSIS (Aubl. l. c.) ♄. S. Native of Guiana and Cayenne, in woods. Leaves opposite, or 3-4 in a whorl; the branches always terminated by 3 leaves.

Guiana Couma. Tree 30 to 40 feet.

Cult. For culture and propagation see *Tabernæmontàna*, p. 92.

Tribe IX.

ALLAMANDIE'Æ. Fruit capsular, composed of 2 joined follicles, prickly or smooth. Seeds fixed to a central placenta, of the figure of a buckler, surrounded by a membranous wing. Albumen wanting.

LVIII. ALLAMA'NDA (so named after Frederick Allamand, a surgeon of Holme, who went to Guiana about 1769, and to Russia in 1776. He sent specimens and descriptions

of plants to Linnæus.) Lin. mant. 146. syst. 1295. p. 252. Gærtn. fruct. 1. p. 293. t. 61. Juss. 148. Pohl, bras. 1. p. 70. —Orèlia, Aubl. guian. t. 106.—Galàrips, Allamand.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-parted; segments lanceolate-oblong, acute. Corolla funnel-shaped; with a narrow tube: and a swollen, large, inflated limb, which is 5-cleft at the apex; furnished with 5 scales in the throat of the tube, which cover the anthers. Anthers 5, almost sessile, converging. Style 1; stigma capitate, contracted in the middle, adhering to the anthers. Capsule echinated, roundish elliptic, 1-celled, 2-valved, many-seeded. Seeds surrounded by a membranous edge, fixed to the edge of the valves. Albumen wanting.—Lactescent shrubs or sub-shrubs, with verticillate leaves; terminal and interpetiolar many-flowered peduncles. Flowers large, yellow. This genus differs from all other Apocyneous plants, in the figure of the corolla. It agrees, in some respects, with *Ambellània*, *Pacoúria*, and *Melodìnus*.

1 A. œnotherifòlia (Pohl, bras. 1. p. 71. t. 57.) stem straight; leaves 3 in a whorl, oblong, acute, attenuated at the base, pilose on the nerves beneath. ♄. S. Native of Brazil, in the province of Goyaz, in humid places, among bushes. Stem fistular. Flowers large, yellow.

Evening Primrose-leaved Allamanda. Shrub.

2 A. Schóttii (Pohl, bras. 1. p. 73. t. 58.) stem erect; leaves oblong, acuminated, 4 in a whorl, quite glabrous on both surfaces. ♄. S. Native of Brazil, on the banks of the river Parahyba. A. Braziliénsis, Schott. A. cathártica, Schrad. in Gött. anz. 1821. p. 701. no. 6. and p. 718. no. 42. Flowers large, yellow.

Schott's Allamanda. Shrub 6 feet.

3 A. angustifòlia (Pohl, bras. 1. p. 73. t. 59.) stems erect; leaves 4-5 in a whorl, narrow-lanceolate, acuminated, ciliated, rather pilose. ♄. S. Native of Brazil, in the province of Goyaz, in boggy places, about Meyapoute. Flowers large, yellow.

Narrow-leaved Allamanda. Shrub.

4 A. Linnæ'i (Pohl, bras. 1. p. 74.) stem scandent; leaves 4 in a whorl, obovate, obtuse, acutish, with sub-undulated edges, glabrous. ♄. ◡. S. Native of the Antilles. A. cathártica, Lin. mant. 214. suppl. 165. Schrad. in Wendl. sert. hann. fasc. 1. p. 6. t. 22. Gærtn. fruct. 1. p. 293. t. 61. f. 4.—Plum. icon. p. 21. t. 29. Flowers large, yellow. The branches are said to be downy.

Linnæus's Allamanda. Fl. June, July. Clt. 1785. Shrub cl.

5 A. Auble'tii (Pohl, bras. 1. p. 75.) stems scandent; leaves 4-5 in a whorl, broad-oblong, acuminated, rusty beneath. ♄. S. Native of Guiana, Cayenne, Maranham, Surinam; and in the Island of Arrowabish, near Essequibo; and on the banks of the Orinoco, near Carichana. A. cathártica, Rœm. et Schultes, syst. 4. p. 186, exclusive of the syn. of Lin. and Willd. H. B. et Kunth. nov. gen. amer. 3. p. 229. Meyer, esseq. p. 129. Curt. bot. mag. 338. Lam. ill. 303. t. 171. Orèlia grandiflòra, Aubl. guian. 1. p. 271. t. 106, exclusive of the synonymes. Echìtes salicifòlia, Rœm. et Schultes, syst. 4. p. 796. Leaves rather hairy beneath, especially on the nerves, as well as the young branches. Flowers large, yellow. We have seen this species growing wild in Maranham; but it did not appear to us to be in any way scandent.

Aublet's Allamanda. Fl. June, July. Clt. 1785. Shrub cl.

6 A. verticilla'ta (Desf. tabl. de l'ecol. ed. 2d. p. 93. Pohl, bras. 1. p. 75. Spreng. syst. 1. p. 584.) leaves usually 6 in a whorl, ovate-oblong, obtuse, quite glabrous. ♄. S. Native of South America. Flowers large, yellow.

Whorled-leaved Allamanda. Shrub.

Cult. All the species of *Allamánda* are worth cultivating, in every collection of stove plants, for the sake of the beauty of their large, yellow flowers, and whorls of showy foliage. A mixture of loam, sand, and peat, is the best soil for them; and cuttings strike root freely in the same kind of earth, under a hand glass, in heat. They require a strong, moist heat to make them flower freely.

LIX. ASPIDOSPE'RMA (from *ασπις ασπιδος*, *aspis aspidos*, a buckler; and *σπερμα*, *sperma*, a seed; in reference to the shape of the seeds.) Mart. nov. gen. bras. 1. p. 57.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx campanulate, 5-parted; segments lanceolate. Corolla 5-cleft; segments lanceolate, acute or obtuse, contorted. Stamens 5, adnate to the tube; which is naked beneath the throat; the rest free. Anthers erect, ovate, inserted above the base of the tube, filled with globose pollen, even to the base. Ovaria twin, combined at the base. Stigma clavate, umbonate, bearded or naked. Capsules solitary or twin, obovate, compressed, unequal-sided. Seeds numerous, surrounded by a membranous wing, peltate, without albumen.—Trees with spreading, squarrose, or refracted branches, covered usually with suberose or solid bark; ovate, quite entire, alternate, sessile, petiolate leaves, which are usually clothed with down; and terminal cymes of small white flowers. Fruit usually one in each cyme.

1 A. tomentòsum (Mart. bras. 1. p. 58. t. 34.) bark of branches corky; leaves crowded at the tops of the branches into round heads, ovate, tapering at the base, almost sessile, tomentose; cymes compound, densely crowded. ♄. S. Native of Brazil, in the mine provinces, where it is called *Pereiro do Campo*. Leaves ovate or obovate. Corollas white, villous outside, and downy inside; with linear-lanceolate, acute segments, which are downy outside, and glabrous inside. Capsule obovate, usually solitary.

Tomentose Aspidosperma. Tree 10 feet.

2 A. macroca'rpon (Mart. l. c. p. 59.) bark of branches solid; leaves broad-ovate, sub-cordate, petiolate, bluntish, coriaceous, glabrous above, in the adult state; cymes compound, dense. ♄. S. Native of Brazil, in the mine provinces, between Tejuco and Serra do Gran Mogol. Bark warted, covered with soft down while young. Leaves coriaceous, clothed with dense white tomentum above when young, but always beneath. Cymes tomentose. Corolla white, globose at the base; with lanceolate, obtuse segments, which are tomentose outside, and glabrous inside.

Large-fruited Aspidospermum. Tree 10 feet.

3 A. refra'ctum (Mart. l. c. p. 60.) bark solid; branches dichotomous, refracted; leaves ovate, acute, downy; cymes simple, few-flowered. ♄. S. Native of Brazil, in the province of Bahia, in the woods called Catingas, between the town of Cactete and Maracas.

Refracted-branched Aspidosperma. Tree.

4 A. bícolor (Mart. l. c. p. 60.) bark solid; branches squarrose; leaves petiolate, obovate, obtuse, glabrous above, and clothed with hoary tomentum beneath. ♄. S. Native of Brazil, in the province of Pianhia, among bushes.

Two-coloured-leaved Aspidosperma. Tree or shrub.

5 A. pyrifòlium (Mart. l. c.) bark solid; leaves petiolate, ovate, acute, glabrous on both surfaces. ♄. S. Native of Brazil, in the province of Pianhia, among bushes near Oeiras, and elsewhere, on the edges of woods.

Pear-leaved Aspidosperma. Shrub or tree.

Cult. For culture and propagation see *Allama'nda*, above.

Tribe X.

CARANDIE'Æ (this tribe contains shrubs agreeing with *Carandas* in particular characters). Fruit solitary, baccate. Seeds peltate, naked. Albumen copious, rather horny.

LX. CARI'SSA (*Krishna-pakphula* is the Sanscrit name of *C. Carándas*, and *Oorissa* is that of *C. diffùsa*). Lin. syst. 251. Schreb. gen. 413. Juss. gen. 149. R. Br. prod. 468.

Lin. syst. *Pentándria, Monogy'nia.* Calyx 5-toothed. Corolla funnel-shaped; limb 5-parted; throat naked. Stamens 5, inclosed. Ovarium 2-celled; cells few-seeded. Style filiform; stigma dilated from the base, bifid. Berry 2-celled; cells 1 or few-seeded. Seeds peltate. Embryo inverted.—Shrubs. Leaves opposite, furnished with intrapetiolar bristles. Peduncles axillary and terminal, many-flowered, every where becoming sterile and spinescent. Flowers white.

* *Species natives of New Holland.*

1 C. ova'ta (R. Br. prod. p. 468.) shrub spiny, erect; branches brachiate; branchlets scabrous; leaves broad-elliptic, acute, mucronate, glabrous, with rather branched veins; spines straight, divaricate, 3 times shorter than the leaves. ♄. S. Native of New Holland, within the tropic.

Ovate-leaved Carissa. Fl. June. Nov. Clt. 1819. Shrub.

2 C. sca'bra (R. Br. l. c.) shrub spiny, diffuse; leaves ovate, mucronate, scabrous on both surfaces. ♄. S. Native of New Holland, within the tropic.

Scabrous Carissa. Shrub diffuse.

3 C. lanceola'ta (R. Br. l. c.) spiny; leaves narrow-lanceolate; segments of corolla lanceolate-subulate. ♄. S. Native of New Holland, within the tropic. There are 2 varieties of this species; the one glabrous, with smooth branches; and the other having the branchlets and leaves here and there downy.

Lanceolate-leaved Carissa. Fl. July, Aug. Clt. 1822. Sh.

* * *Species natives of the East Indies.*

4 C. Cara'ndas (Lin. mant. p. 52.) subarboreous; leaves ovate, mucronate, or elliptic, obtuse, glabrous; spines often 2-forked; corymbs terminal and axillary, few-flowered; cells of fruit 4-seeded. ♄. S. Native of the East Indies, in wild, woody, dry, uncultivated places. Lam. ill. t. 118. f. 1. ann. mus. 8. t. 32. f. 2. Roxb. cor. 1. p. 55. t. 77. Lodd. bot. cab. 663. Cápparis Carándas, Gmel. syst. 1. p. 806. Echìtes spinòsa, Burm. ind. p. 69. Carándas, Rumph. amb. 7. p. 57. t. 25.—Plukn. alm. p. 235. t. 305. f. 4. Branches dichotomous. Spines always in pairs at the divisions of the branches, and at every other pair of leaves, often forked. Peduncles terminal, usually twin. Flowers milky-white, jasmine-like. Berry size of a small plum, when ripe of a shining black. The *Carandas* makes exceedingly strong fences; the number and the strength of their thorns render them almost impassable. The fruit, just before ripe, is employed to make tarts and preserves of various kinds, also to pickle, and by most people reckoned superior for these uses to every other fruit in the country, not even the mango excepted. They are universally eaten by the natives, when ripe, and are tolerably pleasant to the taste even of an European.

Carandas Carissa. Fl. July. Clt. 1790. Tree 15 to 20 ft.

5 C. diffu'sa (Roxb. fl. ind. 2. p. 524.) shrub diffuse, spiny, with dichotomous branches; leaves almost sessile, roundish-ovate, cordate, mucronate, polished; corymbs terminal, rarely axillary, many-flowered; cells of berry 2-seeded. ♄. S. Native of the East Indies, in the Ganjan district, and from thence northward to the mouth of the Hoogly. Spines as in *Carándas*, simple bifid or twice bifid. Mucrone of leaves recurved. Flowers pure white. Berries black when ripe, size of a French bean.

Diffuse Carissa. Shrub diffuse.

6 C. macrophy'lla (Wall. cat. no. 1679.) leaves ovate, acuminated, glabrous, shining; spines short, hooked; flowers terminal and axillary, corymbose. ♄. S. Native of the East Indies. C. mìtis, Herb. Heyne, but hardly of Vahl. Leaves 3 inches long and $1\frac{1}{2}$ broad at the base.

Large-leaved Carissa. Shrub or tree.

7 C. villòsa (Roxb. fl. ind. 2. p. 525.) shrub downy, tender parts villous; leaves from broad-lanceolate to oblong, acute, soft from down, particularly while young; flowers terminal, by threes or sevens; cells of fruit 2-seeded. ♄. S. Native of the East Indies. C. hirsùta, Heyne ex Roth. spec. 128. Branchlets dichotomous. Spines strong and very sharp, less frequently compound than in the 2 preceding species. Corolla small, white, with a curved tube, and linear-lanceolate, acute segments. Berries round, the size of a pea, blackish purple. Bark of the woody part of the plant spongy.

Villous Carissa. Shrub.

8 C. salícina (Lam. dict. 1. p. 554.) shrub spiny; leaves lanceolate-oblong, mucronate, veiny, narrower towards the petioles; flowers in sub-corymbose fascicles. ♄. S. Native of the East Indies. Spines strong, straight, simple. Perhaps only a variety of *C. Carándas*, with narrower leaves.

Willowy-leaved Carissa. Shrub or small tree.

9 C. spina'rum (Lin. syst. 251. mant. 559.) shrub spiny; leaves ovate, acute, veiny, shining; peduncles terminal, 4-5-flowered; segments of corolla lanceolate; cells of berry 2-seeded. ♄. S. Native of the East Indies and Japan. Lam. ill. t. 118. f. 2. Lodd. bot. cab. 162. Thunb. jap. 108. Branches dichotomous. Spines 2 at each ramification, opposite, the one above the branch and the other below it, red at top and shining, as in *C. Carándas*. Leaves small. Teeth of calyx subulate. Corolla white, with lanceolate-oblong segments. Berry black, size of a pea.

Spiny Carissa. Fl. Aug. Dec. Clt. 1809. Tree.

10 C. axilla'ris (Roxb. fl. ind. 2. p. 526.) shrub armed with simple, opposite, recurved spines; leaves oblong, on short petioles; corymbs pedunculate, axillary, many-flowered. ♄. S. Native of the Moluccas. Flowers white.

Axillary-flowered Carissa. Shrub.

11 C. ine'rmis (Vahl, symb. 3. p. 43.) shrub without spines; leaves ovate, cordate, mucronate, veinless; peduncles terminal, tern; calycine segments setaceous. ♄. S. Native of the East Indies. Like *C. spinàrum*, but differs in the leaves being 3 times the size, in the flowers being larger, and in the absence of spines.

Unarmed Carissa. Shrub.

* * * *Species natives of Africa and its islands.*

12 C. Arduìna (Lam. dict. 1. p. 555.) shrub spiny; leaves cordate-ovate, mucronate, nearly sessile; flowers terminal, corymbose; cells of berry 1-seeded. ♄. G. Native of the Cape of Good Hope. Arduìna bispinòsa, Lin. mant. p. 552. Lodd. bot. cab. t. 387. Lýcium cordàtum, Mill. dict. no. 10. fig. p. 200. t. 300. Spines twin, simple, but usually bifid; in this last case one of the clefts points downwards and the other upwards. Leaves dark green, larger than those of box. Flowers white, small, sweet-scented. Berry red.

Arduini's Carissa. Fl. March, Aug. Clt. 1760. Shrub 3 to 5 feet.

13 C. edu'lis (Vahl. symb. 1. p. 22.) shrub spiny; branches villous at top; leaves ovate, acute, veinless; almost sessile; peduncles terminal, twin, or sometimes by threes; calycine segments subulate, ciliated; segments of corolla lanceolate-linear; cells of berry 1-seeded. ♄. S. Native of Arabia Felix, and of Abyssinia. Antùra, Forsk. desc. p. 63. Antùra Hadiénsis, Gmel. syst. veg. 405. Spines strong, red at top. Berries edible.

Edible-berried Carissa. Shrub.

14 C.? XYLÓPICRON (Pet. Th. obs. pl. isl. austr. p. 24. and p. 80.) shrub, spiny; leaves ovate, acuminated, glabrous, 3-5-nerved; peduncles lateral, spiny, 1-2-flowered; branches forming a pyramidal cyme. ♄. S. Native of the Island of Bourbon, about St. Denis. Branches bifurcate. Segments of corolla acute. Berry middle-sized, ovate-oblong, succulent, an inch long, attenuated at the apex, with a bipartite placenta, containing 12-15 seeds.

Xylopicron or *Bitter-wooded* Carissa. Fl. July, Nov. Clt. 1820. Tree 20 feet.

15 C. CORIA'CEA (Wall. cat. no. 1681.) spiny; leaves elliptic, coriaceous, with revolute edges, obtuse, mucronate, glabrous, shining above. ♄. S. Native of the Mauritius. C. xylópicron, Telfair, but hardly of Pet. Th. Leaves 2 or $2\frac{1}{2}$ inches long.

Coriaceous-leaved Carissa. Shrub.

16 C. MADAGASCARIE'NSIS (Pet. Th. l. c. p. 80.) shrub spiny; leaves ovate-roundish; flowers small; fruit round. ♄. S. Native of Madagascar. Very like *C. xylópicron*, but smaller in all its parts; and the fruit round, not oblong.

Madagascar Carissa. Tree small.

17 C. ABYSSÍNICA (R. Br. in Salt. trav. append.) this species has not yet been described. ♄. S. Native of Abyssinia.

Abyssinian Carissa. Shrub or tree.

Cult. See *Strophánthus*, p. 85. for culture and propagation.

LXI. HUNTE'RIA (named by Roxburgh after William Hunter, M. D., of the Bengal medical establishment; an eminent botanist, and author of various papers in the Asiatic Researches, of the History of Pegu, &c.). Roxb. fl. ind. 2. p. 531.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-parted, permanent. Corolla funnel-shaped: having the tube gibbous at the base, and swelled a little at the mouth; segments oblique. Stamens 5, with very short filaments, and ovate, inclosed anthers. Ovarium girded by an annular fleshy ring, ovate, 2-lobed, 2-celled; with 2 ovula in each, attached by their base to the bottom of the partition. Stigma ovate, 2-lobed, inclosed. Berries twin, distinct, roundish-ovate, pulpy, 2-seeded.—Trees with opposite, entire leaves; and terminal, corymbose, small, white flowers.—This genus differs from *Carissa* in the species being unarmed, not thorny; and in the berries being twin, not solitary.

1 H. CORYMBÒSA (Roxb. fl. ind. 2. p. 532.) leaves oblong-lanceolate, obtuse, pointed, glabrous; corymbs terminal, decussate; lobes of calyx ovate. ♄. S. Native of the Prince of Wales's Island. Leaves 3-4 inches long, and 1-2 broad. Flowers numerous, small, white.

Corymbose-flowered Hunteria. Tree.

2 H. EUGENIÆFÒLIA (Wall. cat. no. 1615.) downy in every part; leaves elliptic or obovate-oblong, acuminated; panicles terminal, trichotomous; lobes of calyx rounded. ♄. S. Native of Penang. Nèrium coràca, Herb. Ham. Leaves purplish beneath. Flowers rather large.

Eugenia-leaved Hunteria. Tree.?

3 H. CORIA'CEA (Wall. cat. no. 1610.) leaves coriaceous, glabrous, shining above and pale beneath, obtuse; racemes short, axillary, and lateral. ♄. S. Native of Singapore. Flowers small.

Coriaceous-leaved Hunteria. Tree or shrub.

4 H.? FASCICULA'RIS (Wall. cat. no. 1612.) leaves opposite or 3 in a whorl, elliptic-lanceolate, acuminated at both ends, pale beneath; peduncles short, many-flowered, panicled, axillary. ♄. S. Native of the Pundua mountains.

Fascicled-flowered Hunteria. Shrub or tree.

5 H.? ATROVÍRENS (Wall. cat. no. 1614.) leaves elliptic, acuminated, deep green above and pale beneath; peduncles axillary, trichotomous. ♄. S. Native of Tavoy.

Dark-green-leaved Hunteria. Shrub or tree.

Cult. For culture and propagation see *Strophánthus*, p. 85.

† *Genera hardly known.*

LXII. MONE'TIA (so named by L'Heritier in honour of his friend Jean Baptiste Pierre Antoine de Monet, Knight of Lamarck, of the Academy of Sciences of Paris, author of Flora Gallica, and of the Encyclopédie Méthodique Botanique, &c.). L'Her. stirp. nov. t. 1. Azìma, Lam. ex Juss. gen. 425. Lam. dict. 1. p. 343.

LIN. SYST. *Tetrándria, Monogy'nia.* Calyx ventricose, campanulate, 3-4-cleft. Petals 4, linear, alternating with the segments of the calyx, somewhat reflexed at the apex. Stamens 4, inserted in the receptacle, alternating with the petals; filaments thickened; anthers sagittate, incumbent. Style short; stigma acute. Fruit rather fleshy, pea-formed, 2-celled; cells 1-seeded. Seeds orbicular, compressed, or peltate.—Evergreen spiny shrubs. Leaves opposite, entire, coriaceous. Flowers axillary, solitary, sessile, small. According to Lamarck, *Azìma* is nearly allied to *Carissa*, but differs in the corolla being polypetalous, and in the stamens being hypogynous.

1 M. TETRACA'NTHA; leaves ovate-lanceolate, glabrous, pungent at apex; spines stipular, 4 in a whorl. ♄. S. Native of the East Indies. M. barlerioìdes, Lher. stirp. t. 1. Azìma tetracántha, Lam. dict. 1. p. 339.—Seb. thes. 1. t. 13. f. 1. Branches slightly 4-cornered. Flowers axillary, few, in clusters, of threes at the top, green.

Four-thorned Monetia. Fl. July. Clt. 1758. Sh. 3 to 6 ft.

2 M. DIACA'NTHA (Willd. spec. 1. p. 670.) spines opposite; leaves downy beneath, ovate, petiolate. ♄. S. Native of the East Indies. Azìma diacántha, Lam. dict. 1. p. 340.—Pluk. alm. 27. t. 133. f. 3.—Rheed. mal. 5. p. 73. t. 37.

Two-thorned Monetia. Shrub.

Cult. For culture and propagation see *Strophánthus*, p. 85.

LXIII. ALA'FIA (meaning unknown to us). Pet. Th. gen. mad. no. 34.

LIN. SYST. *Pentándria, Monogýnia.* Calyx small, 5-lobed. Corolla tubular, ventricose; with a 5-parted twisted limb; segments plicately sinuated on one side. Anthers acute, distinct, connivent; filaments bound by the pistil. Style filiform, with 5 appendages. Stigma capitate, acuminated, enclosed by the anthers.—A weak, climbing, lactescent shrub, clothed with numerous, terminal, purplish flowers. Leaves opposite.

1 A. THOUA'RSII (Rœm. coll. 1. p. 203. Rœm. et Schultes, syst. 4. p. 436.). ♄. ◡. S. Native of Madagascar.

Petit Thouars's Alafia. Shrub cl.

Cult. For culture and propagation see *Echìtes*, p. 76.

LXIV. LEUCONO'TIS (from λευκος, *leucos*, white, and *ους ωτος*, *ous otos*, an ear). Jack, in Lin. trans. 14. p. 121.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx 4-parted. Corolla tubular; limb 4-lobed. Stamens 4, inclosed. Ovarium simple, 2-celled; cells 2-seeded. Style short. Stigma annular below and conical above. Berry 1-3-seeded. Seeds exalbuminous. Embryo inverted.—A lactescent shrub, with opposite leaves and axillary dichotomous corymbs of yellow flowers.

1 L. A'NCEPS (Jack, l. c.). ♄. S. Native of Sumatra, where it is called *Akar-Morai* by the Malays. Branches 4-sided. Leaves oblong-acuminated, smooth, having the nerves connected by marginal arches.

Two-edged Leuconotis. Shrub large.

Cult. For culture and propagation see *Strophánthus*, p. 85.

Order CLIII. ASCLEPIA'DEÆ (this order contains plants agreeing with *Asclèpias* in important characters). R. Br. in wern. soc. mem. 1. p. 19. prod. 458.—Apocýneæ, part. Juss. gen. p. 143. Adans. fam. p. 160. Contórtæ, part. Lin.

Calyx 5-cleft or 5-parted (f. 16. *a*. f. 17. *a*.), permanent. Corolla monopetalous (f. 16. *b*. f. 17. *c*. f. 20. *b*.), hypogynous, 5-lobed (f. 16. *b*. f. 17. *b*. f. 20. *b*.), regular, imbricate in æstivation (f. 20. *b*.), rarely valvate, deciduous. Stamens 5, inserted in the bottom of the corolla, alternating with the segments of the limb; filaments usually connected; anthers 2-celled (f. 17. *h*. f. 15. *d*.), but sometimes almost 4-celled from a semi-complete dissepiment in each of the true cells; pollen at the bursting of the anthers coalescing in an equal number of masses to the cells of the anthers, rarely twin or confluent by pairs, or by fours, or solitary, fixed to the 5 processes of the stigma. Ovaria 2. Styles 2, close together, often very short; stigma common to both, dilated, pentagonal: having the angles bearing corpuscles. Follicles 2, one of which is often abortive: having the placenta applied to the suture, but is at length free. Seeds numerous, imbricate, pendulous, usually furnished with a tuft of hairs at the umbilicus. Albumen twin. Embryo straight, with foliaceous cotyledons, a superior radicle, and inconspicuous plumule.—Shrubs, rarely herbs, for the most part lactescent and climbing. Leaves entire, usually opposite, but sometimes also alternate and verticillate, usually furnished with intrapetiolar cilia in place of stipulas. Flowers subumbellate, fascicled or racemose, interpetiolar.

This differs from all other dicotyledonous orders in the pollen of all the anthers in each flower being combined in a definite number of masses of a waxy substance, which, at the bursting of the anthers, are fixed to the 5 glandular processes of the stigma; in this structure it has some analogy with *Orchídeæ*, a monocotyledonous order. It differs from *Apocýneæ*, to which it is nearly allied, in having the stamens united into a fleshy crown, and in the substance of the anthers.

Períploca glàbra is the only instance of an Asclepiadeous plant being a hardy shrub; every other woody species of the order being natives of hot countries. The genus *Hòya* comprehends fleshy-leaved, climbing, or creeping plants, with umbels of waxen odoriferous flowers, distilling honey. *Pergulària* is valued for its fragrance; *Ceropègia* and other genera for their singularity; and *Asclèpias* for beauty and hardiness. But the most remarkable genera of the order are *Stapèlia, Duvàlia, Pectinària, O'rbea, Tridéntia, Huérnia, Piaránthus*, &c. in which the stems are fleshy and of various forms, and the leaves supplied by small thick points or scales, and whose flowers are not less singular for their curious organization, than they are for their colouring and spotting, and offensive for their odour. The root of *Diplólepis vomitòrium, Asclèpias curassávica, Colótropis prócera*, and some others is employed in different countries for ipecacuanha. An infusion of the root of *Asclèpias decúmbens* has the singular property of exciting perspiration, whence it is successfully used in Virginia for pleurisy.

Notwithstanding the poisonous nature of the greater number of the species of this order, yet the young shoots of some are used as an article of food; of this nature are *Pergulària edùlis, Oxystélma esculéntum, Hemidésmus I'ndicus*, and some others.

Synopsis of the genera.

Tribe I.

Orthophura'miæ. *Asclepiàdeæ veræ, part. R. Br. in mem. wern. soc.* 1. *p.* 21. *Pollen masses* 10, *erect* (f. 15. *d*.) *or connivent, smooth, fixed by pairs to the corpuscles of the stigma: that is 5 2-celled anthers, separable into 2 parts by a longitudinal furrow.*

Subtribe I. Stapelie'æ. *Pollen masses erect* (f. 16. *d*.) *or connivent, lying on the stigma, fixed by the base or beneath the middle of the side. Anthers simple at top, that is, not terminated by a membrane.*

§ 1. *Column of fructification or gynostegium inclosed. Stamineous corona appendiculate outside.*

1 Cerope'gia. Tube of corolla ventricose from the base; limb 5-parted, with ligular, conniving segments. Stamineous corona double; leaflets of the inner corona opposite the lobes of the outer one.

2 Hue'rnia. Corolla campanulate, with a 10-cleft limb: having the 5 accessary segments short. Corona double: outer one 5-cleft, with bifid segments: inner one of 5 leaflets, alternating with the segments of the outer one.

3 Piara'nthus. Corolla campanulate, 5-cleft; corona simple, 5-leaved; leaflets dentately crested on the back.

§ 2. *Column of fructification, or gynostegium, exserted or semi-exserted, appendiculate outside. Pollen masses having one of the edges or margins pellucid.*

4 Stape'lia. Corona double: outer one of 5 undivided leaflets, which are usually toothed on the back; leaflets of the inner one opposite the anthers, sometimes obsolete.

5 Gonoste'mon. Corona double: outer one of 5 distinct, canaliculate, obtuse, mucronate leaflets: of the inner one unciform, obtuse, opposite the anthers, sometimes obsolete.

6 Poda'nthes. Corona double: outer one 5-parted to the middle; the segments channel-formed, rhomboid, deeply emarginate or bifid: those of the inner form of a reversed foot.

7 Tride'ntea. Corona double: outer one of 5 tridentiform, distinct leaflets: those of the inner corona unequally bipartite.

8 Tromótriche. Corona double: outer one 5-parted to the base; with cuneate, rhomboid, or serrated, horizontal segments; leaflets of the inner unequally bipartite; inner branch longer, recurved, clavate. Corolla smooth, not wrinkled or corrugated as in the other genera separated from *Stapèlia*, ciliated with clavate trembling glands.

9 O'rbea. Corona double: outer one of 5 long, spreading, bi-tridentate leaflets; of the inner unequally bifid, having the inner branch longer, incurved, and clavate at apex. Corolla

stellate, corrugated, furnished with a large, elevated orb in front of the segments.

10 Obe'sia. Corona double; outer one undivided or 5-lobed, short; segments of the inner corona short, spreading. Corolla without any orb.

11 Duva'lia. Corona double: segments of the outer one bifid: of the inner one unequally bifid, galiately hooked. Corolla having the segments bent more or less to one side.

12 Caruncula'ria. Corona double: outer one 5-parted; segments short, spreading, emarginate; those of the inner corona unequally bifid, globose and granulately carunculate at top, and attenuated at the base; the granules of various forms.

13 Pectina'ria. Corona double; both ciliately multifid, not divided into leaflets.

14 Carallu'ma. Corona simple, 10-parted; the 5 segments opposite the stamens are obtuse and undivided: the outer 5 are bipartite and acute (f. 15. *c.*).

15 Boucerò'sia. Corona simple, 15-lobed; lobes disposed in a double series, all simple: the 5 inner ones laying upon the anthers. Corolla subcampanulate.

16 Hutchí'nia. Corona simple, 20-lobed: the 5 inner lobes lying upon the anthers. Corolla subcampanulate.

17 Eriope'talum. Corona simple, 15-lobed: the 5 inner lobes lying upon the anthers. Corolla subcampanulate. Segments linear.

18 Microste'mma. Corona simple, 5-lobed; lobes alternating with the anthers, sometimes there is a short tooth between each lobe. Pollen masses fixed by the middle.

19 Leptade'nia. Corona wanting. Corolla subrotate: having the throat crowned by 5 scales. Pollen masses fixed by the base, pellucid at top.

20 Othanthe'ra. Corona wanting. Corolla urceolate, with a naked throat. Pollen masses as in *Leptadènia*.

21 Brachyste'lma. Corona simple, 5-cleft, naked on the back. Pollen masses erect, fixed by the base. Corolla campanulate (f. 16. *b.*).

22 Fische'ria. Corona simple, truncate, girded by a ring at the base. Pollen masses fixed by the middle of the side. Corolla rotate, with curled segments.

Subtribe II. Hoya'ceæ. *Pollen masses erect or connivent, lying upon the stigma, fixed by the base or by the middle of the side. Anthers terminated by a membrane.*

§ 1. *Stamineous tube appendiculate outside.*

23 Hò'ya. Corona simple, 5-leaved; leaflets depressed, fleshy, drawn out into a tooth inside, which lies upon the anthers. Corolla rotate.

24 Pteroste'lma. Corona simple, 5-leaved; leaflets membranous, with reflexed sides, each drawn out into a subulate tooth inside. Corolla rotate.

25 Physoste'lma. Corona simple, 5-leaved; leaflets inflated; filaments 10, or 5 bipartite to the base, each alternate filament or leg bearing an anther. Corolla rotate.

26 Tylóphora. Corona simple, 5-leaved; leaflets depressed, fleshy, toothless inside, pressed to the gynostegium. Pollen masses transverse or ascending. Corolla rotate.

27 Beloste'mma. Corona simple, 5-leaved; leaflets linear-oblong, fleshy, fixed vertically to the middle of the gynostegium, spreading. Pollen masses sub-ascending. Corolla rotate.

28 Marsde'nia. Corona simple, 5-leaved; leaflets compressed, undivided at the apex, toothless inside. Corolla rotate.

29 Cosmostígma. Corona simple, 5-leaved; leaflets compressed, bifid, toothless inside. Anthers ventricose. Stigma crowned by a narrow, flexuous, repand margin. Corolla rotate.

30 Heteroste'mma. Corona simple, 5-leaved; leaflets dilated, each furnished with a process inside. Pollen masses tetragonal, pellucid on one margin. Corolla rotate.

31 Pergula'ria. Corona simple, 5-leaved; leaflets compressed, undivided at apex, furnished each with a little segment inside. Corolla rotate.

32 Dischídia. Corona simple, 5-leaved; leaflets compressed, bifid at apex, having the lobes recurved. Corolla rotate.

33 Leptoste'mma. Corona simple, 5-leaved; leaflets cordate or sagittate. Corolla tubular, with a constricted throat, closed with scales or fascicles of hairs.

34 Triplospe'rma. Corona simple, 5-lobed; lobes spreading, stellate, acute, large. Corolla funnel-shaped, with connivent segments. Seeds 3 rows in each follicle.

35 Harrisò'nia. Corona simple, 5-leaved; leaflets undivided at the apex, each furnished with a fleshy tooth or process inside. Corolla urceolate, 5-toothed, with a naked throat.

§ 2. *Stamineous tube inappendiculate outside.*

36 Conchophy'llum. Seeds with a tuft of hairs at end. Follicles smooth. Corolla urceolate, with a bearded throat.

37 Gymne'ma. Seeds with a tuft of hairs at end. Follicles slender, smooth. Corolla urceolate; throat crowned by scales, but sometimes toothless.

38 Sarcólobus. Seeds naked, marginate. Follicles ventricose, fleshy. Corolla subrotate, with a toothless throat.

Tribe II.

Gonolò'beæ. *Asclepiàdeæ veræ, part. R. Br. in mem. wern. soc. 1. p. 21. Pollen masses 10, transverse, attached by pairs to the corpuscles of the stigma, fixed by the outer extremity* (f. 17. *h.*), *and hiding the stigma, dehiscing transversely in respect to the cells, that is 5 2-celled anthers, separable into 2 parts by a transverse furrow. Stamineous corona simple, of 1 leaf* (f. 17. *d.*), *lobed. Anthers naked at the apex, terminated by a membrane.*

39 Gonólobus. Seeds with a tuft of hairs at end. Follicles usually ribbed or muricated. Stems twining.

40 Mate'lea. Seeds naked, crenated. Stem erect.

Tribe III.

Asclepie'æ. *Asclepiàdeæ veræ, part. R. Br. in mem. wern. soc. 1. p. 21. Pollen masses 10, smooth, 2 appertaining to each*

anther, fixed to the corpuscles of the stigma, by the apex or above the middle of the side, pendulous, that is 5 anthers, separable into 2 parts by a longitudinal furrow. Anthers terminated by a membrane.

§ 1. *Stamineous tube appendiculate. Corona simple, 5-leaved; leaflets opposite the anthers; and sometimes with as many small segments between the others in the same series.*

41 Ascle'pias. Corolla 5-parted, reflexed (f. 18. *e.*). Leaflets of corona cucullate, seated on the top of the tube of the filaments: having a little horn-formed segment running from the bottom of each, lying in the hollow. Follicles slender, smooth.

42 Polyòtus. Corolla rotate, 5-parted, reflexed. Leaflets of corona ovate-concave, without any appendage inside, but auriculate at the base. Follicles slender, smooth, or villous.

43 Ensle'nia. Corolla 5-parted, erect. Corona simple, 5-parted, petaloid, flat, truncate; the segments ending in a bifid thread. Stigma conical, subilamellate. Follicles slender, smooth.

44 Gomphoca'rpus. Corolla 5-parted, reflexed. Leaflets of corona subcucullate, furnished with a tooth on each side, but without any appendage inside. Follicles inflated, ramentaceous.

45 Ota'ria. Corolla 5-parted, reflexed. Corona 5-leaved, seated on the upper part with the tube of the filaments; leaflets cucullate: having a horn-formed process running from the bottom, and biauriculate on the inside at the base. Follicles. ?

46 Oxyste'lma. Corolla rotate, not reflexed. Leaflets of corona acute, or acuminated, toothless inside. Follicles smooth.

47 Iphísia. Corolla rotate. Leaflets of corona narrow at top, toothless inside. Follicles smooth.

48 Penta'tropis. Corolla rotate. Leaflets of corona vertically adnate to the gynostegium, averse and free at top. Pollen masses fixed beneath the apex.

49 Raphiste'mma. Corolla campanulate. Leaflets of corona elongated, compressed. Follicles ventricose. Gynostegium appendiculate outside. ?

50 Uroste'lma. Corolla campanulate. Corona 5-lobed; lobes obtuse. Gynostegium furnished with 5 long membranous processes, each process furnished with a filiform appendage. Follicles muricated.

51 Ana'ntherix. Corolla subcampanulate, 5-cleft. Corona 5-lobed; lobes compressed, empty inside, incurved; furnished with a little segment at the apex inside. Follicles muricated.

52 Xysmalòbium. Corolla somewhat campanulate; with a ventricose tube. Gynostegium exserted. Pollen masses compressed. Leaflets of corona obtuse, fleshy, alternating with 5 small denticulations. Follicles ventricose, ramentaceous.

53 Calótropis. Corolla, gynostegium, and pollen masses as in *Xysmalòbium*. Leaflets of corona adnate, longitudinally averse, recurved at the base. Follicles ventricose, smooth.

54 Oxype'talum. Corolla, gynostegium, and pollen masses as in *Xysmalòbium*. Leaflets of corona fleshy, obtuse. Pollen masses fixed to the curvatures of the processes, which at length are ascending.

55 Schube'rtia. Corolla funnel-shaped, ventricose at the base. Gynostegium exserted. ? Leaflets of corona adnate to the tube of the filaments, lanceolate, connivent. Follicles unknown.

56 Lachnóstoma. Corolla somewhat salver-shaped; with a bearded throat. Gynostegium and pollen masses as in *Xysmalòbium*. Leaflets of corona lunately 2-lobed, fleshy; lobes linear.

57 Macrosce'pis. Calyx exceeding the corolla. Corolla and pollen masses as in *Xysmalòbium*. Gynostegium saucer-shaped, hardly exceeding the tube of the corolla. Corona of 5, fleshy, roundish, rather concave scales.

58 Arau'jia. Corolla campanulately urceolate (f. 20. *c.*); with 5 swellings at the base. Gynostegium inclosed. Leaflets of corona saccate, naked inside. Stigma bicornute at apex. Pollen masses fixed by the apex. ?

59 Kana'hia. Corolla campanulate. Gynostegium inclosed. Leaflets of corona dilated from the base, subulate, simple inside. Pollen masses ventricose, fixed by their apexes. Stigma mutic.

60 Diplo'lepis. Corolla urceolate. Gynostegium inclosed. Leaflets of corona furnished each with a small, parallel segment inside. Pollen masses ventricose, fixed beneath their apices.

§ 2. *Gynostegium appendiculate. Corona simple, of one piece: having its tube sometimes furnished with segments or keels inside. Corolla subrotate.*

61 Holoste'mma. Corona annular, quite entire. Pollen masses compressed.

62 Cyna'nchum. Mouth of corona 5-20-cleft, when only 5-cleft the lobes are opposite the anthers.

63 Metaple'xis. Corona 5-parted; lobes alternating with the anthers.

§ 3. *Gynostegium appendiculate. Corona compound, in 2-3 series, each series with a distinct insertion. Throat of corolla without scales.*

64 Dita'ssa. Corona double; outer one 5-parted, with acuminated segments; segments of interior one shorter and opposite those of the outer one.

65 Dæ'mia. Corona double; outer ones 5-parted, sometimes alternating with smaller segments; inner one longer, and alternating with the outer one: having the segments loose or free to the base. Follicles ramentaceous.

66 Sarcoste'mma. Corona double; outer one cup-shaped or annular, crenated; inner one longer and 5-parted; both fleshy. Follicles slender, smooth.

67 Philibe'rtia. Corona double; exterior one annular, entire, fleshy, undulated; inner one inserted on the top of the gynostegium, of 5 entire, fleshy segments. Corolla urceolate, sinuately 5-lobed, furnished with small teeth between the segments.

68 Euste'gia. Corona triple, each composed of 5 segments; outer one inserted in the throat of the corolla, and opposite its segments; segments of the middle one tripartite; inner one undivided.

§ 4. *Stamineous tube or gynostegium naked. Corona wanting.*

69 METASTE'LMA. Throat of corolla campanulate, crowned by 5 teeth, which run down the tube.

70 MICROLÒMA. Throat of corolla urceolate, naked. Scales in the tube 5, inclosed, alternating with as many fascicles of hairs.

71 ASTE'PHANUS. Throat of corolla suburceolate, naked; tube rather hairy.

72 PENTASA'CHME. Corolla rotate; throat crowned by 5 scales. Anthers free. Pollen masses fixed above the middle.

73 HYBANTHE`RA. Corolla rotate. Anthers gibbous on the back. Stigma mutic.

TRIBE IV.

SECAMÒNEÆ. *Pollen masses 20, erect, smooth, that is 4 to each anther, which are fixed to the tops of the 5 exsulcate corpuscles of the stigma. Filaments connate, appendiculate outside. Corolla rotate.*

74 SECAMÒNE. Corona 5-leaved; leaflets compressed laterally, fixed longitudinally by the margins, simple, averse.

75 TOXOCA'RPUS. Corona 5-leaved; leaflets flattish on the back, and furnished with a little segment.

76 GONIOSTE'MMA. Corona tubular, 5-angled, 5-lobed, adhering to the base of the gynostegium.

TRIBE V.

PERIPLÒCEÆ. *Pollen masses 5-20, granular (each granule composed of 4 sperules), applied singly or by fours to the dilated free top of each corpuscle of the stigma. Filaments partly or altogether distinct. Anthers connivent.*

77 HEMIDE'SMUS. Filaments combined at the base, but distinct at top, inserted in the tube. Anthers cohering, beardless. Pollen masses applied by fours to each corpuscle of the stigma. Corolla rotate: having 5 mutic scales inserted in the throat, under the sinuses.

78 BRACHY'LEPIS. Filaments broad, short, distinct, inserted in the upper part of the tube. Anthers cohering, beardless. Pollen masses applied by fours to each corpuscle of the stigma. Corolla rotate: having 5 short, mutic segments in the throat, under the recesses; tube clothed with a broad, fleshy scale inside.

79 STREPTOCAU'LON. Filaments distinct, inserted in the tube. Anthers cohering by the base, but free and beardless at top. Pollen masses fixed singly to each corpuscle of the stigma. Corolla subrotate; throat crowned by 5 short aristate scales under the sinuses; anthers flexuous, erect, filiform, straight at the apex.

80 DECA'LEPIS. Filaments distinct, inserted in the upper part of the throat, along with the 5 upper scales, and combined with them to the middle. Anthers cohering at the base, but distinct at top and beardless, ending each in a subdilated appendage. Pollen masses as in *Streptocaúlon*. Corolla subrotate, crowned by 5 oblong-oval, flat, mutic scales, in the throat under the sinuses; and furnished with 5 linear, obtuse scales in the tube.

81 FINLAYSÒNIA. Filaments distinct, inserted in the throat inside tubercles. Anthers cohering at the base, each terminated by a broad ovate point. Pollen masses as in *Hemidésmus*. Corolla rotate; having the throat crowned by 5 awned tubercles, under the sinuses; awns capillary, erect, hooked at apex.

82 PERÍPLOCA. Filaments distinct. Anthers combined, bearded. Pollen masses applied singly to each corpuscle of the stigma. Corolla rotate: having 5 aristate scales in the throat.

83 PHYLLANTHE`RA. Filaments distinct. Anthers cohering, beardless, ending each in a dilated, foliaceous membrane. Pollen masses applied by fours to each corpuscle of the stigma. Corolla deeply 5-parted; throat naked?

84 LEPÓSMA. Anthers inserted above the base of the tube of the corolla. Pollen masses fixed by pairs to each corpuscle of the stigma. Corolla rotate, furnished with 5 fleshy scales in the throat, which cover the genitals.

85 GYMNANTHE`RA. Filaments distinct. Anthers cohering, beardless. Pollen masses fixed by fours to each corpuscle of the stigma. Corolla salver-shaped.

86 CRYPTOSTE`GIA. Filaments distinct, short, inserted in the bottom of the tube of the corolla. Anthers cohering, inclosed. Pollen masses fixed singly to each corpuscle of the stigma. Segments of calyx long, lanceolate. Corolla campanulately funnel-shaped; tube furnished with 5 bipartite scales inside, which cover the anthers, being opposite them.

Tribe I.

ORTHOPHURA`MIÆ (from *ορθος, orthos*, straight, and *φυραμα, phurama*, a mass; in reference to the pollen masses being erect). Asclepiàdeæ veræ, part. R. Br. in mem. wern. soc. 1. p. 21. Pollen masses 10, erect (f. 15. *d.*) or connivent, smooth, waxy, fixed by pairs (f. 15. *c.*) to the 5 corpuscles of the stigma; that is 5 anthers, separable into 2 parts by a longitudinal furrow. (f. 15. *c.*)

SUBTRIBE I. STAPELIE`Æ. Pollen masses fixed by the base or beneath the middle of the side, lying on the stigma. Anthers simple at top, that is, not terminated by a membrane. (f. 15. *d.*)

§ 1. *Column of fructification, or gynostegium inclosed. Stamineous corona appendiculate outside.*

I. CEROPE`GIA (from *κηρος*, wax, and *πηγη, pege*, a fountain; in reference to the waxy pollen masses). R. Br. in mem. wern. soc. 1. p. 21. Wight and Arnott, contrib. ind. bot. p. 29.—Isaùra, Comm. in Poir. encycl. 3. p. 185.—Stephanòtis, Pet. Th. nov. gen. mad. no. 35. in Rœm. coll. p. 203. Juss. ann. mus. 15. p. 347.—Ceropègia species, Lin. and others.

LIN. SYST. *Pentándria, Digýnia.* Calyx 5-parted. Corolla funnel-shaped, more or less ventricose from the base; segments of the limb narrow, cohering at the apex. Column of fructification inclosed. Stamineous corona 5-10-15-lobed: the lobes disposed in a single or double series, ligulate, placed in front of the stamens. Anthers simple at the top: pollen masses erect, fixed by the base, with simple edges. Stigma mutic. Follicles cylindrical, smooth. Seeds comose.—Usually twining herbs or subshrubs, only sometimes lactescent. Leaves opposite. Roots fibrous or tuberous. The corona in this as in most of the genera in the present order consists of a single whorl of 5 leaves opposite the stamina, and alternating with the segments of the corolla. In *Ceropègia* the leaflets of the corona are mostly 3-lobed; the lobes are sometimes distinct to near the base, form-

ing a 15-parted corona, more rarely or nearly altogether united, in this case forming a 10-15-lobed corona, and sometimes the lateral lobes become united to the middle one, and in this case present a 5-lobed corona. When the leaflets are distinct to near the base, the lateral segments approach and partially adhere to the back of the middle or primary one; when we have them apparently in a double series, but when they are united to near the apex, the lateral segments remain distinct, and a single series only is formed. Wight and Arnott, contrib. ind. bot. p. 30.

§ 1. *Corona* 10-*lobed; lobes disposed in a simple series; alternate ones the shortest, ovate, obtuse, entire, or semibifid.*

1 C. LU'CIDA (Wall. pl. asiat. rar. 2. p. 33. t. 139.) glabrous, twining; root fibrous; leaves from broad-ovate to oblong-lanceolate, acuminated; peduncles many-flowered; calycine segments subulate, recurved at apex; corolla clavate, hardly ventricose at the base: segments of the limb attenuated, equal in length to the tube; lateral lobes of the leaflets of the corona united above the middle, with pilose edges: the primary ones recurved at top. ♃. ⌒. S Native of Silhet and Prome. Corolla green, spotted with purple: the segments tipped with blackish purple, and ciliated at top.

Shining Ceropegia. Pl. tw.

2 C. HIRSU'TA (Wight, and Arnott. contrib. ind. bot. p. 30.) suffruticose, hairy, twining; leaves from cordate-ovate, bluntly acuminated, to narrow-lanceolate, acute; peduncles few-flowered; calycine segments filiform; corolla clavate, ventricose at the base: segments of the limb widening upwards, shorter than the tube; lateral lobes of the leaflets of corona united to the middle: the primary ones elongated and hooked at the apex; follicles straight, glabrous. ♄. ⌒. S. Native of the Neelgherry mountains.—Wight. cat. 1510.

Hairy Ceropegia. Shrub tw.

3 C. LONGIFLÒRA (Poir. encycl. 2. p. 177.) twining, glabrous; leaves petiolate, ovate, subacuminated; umbels erect, peduncculate, length of leaves; corolla long, cylindrical; with nearly filiform, hairy segments; corona unknown. ♃. ⌒. S. Native probably of the East Indies. Leaves an inch long. Corolla an inch long, pale green or purplish. This species agrees with *C. tuberòsa* in the leaves, and with *C. júncea* in the flowers.

Long-flowered Ceropegia. Pl. twining.

4 C. JU'NCEA (Roxb. cor. 1. p. 12. t. 10.) glabrous, rather fleshy, twining; leaves small, sessile, lanceolate, acute; peduncles few-flowered; calycine segments subulate; corolla clavate, curved, ventricose at the base: segments of limb broadest upwards, about equal in length to the tube, pilose; lateral lobes of the leaflets of corona united to the middle: the primary ones hooked at apex. ♃. ⌒. S. Native of the Circars, in hedges near Samulcottah, &c. Flowers large, greenish yellow, and elegantly variegated with purple. Root tuberous, with many-branched fibres. The plant is called *Bella-gada* by the Telingas, who eat every part of the plant.

Rushy Ceropegia. Clt. 1822. Pl. tw.

5 C. AFRICA'NA (R. Br. in bot. reg. t. 626.) glabrous, twining; root tuberous; leaves ovate-lanceolate, fleshy; corolla ventricose at the base; tube slender; segments of the limb bearded; corona as in *C. Wightii*. ♃. ⌒. S. Native of the Cape of Good Hope, but more probably of the East Indies. Lodd. bot. cab. 906. Flowers erect, with a pentagonal throat, a green tube, and dark purple segments.

African Ceropegia. Fl. June, July. Clt. 1823. Pl. tw.

6 C. WÍGHTII (Graham, mss. Wight, in bot. mag. 3267.) glabrous, twining; root tuberous; leaves ovate, acute, fleshy; corolla spherically ventricose at the base: tube slender: segments of the limb downy; lateral lobes of leaflets of corona united to the apex, glabrous: the primary ones fleshy, compressed laterally, curved outwardly in the middle, hardly twice the length of the others. ♃. ⌒. S. Native of the East Indies. Nearly allied to *C. Africàna* in the form of the corolla and crown.

Wight's Ceropegia. Clt.? Pl. tw.

7 C. LU'SHII (Graham, in edinb. new. phil. journ. ex Hook, in bot. mag. 3300.) glabrous; leaves linear, acuminated, fleshy channelled; tube of corolla globosely inflated at the base; segments linear, hairy, approximate; exterior lobes of staminеous corona lunately emarginated, alternating with the interior ones, which are elongated, and cylindrically filiform, erect, flexuous, much longer than the exterior ones. ♃. ⌒. S. Native of the East Indies. Root bulbous. Peduncles umbellate, axillary. Corolla yellowish green, tinged with purple; segments deep purple and hairy within.

Dr. Lush's Ceropegia. Clt.? Pl. tw.

§ 2. *Corona apparently a double series of lobes; the leaflets are nearly free to the base; the lateral lobes of the leaflets distinct, approximating the primary ones, and partly adhering to their backs.*

* *Lateral lobes of the leaflets of the corona ligulate, longer than the gynostegium.*

8 C. E'LEGANS (Wall. ascl. no. 4. in bot. mag. t. 3015. Wight. cat. no. 1512.) suffruticose, glabrous, twining; root fibrous; leaves oblong, or oblong-lanceolate, acuminated; peduncles 1-6-flowered, shorter than the leaves; calycine segments subulate, much shorter than the ventricose base of the corolla; corolla with a clavate tube, a hemispherical limb, and broad ligulate segments, which are much shorter than the tube, and ciliated with long hairs; lateral lobes of the leaflets of the corona ligulate, one half shorter than the primary ones; follicles slender, torulose, curved, 6-8 inches long. ♄. ⌒. S. Native of the mountains of Dindygul and Neelgherry. Corollas purple.

Elegant Ceropegia. Fl. Aug. Oct. Clt. 1828. Shrub tw.

9 C. MACRA'NTHA (Wight, contrib. ind. bot. p. 31.) suffruticose, twining; leaves ovate, acuminated, ciliated; umbels few-flowered, on short peduncles; calycine segments subulate; corolla ventricose at the base; limb rather dilated; segments rounded-linear, villous inside; lateral lobes of the leaflets of the corona ligulate, hardly twice shorter than the middle ones. ♄. ⌒. S. Native of the Himalaya, at a place called Khuriepass, Royle. The corolla of this species is from 2-3 inches long, and except the ventricose base is nearly cylindrical, which readily distinguishes it from *C. élegans*, a nearly allied species.

Long-flowered Ceropegia. Shrub tw.

10 C. LONGIFÒLIA (Wall. pl. rar. asiat. 1. p. 56. t. 73.) downy, twining; root fibrous; leaves narrow-lanceolate, much attenuated; peduncles many-flowered, shorter than the leaves; corolla ventricose at the base: with a clavate tube; segments of the limb almost one half shorter than the tube, broadest upwards and ciliated; lobes of the leaflets of the corona hairy: lateral ones narrow-ligulate, almost one half shorter than the middle or primary ones. ♃. ⌒. S. Native of Nipaul, in hedges. Flowers brownish green; with a yellow limb. Leaves 5-6 inches long, and 1 broad.

Long-leaved Ceropegia. Pl. tw.

11 C. ANGUSTIFÒLIA (Wight, contrib. ind. bot. p. 31.) downy, twining; leaves narrow-lanceolate, much attenuated; peduncles many-flowered; corolla hardly ventricose at the base: tube almost cylindrical; segments of the limb broadest upwards, much shorter than the tube; lobes of the leaflets of corona narrow, ligulate: lateral ones hairy, about one half shorter than the middle ones. ♃. ⌒. S. Native of Silhet. Ceropègia, Wall. ascl. nos. 8. 13. 19. Nearly allied to *C. longifòlia*.

Narrow-leaved Ceropegia. Pl. tw.

** *Lateral lobes of the leaflets of the corona ligulate, shorter than the gynostegium.*

12 C. SPHENA'NTHA (Wight and Arnott, contrib. ind. bot. p. 31.) twining, glabrous; leaves distant, lanceolate, attenuated; peduncles many-flowered; calyx minute, with filiform segments; corolla ventricose at the base; tube clavate; limb hemispherical: segments broadest upwards, long-ciliated; lobes of leaflets of corona ligulate: lateral ones shorter than the gynostegium, hairy. ♃. ◠. S. Native among the Neelgherry mountains.—Wall. ascl. no. 6. Wight, cat. no. 1513.

Bound-flowered Ceropegia. Pl. tw.

13 C. LANCEOLA'TA (Wight, contrib. ind. bot. p. 31.) twining, glabrous; leaves narrow-lanceolate, finely acuminated; peduncles many-flowered; calycine segments filiform, exceeding the ventricose base of the corolla; tube clavate; limb dilated: segments much shorter than the tube; middle lobes of the leaflets of the corona a little longer than the gynostegium, but the lateral ones are shorter, acute, and ciliated; follicles slender, glabrous. ♃. ◠. G. Native of Nipaul. Ceropègia, Wall. cycl. no. 12.

Lanceolate-leaved Ceropegia. Pl. tw.

14 C. PUSÍLLA (Wight and Arnott, l. c.) herbaceous, glabrous, erect; root tuberous; leaves linear; flowers solitary, ascending; corolla ventricose at the base: tube cylindrical: segments of the limb much shorter than the tube; middle lobes of the leaflets of the corona a little longer than the gynostegium, but the lateral ones are a little shorter. ♃. G. Native of the Neelgherry mountains. Ceropègia, Wall. ascl. no. 7.

Least Ceropegia. Pl. ¼ foot.

*** *Lateral lobes of the leaflets of the corona acuminated, approximating the primary ones: leaflets as well as their lateral lobes interjected by broad sinuses at their apices.*

15 C. BULBÒSA (Roxb. cor. 1. p. 11. t. 7.) twining, glabrous, rather fleshy; root tuberous; leaves from almost orbicular to lanceolate, acuminated; peduncles many-flowered, shorter than the leaves; calycine segments much shorter than the ventricose base of the corolla; tube of corolla sub-clavate; segments of the limb broadest upwards, much shorter than the tube, ciliated; middle lobes of the leaflets of the corona subulate, incurved at top: lateral ones minute, acuminated, lying on the primary ones. ♃. ◠. S. Native of Coromandel, at Samulcottah, Negapatam, Allahabad, &c. Wight, in Hook. bot. misc. 2. p. 99. suppl. t. 2. The plant is called *Manchy Mandu* by the Telingas. Root flattish, solid, edible. Flowers large, erect, with a greenish tube and a purple limb; having the segments united at the apex.

Bulbous-rooted Ceropegia. Fl. April, Sept. Clt. 1821. Pl. tw.

16 C. ACUMINA'TA (Roxb. cor. 1. p. 12. t. 8.) herbaceous, twining, glabrous, rather fleshy; root tuberous; leaves linear-lanceolate, attenuated at the apex; peduncles many-flowered; corolla ventricose at the base: tube subclavate: segments of the limb much shorter than the tube; primary or middle lobes of the leaflets of the corona subulate: lateral ones minute. ♃. ◠. S. Native of Coromandel, at Samulcottah, where it is called *Commoa-manda* by the Telingas. Root solid, flat. Leaves 2-4 inches long, and 4-6 lines broad. Flowers exactly as in *C. bulbòsa*.

Acuminated-leaved Ceropegia. Fl. June, July. Clt. 1820. Pl. tw.

17 C. STEPHANÒTIS (Rœm. et Schultes, syst. 6. p. 4.) twining, glabrous, frutescent; leaves ovate, coriaceous, marginated, acuminated; peduncles axillary, generally 3-flowered; calycine segments lanceolate, acute; corolla glabrous, with ovate, acute lobes; corona unknown. ♄. ◠. S. Native of Madagascar. Isaùra allícia, Comm. in Poir. encycl. 3. p. 185. Stephanòtis, Pet. Th. nov. gen. mad. no. 35. in Rœm. coll. p. 203. Leaves 3 inches long and 1½ broad, yellowish green. Corolla pale yellow.

Crown-eared Ceropegia. Shrub tw.

**** *Lateral lobes of the leaflets of the corona very short, obtuse, or altogether cohering with the middle ones.*

18 C. ARNOTTIA'NA (Wight, contrib. ind. bot. p. 32.) twining, glabrous; stems slender; leaves narrow-lanceolate, mucronulate; peduncles short, many-flowered; calycine segments narrow-subulate, longer than the ventricose base of the corolla; tube short, widened a little upwards; segments of the limb filiform, connivent, longer than the tube; middle lobes of the leaflets of the corona ligulate: lateral ones short, obtuse, approximate, adnate to the back of the primary ones, even to the apex, with a small distinct recess or sinus, ciliated a little. ♃; ◠. S. Native of hills about Prome. Ceropègia, Wall. ascl. no. 3.

Arnott's Ceropegia. Pl. tw.

19 C. WALLÍCHII (Wight, in bot. mag. 3267.) erect; root tuberous; leaves ovate, sessile, approximate towards the top of the stem, ciliated; peduncles lateral, short, 1-flowered; calycine segments subulate; corolla ventricose at the base: tube widened upwards: segments of the limb broadest at top, connivent, densely ciliated; primary lobes of the leaflets of the corona filiform: sublateral ones short, obtuse, ciliated; follicles very long, glabrous. ♃. ◠. S. Native of the Himalaya, Royle; near Lahooghat, in Kamaon, Lindsay. Ceropègia erécta ?, Wall. ascl. no. 1.

Wallich's Ceropegia. Clt.? Pl. erect.

20 C. PUBE'SCENS (Wall. pl. rar. asiat. 2. p. 81. t. 187.) herbaceous, twining; stems glabrous; leaves ovate, finely acuminated, downy on both surfaces; peduncles many-flowered, shorter than the leaves; corolla cylindrical, hardly ventricose at the base: segments of the limb broadest at the base, somewhat cordate, tapering upwards, and connivent; primary lobes of the leaflets of the corona subulate, recurved at top: lateral ones marginating the primary ones, or altogether adnate. ♃. ◠. S. Native of Nipaul, on mount Chandaghiry. Corolla glabrous outside, villous inside at the base, with a purple tube, and yellowish pentagonal limb. Leaves 3 inches long, ciliated.

Downy Ceropegia. Pl. tw.

21 C. TUBERÒSA (Roxb. cor. 1. p. 12. t. 6.) herbaceous, glabrous, twining; leaves from nearly orbicular to oval or ovate, cuspidate, as also lanceolate, finely acuminated; peduncles usually twin, few or many-flowered, longer or shorter than the leaves; calyx small: with subulate segments; corolla ventricose at the base: having the tube widened upwards; segments of the limb narrow, nearly linear, villous, one half shorter than the tube, with approximate edges; gynostegium stipitate; middle lobes of the leaflets of the corona ligulate: lateral ones marginating the primary ones, or altogether adnate; follicles slender. ♃. ◠. S. Native on the Coromandel coast, frequent; and in sandy places near Negapatam, in Tanjore. Wight and Arnott, contrib. ind. bot. p. 33. Wight, cat. no. 1516. C. mucronàta, Roth, nov. spec. p. 179. C. biflòra, Lin. spec. 309.? C. candelàbrum, Rottl. herb. Roxb. fl. ind. 2. p. 27. but not of Lin.? Flowers said to be the colour of those of *C. bulbòsa*. This is a very variable species as regards the foliage, but is constant in the shape of its flowers, the slender segments of the limb with their margins approximating their whole length, and forming a straight beak to the corolla, and in the stalked gynostegium or column of fructification.

Tuberous-rooted Ceropegia. Fl. April, Sept. Clt. 1821. Pl. tw.

22 C. Loureìrii; herbaceous, glabrous, procumbent; leaves ovate-lanceolate, with revolute edges; umbels pendulous; corolla with a large, globose base, and a small, 5-cleft limb. ↄ. ⌒. G. Native of Cochinchina, among bushes. Ceropègia candelàbrum, Lour. coch. 114. Flowers white. Stigma sessile, bifid. Follicles slender.

Loureiro's Ceropegia. Pl. twining.

23 C. obtu'sa (Lour. coch. 114.) twining, glabrous; leaves oblong, obtuse; peduncles shorter than the leaves. ↄ. ⌒. S. Native of Cochinchina, in the suburbs of Huaca. Flowers paler than those of *C. tuberòsum*, from which it differs more in the shape of the leaves than in the flowers; the follicles are also slenderer.

Blunt-leaved Ceropegia. Pl. tw.

† *Species hardly known.*

24 C. candela'brum (Lin. spec. p. 309.). ↄ. ⌒. S. Native of Malabar.—Rheed. mal. 9. t. 16. Leaves ovate, mucronate. Flowers erect, reddish or brownish purple; with villous segments. This species has been taken up by Linnæus from Rheede's figure. It seems to be nearly allied to *C. tuberòsa*, but has a very different habit. The *C. candelàbrum* of most modern authors is undoubtedly *C. tuberòsa*.

Chandelier Ceropegia. Pl. tw.

25 C. dichótoma (Haw. syn. p. 13.) fleshy; stem erect, dichotomous, articulated, terete; leaves linear, acute, horizontal; having the veins and midrib white above. ♄. S. Native of the East Indies? Flowers? Leaves 1½ inch long.

Dichotomous-stemmed Ceropegia. Shrub 1 foot.

26 C.? campanula'ta; root round, depressed: leaves linear; corolla tubularly campanulate, 4-cleft; calyx small, 4-5-toothed. ↄ. S. Native of the Gold Coast, at Accra, among grass. Corolla dark purplish brown. Perhaps a new genus. There is also another species growing along with this, which differs from the first in the root being fusiform. The roots of both are eatable. Stem 1-2-flowered in both. Flowers terminal.

Campanulate-flowered Ceropegia. Pl. ½ foot.

27 C.? aphy'lla (Haw. syn. p. 13. no. 2.) plant fleshy; branches dichotomous, articulated, weak, terete; leaves stipula-formed, adpressed. ♄. ⌒. S. Native country unknown.

Leafless Ceropegia. Shrub tw.

28 C.? nítida (Poir. dict. suppl. 2. p. 178.) leaves lanceolate, bluntish, shining above; umbels on short peduncles. ♄. S. Native of St. Domingo. Stem woody. Branches slender, elongated. Leaves subovate, sometimes elliptic, attenuated at the base, and sometimes acute at the apex, 1-2 inches long, and ½ broad.

Shining-leaved Ceropegia. Shrub tw.

29 C.? sinua'ta (Poir. dict. suppl. 2. p. 179.) leaves narrow-lanceolate, sinuated, acute at both ends; umbels 4-6-flowered, much shorter than the leaves. ↄ. ⌒. G. Native of the Cape of Good Hope. Burm. afr. p. 36. t. 15. Root a fascicle of fusiform simple tubers. Corolla tubular, pale red. There is only one follicle comes to perfection from each flower; it is pendulous and long-acuminated. Seeds numerous, oblong, brown. Said to differ from *Microlòma sagittàta* in the leaves being longer and not sagittate at the base.

Sinuated-leaved Ceropegia. Fl. July, Aug. Clt. 1818. Pl. tw.

30 C. corda'ta (Lour. coch. 114.) leaves cordate; umbels on long pendulous peduncles; segments of corolla ovate, connivent. ↄ. ⌒. S. Native of Cochinchina, in hedges. Flowers greenish yellow, in large, hemispherical, axillary umbels. Calycine segments small, ovate, acute. Perhaps the same as *Cynánchum cordifòlium*, Retz. fasc. 2. p. 15. no. 37.

Cordate-leaved Ceropegia. Pl. tw.

31 C. stapeliæfórmis (Haw. in phil. mag. feb. 1827. p. 121.) branches, prostrate, fleshy, thong-formed, lurid, terete, nearly leafless, simple, clouded with brown. ♄. S. Native of the Cape of Good Hope. This species has the habit of *O'rbea*. Branches rough from tubercles. Leaves very minute, ternate, almost invisible, and as if they were adnate to the stem, cordate, cuspidate. Flowers sessile, rising from the axils of the leaves.

Stapelia-formed Ceropegia. Fl. July. Clt. 1824. Pl. proc.

Cult. A mixture of peat, sand, and vegetable mould is the best soil for these plants; cuttings of them root readily in sand, if placed in heat, without any hand-glass over them. They should have little or no water, when in a dormant state, particularly the bulbous-rooted kinds.

II. HUE'RNIA (named after Justus Huernius, one of the earliest collectors of Cape Plants, and from whose drawing the first account of *Stapèlia* was taken.) R. Br. in. mem. wern. soc. 1. p. 22.—Stapèlia species, Lin. Juss. Mass.

Lin. syst. *Pentándria, Digýnia.* Corolla campanulate; limb 10-cleft, the accessory segments small and tooth-formed. Column of fructification inclosed. Stamineous corona double; outer one 5-cleft, with bifid segments; inner one of 5 leaves, which are subulate from the gibbous base, alternating with the segments of the outer corona. Anthers simple at top. Pollen masses erect, fixed by the base, having one of the margins cartilaginous and pellucid. Stigma mutic. Follicles sub-cylindrical, smooth. Seeds comose.—Succulent plants with the habit of *Stapèlia*, natives of South Africa.

1 H. reticula'ta (R. Br. l. c.) branches pentagonal, denticulated; teeth spreading; corolla 10-angled; tube bearded inside, widened into an elevated orb. ♄. S. Native of the Cape of Good Hope, in the fissures of rocks, toward Olifant's river. Stapèlia reticulàta, Mass. stap. p. 9. t. 2. Sims, bot. mag. 1662. Jacq. stap. t. 20. H. reticulàta diffórmis, Jacq. stap. 19. Corolla with a purplish bottom; yellow limb dotted with purple. Flowers twin or tern. Branches deep green, with purple spots.

Reticulated-flowered Huernia. Fl. July, Aug. Clt. 1793. Shrub ½ foot.

2 H. campanula'ta (R. Br. l. c.) branches 4-5-angled; corolla sub-campanulate, having the bottom closed by clavate, horizontal pili; ligulæ repandly truncate, dark. ♄. S. Native of the Cape of Good Hope. Stapèlia campanulàta, Mass. stap. p. 11. t. 6. Jacq. stap. t. 32. Sims, bot. mag. t. 1227. Branches glaucous, clouded with purplish marks. Limb of corolla sulphur-coloured, with numerous rose-coloured dots outside, and with numerous dark brown elevated dots inside, and striated with dark veins towards the base. Hairs in the throat blackish. Bottom of corolla black. This differs from the last species, in the bottom of the corolla being campanulate, and in the peduncles being 2-3-flowered.

Campanulate-flowered Huernia. Fl. July, Oct. Clt. 1795. Shrub ½ foot.

3 H. venu'sta (R. Br. l. c.) branches 4-5 angled; branchlets spreading, divaricate; teeth of branches spreading, acute; corolla with a glabrous tube, widened into an elevated orb. ♄. S. Native of the Cape of Good Hope. Stapèlia venústa, Mass. stap. p. 10. t. 3. Jacq. stap. t. 23. Corolla large, with a sulphur-coloured limb, dotted with red; having the bottom and elevated orbicle also dotted with red. Flowers solitary or twin. Peduncles deflexed.

Graceful Huernia. Fl. June, July. Clt. 1795. Shrub ½ foot.

4 H. LENTIGINÒSA (R. Br. l. c.) branches pentagonal, spreading, furnished with hooked teeth or tubercles; bottom of corolla girded by a concave, elevated orbicle; alternate segments of the corolla obsolete. ♄. S. Native of the Cape of Good Hope. Stapèlia lentiginòsa, Curt. bot. mag. t. 505. Ait. hort. kew. ed. 2d. vol. 2. p. 97. Stems branched at top. This species agrees with *H. guttàta*, in the colour and form of the flowers; but in *H. guttàta* the peduncles are longer, rising from the base of a simple stem, and having the tubercles or teeth of the branches not hooked; and the spots on the limb of the corolla are larger.

Freckled-flowered Huernia. Fl. July, Nov. Clt. 1795. Shrub $\frac{1}{2}$ foot.

5 H. GUTTA'TA (R. Br. l. c.) branches tetragonal and pentagonal; teeth or tubercles horizontal; bottom of corolla girded by a concave, elevated orbicle; stems simple at top, glaucous. ♄. S. Native of the Cape of Good Hope. Stapèlia guttàta, Mass. stap. p. 10. t. 4. Ait. hort. kew. ed. 2. vol. 2. p. 96. Allg. teutsch. gart. mag. 7. t. 41. Corolla sulphur-coloured, dotted with red, with a scabrous bottom, purplish outside. Peduncles length of flowers, by threes. Inner corona spotted with purple; base wholly purple.

Spotted-flowered Huernia. Fl. Aug. Nov. Clt. 1795. Shrub $\frac{1}{2}$ foot.

6 H. HU'MILIS (R. Br. l. c.) branches 4-5-angled, spreading; teeth of branches acute, horizontal; corolla orbicular; flowers solitary. ♄. S. Native of the Cape of Good Hope. Stapèlia hùmilis, Mass. stap. p. 10. t. 5. Corolla with a campanulate tube, and a prominent ring. Orbicle dark purple, undulated, spotted with white; limb sulphur-coloured, dotted with purple. This differs from the rest of the species, in the shortness of the stems, smallness of the flowers, and solitary peduncles.

Dwarf Huernia. Fl. Aug. Nov. Clt. 1795. Shrub $\frac{1}{4}$ foot.

7 H. TUBA'TA (R. Br. l. c.) branches simple, very thick, tetragonal: with large teeth; flowers solitary; corolla glabrous, dotted inside; corona 10-lobed; lobes roundish, ex Haw. suppl. pl. succ. p. 10. Orbicle short. ♄. S. Native of the Cape of Good Hope. Stapèlia tubàta, Jacq. stap. t. 23. Lodd. bot. cab. 225. Corolla glabrous, pale yellow inside, spotted with small red dots; the throat also dotted. In Willd. enum. p. 287. the throat of the corolla is described as being pilose, and the limb flat.

Var. β; corolla 12-cleft. ♄. S. Native of the Cape of Good Hope. Stap. duodécimfida, Jacq. t. 33 and 34.

Tube-flowered Huernia. Fl. Aug. Nov. Clt. 1805. Shrub $\frac{1}{2}$ foot.

8 H. CRÍSPA (Haw. syn. p. 31.) branches 4-5-angled, simple, or usually confluent, curled: with small teeth. ♄. S. Native of the Cape of Good Hope. Stapèlia crísp a, Hort. This is very distinct from both *H. barbàta* and *H. tubàta*, but is perhaps only a monstrous variety of one of them. The teeth of the branches are smaller than in any other species.

Curled-branched Huernia. Cl.? Shrub $\frac{1}{2}$ foot.

9 H. BARBA'TA (R. Br. l. c.) branches 4-5-angled, with spreading, acute teeth; peduncles 2-3-flowered; corolla almost closed with clavate, rufous bristles; ligulæ oblong-rhomboid, retuse. ♄. S. Native of the Cape of Good Hope. Stapèlia barbàta, Mass. stap. p. 11. t. 7. Jacq. stap. t. 46. Corolla cream-coloured, variegated, with elevated purple spots. Corona dark. Style white. Flowers in fascicles, at the base of the branches, ex Haw. syn. p. 31.

Bearded-flowered Huernia. Fl. Aug. Nov. Clt. 1795. Shrub $\frac{1}{2}$ foot.

10 H. CLAVÍGERA (Haw. syn. p. 26. suppl. pl. succ. p. 10.) branches tetragonal, with spreading, stiff teeth; flowers solitary; corolla campanulate, dotted inside; ligulæ 2-lobed. ♄. S. Native of the Cape of Good Hope. Stapèlia clavígera, Jacq. stap. t. 4. diar. lips. p. 269. Stapèlia campanulàta, Sims. bot. mag. t. 1661, but not t. 1293, which is the true *S. campanulàta*. Corolla pale green, livid outside, obscure yellow inside, and furnished with blood-coloured dots, and clavate hairs; exterior corona brown.

Club-bearing Huernia. Fl. July, Nov. Clt. 1795. Shrub $\frac{1}{2}$ foot.

11 H. OCELLA'TA (Rœm. et Schultes, syst. 6. p. 9.) branches 4-5 angled; corolla sub-campanulate; the rest as in the other species. ♄. S. Native of the Cape of Good Hope. Stapèlia ocellàta, Jacq. diar. lips. 1814. p. 270. stap. t. 40. Corolla greenish yellow, with purple marks.

Ocellated-flowered Huernia. Fl. Aug. Nov. Clt.? Sh. $\frac{1}{2}$ ft.

Cult. For culture and propagation see *Stapèlia*, p. 117.

III. PIARA'NTHUS (πιαρ, *piar*, fatness; and ανθος, *anthos*, a flower; in reference to the fleshy flowers.) R. Br. in mem. wern. soc. 1. p. 23. Haw. syn. p. 34.—Stapèlia species, Masson.

LIN. SYST. *Pentándria*, *Monogýnia*. Corolla campanulate, 5-cleft, fleshy. Column of fructification inclosed. Stamineous corona simple, 5-leaved; leaflets toothed on the back. Anthers simple at top, Pollen masses erect, fixed by the base, with one of the margins cartilaginous and pellucid. Stigma mutic. Follicles unknown.—Succulent plants, natives of south Africa, with the habit of *Stapèlia*. Flowers rising from the sides of the branches, beyond the angles and teeth.

1 P. PUNCTA'TUS (R. Br. l. c.) joints of branches oblong, somewhat tetragonal, toothed; flowers in fascicles; segments of corolla lanceolate, acute, papillose above. ♄. S. Native of the Cape of Good Hope. Stapèlia punctàta, Mass. stap. p. 18. t. 24. Obèsia? punctàta, Haw. syn. p. 43. Branches decumbent, creeping. Flowers usually 3 together, on dark purple peduncles. Calyx dark purple. Corolla with a deep red bottom, and very pale red segments, spotted with blood-coloured dots. Probably a true species of *Obèsia*.

Dotted-flowered Piaranthus. Fl. July, Nov. Clt. 1795. Shrub proc.

2 P. PU'LLUS (R. Br. l. c.) branches usually hexagonal, erect; tubercles or teeth spreading; flowers aggregate; segments of corolla lanceolate, silky above, replicate. ♄. S. Native of the Cape of Good Hope. Stapèlia púlla, Mass. stap. 21. t. 31. Sims, bot. mag. 1648. Willd. spec. 1. p. 1288, exclusive of the syn. Stapèlia fasciculàta, Thunb. Allg. teutsch. gart. Angles of branches a little sinuated, having strong teeth. Corolla dark purple. Flowers 3-4-together.

Dark-flowered Piaranthus. Fl. Aug. Sept. Clt. 1774. Shrub $\frac{1}{2}$ foot.

3 P.? FASCICULA'TUS (Rœm. et Schultes, 6. p. 10.) branches usually hexagonal, with acute, spreading teeth; flowers pedunculate, fascicled. ♄. S. Native of the Cape of Good Hope, near Roggeveldsberg, on the Hanton hills. Branches decumbent. Peduncles length of the joints of the branches.

Fascicled-branched Piaranthus. Shrub decumbent.

4 P. PARVIFLÒRUS (Spreng. syst. 1. p. 841.) branches tetragonal; teeth thick, recurved; corolla small, with narrow, flat, spreading segments, which are ciliated on the edges; peduncles 2-3 together, longer than the flowers. ♄. S. Native of the Cape of Good Hope, in Namaqua Land. Stapèlia parviflòra, Mass. stap. p. 22. t. 35. Corollas yellow, size of those of *Cynánchum eréctum*.

Small-flowered Piaranthus. Fl. Aug. Clt. 1795. Shrub $\frac{1}{2}$ foot.

5 P. GUSSONEA'NUS; branches glaucous, tetragonal; angles toothed; flowers in fascicles beyond the angles, small; corollas glabrous. ♄. S. Native of Sicily, on rocks. Stapèlia

Gussoneàna, Jacq. ex bot. reg. t. 1731. Corollas yellow, striped with brown, and tipped with purple.

Gussone's Piaranthus. Fl. Ju. Jul. Clt. 1832. Shrub ½ foot.

6 P. A'RIDUS; branches numerous, erect, tetragonal, floriferous at top: with spreading, acute teeth; pedicels solitary; segments of corolla flat, ovate-lanceolate, setaceously ciliated at top; bottom of corolla circular. ♄. S. Native of the Cape of Good Hope, in the dry desert called Karro. Stapèlia árida, Mass. stap. p. 21. t. 33. Corollas size of those of *Cynánchum vincetóxicum*, pale yellow, with a yellow, circular bottom, white corona: having the segments dotted at the base, and pilose at the apex, ex Willd. Teeth of branches curved, similar to spines.

Arid Piaranthus. Fl. Aug. Clt. 1795. Shrub ¼ foot.

7 P. INCARNA'TUS; branches erect, tetragonal: with spreading, acute teeth; flowers aggregate, almost sessile; segments of corolla narrow, flat, acute, ex Mass., obtuse, ex Thunb. ♄. S. Native of the Cape of Good Hope, in Saldanha Bay. Stapèlia incarnàta, Lin. suppl. p. 171. Thunb. prod. 1. p. 46. fl. cap. 2. p. 167. Mass. stap. p. 22. t. 44.—Burm. afr. p. 15. t. 7. f. 1. Pedicels rising, as in other species, from the angles beyond the teeth. The herb is eaten by the Hottentots, ex Lin. Flowers small, flesh-coloured, size of those of Stapèlia pilífera. Corona covering the gynostegium, with a greenish margin, of 5 yellow, erect, bifid segments, and other 5 linear, inflexed ones, in the centre, ex Thunb.

Var. β, albus (Mass. stap. l. c.) flowers white.

Flesh-coloured-flowered Piaranthus. Fl. April, Aug. Clt. 1793. Shrub 1 foot.

8 P. MAMMILA'RIS; branches hexagonal, bearing the flowers in the middle: furnished with spine-like, recurved tubercles; pedicels shorter than the flowers; corolla glabrous; segments lanceolate, with revolute edges. ♄. S. Native of the Cape of Good Hope, on rocks, about Olifant's river; and towards the north, near Hex river, in the Karro. Stapèlia mammilàris, Lin. mant. p. 216. Thunb. prod. 1. p. 46. fl. cap. 2. p. 166.—Burm. afr. p. 27. t. 11. Pedicels usually by fours.

Mammilary Piaranthus. Fl. June, July. Clt. 1774. Shrub.

Cult. See *Stapèlia*, p. 117, for culture and propagation.

§ 2. *Column of fructification, or gynostegium, exserted, or semi-exserted, appendiculate outside. Pollen masses pellucid on one of the margins.*

IV. STAPE'LIA (named by Linnæus, after Boderus a Stapel, a physician of Amsterdam, Commentator on Theophrastus, in 1644.) R. Br. in mem. wern. soc. 1. p. 23.—Stapèlia species, Lin. and others.

Lin. syst. *Pentándria, Digy'nia.* Corolla rotate, 5-cleft, fleshy. Column of fructification exserted. Stamineous corona double; exterior one of 5 undivided leaflets; interior one of 5 subulate leaflets. Anthers simple at top. Pollen masses fixed by the base, having one of the edges cartilaginous and pellucid. Stigma mutic. Follicles somewhat cylindrical, smooth. Seeds comose.—Fleshy, leafless, angular, usually tubercular plants, natives of south Africa, in the desert plains called Karro. Flowers for the most part showy, but with a nauseous, fetid odour.

§ 1. *Branches or stems alately tetragonal, downy.*

1 S. GRANDIFLÒRA (Mass. stap. p. 3. t. 11.) branches quadrangular, clavate, downy; tubercles or teeth remote; corolla large, flattish: with ovate-lanceolate, acute segments, which are ciliated on the edges. ♄. S. Native of the Cape of Good Hope. Haw. syn. p. 16. no. 1. Plant grey, from down. Peduncles 3-flowered. Corolla large, dark purple in the bottom; but the segments are lighter purple, ciliated with grey hairs, and striped with white.

Great-flowered Stapelia. Fl. Sept. Dec. Clt. 1795. Shrub 1 foot.

2 S. SPECTA'BILIS (Haworth, syn. p. 16. no. 2.) branches tetragonal, downy; tubercles or teeth remote; segments of corolla ovate-lanceolate, furnished from the base behind the middle with dense red hairs, and having pale stripes on the upper surface, with black tips. ♄. S. Native of the Cape of Good Hope. Stapèlia grandiflòra, Curt. bot. mag. 585, exclusive of the synonyms.

Shewy Stapelia. Fl. Nov. Jan. Clt. 1802. Shrub 1 foot.

3 S. AMBÍGUA (Mass. stap. p. 13. t. 12. Haw. syn. p. 17.) branches erect, quadrangular, clavate; teeth remote, incurved; corolla flat: with oblong-lanceolate, acute, hispid segments, which are ciliated on the edges; leaflets of the inner corona cultriform, serrated on the back, and toothed at top; peduncles 3-4-flowered. ♄. S. Native of the Cape of Good Hope. Jacq. stap. 35. Corolla size of those of *S. hirsùta*, of a rufous, purple colour, variegated with transverse, dark, violaceous stripes, having the edges of the segments of an obscure violet colour.

Ambiguous Stapelia. Fl. June, Nov. Clt. 1795. Shrub 1 to 2 feet.

4 S. SORÒRIA (Mass. stap. p. 23. t. 39. Jacq. stap. t. 22. 36, 37.) branches divaricate, quadrangular; teeth remote, acute, incurved; segments of corolla lanceolate, villous in the centre, and ciliated on the edges. ♄. S. Native of the Cape of Good Hope. Lodd. bot. cab. 94. Corolla dark purple, with yellow, transverse rugæ. According to Masson, this species differs from *S. hirsùta*, in habit; in the divaricate, 5-angled branches, which are said to be tetragonal at the top; in the drooping flowers; and in the self-coloured corolla. Stem purplish. Peduncles simple, solitary, purple.

Sister Stapelia. Fl. July, Aug. Clt. 1797. Shrub 1 foot.

5 S. PA'TULA (Willd. enum. p. 281.) corolla flat, with villously ciliated margins, and hairy disk, the rest wrinkled and glabrous; appendages of inner crown, oblong, lanceolate, one-toothed inside. ♄. S. Native of the Cape of Good Hope. Perhaps a variety of *S. soròria.*

Spreading-flowered Stapelia. Fl. July, Aug. Clt. 1797. Shrub 1 foot.

6 S. REFLE'XA (Haw. syn. p. 18.) leaflets of inner corona sub-deltoid, having the interior process incurvedly claw-formed; seat of style impressed with a cross. ♄. G. Native of the Cape of Good Hope. S. defléxa, Hort. Jacq. stap. t. 5. bot. mag. 1810. Very like the preceding, but one half smaller. Corolla of a greenish-wine colour, with revolutely reflexed segments; having transverse, waved, contiguous, whitish stripes at the middle; and furnished with long purple hairs inside, towards the base. Ligulæ dusky, rufous, recurved, cuneated at apex.

Reflexed Stapelia. Fl. June, Aug. Clt.? Shrub ½ foot.

7 S. LU'CIDA (D. C. cat. hort. monsp. 1816. p. 149.) branches erect, floriferous in the middle; teeth erect; segments of corolla with pilose edges, ovate-acuminated, revolutely inflexed, having the disks shining, and rather pilose; leaflets of outer corona oblong. ♄. S. Native of the Cape of Good Hope. This species is nearly allied to *S. soròria, ambígua,* and *defléxa:* from the first it differs, in the branches not being divaricate, but erect; in the peduncles being shorter than the corolla; in the wrinkles of the corolla not being yellowish; and in the bottom not being villous: and from the second, to which it is more nearly allied, in the branches not bearing the flowers at their base, but in the middle; in the segments of the corolla not being flat; in the flowers being smaller, and of a deeper colour: and from the third, in the leaflets of outer corona, and in many other points.

Shining-flowered Stapelia. Fl. June, Aug. Clt. 1812. Shrub ½ foot.

8 S. juve'ncula (Jacq. stap. Poir. suppl. 5. p. 231.) bottom of corolla campanulate; segments of corolla wrinkled transversely; segments of exterior corona lanceolate, acuminated; those of the inner corona diverging; appendages short, obtuse; branches floriferous in the middle. ♄. S. Native of the Cape of Good Hope. This is very nearly allied to *S. vétula;* but differs, in the branches being more numerous, and not being floriferous at the base; in the segments of the corolla being more acute. Peduncles aggregate. Corollas brownish purple, 3-nerved.

Girl Stapelia. Fl. July, Aug. Clt. ? Shrub 1 foot.

§. 2. *Æquilateràles. Angles of stems 4, flat, equal, downy.*

9 S. Massòni (Hort. Haw. syn. p. 18.) branches large, of 4 equal angles. ♄. S. Native of the Cape of Good Hope. This plant has never been rightly examined.

Masson's Stapelia. Fl. ? Clt. ? Shrub 1 foot.

10 S. aste'rias (Mass. stap. 14. t. 14.) teeth of branches short, erect; corolla large: with ovate-lanceolate, long-acuminated segments, which are revolute, and ciliated on the edges; stamens unequally bifid. ♄. S. Native of the Cape of Good Hope. Curt. bot. mag. 536. Jacq. stap. t. 58. Branches floriferous at the base, erect; outer branch of the leaflets of the inner corona bi-tridentate. Corolla of an obscure violet colour; the segments variegated with transverse, yellowish stripes; the bottom dark purple.

Star-fish Stapelia. Fl. May, Nov. Clt. 1795. Sh. ½ foot.

11 S. stella'ris (Jacq. stap. t. 62. Haw. syn. p. 19.) corolla wrinkled at the base; segments shining above, glabrous, of a port wine colour, but with pale, transverse, anastomosing veins, ciliated with rufous hairs; leaflets of the outer corona linear, obtuse, a little recurved, and rather erose at top; inner corona as in *S. astèrias*, but the lower branch is paler. ♄. S. Native of the Cape of Good Hope.

Starry Stapelia. Fl. ? Clt. ?. Shrub ¼ to ½ foot.

12 S. hirsu'ta (Lin. spec. p. 316. Thunb. prod. 1. p. 46. fl. cap. 2. p. 168.) corolla having the segments villously ciliated with white hairs, and the bottom villous from rufous hairs; the rest wrinkled transversely, and glabrous; segments of outer corona acute, lanceolate; leaflets of inner corona spreading; appendages adnate, ovate-oblong, about equal in length to the horns. ♄. S. Native of the Cape of Good Hope. Mill. icon. t. 250. Jacq. misc. 1. p. 28. t. 3. stap. t. 13 and 38. Lam. ill. t. 178. f. 2.—Bradl. succ. pl. 3. p. 5. t. 23.—Roes, insect. t. 9. Branches floriferous at the base, hairy; with subulate, erect teeth. Corolla yellowish, with deep violet, transverse stripes, a pale red bottom, and red nectaries, size of a French rose.

Var. β, àtra (Jacq. diarr. lips. 1814. p. 296.) flowers deep purple. Ker. bot. reg. t. 156.

Hairy Stapelia. Fl. July, Aug. Clt. 1710. Shrub ½ foot.

13 S. hama'ta (Jacq. stap. t. 12. diarr. lips. 1814. p. 269.) corollas flat, ciliated, wrinkled above, with a hairy centre; segments of exterior corona emarginate; inner leaflets of inner corona lanceolate-subulate, hooked: outer ones parallel, with the beaks erect, a little toothed at the apex. ♄. S. Native of the Cape of Good Hope. Lodd. bot. cab. 242. Branches tufted, with mucronate straight teeth, floriferous at the base. Corolla 3 inches broad, blood-coloured; segments acuminated, with transverse white stripes, ciliated with red hairs. Segments of corona subulate, bifid, or hooked, rufescent.

Hooked-crowned Stapelia. Fl. July, Aug. Clt. 1820. Shrub ¼ foot.

14 S. coma'ta (Jacq. stap. t. 4. diarr. lips. 1814. p. 269.) corollas ciliated, with a flat, hairy disk; the rest glabrous, and wrinkled transversely; leaflets of inner corona acute, recurved; segments of corolla lanceolate, rather concave, at first deflexed, then spreading; appendages oblong, truncate, crenated. ♄. S. Native of the Cape of Good Hope. Branches sulcate; with erect teeth; floriferous at the base. Peduncles usually solitary. Corolla pale yellow; having the segments ciliated with red hairs, and striped with yellow or blood-colour.

Shaggy Stapelia. Fl. Sept. Clt. 1819. Shrub ½ to 1 foot.

15 S. multiflòra (D. C. cat. hort. monsp. 1813. p. 149.) corolla rotate, with a hairy bottom; segments flat, reflexed, ciliated; horns subulate; wings joined to the middle, nearly entire; branches floriferous in the middle, with erect teeth; pedicels aggregate. ♄. S. Native of the Cape of Good Hope. Nearly allied to *S. comàta*, of which it is probably only a variety; from which it is distinguished, in the pedicels being aggregate, not solitary; in the flowers being wholly of a violaceous red colour, not yellowish in the middle of the segments. Wings few-toothed, not tridentate; and the ligulæ are sometimes tridentate, not acute; marginal hairs purple or white; central ones silky and purple.

Many-flowered Stapelia. Fl. Sept. Clt. 1817. Shrub ½ to 1 foot.

16 S. ru'fa (Mass. stap. p. 16. t. 20.) segments of corolla triangular, acute (ex Mass.), lanceolate, acuminated, ex Haw., ciliated, and transversely wrinkled; ligulæ linear-lanceolate, waved; stamens dilated unequally, and emarginately bifid; branches floriferous at the base: with erect teeth; pedicels twin or tern. ♄. S. Native of the Cape of Good Hope, beyond Platte Kloof. Lodd. bot. cab. 239. Corollas size of those of *Periploca Græ'ca*, or a little larger, of an obscure violet colour, variegated with deep purple, ex Willd., pale red, ex Haw., transverse stripes; having the bottom stellate, rufous, and variegated. Corona or nectarium variegated, ex Willd. Ligulæ deep brown, ex Haw. Hairs on the edges of the corolline segments, and those in the bottom of the corolla port-wine-coloured, ex Haw.

Rufous Stapelia. Fl. Ju. Nov. Clt. 1795. Shrub ¼ to ½ foot.

17 S. pulvina'ta (Mass. stap. p. 13. t. 13.) segments of corolla roundish, wrinkled transversely, abruptly acuminated, ciliated; bottom of corolla elevated, villous; branches floriferous at the base; pedicels solitary. ♄. S. Native of the Cape of Good Hope, near Cannes. Sims, bot. mag. 1240. Allg. teutsch. gart. mag. 1815. p. 110. t. 11. Branches reclinate or procumbent, floriferous ones ascending. Corolla large, with deep violaceous segments, variegated with whitish, transverse wrinkles, fuscous and concave at the apex, and with a rufous bottom. Of all the species this is the most elegant.

Cushion-flowered Stapelia. Fl. Ju. Nov. Clt. 1795. Shrub proc.

18 S. lanígera (Haw. suppl. pl. succ. p. 8.) stems quadrangular; angles equal, nearly flat, downy; corolla very woolly, dark brown, striped with yellow. ♄. S. Native of the Cape of Good Hope. Stapèlia pulvinàta, Donn. hort. cant. but not others. Nearly allied to *S. pulvinàta* and *S. hirsùta.*

Wool-bearing Stapelia. Fl. July, Sept. Clt. 1800. Shrub ½ foot.

19 S. fissiróstris (Jacq. stap. t. 7. diar. lips. 1814. p. 268.) segments of corolla lanceolate, cuspidate, or acuminated, with revolute, ciliated edges, wrinkled transversely; segments of inner corona subulate, bifid; of the outer, ovate, bluntish; branches ascending; pedicels aggregate. ♄. S. Native of the Cape of Good Hope. Corolla 2 inches; segments green outside, and yellowish green inside, variegated with fuscous, scabrous, transverse stripes.

Cleft-beaked Stapelia. Fl. July, Nov. Clt. 1823. Shrub 2½ feet.

§ 3. *Ligulæ, or segments of the outer corona, rhomb-oblong or cuneated. Leaflets of inner corona simple, subulate, undulated. Stems glabrous, with 4 equal sides, but much more slender than those of the former section. This is probably the best marked section of the genus; nevertheless the species agree in habit, and teeth of branches, with the last.*

20 S. CONCÍNNA (Mass. stap. p. 15. t. 18.) branches glabrous, floriferous at the base, with erect teeth; segments of corolla ovate-lanceolate, acute, ciliated; bottom of corolla villous, ex Haw. ♄. S. Native of the Cape of Good Hope, in Karro. Heyne, term. bot. t. 16. f. 8. Flowers about the size of those of *Anemòne nemoròsa*, flat, grey, with transverse, undulated, fuscous stripes, and white bristles; and a brown bottom. Pedicels purplish, usually twin. Segments of outer corona emarginate.

Neat Stapelia. Fl. Ju. Aug. Clt. 1798. Shrub ¼ foot.

21 S. GLANDULÍFERA (Jacq. stap. t. 46.) branches glabrous, floriferous in the middle; corolla very villous; segments ovate, acuminated; villi sub-spatulate, white; ligulæ rhomb-oblong, quite entire, horny, obtuse. ♄. S. Native of the Cape of Good Hope. Pedicels twin or tern, hairy, filiform. Corolla small, yellowish, having the bottom and numerous concentric, transverse, broken stripes, rufous. Ligulæ yellowish brown. Stamens bay-coloured.

Gland-bearing Stapelia. Fl. Aug. Nov. Clt. ? Shrub ¼ to ½ foot.

22 S. FLAVICOMA`TA (Haw. suppl. pl. succ. p. 8.) stems numerous, quadrangular, slender; angles equal, downy, teeth leaf-formed, tumid, and contiguous. ♄. S. Native of the Cape of Good Hope. Very nearly allied to *S. glandulífera;* but the branches are thicker, more numerous, shorter, with the teeth larger, more leaf-formed, and more close together.

Yellow-haired Stapelia. Fl. July. Clt. 1810. Shrub ½ foot.

23 S. HISPÍDULA (Hornem. hort. hafn. p. 251.) segments of corolla acuminated, wrinkled transversely, hispid from clavate hairs, replicate and naked at apex; segments of outer corona or ligulæ entire, acute: of the inner subulate, connivent; pedicels aggregate, almost radical, much longer than the corollas. ♄. S. Native of the Cape of Good Hope. This species differs from *H. concínna*, Mass. in the pedicels being very long, and almost radical, in the segments of the corolla not being ciliated, and in the segments of the exterior corona being undivided.

Hispid Stapelia. Fl. July, Aug. Clt. 1824. Shrub ¼ foot.

24 S. GLANDULIFLÒRA (Mass. stap. p. 16. t. 19.) branches glabrous, with erect, acute teeth, floriferous at the base; peduncles twin or tern; corolla clothed with white, clavate, setaceous glands: segments ovate-lanceolate, acute, spreading. ♄. S. Native of the Cape of Good Hope, among bushes, about North Olifant's river. Smith, exot. bot. t. 19. Jacq. stap. t. 40. Branches spreading. Corolla size of those *S. concínna*, sulphur-coloured. Corona orange and black, ex Willd. Pedicels purplish. Corolla about the size of those of *Anemòne nemoròsa*, shorter than the calyx, spotted with deep red dots; and the bottom deep brown, ex Mass.

Gland-flowered Stapelia. Fl. May, Nov. Clt. ? Shrub ½ foot.

25 S. ACUMINA`TA (Mass. stap. p. 15. t. 17.) branches glabrous, floriferous in the middle; pedicels glabrous, twin or tern, shorter than the corolla; segments of corolla ovate, cuspidately acuminated, ciliated on the edges; the rest of the corolla glabrous. ♄. S. Native of the Cape of Good Hope, in Namaqua Land. Corollas a little larger than those of *H. rùfa;* segments green, variegated with dark purple stripes, transversely undulated, tipped with dark purple. Segments of calyx oval, acute.

Acuminated-flowered Stapelia. Fl. July, Sept. Clt. 1795. Shrub ½ foot.

§ 4. *Anómalæ. Anomalous species, without the characters of the preceding sections, and which will probably constitute new genera, but the characters are not sufficiently known as to establish these genera.*

* *Obtuse-dentatæ. Angles of branches obtuse, having the teeth almost obliterated, or very blunt.*

26 S. APE´RTA (Mass. stap. p. 23. t. 37.) branches numerous, tetragonal, sub-tridentate at the apex, glaucescent; corolla flat, segments ovate, obtuse, 5-nerved, wrinkled, with glabrous edges. ♄. S. Native of the Cape of Good Hope, in Namaqua Land, near Kok Fountain. Pedicels twice longer than the branches, usually solitary. Corolla obscure, purple, with dashes of a more obscure colour; bottom circular, greyish, dotted with black. Perhaps a species of *Carunculària*.

Open-flowered Stapelia. Fl. July, Aug. Clt. 1795. Shrub 1 foot.

27 S. RAMÒSA (Mass. stap. p. 21. t. 32.) branches numerous, erect, tetragonal, glaucescent; flowers aggregate, almost sessile; segments of corolla lanceolate, acute, with revolute edges. ♄. S. Native of the Cape of Good Hope, in Karro, beyond Platte Kloof. Pedicels very short, rising from the upper part of the branches, without the teeth. Angles of branches sinuated. Corollas size of those of *H. pruinòsa*, dark purple, with a circular white bottom. Perhaps a species of *Piaránthus*.

Branched Stapelia. Fl. Ju. July. Clt. 1795. Shrub 1 foot.

* * *Branches terete, tubercular; having a hair or spine rising from each tubercle.*

28 S. PILÍFERA (Lin. suppl. 171. Thunb. prod. 1. p. 46. fl. cap. 2. p. 165.) branches numerous, terete, furrowed; tubercles furnished each with a bristle; flowers sessile, solitary; corolla campanulate, with ovate, acuminated segments; segments of corona bifid. ♄. S. Native of the Cape of Good Hope, on very arid hills, under bushes, in Karro, beneath Roggeweld, Masson; beyond Hartequas Kloof, Thunb. Flowers small, purple, at the tops of the branches, Lin. Corolla size of that of *S. árida*, dark purple, with a red circle in the middle, ex Mass. Corolla smooth outside, but muricated by elevated callosities inside, ex Thunb. Perhaps this will form a new genus.

Piliferous Stapelia. Fl. Ju. Aug. Clt. 1790. Shrub.

29 S. GORDÒNI (Mass. stap. p. 24. t. 40.) branches terete; tubercles terminating each in a spine; pedicels solitary, at the tops of the branches; corolla large, 5-toothed; teeth or segments broad, roundish, short-acuminated; exterior corona 5-toothed. ♄. S. Native of the Cape of Good Hope, in Groot-Namaqua Land, towards the orange river. Corollas among the largest of the genus, almost 3 inches in diameter, repandly 5-toothed, of a brownish yellow colour, with a whitish centre; segments of the corona short, black in the middle, and white on the margins. Follicles solitary, erect, long, acute. This differs from all other species, in the singular form of the corolla, and in the solitary follicles; it therefore will hereafter constitute a new genus, which we would propose calling *Monothylàceum*, from its solitary follicles.

Gordon's Stapelia. Fl. July, Aug. Clt. 1796. Shrub ½ foot.

† *The following species being hardly known, they have not been arranged in any of the sections above.*

30 S. CORDA`TA (Hort. ex Haw. syn. p. 26. no. 27.) ♄. S. Native of the Cape of Good Hope. There is nothing known of this plant but the name.

Cordate Stapelia. Fl. Ju. Aug. Clt. 1805. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

31 S. CANE'SCENS (Hort. ex Haw. syn. p. 26. no. 29.) ♄. S. Native of the Cape of Good Hope. Nothing is known further of the species.

Canescent Stapelia. Fl. Ju. Aug. Clt. 1795. Shrub.

32 S. OPHIU'NCULA (Hort. ex Haw. syn. p. 27. no. 31.) ♄. S. Native of the Cape of Good Hope. Nothing but the name is known of this species.

Small-serpent Stapelia. Fl. Ju. Aug. Clt. 1805. Shrub proc.

33 S. CAUDA'TA (Thunb. prod. 1. p. 46. fl. cap. 2. p. 171.) stem hairy, leafy; leaves oblong-linear, falcate; flowers axillary, pedicellate, solitary, drooping: segments of the limb linear. ♄. S. Native of the Cape of Good Hope. Leaves sessile. Pedicels much shorter than the corolla. Corolla flat, purple, scaly inside. Perhaps a species of *Ceropègia* or *Brachystélma*.

Tailed Stapelia. Shrub $\frac{1}{2}$ foot.

34 S. QUADRA'NGULA (Forsk. descr. p. 52. t. 6.) stem tetragonal; branches divaricate, floriferous at the apex: furnished with truncate teeth; flowers small, crowded, sessile; corolla 5-cleft. ♄. S. Native of Arabia Felix. Flowers greenish yellow. Calyx 5-toothed, permanent. Juice not milky, but aqueous. Forsk. cat. p. 108. no. 194. has also *S. quadrángula ramòsa*, no. 194, besides *S. quadrángula*, no. 190. Sides of stem half an inch wide.

Quadrangular-stemmed Stapelia. Shrub $1\frac{1}{2}$ foot.

35 S. MULTA'NGULA (Forsk. cat. no. 192.) stem branched, creeping, with 6-9 angles, and as many furrows; angles toothed; follicles subulate. ♄. S. Native of Arabia Felix. Sak el Ghorob. Forsk. descr. p. 52. Anónymos, Poir. ency. 7. p. 391. The Arabians affirm, that this plant, after being apparently quite dead, by drying for a long time, if it is allowed to come in contact with moist earth, it will again revive. Forsk. desc. p. 52.

Many-angled Stapelia. Shrub.

36 S. CLAVA'TA (Willd. spec. 1. p. 1295.) stem simple, thick, clavate, reticulately and obsoletely warted, bearing the fruit at the apex. ♄. S. Native of the Cape of Good Hope, in sandy fields, beyond Kopperberg. Stapèlia, Patters. trav. p. 57. t. 8. only the fruit.

Clavate-stemmed Stapelia. Shrub.

N.B.—There is a species of *Stapèlia*, which was collected at the Cape of Good Hope, on the banks of the Kaigaviel, near Roode Gebroken Klip, by Lichtenstein, which Willd. has called, in his enum. suppl. p. 14, *breviróstris*, but without giving any character of the plant. In the Neweste best. des Gart zu Belvidere, the following names occur, but without any diagnosis of either—1. *S. Buffoniàna*, 2. *S. bifòlia*, 3. *S. cymòsa*, 4. *S. tridentàta*, 5. *S. virgàta*, and 6. *S. verticillàta*; but these names are very likely synonymous with some of those described above. There are several undescribed species preserved in spirits of wine in the Banksian museum. What is *S. dentàta*, Forsk. cat. 192? and what is *S. papillòsa* of Tabl. de l'ecole, ann. 1815. p. 92?

Cult. Singular succulent, grotesque plants; bearing remarkable and singularly beautiful, star-like flowers, usually with a very disagreeable smell. The soil best suited for them is a mixture of loam, sand, and lime or brick rubbish; for, if grown in a richer soil, they become more luxuriant, and bear larger flowers; but in such a soil they are more apt to rot, if they chance to get a little too much water supplied them. They require very little water, except when in blossom; and in the winter, the less given to them the better. They are readily increased by cuttings, which should be allowed to dry for at least a week or fortnight after they are taken off from the mother plant, before they are set; after which they may be planted in separate pots, when they will almost immediately strike root; for if planted when first taken off, and full of juice, they have every chance to rot.

V. GONOSTE'MON (from *γωνια, gonia*, an angle; and *στημων, stemon*, a stamen.) Haw. syn. p. 27. Stapèlia species of authors.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate, 5-cleft. Ligulæ or segments of the exterior corona distinct, rufous, oblong, cuneated and recurved at the apex, channel-formed: those of the inner corona rectangularly incurved, unciform or pediform, short, rufous, length of the ligulæ, and adnate to them; bearing at the base large, didymous, yellow anthers. Between the corona and the angles of the style, there are 3 stigmas, 2 of which are anther-formed, the other black and dot-formed; and from this dot there runs down an oblong, very minute, bifid, yellow ligulæ.—Succulent shrubs, with the habit of Stapelia; but the branches are more slender and divaricate. Flowers fascicled. Pedicels length of the corolline segments.

1 G. DIVARICA'TA (Haw. syn. p. 27.) branches numerous, tetragonal, glabrous, gradually attenuated: with small, erect teeth; corolla quite glabrous; segments lanceolate, spreading, with revolute ciliated edges. ♄. S. Native of the Cape of Good Hope. Stapèlia divaricàta, Mass. stap. p. 17. t. 22. Sims, bot. mag. 1007. Branches floriferous in the middle, or at the base. Pedicels twin or tern. Segments of exterior corona roundish, obtuse, mucronate. Corolla shining, greenish brown outside, and flesh-coloured inside, tipped with green. Corona orange-coloured.

Divaricate-branched Gonostemon. Fl. Ju. Nov. Clt. 1793. Shrub $\frac{1}{2}$ foot.

2 G. PA'LLIDA; branches erect, short, tetragonal, glabrous: with short, deciduous teeth; corolla glabrous; segments acute, ciliated; pedicels aggregate, rising above the base of the branches; segments of outer corona spreading, in the figure sub-tridentate; of the interior one erect and bluntish. ♄. S. Native of the Cape of Good Hope. Stapèlia pállida, Wendl. coll. 2. p. 39. t. 51. Corolla pale yellow, verging to flesh-coloured; the segments tipped with greenish yellow. Corona yellow.

Pale-yellow Gonostemon. Fl. July, Sept. Clt. 1818. Shrub $\frac{1}{2}$ foot.

3 G. STRÍCTA (Haw. suppl. pl. succ. p. 12.) corollas naked, flat; branches erect. Native of the Cape of Good Hope. Stapèlia strícta, Sims, bot. mag. 2037. Branches slenderer than in the preceding.

Straight Gonostemon. Fl. Ju. Nov. Clt. 1814. Shrub $\frac{1}{4}$ foot.

Cult. For culture and propagation see *Stapèlia*, above.

VI. PODA'NTHES (from *πους ποδος, pous podos*, a foot; and *ανθος, anthos*, a flower; in allusion to the flowers being on long pedicels.) Haw. syn. p. 32.—Stapèlia species of authors.

Lin. syst. *Pentándria, Monogy'nia.* Corolla 5-cleft, wrinkled; with a broad, campanulate bottom, girded by a tumid orbicle. Ligulæ, or segments of the exterior corona, combined to the middle, channel-formed, rhomboid, deeply emarginated, or cuneately 2-lobed; those of the inner corona simple, short, form of a reversed foot, alternating with the ligulæ, incurvedly and closely adpressed to the style; the rest as in *Stapèlia*.—Habit of *Stapèlia*; but the branches are much more slender, effusely decumbent and weak, rooting at the base, obsoletely 4-5-angled; with much larger, deltoid-acuminated, ascending, thick teeth, but terminated by a less manifest leaf.

1 P. PU'LCHRA (Haw. syn. p. 32.) weak and much branched; flowers twin, semi-quinquefid, corrugated, with a minutely pilose bottom. ♄. S. Native of the Cape of Good Hope. Stapèlia verrucòsa, Hort. but not of Mass. Flowers on long, bent pedicels. Segments of corolla deltoid acuminated, green outside, and sulphur-coloured inside, warted; warts numerous,

dark brown. Bottom of corolla dark brown, girded by a few glandular hairs.

Var. β, verrucòsa; branches longer and thicker. ♄. S. Stapèlia verrucòsa, Sims, bot. mag. 1786, but not of Mass. Stapèlia pulchélla, Hort. but not of Mass. Corolla pale yellow, with dark purple marks. Segments of the outer corona emarginate; the inner one of ovate yellow corpuscles.

Fair Podanthes. Fl. Aug. Sept. Clt. 1800. Shrub cr.

2 P. irrora'ta (Haw. syn. p. 33.) branches numerous, erectish, decumbent; pedicels usually solitary: corolla more semi-quinquefid than the last, wrinkled and bedewed: with lanceolate, acuminated segments. ♄. S. Native of the Cape of Good Hope. Stapèlia irroràta, Mass. stap. p. 12. t. 9. Lodd. bot. cab. 127. Corolla sulphur-coloured, and spotted with blood colour; having the bottom blood-coloured, and the segments tipped with purple. This species differs from *P. verrucòsa*, in the flowers not being warted, and in the want of the pentagonal circle, and colour, ex Willd. spec. 1. p. 1452.

Bedewed Podanthes. Fl. July. Sept. Clt. 1795. Shrub dec.

3 P. verrucòsa (Haw. syn. p. 33.) branches numerous, ascending, tetragonal; pedicels solitary or twin; corolla quinquefid, warted; segments ovate, acuminated; orbicle in the bottom of the corolla scabrous, pentagonal. ♄. S. Native of the Cape of Good Hope. Stapèlia verrucòsa, Mass. stap. 2. no. 8. t. 8. but not of Sims, Jacq. stap. t. 26. Corolla yellowish, spotted with blood-colour; but with the tops of the segments, and about the bottom brownish. Segments of the outer corona lunutely 2-lobed; leaflets of the inner uncinate, obtuse, and retuse.

Warted-flowered Podanthes. Fl. Aug. Oct. Clt. 1795. Shrub ½ foot.

4 P. roríflua; corolla 5-cleft, dotted, with an equal bottom; segments of the outer corona emarginate; leaflets of the inner corona incurved, 2-lobed. ♄. S. Native of the Cape of Good Hope. Stapèlia roríflua, Jacq. stap. t. 30. Willd. enum. p. 285. Orbicle none. Beaks gibbous, lying upon the stigma, ex Jacq. Corolla yellow, dotted with red.

Dew-flowing-flowered Podanthes. Fl. July, Sept. Clt. 1802. Shrub proc.

5 P. pulche'lla (Haw. syn. 33.) branches numerous, tetragonal, reclinate; pedicels fasciculate; corolla 5-cleft, wrinkled: with ovate, acute segments; orbicle circular. ♄. S. Native of the Cape of Good Hope. Stapèlia pulchélla, Mass. stap. p. 22. t. 26. Corolla yellow, dotted with blood-colour. Tips of segments and bottom fuscescent.

Neat Podanthes. Fl. May, Nov. Clt. 1795. Shrub dec.

6 P. cilia'ta (Haw. syn. p. 34.) branches numerous, tetragonal, procumbent, radicant; pedicels solitary; corolla 5-cleft, papillose above, and ciliated on the margins: with ovate, acute, flat segments. ♄. S. Native of the Cape of Good Hope, in Karro. Stapèlia ciliàta, Thunb. prod. 1. p. 46. fl. cap. 2. p. 168. Mass. stap. p. 9. t. 1. Corolla yellowish, ex Willd., purplish green, greyish inside, with rufescent papilla, ex Thunb. Cilia clavate, white, ex Thunb. Orbicle beset with papillæ, which are tipped with purple.

Ciliated Podanthus. Fl. Oct. Dec. Clt. 1795. Shrub cr.

Cult. For culture and propagation see *Stapèlia*, p. 117.

VII. TRIDE'NTEA (from *tridens*, a trident; in reference to the segments of the outer corona being tridentate.) Haw. syn. p. 34.—Stapèlia species of authors.

Lin. syst. *Pentándria, Monogýnia.* All as in *Stapèlia*, except the ligulæ or segments of the outer corona, which are tridentiform; and those of the inner corona are unequally bipartite.—The species have almost the habit of those of *Podánthes;* but the branches are naked, and more erect; and the teeth are smaller, and terminated by a very manifest green leaf.

1 T. gemmiflòra (Haw. syn. p. 34.) branches numerous, erect, tetragonal; pedicels solitary or twin; corolla corrugated; segments ovate, acute, ciliated with white hairs, 5-nerved above. ♄. S. Native of the Cape of Good Hope, in arid places, among bushes, beyond Platte Kloof. Stapèlia gemmiflòra, Mass. stap. p. 14. t. 15. Jacq. stap. t. 9. Corolla almost black, ciliated with dark hairs. Orbicle none, ex Haw. Ligulæ deep purple, with paler tips. Outer branches of inner corona dark purple; inner ones tipped with white.

Var. β; corolla marked with golden yellow dots, Mass.

Var. γ; corolla wholly black, Haw.

Gem-flowered Tridentia. Fl. Oct. Nov. Clt. 1795. Shrub ½ foot.

2 T. Sty'gia (Haw. syn. p. 34.) corollas wrinkled, black, ciliated with red hairs; branches thick, short, yellowish green. ♄. S. Native of the Cape of Good Hope. Stapèlia Stýgia, Rœm. et Schultes, syst. 6. p. 561. The branches of this species are very different from the preceding, being shorter, thicker, and paler.

Stygian Tridentea. Fl. July, Sept. Clt. 1810. Shrub ¼ foot.

3 T. moscha'ta (Haw. syn. p. 25. suppl. pl. succ. p. 10.) corolla ciliated, wrinkled from tubercles above, and dotted beneath; leaflets of inner corona subulate, diverging; appendages lanceolate. ♄. S. Native of the Cape of Good Hope. Stapèlia hircòsa, Jacq. stap. t. 43. Willd. enum. p. 281. Corolla brownish purple, spotted with yellow. Leaflets of outer corona tripartite; the middle segments much the longest.

Musky Tridentea. Shrub.

4 T.? ve'tula (Haw. syn. p. 34.) branches numerous, erect, tetragonal: pedicels twin or tern; corolla glabrous, with lanceolate, bluntly acuminated segments, which are 3-nerved above, and wrinkled. ♄. S. Native of the Cape of Good Hope, on the mountains, at Hex river. Stapèlia vétula, Mass. stap. p. 15. t. 16. Jacq. stap. t. 27. Allg. gart. mag. 1818. p. 17. t. 2. Corolla dark, violaceous, with a dark purple bottom. Segments of corolla ovate, acuminated, 3-nerved above, ex Willd. Ligulæ oblong, acute: inner branches of inner corona subulate, diverging; outer ones ovate, somewhat tridentate, ex Willd. Perhaps a true species of *Stapèlia*.

Stale Tridentea. Fl. May, Nov. Clt. 1793. Shrub ¼ to ½ foot.

5 T. Símsii; branches tetragonal, erect: with thick teeth; segments of corolla 5-nerved, ovate, acuminated; ligulæ retusely tricuspidate; branches of inner corona subulate. ♄. S. Native of the Cape of Good Hope. Stapèlia vétula, Sims, bot. mag. t. 1234, exclusive of the synonyms. Stapèlia Símsii, Rœm. et Schultes, syst. 6. p. 33. Trid. vétula, Haw. syn. p. 36. Corolla dark. Ligulæ yellow.

Sims's Tridentea. Fl. May, Nov. Clt. 1800. Shrub ¼ to ½ foot.

6 T. depre'ssa; segments of corolla ciliated, wrinkled; ligulæ tridentate; branches of inner corona a little toothed, subulate, spreading. ♄. S. Native of the Cape of Good Hope. Stapèlia deprèssa, Jacq. diar. lips. 1814. p. 268.

Depressed Tridentea. Fl. July, Aug. Clt. ? Shrub ¼ to ½ foot.

7 T. rugòsa; branches tetragonal, procumbent, but afterwards erect; pedicels solitary; corolla wrinkled, glabrous; inner branch of inner corona clavate, outer one terete, obtuse. ♄. S. Native of the Cape of Good Hope. Stapèlia rugòsa, Jacq. stap. t. 21. Willd. enum. p. 284. Corolla 3 inches broad, pale green beneath, but marked above with dark purple and blood-coloured dots. Bottom of corolla orbicular, tumid, ex Willd. Orbicle spurious, depressed, surrounded by 5 crenatures, ex Jacq. l. c.

Wrinkled-flowered Tridentea. Shrub dec.

8 T. paniculata (Haw.) corollas flat, transversely papillose,

hairy; segments of exterior corona, or ligulæ, obtuse, obsoletely tridentate; horns subulate, connivent: outer branches of inner corona ovate, obtuse. ♄. S. Native of the Cape of Good Hope. Stapèlia paniculàta, Jacq. stap. t. 61. Corolla of a livid green colour outside, glabrous, brownish purple, and beset with violaceous papillæ inside; hairs white.

Panicled Tridentea. Fl. June, Sept. Clt. 1805. Shrub.

Cult. For culture and propagation see *Stapèlia*, p. 117.

VIII. TROMO'TRICHE (τρομος, *tromos*, tremor; θριξ τριχος, *thrix, trichos*, a hair; in reference to the cilia of the corolla being tremulous.) Haw. syn. p. 36.—Stapèlia species of authors.

Lin. syst. *Pentándria, Digýnia.* Corolla smooth, revolute, ciliated with tremulous spatulate hairs. Segments of exterior corona, or ligulæ, connate at the base, horizontal, cuneate-rhomboid and serrated; those of the inner corona unequally bifid; inner branch recurved, longer and slenderer than the other, gradually thickened to the apex, whence it appears like a stigma.—Habit almost of the first section of *Stapèlia;* but the branches are naked, and very glaucous, or rather pruinose, erectly decumbent; the teeth distant, thick, horizontal, or a little recurved.

1 T. revolu'ta (Haw. syn. p. 36.) branches tetragonal, glaucous, erect; corolla glabrous; but the segments are ciliated with spatulate glands, acute, and revolute; ligulæ quadrate, obcuneated and retuse at top; outer branch of inner corona tooth-formed, acute. ♄. S. Native of the Cape of Good Hope, in Karro, under bushes. Stapèlia revolùta, Mass. stap. p. 12. t. 10. Sims, bot. mag. 724. Branches floriferous at top. Pedicels solitary. Corolla pale, violaceous, ex Willd., greenish yellow outside, and purplish inside, ex Mass; dirty dark red, with a pale circle at the base of the lobes, ex Haw. suppl. pl. succ. p. 11.

Revolute-flowered Tromotriche. Fl. Ju. Sept. Clt. 1790. Shrub 1 foot.

2 T. glau'ca (Haw. syn. p. 37.) branches tetragonal, very glaucous; corolla glabrous; segments ovate, acute, revolute, fringed with clavate glands; ligulæ bi-tridentate at apex. ♄. S. Native of the Cape of Good Hope. Stapèlia glaûca, Jacq. stap. t. 10. Willd. enum. p. 279. Very like *T. revolùta*, in the mode of growth, colour, form, and corolla; but differs from it in the segments of the exterior corona being tridentate, ex Willd. Branches sometimes hexagonal, ex Jacq. Pedicels aggregate at the tops of the branches. Corolla livid green outside, and striated: blood-coloured inside; with a white bottom; ex Jacq. Lobes of outer corona obtuse, and a little emarginate at the apex: therefore the plants of Jacquin and Haworth are probably distinct.

Glaucous Tromotriche. Fl. Ju. Nov. Clt. 1799. Sh. 1 to 2 feet.

3 T. pruinòsa (Haw. syn. p. 37.) branches bluntly tetragonal, erect, with recurved teeth; corolla with flat, ovate, pilose, or downy segments, the down appearing like powder; ligulæ serrated at top.? ♄. S. Native of the Cape of Good Hope, in the dry regions of Namaqua Land, among bushes. Stapèlia pruinòsa, Mass. stap. p. 24. t. 41. Corolla blackish, beset with white adpressed hairs, ex Willd. Stems purplish. Flowers small, solitary, twin, or tern, towards the tops of the branches, purplish, ex Mass. Perhaps a species of *Piaránthus*.

Pruinose-flowered Tromotriche. Fl. Ju. July. Clt. 1795. Shrub 1½ foot.

4 T. obliqua; branches tetragonal, glaucous? corolla glabrous; segments ovate-acuminated, bent, obliquely ciliated with clavate white or purple glands; ligulæ bidentate, acute. ♄. S. Native of the Cape of Good Hope. Stapèlia oblìqua, Willd. enum. suppl. p. 13. Corolla dirty yellow, marked with confluent, violaceous spots. Exterior corona greenish yellow, dotted at top, and furnished with a mark at the base.

Oblique-flowered Tromotriche. Fl. Ju. Sept. Clt. 1805. Shrub 1½ foot.

5 T. fusca'ta (Haw. suppl. pl. succ. p. 10.) branches tetragonal, erectish, glaucous-green; corolla glabrous; leaflets of outer corona 2-3-toothed; shorter branches of inner corona obtuse. ♄. S. Native of the Cape of Good Hope. T. glaúca, β, Haw. syn. p. 37. Stapèlia fuscàta, Jacq. stap. t. 55. Flowers brownish purple. Corolla pale at bottom, striated transversely with red; ciliated at top, with clavate, wine-coloured glands. Ligulæ dark brown.

Brownish-flowered Tromotriche. Fl. Ju. Nov. Clt. 1814. Shrub ½ to 1 foot.

Cult. For culture and propagation see *Stapèlia*, p. 117.

IX. O'RBEA (from *orbis*, an orb; the orb in the centre of the flower is very large and elevated.) Haw. syn. p. 38.—Stapèlia species of authors.

Lin. syst. *Pentándria, Digýnia.* Corolla 5-cleft, starry, the whole of the inside corrugated, furnished with a large, elevated orb in the centre. Segments of outer corona, or ligulæ, long, spreading, bi or tridendate at the apex; those of the inner corona unequally bifid; the inner branch recurved, longer than the outer one, style-formed, clavate, and stigma-formed at the apex.—Habit of the species of *Podánthes;* but the branches are more robust, and less effuse; and, when old, become decumbent and creeping: the teeth are smaller, and horizontal, not ascending.

1 O. maculòsa (Haw. syn. 37.) corolla smooth, ciliated; ligulæ tridentate; orb convex, downy, ex Haw. ♄. S. Native of the Cape of Good Hope. Stapèlia maculòsa, Jacq. stap. t. 31. Willd. enum. p. 283. Sims, bot. mag. 1833. Stap. míxta, Donn. hort. cant. Segments of corolla ovate, acute, dirty yellow, red at the apex and edges, almost covered by confluent, rufous, large spots. Orb waved, elevated, but small for the size of the flower. Ligulæ 2-3-toothed at top, brownish grey, pale at top, and marked by a large, distinct, brown spot, ex Haw.

Spotted-flowered Orbea. Fl. Ju. Sept. Clt. 1804. Shrub 1 foot.

2 O. míxta (Haw. syn. p. 38.) corolla glabrous, with ovate, acuminated, wrinkled segments, an elevated, papillose orb, and bifid ligulæ. ♄. S. Native of the Cape of Good Hope. Stapèlia míxta, Mass. stap. p. 23. t. 38. Flowers drooping, of an obscure violaceous colour, wrinkled with transverse yellow stripes, and a yellow orb, beset with brown papilla. Very nearly allied to *O. variegàta;* but differs in the form of the teeth of the branches, and in the flowers being twice the size, in the acuminated segments, in the elevated, papillose orb, &c.

Mixed Orbea. Fl. Ju. Sept. Clt. 1800. Shrub 1 foot.

3 O. quinquene'rvis (Haw. syn. p. 38.) corolla glabrous, ? 5-nerved on both sides; segments roundish elliptic; ligulæ tridentate, middle tooth small; branches spotted with brown. ♄. S. Native of the Cape of Good Hope. Stapèlia quinquenérvis, Rœm. et Schultes, syst. 6. p. 37. Larger than *O. variegata*. Corolline segments sulphur-coloured, less spotted than in *O. bisúlca;* but having brown spots on both surfaces in certain places; and the corolla, and exterior corona, are more deeply cleft than in *O. bisúlca*. Ligulæ yellow, having a blood-coloured spot at the base, but with distinct brownish dots at the apex.

Five-nerved-flowered Orbea. Fl. Ju. Sept. Clt. 1800. Shrub 1 foot.

4 O. bisu'lca (Haw. syn. p. 39.) corolla glabrous; orb large; ligulæ emarginate; branches thick, green. ♄. S. Native of

the Cape of Good Hope. Stapèlia trisúlca, Jacq. stap. t. 64. Corolla dirty yellow, covered with dark rufous dots; orb sulphur-coloured; ligulæ yellow; with a large deep brown mark at the base, and dotted at the apex.

Two-furrowed Orbea. Fl. June, Sept. Clt. 1805. Shrub 1 foot.

5 O. variega'ta (Haw. syn. 40.) corolla glabrous, convex outside of the tube; segments ovate, acute; ligulæ bifid, acute; orb tumid, large. ♄. S. Native of the Cape of Good Hope, on the sides of mountains, at Leuweberg, and elsewhere. Stapèlia variegàta, Thunb. prod. 1. p. 46. fl. cap. 2. p. 170. Jacq. stap. t. 24. misc. 1. p. 27. t. 4. D. C. pl. gr. t. 149. Tratt. thes. t. 18. but not of Forsk. desc. p. 51. which does not belong to the genus, but is probably an Apocyneous plant. Herm. lugd. t. 53.—Burm. afr. dec. 2. p. 30. t. 12. f. 2. Flowers solitary, large, drooping. Corolla sulphur-coloured, variegated with transverse wrinkles, and irregular brownish-purple spots: having the orb in the bottom paler, Willd. Branches floriferous at the base.

Variegated-flowered Orbea. Fl. June, Sept. Clt. 1727. Shrub 1 foot.

6 O. Curtísii (Haw. syn. p. 40.) corolla sulphur-coloured; ligulæ entire. ♄. S. Stapèlia variegàta, Curt. bot. mag. t. 26. exclusive of the synonymes.

Curtis's Orbea. Fl. June, Sept. Clt. 1690. Shrub 1 ft.

7 O. planiflòra; corolla glabrous, flat; orb tumid; leaflets of outer corona obtuse, bidentate. ♄. S. Native of the Cape of Good Hope. Stapèlia planiflòra, Jacq. stap. Poir. suppl. 5. p. 232. Lodd. bot. cab. 191. Branches procumbent, glabrous. Pedicels solitary or twin at the insertion of the branches. Corolla pale sulphur-coloured, spotted with blackish purple. This species is very like *O. variegàta*, but differs in the corolla being very flat.

Var. β, marginàta (Poir. l. c.) edges of corolla dark purple. ♄. S.

Flat-flowered Orbea. Fl. July, Nov. Clt. 1805. Sh. proc.

8 O. Wendlandia'na; corolla glabrous: with acuminated, reflexed segments; orb elevated, tumid; ligulæ emarginate; branches decumbent, floriferous at the base; pedicels solitary. ♄. S. Native of the Cape of Good Hope. Stapèlia rugòsa, Wendl. coll. 2. p. 41. t. 52. Stap. Wendlandiàna, Rœm. et Schultes, syst. 6. p. 39. Teeth of branches long, subspinose. Pedicels pale red. Corolla pale yellow outside, and yellow and spotted with brown inside; and the orb brownish, as well as the ligulæ; inner corona pale yellow.

Wendland's Orbea. Fl. June, Sept. Clt. 1818. Sh. dec.

9 O. margina'ta; corolla flat, glabrous; ligulæ bidentate, obtuse; orb tumid, bluntly 5-angled. ♄. S. Native of the Cape of Good Hope. Stapèlia marginàta, Willd. enum. suppl. p. 13. Corolla pale yellow, margined with red, and painted with the same colour; orb pale yellow; ligulæ yellow, dotted at top, and furnished with 3 red spots at the base, the middle yellow.

Marginate-flowered Orbea. Fl. June, Sept. Clt. 1805. Shrub dec.

10 O. conspurca'ta; corolla glabrous, but ciliated with minute clavate hairs; orb tumid; ligulæ bifid. ♄. S. Native of the Cape of Good Hope. Stapèlia conspurcàta, Jacq. stap. t. 47. Corolla dirty yellow, ornamented with violaceous spots, as well as the orb; ligulæ yellow, painted with a broad, dotted, violaceous line. Nearly allied to *O. normàlis*, but differs in the edges of the corolla being ciliated with minute, clavate, white hairs.

Defiled Orbea. Fl. June, Oct. Clt. 1795. Shrub dec.

11 O. norma'lis; corolla flat, glabrous; ligulæ bifid, furnished with a blunt tooth between each; orb rather tumid. ♄. S. Native of the Cape of Good Hope. Stapèlia normàlis, Jacq. stap. t. 42. diar. lips. 1814. p. 268. Ker. bot. reg. 755. Very like *O. variegàta*, but differs in the dots on the corolla, and ligulæ disposed in regular parallel rows.

Regular-spotted Orbea. Fl. July, Aug. Clt. 1821. Sh.

12 O. clypea'ta (Haw. suppl. pl. succ. p. 13.) corolla flat, glabrous; ligulæ semibifid, acute, with a tooth between each; orb tumid. ♄. S. Native of the Cape of Good Hope. Stapèlia clypeàta, Jacq. diar. lips. 814. p. 269. stap. t. 48. Both branches of the leaflets of inner corona capitate. Corolla yellow, spotted with purple.

Shielded-flowered Orbea. Clt. 1812. Shrub $\frac{1}{2}$ foot.

13 O. orbicula'ris (Haw. syn. p. 40.) corolla glabrous; with roundish, acuminated segments; orb tumid; ligulæ short, obcordately emarginate. ♄. S. Native of the Cape of Good Hope. Stapèlia orbiculàris, Andr. bot. rep. t. 439. Branches tufted, erect, curved at the base. Pedicels solitary. Corolla pale yellow: having approximate, brownish lines on the segments; orb yellow, dotted with brown; bottom deep brown.

Orbicular-ringed Orbea. Fl. July, Nov. Clt. 1799. Shrub $\frac{1}{2}$ foot.

14 O. bufònia (Haw. syn. p. 40.) corolla flat, glabrous; ligulæ bifid, obtuse; orb tumid. ♄. S. Native of the Cape of Good Hope. Stapèlia bufònia, Jacq. t. 1. and 49. diar. lips. p. 269. Willd. enum. p. 283. Sims, bot. mag. 1076. Branches glaucescent. Pedicels solitary. Corolla pale and livid green outside, with red nerves, and dirty brown inside, spotted with purple, and striped with yellow.

Toad Orbea. Fl. June, Sept. Clt. 1806. Shrub $\frac{1}{2}$ foot.

15 O. marmora'ta; corolla flat, glabrous; ligulæ bifid, obtuse; orb subtumid. ♄. S. Native of the Cape of Good Hope. Stapèlia marmoràta, Jacq. diar. lips. 1814. p. 269. stap. t. 28. Very nearly allied to *O. bufònia*. Corolla purple, striped with yellow and white.

Marbled-flowered Orbea. Fl. June, Sept. Clt. 1820. Sh. $\frac{1}{2}$ foot.

16 O. retu'sa (Haw. syn. p. 41,) corolla glabrous; with deltoid segments, which are 5-nerved outside as in all the rest; ligulæ long, lorate, retuse; orb large. ♄. S. Native of the Cape of Good Hope. Stapèlia retùsa, Rœm. et Schultes, syst. 6. p. 41. Branches similar to those of *O. anguìna*, but thicker. Pedicels long, from the base of the branches. Corolla yellowish inside, spotted, and striped with dark brown, but more particularly towards the base; but the orb is paler and less spotted. Ligula green, with very minute rufous spots. Inner corona beset with small, scattered, black tubercles, as in *O. anguìnea*.

Retuse Orbea. Fl. July, Aug. Clt. 1800. Shrub $\frac{1}{2}$ ft.

17 O. anguìnea (Haw. syn. p. 41.) corolla glabrous; ligulæ semibipartite; orb large. ♄. S. Native of the Cape of Good Hope. Stapèlia anguìna, Jacq. stap. t. 54. Lodd. bot. cab. 828. Pedicels long, rising from the base of the branches. Corolla yellow, marked with numerous rufous spots; the orb is marked with large spots of two forms, dark brown yellow on the sides near the base. Gynostegium dotted with dark brown.

Snake-speckled Orbea. Fl. June, July. Clt. 1812. Sh. $\frac{1}{2}$ ft.

18 O. pícta (Haw. syn. p. 42.) corolla semiquinquefid, glabrous, with ovate, acuminated segments; ligulæ bifid; orb elevated, depressed in the centre. ♄. S. Native of the Cape of Good Hope. Stapèlia pícta, Donn. hort. cant. p. 53. Sims, bot. mag. 1169. Allg. teutsch. gart. mag. 7. p. 413. t. 42. S. variegàta, Jacq. misc. 1. p. 27. t. 4.? Branches simple, 4-furrowed, torulose. Corolla yellow, variegated with dark purple. It differs from *O. variegàta* in the corolla being rather smaller, in the ring or orb being narrower, not dotted, but varie-

gated with black and white, and from all the rest in the bottom part of the corolla being very dark brown.

Painted-flowered Orbea. Fl. Ju. Sept. Clt. 1799. Sh. ½ ft.

19 O. Woodfordia'na (Haw. syn. p. 42.). ♄. S. Native of the Cape of Good Hope. Stapèlia Woodfordiàna, Hort. Haworth has not seen the flowers of this species; but the plant is very like *O. anguìnea* and *O. pícta*.

Woodford's Orbea. Clt. 1810. Shrub ½ foot.

20 O. le'pida (Haw. suppl. pl. succ. p. 13.) corolla glabrous; orb tumid; ligulæ obtuse, emarginate or retuse. ♄. S. Native of the Cape of Good Hope. Stapèlia lépida, Jacq. stap. t. 15. Willd. enum. p. 280. Podánthes? lépida, Haw. syn. p. 34. no. 5. Very like *O. variegàta*, but the branches are green, not glaucescent. Pedicels usually twin. Corolla greenish yellow, with purple spots; ligulæ green, spotted with red. Outer branch of inner corona subulate, acute; inner one obtuse.

Pretty Orbea. Fl. July, Aug. Clt.? Shrub ½ foot.

21 O. muta'bilis; corolla fringed, spotted; teeth of branches spreading; ligulæ tridentate; inner branch of inner corona clavate. ♄. S. Native of the Cape of Good Hope. Stapèlia mutábilis, Jacq. t. 59-60. Spreng. syst. 1. p. 838. Stap. rùfa, Mass.? Corolla greenish yellow, with numerous transverse purple stripes, ciliated with red, clavate, tremulous hairs. This species seems to be intermediate between *Orbea* and *Tromótriche*.

Changeable-flowered Orbea. Fl. June, July. Clt. 1823. Shrub ½ foot.

22 O. inodòra (Haw. suppl. pl. succ. p. 12.) corolla sulphur-coloured, spotted with dark brown, scentless; leaflets of outer corona emarginate, shorter than the large orb, depressed, rather flexuous. ♄. S. Native of the Cape of Good Hope. Inner branches of inner corona incurved, a little attenuated at the top: outer one longer and incurved.

Scentless Orbea. Fl. July, Sept. Clt. 1788. Shrub ½ ft.

Cult. For culture and propagation see *Stapèlia*, p. 117.

X. OBE'SIA (*obesus*, fat; flowers). Haw. syn. p. 42.—Stapèlia species of authors.

Lin. syst. *Pentándria*, *Digýnia*. All as in *Stapèlia;* but the exterior corona is 5-lobed, therefore there are no ligulæ; the orb or ring is also wanting. Leaflets of inner corona bipartite, yellow, small, thick, and truncate, thickest at the apex; outer branch spreading; inner branch semicylindrical, closely incurved above the table of the style.—Glaucescent plants with the habit of *Stapèlia*. Joints of branches short, almost oblong, very thick, obsoletely tetragonal, radicant: with small, horizontal teeth. Flowers small, usually twin.

1 O. gemina'ta (Haw. syn. p. 42.) joints of branches proliferous, creeping, suboval, obscurely tetragonal, floriferous at top; flowers usually twin; outer corona 5-lobed; margins of segments of corolla revolute. ♄. S. Native of the Cape of Good Hope. Stapèlia geminàta, Mass. stap. p. 18. t. 25. Sims, bot. mag. 1326. Lodd. bot. cab. p. 300. Jacq. stap. t. 8. Corolla orange yellow, dotted with blood colour; segments lanceolate, acuminated, rather hairy inside, when examined by a lens, ex Mass. Lobes of outer corona tridentate.

Twin-flowered Obesia. Fl. May, Nov. Clt. 1795. Sh. cr.

2 O. decòra (Haw. syn. p. 43.) joints of branches oblong, obsoletely tetragonal, floriferous at base; flowers twin; outer corona 5-lobed; segments of corolla scabrous from dots above, lanceolate, acuminated, with revolute edges. ♄. S. Native of the Cape of Good Hope. Stapèlia decòra, Mass. stap. p. 19. t. 26. Corolla yellow, beset with dark purple, elevated dots. It differs from *O. geminàta* in the joints of the branches being smaller, in the teeth being stronger, and in the flowers being rather larger, and scabrous from dots.

Graceful Obesia. Fl. May, Nov. Clt. 1795. Pl. tufted.

Cult. For culture and propagation see *Stapèlia*, p. 117.

XI. DUVA'LIA (named after H. A. Duval, of Paris; author of Enumeratio Plantarum Succulentarum in Horto Alenconio). Haw. syn. p. 44.—Stapèlia species of authors.

Lin. syst. *Pentándria*, *Digýnia*. All as in *Stapèlia;* but the segments of the corolla are more or less bent to one side; the orb is elevated; the lobes of the outer corona are entire, bifid, or emarginate at apex; the segments of the inner corona are minute, hollow, resembling a bird's head, and incurvedly addressed to the angles of the style; the table of the style is round, a little repand, with 5 angular depressions.—Habit of *Stapèlia*. Branches short, proliferous, almost as in *Piaránthus*, often shorter and more glomerate, and throwing out numerous roots, usually glaucescent.

* *Corollas ciliated.*

1 D. reclina'ta (Haw. syn. p. 44.) corolla with lanceolate, ciliated, replicate segments; an elevated, convex orb; branches tetragonal, floriferous in the middle; segments of exterior corona bifid; leaflets of the inner one galeately hooked. ♄. S. Native of the Cape of Good Hope. Stapèlia reclinàta, Mass. stap. p. 19. t. 28. Jacq. stap. p. 4. Sims, bot. mag. 139. Cilia of corolla clavate. Pedicels solitary or aggregate. Corolla small, dark purple.

Reclinate-flowered Duvalia. Fl. July, Sept. Clt. 1795. Shrub cr.

2 D. e'legans (Haw. syn. p. 44.) corolla with deltoid, acuminated, ciliated segments, which are clothed with long purple hairs inside, and a small, elevated orb; segments of the outer corona purplish; branches tetragonal, floriferous in the middle. ♄. S. Native of the Cape of Good Hope. Stapèlia élegans, Mass. 19. t. 27. Sims, bot. mag. 1184. Pedicels twin or tern. Corolla hispid, fringed, smaller than those of *O. reclinàta*, dark purple, with a rufescent, pentagonal bottom.

Elegant Duvalia. Fl. July, Sept. Clt. 1795. Shrub cr.

3 D. cæspitòsa (Haw. syn. p. 45.) corolla with lanceolate, acute, replicate, ciliated segments, an elevated orb; segments of outer corona bifid; leaflets of the inner depressedly hooked; joints of branches crowded, tetragonal, floriferous above the base. ♄. S. Native of the Cape of Good Hope, in Karro, under bushes. Stapèlia cæspitòsa, Mass. stap. p. 20. t. 29. Redout. liliac. t. 148. Jacq. stap. t. 2. Corollas size of those of *D. élegans*, dark purple; having the orb and corona green. Segments of the corolla ciliated from the base to above the middle; the apex naked.

Tufted Duvalia. Fl. May, Aug. Clt. 1790. Shrub proc.

4 D. Jacquinia'na; corolla with lanceolate segments, having their edges reflexed and ciliated, and an elevated orb; segments of outer corona bifid; leaflets of the inner falcately hooked; joints of branches oblong. ♄. S. Native of the Cape of Good Hope. Stapèlia radiàta, Jacq. stap. t. 37. Stap. Jacquiniàna, Rœm. et Schultes, syst. 6. p. 45. Flowers deep purple.

Jacquin's Duvalia. Fl. July, Sept. Clt. 1802. Sh. proc.

5 D.? defle'xa; corolla wrinkled, ciliated, downy in the centre; segments with revolute edges, the whole straight and deflexed; segments of the outer corona beaked, acute, gibbose at the base, erect; leaflets of the inner corona subrotate. ♄. S. Native of the Cape of Good Hope. Stapèlia defléxa, Jacq. stap. diar. lips. 1814. p. 268. Branches ascending a foot high and more. Pedicels aggregate at the base and in the middle of the branches. Corolla yellow inside, livid green outside, with rufescent stripes.

Deflexed Duvalia. Shrub.

6 D. tubercula'ta (Haw. syn. p. 46. suppl. pl. succ. p. 13.) branches oblong, tetragonal; teeth large, recurved; orb hairy; segments of corolla ciliately pubescent, dark brown. ♄. S. Native of the Cape of Good Hope. Stapèlia tuberculàta,

Hort. Plant smaller than *D. radiàta*. Ligulæ angular, entire, pale rufous. Segments of inner corona pale red.

Tubercled Duvalia. Fl. July, Sept. Clt. 1808. Sh. proc.

7 D. HIRTE'LLA ; segments of corolla replicate, lanceolate, ciliated on the edges ; orb elevated, hairy ; segments of outer corona obtuse ; segments of inner corona falcately hooked ; branches columnar, not oblong, as in *D. cæspitòsa* ; pedicels usually solitary. ♄. S. Native of the Cape of Good Hope. Stapèlia hirtélla, Jacq. stap. t. 14. Willd. enum. p. 285. Haw. syn. p. 26. suppl. pl. succ. p. 10. Corolla livid green outside, deep purple inside.

Hairy-flowered Duvalia. Fl. Jul. Sept. Clt. 1800. Sh. proc.

8 D. MASTÒDES ; segments of corolla replicate, ciliated at the base; orb elevated, glabrous ; branches hexagonal ; tubercles of branches flattish, mammillary. ♄. S. Native of the Cape of Good Hope. Stapèlia mastòdes, Jacq. stap. t. 56-57. Corolla brownish purple. Pedicels in fascicles, near the tops of the branches.

Teat-toothed Duvalia. Fl. July, Aug. Clt.? Shrub proc.

* * *Segments of corolla naked, not ciliated.*

9 D. RADIA'TA (Haw. syn. p. 45.) corolla with narrow, distant, replicate, naked segments, and an elevated orb ; segments of the outer corona obtuse, entire ; joints of branches short, tetragonal ; pedicels twin. ♄. S. Native of the Cape of Good Hope. Stapèlia radiàta, Sims, bot. mag. 619. Lodd. bot. cab. 831. Inner corona of 5 tongue-shaped, concave bodies, disposed in a stellate manner, bending back upon the centre of the corolla, at the apex. Corolla dark purple. In Jacq. stap. t. 29, the corolla is ciliated.

Radiate-nectaried Duvalia. Fl. June, Sept. Clt. 1795. Sh. proc.

10 D. REPLICA'TA (Haw. l. c.) corolla with lanceolate, replicate, naked segments, and an elevated orb ; segments of the exterior corona obtuse ; leaflets of the interior corona falcately uncinate. ♄. S. Native of the Cape of Good Hope. Stapèlia replicàta, Jacq. stap. Willd. enum. p. 286. Branches ascending. Pedicels usually solitary. Corolla livid green outside, blackish purple inside. Perhaps the same as *D. radiàta*.

Replicate-flowered Duvalia. Fl. July, Sept. Clt. 1812. Shrub proc.

11 D. LÆVIGA'TA (Haw. syn. p. 46. suppl. pl. succ. p. 14.) orb large ; segments of corolla horizontal. ♄. S. Native of the Cape of Good Hope. Stapèlia lævigàta, Hort. Very nearly allied to *D. radiàta*. Orb larger and petals more horizontal than in any other species.

Smooth Duvalia. Fl. July, Sept. Clt. 1800. Shrub proc.

12 D. GLOMERA'TA (Haw. syn. p. 46.) flowers usually 4 together ; segments of corolla connivent, except at the tops ; orb rather downy ; branches prostrate or dependent, glomerate, rooting at bottom. ♄. S. Native of the Cape of Good Hope. Stapèlia glomeràta, Hort. Segments of inner corona length of ligulæ. Corolla thick, dark brown. Orb very blunt, subrepand, with a pale base. Very like *D. compácta*, but larger.

Glomerate-branched Duvalia. Clt. 1804. Shrub proc.

13 D. COMPA'CTA (Haw. syn. p. 46.) flowers usually twin ; segments of corolla dark purple, retrofracted and connivent ; table of style and stamens brown ; joints of branches densely glomerate, an inch long. ♄. S. Native of the Cape of Good Hope. Stapèlia compácta, Rœm. et Schultes, syst. 6. p. 46. Segments of inner corona like a bird's head, a little paler than the table of the style ; the rest as in the other species. Branches prostrate, rooting at bottom. Smaller and more compact than *D. glomeràta*.

Compact Duvalia. Fl. July, Sept. Clt. 1800. Sh. tufted.

Cult. For culture and propagation see *Stapèlia*, p. 117.

XII. CARUNCULA'RIA (from *caruncula*, a fleshy protuberance ; tops of inner corona carunculate). Haw. syn. p. 334. —Stapèlia species of authors.

LIN. SYST. *Pentándria, Digýnia.* All as in *Stapèlia*, except the segments of the outer corona or ligulæ, which are short and emarginate ; segments of inner corona bipartite, recurved, compressed, attenuated downwards, globose at top, and granulately carunculate ; granules of very different forms.—Much-branched plants, with the habit of *Stapèlia*. Branches tetragonal.

1 C. PEDUNCULA'TA (Haw. syn. p. 334.) segments of corolla lanceolate, with revolute edges, and fringed angles ; branches numerous, divaricate, tetragonal ; peduncles very long. ♄. S. Native of the Cape of Good Hope. Stapèlia pedunculàta, Mass. stap. p. 17. t. 21. Haw. syn. p. 23. Allg. teutsch. gard. mag. 1811. p. 309. t. 30. Sims, bot. mag. t. 793. Jacq. stap. t. 50-51-52-53. Segments of corolla lanceolate, acuminated, ciliated with pedicellate glands on the margins at the base. Branches somewhat dentate, floriferous in the middle (ex Willd. spec. 1. p. 1284.). There are brownish-purple and yellowish-flowered varieties of this species. Branches glaucous. Pedicels very long, 4-5 together. Corolla green outside.

Pedunculate Caruncularia. Fl. June, Nov. Clt. 1790. Sh.

2 C.? SERRULA'TA ; corolla strigose ; segments revolute on the edges ; segments of outer corona oblong, truncate, serrated at apex ; leaflets of the interior corona hooked and 2-lobed ; outer lobe serrated ; pedicels twin. ♄. S. Native of the Cape of Good Hope. Stapèlia serrulàta, Jacq. stap. t. 41. diar. lips. 1814. p. 269. Willd. enum. p. 286. Corolla brownish-yellow, campanulate ; corona yellow.

Serrulated Caruncularia. Fl. June, Aug. Clt. 1805. Sh.

Cult. For culture and propagation see *Stapèlia*, p. 117.

XIII. PECTINA'RIA (from *pectin*, a comb ; in reference to the inner corona of the flowers being ciliately multifid). Haw. suppl. pl. succ. 14. Stapèlia articulàta, Mass.

LIN. SYST. *Pentándria, Digynia.* All as in *Stapèlia ;* but the corolla is tuberculate, and the branches of the plant warted ; and the outer corona of the corolla lacerately multifid.—A small tufted plant, with the habit of *Stapèlia* ; joints of branches oblong-terete, reticulately and obsoletely warted ; each wart furnished with a small spine. Corolla beset with mucronate papilla or warts above ; with triangular segments. Stapèlia mammillàris, Lin. probably belongs also to this genus, and is perhaps only the same as *P. articulàta*.

1 P. ARTICULA'TA (Haw. l. c.). ♄. S. Native of the Cape of Good Hope, in the regions of Roggeweld. Stapèlia articulàta, Mass. stap. p. 20. t. 30. Branches floriferous at the apex. Flowers solitary. Corolla small, blackish purple. Tubercles on the branches greenish purple. The plant is eaten with vinegar by the Dutch at the Cape, and raw by the Hottentots.

Jointed Pectinaria. Fl. July. Clt. 1800. Shrub.

Cult. For culture and propagation see *Stapèlia*, p. 117.

XIV. CARALLU'MA (the *C. adscéndens* is called *Carallum* by the Telingas). R. Br. in wern. soc. mem. 1. p. 25. —Stapèlia species, Roxb.

LIN. SYST. *Pentándria, Digýnia.* Corolla rotate (f. 15. *b.*), deeply 5-cleft (f. 15. *b.*). Column of fructification exserted. Stamineous corona in a simple series, 10-leaved, 5 of the leaflets are undivided, and opposite the anthers, the rest bipartite (f. 15. *c.*), and ligulate. Anthers simple at top : pollen masses erect, tetragonal (f. 15. *d.*), fixed by the base, pellucid on one side on the margin. Stigma mutic. Follicles slender, smooth. Seeds comose.—Habit almost of *Stapèlia*. Inhabitants of the East Indies. Stems tetragonal, toothed along the angles. Peduncles solitary, 1-flowered, rising from the axils of the teeth. The crown in this genus, as in *Ceropègia*, consists of 5 3-lobed

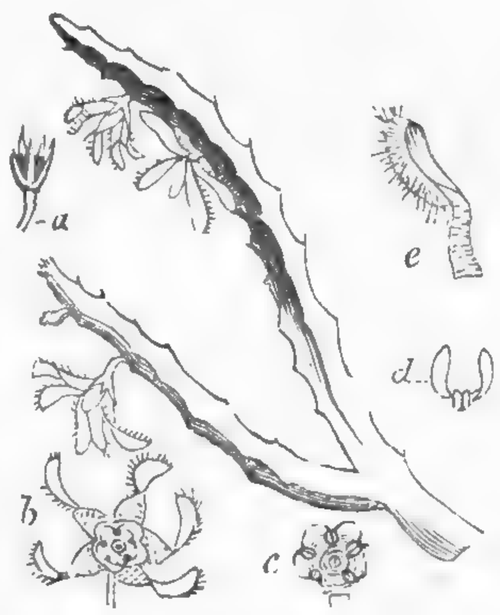
leaves: the lateral lobes united by pairs into 5 ligulate forked leaflets, alternating with the primary lobes and with the stamens.

1 C. adsce'ndens (R. Br. l. c.) branches slender, ascending, bearing each a solitary flower at top; segments of corolla reflexed at the edges, acuminated, glabrous. ♄. S. Native of Coromandel. Stapèlia adscéndens, Roxb. cor. 1. p. 82. t. 30. Corollas size of those of *Periploca Græ'ca*, yellowish; segments tipped with violet. Stems rooting at the base. Flowers variegated with purple and yellow, ex Roxb., usually drooping.

Ascending Caralluma. Fl. July. Clt. 1804. Sh. 1 to 2 ft.

2 C. fimbria'ta (Wall. pl. asiat. rar. 1. p. 7. t. 8.) branches elongated, attenuated; flowers axillary, solitary, subcampanulate, drooping; segments of corolla falcate at top (f. 15. *e*.), with replicate, fringed edges. ♄. S. Native of the Burmese empire, on sterile sandy hills at Yenangeum, on the banks of the Irrawaddy; and among the ruins of Pagamon. Stem branched at top. Segments of corolla naked in the lower part, marked with many transverse purple lines, pale yellow beneath; upper part purple; upper margin straight and downy, fringed behind with articulated vacillating hairs. Very closely allied to *C. adscéndens*, but that species differs from this in the absence of the long vacillating hairs to the corolla. Stapèlia subulàta, Forsk. cat. arab. p. 108. no. 193. t. 7. is the same, or a very nearly allied species. (f. 15.)

FIG. 15.



Fringed Caralluma. Clt. 1829. Shrub ½ foot.

Cult. For culture and propagation see *Stapèlia*, p. 117.

XV. BOUCERO'SIA (from *βουκερως*, *boukeros*, furnished with buffalos' horns; in reference to the curved lobes of the corona). Wight and Arnott, contrib. ind. bot. p. 34. Carallùma species, Haw. and Wall. Stapèlia species, Roxb.

Lin. syst. *Pentándria*, *Digýnia*. Corolla subcampanulate, 5-cleft; segments broadly triangular, with acute recesses. Column of fructification hardly exserted. Stamineous corona 15-lobed; lobes disposed in a double series; the 5 inner ones opposite the stamens, and lying upon the anthers; the rest exterior, erect, or a little incurved at apex, adhering to the back of the inner ones. Anthers simple at the apex; pollen masses erect, tetragonal, pellucid on the one side at the margin. Stigma mutic. Follicles smooth, terete, attenuated at the apex. Seeds comose.—Fleshy, leafless, erect plants, with the habit of *Stapèlia*. Branches and stems tetragonal; with toothed angles. Flowers numerous, terminal, umbellate.—In *Carallùma* the lateral lobes of each leaflet of the corona are separated by means of the middle or primary lobe, with the edge of which they cohere at the base: in this genus, on the contrary, the edges of the lateral lobes of each leaflet cohere, and their line of junction is also attached along the middle of the back of the primary lobe. In both genera the lateral lobes cohere by the margins with the lateral ones of the adjoining leaflet; so that in *Carallùma* we have a corona of 10 narrow and 5 broad segments, attached to each other by the edges only, and forming consequently a simple series, while, in *Boucerò'sia* the 5 broad segments are surrounded by the 10 narrow ones, and a double corona is formed. Wight. and Arnott, contrib. ind. bot. p. 34.

1 B. umbella'ta (Wight and Arnott, l. c.) segments of corolla glabrous. ♄. S. Native of the southern provinces of the Indian peninsula, in arid places. Carallùma umbellàta, Haw. syn. p. 47. Wall. ascl. no. 20-21. Stapèlia umbellàta, Roxb. cor. 3. t. 241. Stapèlia Callamùlia, Haw. Flowers purple.

Umbellate-flowered Boucerosia. Fl.? Clt. 1829. Sh. ½ ft.

2 B. crenula'ta (Wight and Arnott, l. c.) segments of corolla fringed on the edges. ♄. S. Native of the Burmese empire, on sandy mountains, near the town of Segaen, on the left bank of the Irrawaddy, opposite Ava. Carallùma crenulàta, Wall. pl. asiat. 1. p. 6. t. 7. Corollas pale greenish-white below, yellow above, and ornamented with broadish transverse stripes, which become narrower as they approach the base. This is a smaller, more compact, and more glossy plant than the preceding.

Crenulated Boucerosia. Clt. 1829. Shrub ½ foot.

Cult. For culture and propagation see *Stapèlia*, p. 117.

XVI. HUTCHI'NIA (named after Mr. Hutchin of Norwich, a most successful cultivator and liberal distributor of succulent plants). Wight and Arnott, contrib. ind. bot. p. 34.

Lin. syst. *Pentándria*, *Digýnia*. Corolla subcampanulate, 5-cleft. Column of fructification hardly exserted. Stamineous corona 20-lobed; the 5 inner lobes lying on the anthers, the next 5 outside of these alternating with them, each of these 5 furnished with 2 lateral lobes, which exceed the middle one. Anthers simple at top. Pollen masses erect, pellucid on the margin on one side.—A fleshy, leafless, erect plant; branches tetragonal: with toothed angles. Flowers numerous, terminal, subumbellate. Corolla pilose inside.

1 H. I'ndica (Wight and Arnott, contrib. ind. bot. p. 35.). ♄. S. Native of the peninsula of India, in arid places. Wight, cat. no. 1520. Teeth of branches reflexed. Flowers pale, greenish white outwardly, but tinged with purple, and covered with purplish hairs within. Follicles not seen.

Indian Hutchinia. Shrub ½ foot.

Cult. For culture and propagation see *Stapèlia*, p. 117.

XVII. ERIOPE'TALUM (from *εριον*, *erion*, wool, and *πεταλον*, *petalon*, a petal; segments of corolla usually densely villous inside). Wight, contrib. ind. bot. p. 35.

Lin. syst. *Pentándria*, *Digýnia*. Corolla subcampanulate, 5-cleft; segments narrow, linear: with broad recesses. Stamineous corona 15-lobed; the 5 inner lobes lying upon the anthers; the 10 exterior ones erect, approximate, adhering to the inner series. Anthers simple at apex; pollen masses fixed nigh the base, erect, lying upon the stigma, pellucid on the margin on one side. Follicles slender, glabrous.—Erect, rather branched herbs. Stems terete. Leaves minute, scale-formed, adpressed. Flowers small, umbellate; umbels lateral or terminal, sessile. Segments of corolla longer than the tube, usually clothed with dense villi or wool inside, hence the generic name. This genus agrees in habit with *Microstémma*, but differs in the form of the corona; on the other hand it resembles *Boucerò'sia* in the corona, but has a widely different habit.

1 E. parviflòrum (Wight, l. c.) segments of corolla hardly longer than the tube, woolly; corona exceeding the gynostegium or column of fructification. ♃. S. Native of Doongie, Royle.

Small-flowered Eriopetalum. Pl. erect.

2 E. attenua'tum (Wight, l. c.) segments of corolla slender, attenuated, villous, twice or thrice longer than the tube; corona shorter than the gynostegium. ♃. S. Native of Doongie, Royle.

Attenuated-petalled Eriopetalum. Pl. erect.

3 E. læviga'tum (Wight, l. c.) segments of corolla linear, with undulated margins, nearly glabrous, almost twice as long as the tube; corona equal in length to the gynostegium. ♃. S.

Native in the woods of Cossala and Gorukpur. Gomphocárpus lævigàta, Ham. Microstémma, Wall. ascl. no. 23.

Smooth Eriopetalum. Pl. erect.

Cult. For culture and propagation see *Stapèlia*, p. 117.

XVIII. MICROSTE'MMA (from *μικρος*, *micros*, small, and *στεμμα*, *stemma*, a crown; in reference to the smallness of the stamineous corona). R. Br. in wern. soc. mem. 1. p. 25.

Lin. syst. *Pentándria*, *Digynia*. Corolla rotate, 5-cleft. Column of fructification exserted. Stamineous corona undivided, fleshy, 5-lobed; lobes alternating with the anthers; anthers simple at the apex; pollen masses inserted by the middle, lying upon the stigma. Stigma mutic. Follicles slender, smooth. Seeds comose.—Glabrous erect herbs, natives of New Holland, with tuberous roots. Stems simple at bottom, with minute leaves; branched at top, with linear, opposite leaves. Umbels lateral and terminal, almost sessile. Corollas blackish purple, bearded inside.

1 M. tuberòsum (R. Br. prod. p. 459.). ♄. S. Native of New Holland, within the tropic.

Tuberous-rooted Microstemma. Pl. 1 foot. ?

Cult. For culture and propagation see *Ceropègia*, p. 112.

XIX. LEPTADE'NIA (from *λεπτος*, *leptos*, slender; and *αδην*, *aden*, a gland; in reference to the slender pollen masses. R. Br. in wern. soc. 1. p. 34.

Lin. syst. *Pentándria*, *Digýnia*. Corolla sub-rotate, with a short tube, furnished with 5 scales, one between each segment; limb bearded, valvate in æstivation. Column or gynostegium nearly globose. Stamineous corona none. Anthers free, simple at apex; pollen masses erect, fixed by the base, coarctate and pellucid at top. Stigma mutic, rarely apiculated. Follicles smooth. Seeds comose.—Twining shrubs, usually greyish from powdery tomentum. Leaves flat, opposite. Umbels interpetiolar, sometimes cymose. Corpuscles of stigma minute. Mr. R. Brown has examined three species of this genus, none of which are yet described, one of them collected by Forskal.

1 L. Forskœ'lii; flowers umbellate. ♃. ◠. S. Native of Arabia Felix.

Forskœl's Leptadenia. Pl. tw.

2 L. cymòsa; flowers cymose. ♃. ◠. S. Native of the East Indies.

Cymose-flowered Leptadenia. Pl. tw.

3 L. reticula'ta (Wight, and Arnott, contr. ind. bot. p. 47.) twining; bark of the older branches corky, glabrous; young branches clothed with cinereous down, and sometimes with tomentum; leaves ovate or lanceolate, acute, usually smoothish, and sometimes clothed with short white down; umbels lateral, many-flowered, about equal in length to the petioles; segments of corolla with revolute edges, bearded inside; scales of throat simple, short; stigma mutic; follicle sub-cylindrically oblong, obtuse, often solitary by abortion.

Var. α; leaves clothed with short, mealy down, but at length, almost glabrous; peduncles about equal in length to the petioles, and the pedicels about equal in length to the peduncles. ♄. ◠. S. Native of the East Indies, very abundant about Negapatam, on the sea coast, where it grows to a great size. Wight, cat. no. 1535. Cynánchum reticulàtum, Retz. obs. 2. p. 15. Willd. spec. 1. p. 1258. Rœm. et Schultes, syst. 6. p. 107. Cynánchum asthmáticum, Herb. Ham. no. 766. Asclèpias tuberòsa, Roxb. fl. ind. 2. p. 38. Mus. ind. or. t. 614. Asclèpias volùbilis, Herb. Madr. Ham. Wall. ascl. no. 7, exclusive of Secamòne canéscens, Smith, in Rees' cycl.

Var. β; branchlets tomentose; leaves oblong-lanceolate; peduncles very short. ♄. ◠. S. Native of the Peninsula of India, in the southern provinces. Leptadènia brévipes, Wight, cat. no. 1536.

Var. γ; leaves broad-obtuse, retuse at the base, rather velvety beneath. ♄. ◠. S. Native of Ava, near Pegu. Gymnèma aurantìaca, Wall. ascl. no. 147.

Reticulated Leptadenia. Shrub tw.

4 L. imbe'rbis (Wight, l. c. p. 48.) twining, glabrous; leaves broadly ovate or cordate, acuminated; umbels lateral, many-flowered, about equal in length to the petioles; segments of corolla revolute on the edges, beardless; scales of throat simple; stigma apiculated. ♄. ◠. S. Native of the East Indies, at Meerut and Suroy. Wall. ascl. no. 77. *e*, unnamed. The only certain character which distinguishes this from the varieties of the last, are the beardless segments of the corolla.

Beardless Leptadenia. Shrub tw.

5 L. spa'rtium (Wight. l. c.) suffruticose, glabrous; stems slender, much branched; leaves narrow-linear, tapering at the apex; umbels almost sessile; segments of corolla beardless inside, with revolute margins; scales of throat broad, exserted; stigma mutic. ♄. ◠. S. Native of the East Indies, on the banks of the river Yavanna, Hamilton: Himalaiah, Royle: Simla, Countess of Dalhousie. Gymnèma spártium, Wall. ascl. no. 76. Cannýchum angustifòlium, Ham. herb.

Broom-like Leptadenia. Shrub tw.

6 L.? elliptica (Blum. bijdr. p. 1066.) leaves oval, acutish, hardly emarginate at the base, coriaceous, glabrous, veinless above, paler beneath, and full of fine parallel veins; cymes panicled, interpetiolar, clothed with rust-coloured scurf. ♄. ◠. S. Native of Java and Nusæ Kambanga, in woods. Flowers small, sweet-scented. Stamineous crown small, 5-angled, girded at the base by a fleshy, 5-lobed urceolus. Follicles smooth or lepidoted. Seeds comose. This plant differs, in having a stamineous crown, from the other species of *Leptadènia*.

Elliptic-leaved Leptadenia. Fl. year. Shrub tw.

Cult. For culture and propagation see *Ceropègia*, p. 112.

XX. ORTHANTHE'RA (from *ορθος*, *orthos*, erect; and *ανθηρα*, *anthera*, an anther; anthers erect.) Wight. contrib. ind. bot. p. 48.

Lin. syst. *Pentándria*, *Digýnia*. Corolla urceolate, 5-cleft; throat naked; tube rather ventricose; æstivation valvate. Staminal corona none. Anthers simple at top, erect, acute; pollen masses erect, fixed by the base, coarctate and pellucid at apex. Stigma apiculate.—A leafless shrub. Umbels on short peduncles, few-flowered. Calyx 5-parted; segments subulate at top. Corolla villous outside, glabrous inside, twice as long as the gynostegium. Filaments furnished with a gland, or fleshy leaflet, at the base of each, as in *Gymnodènia*. Anthers free, lying upon the stigma, which is apiculated. Follicles unknown.—This genus is perhaps closely allied to *Leptadènia*, from which it only differs, by the urceolate corolla, the absence of scales to the orifice of the tube, and erect anthers. The habit is also different.

1 O. vimínea (Wight, l. c.) ♄. S. Native of Hindostan, at Doab. Apocíneæ vimínea, Wall. cat. no. 7478.

Twiggy Orthanthera. Shrub.

Cult. See *Ceropègia*, p. 112, for culture and propagation.

XXI. BRACHYSTE'LMA (from *βραχυς*, *brachys*, short; and *στελμα*, *stelma*, a crown; corona short.) R. Br. in bot. mag. 2343. bot. reg. 722.

Lin. syst. *Pentándria*, *Digýnia*. Corolla campanulate (f. 16. *b*.), having the sinuses angular. Column or gynostegium inclosed. Corona simple, 5-cleft; lobes opposite the anthers, simple on the back. Anthers naked at top. Pollen masses

erect, fixed by the base.—Suffruticose, twining plants. Leaves opposite, membranous. Root a roundish tuber.

1 B. tuberòsum (R. Br. l. c.) leaves membranous, linear-lanceolate, concave; flowers aggregate, 3-4 in each fascicle; lobes of corona connivent; segments of corolla fringed at the base. ♃. ⌒. G. Native of the Cape of Good Hope. Stapèlia tuberòsa, Meerb. icon. t. 54. f. 1. Calyx and pedicels beset with glandular down. Corolla greenish outside, dotted with red; but blackish purple inside, with a deep yellow centre, and broken cross lines; tube campanulate. Lobes of corona triangular. Flowers fetid (f. 16.). Root a roundish tuber (f. 16. *c*.)

FIG. 16.

Tuberose-rooted Brachystelma. Fl. June, July. Clt. 1821. Pl. tw.

2 B. spatulatum (Lindl. bot. reg. 1113.) pilose; leaves spatulate, obtuse; segments of corolla twice as long as the tube; flowers solitary, pedicellate, one half shorter than the leaves. ♃. ⌒. G. Native of the Cape of Good Hope. Corolla dirty purple, dotted; having the segments tailed, tomentose outside.

Spatulate-leaved Brachystelma. Fl. July. Clt. 1826. Pl. tw.

Cult. For culture and propagation see *Ceropègia*, p. 112.

XXII. FISCHE'RIA (named after F. E. L. Fischer, M.D. Director of the Botanic Garden at St. Petersburgh.) D. C. cat. hort. monsp. 1813. p. 112.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate; segments undulately curled. Stamineous corona fleshy, truncate, but not otherwise lobed, girded at the base by a nectariferous ring. Anthers simple at the apex, hooked, replicate inside; pollen masses inserted by the middle of the side, lying upon the stigma. Stigma pentagonal. Follicles two.—A climbing, evergreen shrub. Branches long, terete. Leaves opposite, cordate at the base, oval-oblong, acute, petiolate. Peduncles interpetiolar, bearing simple umbels of pedicellate flowers. This appears to be intermediate between *Microstémma* and *Hòya*; but it differs from them, and all the other allied genera, in the corona being entire.

1 F. sca'ndens (D. C. l. c. t. 67. ined.) ♄. ◡. S. Native, probably of South America. Branches downy. Flowers yellowish green. Very like Cynánchum crispiflòrum, Swartz; but differs from it, in the calycine segments being shorter, spreading, not reflexed; in the corolla being rotate, not with a pentagonal tube; and particularly in the corona and genitals.

Climbing Fischeria. Fl. ? Clt. ? Shrub tw.

Cult. See *Hòya*, p. 128., for culture and propagation.

Sub-tribe II.

HOYACEÆ. Pollen masses erect or connivent, lying upon the stigma, fixed by the base, or beneath the middle of the side. Anthers terminated by a membrane.

§ 1. *Tube of stamens appendiculate outside.*

XXIII. HO'YA (named in honour of Mr. Thomas Hoy, late gardener to the Duke of Northumberland, at Sion House; whose merits, as an intelligent and successful cultivator of plants, have been long known to the botanists of this country.) R. Br. in mem. wern. soc. 1. p. 26.—Asclèpias species of Lin.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate, 5-cleft. Stamineous corona 5-leaved; leaflets depressed, spreading, fleshy, drawn each out into a tooth on the inner side, which lies on the anthers. Anthers terminated by a membrane; pollen masses fixed by the base, connivent, compressed. Stigma depressed, mutic or sub-apiculated. Follicles smooth. Seeds comose.—Twining, scandent, or decumbent shrubs, natives of the East Indies, China, and New Holland. Leaves opposite, fleshy, or membranous. Umbels many-flowered, interpetiolar.

§ 1. *Twining, scandent, or decumbent shrubs, usually radicant. Leaves fleshy. Leaflets of corona furrowed beneath. Hòya vèræ.*

* *Leaflets of corona flattish, broadly obovate, or nearly orbicular.*

1 H. velutìna (Wight. contrib. ind. bot. p. 35.) twining; leaves oval, short-acuminated, with revolute margins, glabrous above, and velvety beneath; corolla downy outside, and glabrous inside; segments broad, with revolute edges; leaflets of corona nearly orbicular, depressed, shining above: with the obtuse inner angles lying upon the umbilicate stigma. ♄. ⌒. S. Native of the East Indies. Hòya, Wall. ascl. no. 39.—Rumph. amb. 5. t. 172.? but Roxb. refers his *Ascl. Sussvèla* to this.

Velvety Hoya. Shrub tw.

2 H. orbicula'ta (Wall. ascl. no. 32. Wight and Arnott, l. c.) twining; leaves fleshy, orbicular, glabrous; peduncles many-flowered, shorter than the leaves; corolla downy inside: with acuminated segments; leaflets of corona obovate, or nearly orbicular, depressed, with the inner angles obtuse; stigma apiculated. ♄. ⌒. S. Native of Ava, at Prome. Rumph. amb. 5. t. 175. f. 28. Leaves generally 4 at each joint of the stem.

Orbicular-leaved Hoya. Shrub tw.

3 H. pe'ndula (Wight, and Arnott, contrib. ind. bot. p. 36.) twining; leaves fleshy, glabrous, from oblong-oval acute to broad ovate, acuminated, with revolute edges; peduncles pendulous, a little longer than the petioles, many-flowered; corolla downy inside; leaflets of corona oboval, very blunt, depressed, having the inner angles short and truncate at the apex; stigma apiculated. ♄. ⌒. S. Native of the East Indies.

Var. α, Rheédii (Wight, and Arnott, l. c.) leaves oblong-oval, acute. ♄. ⌒. S. Native of Malabar and the Circars. Asclèpias péndula, Roxb. fl. ind. 2. p. 36.—Rheed. mal. 9. t. 13.

Var. β, Neelgherénse (Wight, and Arnott, l. c.) leaves ovate, acuminated. ♄. ⌒. S. Native of Neelgherries. Wight. cat. no. 1521. H. revolùta, Wight. Hòya, Wall. ascl. nos. 27. and no 41.

Pendulous-umbelled Hoya. Shrub tw.

4 H. longifòlia (Wall. ascl. no. 40. Wight, and Arnott, l. c.) twining, radicant: leaves fleshy, narrow-lanceolate, acuminated, attenuated at the base; corolla downy inside, with ciliated margins; leaflets of corona broad-obovate, obtuse, having the inner angles lying on the stigma. ♄. ⌒. S. Native of the Himalaiah, at Mussooree, Royle, Nepaul, and Singapore. Hòya, Wall. ascl. no. 44.? Leaves 3-6 inches long, and 6-12 lines broad.

Long-leaved Hoya. Shrub tw.

5 H. linea'ris (Wall. ex D. Don, prod. fl. nep. p. 130. Wall. ascl. no. 34. Wight, and Arnott, l. c.) twining, pilose; stems slender, radicant, leafy; leaves fleshy, narrow-linear, acutish; corolla rather downy inside, with ciliated edges; segments obtuse; leaflets of corona nearly orbicular, having the inner angles lying upon the stigma, ♄. ⌒. S. Native of Nipaul. Plant 3 times smaller than *H. lanceolàta*.

Linear-leaved Hoya. Shrub tw.

6 H. PARVIFLÒRA (Wight, contrib. ind. bot. p. 37.) twining, glabrous; branches slender; leaves fleshy, lanceolate, tapering at both ends; peduncles slender, about equal in length to the leaves, many-flowered; corolla glabrous; leaflets of corona broad obovate, emarginate, or obcordate, with the inner angles acuminated, and lying upon the stigma, which is apiculated. ♄. ⌒. S. Native of the Burman Empire, at Maulmeyne. Hòya, Wall. ascl. no. 33.

Small-flowered Hoya. Shrub tw.

* * *Leaflets of corona flattish above, ovate or lanceolate.*

7 H. FU'SCA (Wall. pl. rar. asiat. 2. p. 78. t. 175.) twining, glabrous; leaves coriaceous, hardly fleshy, linear-oblong, acuminated, transversely veined; peduncles short, many-flowered; corolla glabrous, with obtuse segments; leaflets of corona ovate, obtuse: with the inner angles erect and attenuated, lying upon the stigma, which is apiculated. ♄. ⌒. S. Native of Nipaul and Silhet. The flowers are rather small, brownish coloured, and very numerous. Leaves 5-6 inches long, and 1 or 1½ broad.

Brown-flowered Hoya. Shrub tw.

8 H. HOOKERIA'NA (Wight, contrib. ind. bot. p. 37.) twining, glabrous; leaves fleshy, oblong-lanceolate, 3-nerved; peduncles short, many-flowered; corollas small, glabrous, with obtuse segments; leaflets of corona ovate, acute, with the inner angles short; stigma obtuse. ♄. ⌒. S. Native of Chittagong and Silhet. *H. Nicobárica*, R. Br. mss. is this or a very similar species. Leaves 6-10 inches long, and 1 or 1½ broad.

Hooker's Hoya. Shrub tw.

9 H. NICOBA'RICA (R. Br. herb. ex Trail, in hort. trans. 7. p. 29.) umbels globose; flowers very numerous; leaves ovate-lanceolate. ♄. ⌒. S. Native of the Nicobar Islands.

Nicobar Hoya. Shrub tw.

10 H. PARASÍTICA (Wall. ascl. no. 29. Wight, and Arnott, l. c.) plant parasitical, climbing, radicant, glabrous; branches slender, terete; leaves fleshy, glabrous, shining, finely 3-nerved at the base, oblong-lanceolate, attenuated; peduncles almost twice as short as the leaves, many-flowered, sometimes twin; umbels sub-globose; corolla glabrous, deeply 5-cleft; leaflets of corona ovate, acute, with the inner angles lying upon the stigma. ♄. ⌒. S. Native in the woods of Sundabund, at the estuary of the Ganges. Asclèpias parasítica, Roxb. fl. ind. 2. p. 42. and mus. ind. orient. t. 1382. H. pállida, Lindl. bot. reg. t. 951. H. acùta, Haw. rev. p. 4. H. lanceolàta, Lindl. in Donn. hort. cantab. ed. 11. p. 92. H. álbens, Mill. brist. cat. 1826. Flowers fragrant, yellow; corona paler than the rest of the flower, purple in the centre. Leaves paler beneath, and darker above.

Parasitical Hoya. Shrub tw.

11 H. TRINE'RVIS (Trail, in hort. trans. 7. p. 26.) stems slender, filiform; leaves variable in size, oblong, sharply acuminated, pale green beneath, and mottled with small brown spots, light yellowish green above, with 3 prominent veins; umbels globose; segments of corolla sharp-pointed; the sides and ends of which are reflexed. ♄. ⌒. S. Native of China. Lodd. bot. cab. 936. Corollas pale greenish yellow, slightly scented, frequently mottled beneath with red. Corona of a pale greenish white, with a yellowish tinge in the centre.

Three-nerved-leaved Hoya. Fl. July, Aug. Clt. 1824. Shrub tw.

12 H. OVALIFÒLIA (Wight, and Arnott, contrib. ind. bot. p. 37.) twining, radicant, glabrous; leaves fleshy, oval, acuminated at both ends; peduncles shorter than the leaves, many-flowered; corolla downy inside; segments ovate, acute; leaflets of corona oval, obtuse, with the inner angles short; stigma mutic. ♄. ⌒. S. Native of the Neelghery mountains, and Singapore. Hòya, Wight, cat. no. 1522. Wall. ascl. no. 31, 43,? and 45. This is very nearly allied to *H. parasítica*.

Oval-leaved Hoya. Shrub tw.

13 H. ARNOTTIA'NA (Wight. contrib. ind. bot. p. 37.) twining, glabrous, radicant; leaves fleshy, broad-ovate, acuminated; corolla downy inside: with orbicular, cuspidate segments; leaflets of corona oval, somewhat acuminated, with the inner angles short; stigma mutic. ♄. ⌒. S. Native of Nipaul. Hòya, Wall. ascl. no. 35.

Arnott's Hoya. Shrub twining.

14 H. GYMNANTHE'RA (Wight, l. c.) leafless; epidermis of stem smooth and shining; umbels many-flowered, on short peduncles; flowers small; leaflets of corona ovate; tops of anthers membranous, pellucid, very narrow, hardly touching the pollen masses. ♄. ⌒. S. Native of the East Indies. Wall. ascl. no. 145, without a name.

Naked-anthered Hoya. Shrub tw.

* * * *Leaflets of corona convex above, oval, or ovate, with revolute edges.*

15 H. BRUNONIA'NA (Wight, l. c.) twining, glabrous; branches obsoletely tetragonal; leaves fleshy, oval-oblong, acuminated; corolla rather fleshy, glabrous outside, bearded inside; leaflets of corona oval, acute, convex above, with revolute edges. ♄. ⌒. S. Native of the East Indies. Hòya, Wall. ascl. no. 37.

Brown's Hoya. Shrub twining.

16 H. CARNÒSA (R. Br. in wern. soc. mem. 1. p. 27.) twining, glabrous; stems and branches terete; leaves fleshy, oval-oblong, acuminated; umbels pendulous, on short peduncles; pedicels pilosely pubescent; corolla fleshy, glabrous outside, but bearded inside; leaflets of corona ovate, acute, drawn out at top, convex above, with revolute edges; membranes of anthers rather large, hiding the stigma, which is bluntly apiculated; pollen masses pellucidly marginate on one side. ♄. ⌒. S. Native of China, about Canton, as well as the tropical part of Asia. Asclèpias carnòsa, Lin. suppl. 1. p. 170. Sims, bot. mag. 788. Smith, exot. bot. 2. p. 21. t. 70. Stapèlia Chinénsis, Lour. coch. p. 165. Schóllia, crassifòlia, Jacq. eclog. no. 2. Schóllia carnòsa, Schrank. ex Steudel, nom. Flowers white, or pinkish, waxy as in the other species of the genus, and are much admired.

Fleshy, or Common Hoya. Fl. Jul. Aug. Clt. 1802. Sh. tw.

17 H. PÓTSII (Trail, in hort. trans. 7. p. 25. t. 1.) stems slender, greenish brown, unequally covered with warts; leaves cordate, acuminated, with a rusty stain partly spread over them, pale whitish beneath, light yellowish green above, with 3 principal veins; umbels globose. ♄. ⌒. S. Native about Macao. Flowers pale yellow, slightly downy, smelling like *Heliotròpium*. Corona slightly purple in the centre.

Pots's Hoya. Fl. Ju. Aug. Clt. 1822. Shrub tw.

18 H. AUSTRA'LIS (R. Br. mss. ex hort. trans. 7. p. 27.) leaves from elliptic to obovate; corollas bearded; leaflets of corona furrowed beneath. ♄. ⌒. S. Native of New Holland, within the tropic. Hòya carnòsa, R. Br. prod. p. 460. Flowers white, or pinkish.

Southern Hoya. Clt. 1820. Shrub twining.

19 H. CRASSIFÒLIA (Haw. suppl. pl. succ. p. 8. exclusive of the synon.) leaves petiolate, obovate, obsoletely spotted, bluntly acuminated, very thick. ♄. ⌒. S. Native of the East Indies. Leaves 4 inches long, dark green above, and pale beneath. Very like *H. carnòsa*, but the leaves are thicker, more obsoletely spotted. Branches warted, producing roots from the warts. Flowers unknown.

Thick-leaved Hoya. Fl. ? Clt. 1817. Shrub tw.

20 H. LANCEOLA'TA (Wall. ex D. Don, prod. fl. nep. p. 130. Wall. ascl. no. 36.) twining, glabrous; stems slender, leafy; leaves fleshy, lanceolate, acuminated at both ends; peduncles

few-flowered, shorter than the leaves ; corolla downy inside : with obtuse segments ; leaflets of corona convex above, with recurved edges : having the inner angles elongated, obtuse, and erect, exceeding the apiculated stigma. ♄ . ◠. S. Native of Nipaul and Silhet. Nearly allied to *H. carnòsa*, but very much smaller.

Lanceolate-leaved Hoya. Shrub tw.

* * * * *Leaflets of corona elongated, triangular.*

21 H. LATIFÒLIA : twining ; leaves broad-ovate, acuminated, obtuse or sub-cordate at the base, 3-nerved, fleshy, glabrous ; peduncles many-flowered ; segments of corolla obtuse, cuspidate ; leaflets of corona nearly equal in length to the corolla, coriaceous : having the inner angles erect, terete, obtuse ; follicles subulate, slender. ♄ . ◠. S. Native of Penang. H. macrophýlla, Wight, contrib. ind. bot. p. 38.—Wall. ascl. no. 138. unnamed. This is a magnificent plant ; but the specimens from which the character is drawn up was so much mutilated, as to be impossible to say with certainty that it belongs to the genus. Leaves 7-10 inches long, and 4-10 broad.

Broad-leaved Hoya. Shrub twining.

* * * * * *Corolla 5-parted, flat or reflexed. Segments of corona quite entire on the inner angles. Perhaps species of Tylóphora.*

22 H. MACROPHY'LLA (Blum. bijdr. p. 1063.) leaves 3-nerved, ovate or oval-oblong, acuminated, fleshy ; corolla silky inside. ♄ . ◠. S. Native of Java, in calcareous soil, about Kuripan, and at the bottom of Mounts Gede and Salak, where it is called *Aroy Kilampahan*, and *Aroy Kikandel lalakkie*. It differs from *H. carnòsa*, in the leaves being nerved, larger, acuminated ; and in the flowers being smaller.

Large-leaved Hoya. Fl. year. Shrub tw.

23 H. CORIA'CEA (Blum. bijdr. 1063.) leaves almost veinless, oval, acute or acuminated, coriaceous, glabrous ; corolla silky inside. ♄ . ◠. S. Native of Java, among bushes, at the foot of Mount Salak.

Coriaceous-leaved Hoya. Fl. Oct. Shrub tw.

24 H. CORONA'RIA (Blum. bijdr. p. 1063.) leaves veinless, oval, acute, with recurved edges, coriaceous, villous beneath ; corollas glabrous. ♄ . ◠. S. Native of Java, on the mountains and banks about Rompien, where it is called *Aroy Kilampahan*. Corona Ariadna, Rumph. amb. 5. t. 172.

Garland Hoya. Fl. year. Shrub tw.

25 H. LACUNÒSA (Blum. bijdr. p. 1063.) leaves veinless, ovate, acuminated, glabrous, lacunose above, and convex beneath ; corolla revolute, velvety-villous inside ; leaflets of corona without furrows beneath. ♄ . ◠. S. Native of Java, about Buitenzorg, on trees.

Lacunose-leaved Hoya. Fl. year. Shrub tw.

26 H. DIVERSIFÒLIA (Blum. bijdr. p. 1064.) leaves veinless, oval, acutish, or orbicular, fleshy, glabrous ; corollas silky inside. ♄ . ◠. S. Native of Java, in calcareous soil, about Kuripan and Batavia.

Divers-leaved Hoya. Fl. year. Shrub tw.

* * * * * * *Corolla 5-cleft, reflexed. Stamineous corona tubular at the base ; leaflets of corona quite entire, having both the interior and exterior angles drawn out a considerable length.*

27 H. MULTIFLÒRA (Blum. bijdr. p. 1064.) stem shrubby, climbing ; leaves rather coriaceous, veiny, cuneate-oblong, or oblong-lanceolate, glabrous, paler beneath ; corolla bearded at the base. ♄ . ◠. S. Native of Java, on the west side, on the mountains, among bushes, where it is called *Tjunkankan*.

Many-flowered Hoya. Fl. year. Shrub tw.

* * * * * * * *Corolla campanulate, angular, with 5 plaits ; leaflets of corona quite entire, with the inner angles ascending.*

28 H. CAMPANULA'TA (Blum. bijdr. p. 1064.) stem shrubby, climbing ; leaves coriaceous, almost veinless, oblong, acuminated, glabrous ; corolla campanulate, glabrous. ♄ . ◠. S. Native of Java, with the preceding.

Campanulate-flowered Hoya. Fl. year. Shrub tw.

* * * * * * * * *Corolla 5-parted, flat, or reflexed. Leaflets of corona emarginate on the outer angles. Acanthostémma.* Blum. bijdr. p. 1065.

29 H. RU'MPHII (Blum. bijdr. p. 1065.) leaves veinless, oblong-lanceolate, acuminated, fleshy, glabrous, flat, and paler beneath ; corolla rather silky inside. ♄ . ◠. S. Native of Java, and the Moluccas, on the mountains.—Rumph. amb. 5. t. 175. f. 1.

Var. β, longifòlia (Blum. l. c.) leaves long-acuminated, with recurved edges ; corolla glabrous. ♄ . ◠. S. Native of Java, near Tuju, on the mountains of Megamendung.

Rumphius's Hoya. Fl. year. Shrub tw.

30 H. PU'BERA (Blum. bijdr. p. 1065.) leaves small, veinless, oval-oblong, acute, fleshy, downy ; corolla hairy inside. ♄ . ◠. S. Native of the Island of Nusæ-Kambanga, on trees by the sea-side.

Downy Hoya. Fl. Oct. Nov. Shrub tw.

† *The flowers of the following three species are unknown ; but, nevertheless, it is probable they belong to the section Hòyæ vèræ.*

31 H. FINLAYSONIA'NA (Wight, l. c.) twining, glabrous ; branches terete ; leaves oblong-lanceolate, bluntly acuminated, reticulated above in the dried state, veinless beneath, on short petioles. ♄ . ◠. S. Native, probably, of Penang. Hoya, Wall. ascl. no 42. Leaves 5-7 inches long, and 1-2 broad.

Finlayson's Hoya. Shrub twining.

32 H. OBTUSIFÒLIA (Wight. l. c.) twining, glabrous ; leaves fleshy, oval-oblong, obtuse at both ends, cuspidate, shining above, transversely and obscurely veined beneath, in the dried state ; peduncles almost one-half shorter than the leaves, many-flowered. ♄ . ◠. S. Native of the East Indies. Hòya, Wall. ascl. no. 38. From the variation of the leaves, this species would appear to rank near *H. fúsca*.

Obtuse-leaved Hoya. Shrub tw.

33 H. ANGUSTIFÒLIA (Trail, in hort. trans. 7. p. 29.) leaves narrow-lanceolate. ♄ . ◠. S. Native of China.

Narrow-leaved Hoya. Shrub twining.

§ 2. *Leaves membranous. Leaflets of corona without any furrow beneath.*

34 H. VIRIDIFLÒRA (R. Br. in mem. wern. soc. 1. p. 26.) twining ; leaves ovate, or cordate, acuminated, membranous, glabrous ; corolla glabrous : with ovate, acutish segments ; leaflets of corona flat above, oboval, very blunt, with the inner angles short and obtuse ; follicles thick, divaricate, obtuse, clothed with rusty mealiness. ♄ . ◠. S. Native on the coast of Coromandel, frequent ; and at Morang and Gongachora, and Silhet. Wall. ascl. no. 24, exclusive of f. 26. and 60 c. Wight, in Hook. bot. misc. 2. p. 98. suppl. t. 1. Asclèpias volùbilis, Lin. suppl. 170. Roxb. fl. ind. 2. p. 36. Asclèpias viridiflòra, Roxb. in. mus. or. t. 611. Apócynum tiliæfòlium, Lam. dict. 1. p. 214.—Rheed. mal. 9. t. 15. Flowers green.

Var. α, alpìna (Wight, and Arnott, contrib. ind. bot. p. 39.) flowers larger ; segments of corolla obtuse. ♄ . ◠. S. Wight, cat. no. 1523. b. Wall. ascl. no. 25. Native of the Neelgherries.

Green-flowered Hoya. Fl.? Clt. ? Shrub tw.

35 H. LACU'NA (Ham. herb. ex Wight, and Arnott, contrib. ind. bot. p. 39.) twining ; leaves between coriaceous and membranous, cordate or ovate, acuminated, downy above, and velvety beneath ; segments of corolla obtuse ; leaflets of corona with

short, subulate, erect, inner angles. ♄. ⌒. S. Native of the East Indies, at Korma, Hamilton, and at Segaen, Wall. Ham. herb. no. 770. Wall. ascl. no. 24, f. 146, and 156, without a name. *Lakun* of the Hindoos.

Lakun Hoya. Shrub tw.

† † *Species described by Vahl, under the generic name of Sperlíngia, which name ought to take precedence of Hòya, being the oldest, which we have still retained, on account of that name being generally received. Both species are probably identical with two of those described above.*

36 H. verticilla'ta; climbing, rooting; stems terete, glabrous; leaves 4 in a whorl, petiolate, oblong, acuminated, acute, fleshy, glabrous, veinless; umbels pedunculate, copious; pedicels compressed, filiform; segments of corolla triangular, acute at both ends, retusely sub-bicornute outside, on the outer margin: with inflexed, conduplicate edges; corona a simple star, covering the genitals, having the lobes equal in length to the segments of the corolla, complicate, lanceolate, with an elevated line in the middle, and a corresponding furrow on the opposite side, yellowish, shining; follicles 6-8 inches long, glabrous. ♄. ⌒. S. Native of the East Indies. Sperlíngia verticillàta, Vahl, in act. soc. hist. nat. hafn. 6. p. 113.

Whorled-leaved Hoya. Shrub twining.

37 H. opposìta; leaves opposite. ♄. ⌒. S. Native of the East Indies. Sperlíngia opposìta, Vahl, l. c. p. 114. Nummulària láctea màjor, Rumph. amb. 5. p. 470. t. 175. f. 1. Very like *H. verticillàta;* but differs, in the opposite leaves, the narrower petioles, which are convex beneath, and concave above; while, in that species, they are flattened and depressed, almost an inch long, succulent, and articulated at the base.

Opposite-leaved Hoya. Shrub twining.

Cult. The species of *Hòya* all bear handsome waxy blossoms, disposed in simple umbels. They grow freely in a mixture of loam, peat, and sand, and are otherwise easily managed. They are readily propagated by cuttings, in a moist heat.

XXIV. PTEROSTE'LMA (from *πτερον, pteron,* a wing; and *στελμα, stelma,* a crown; leaflets of corona membranous.) Wight, contrib. ind. bot. p. 39.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate, 5-cleft. Stamineous corona 5-leaved; leaflets membranous, with reflexed sides: having the inner angles drawn out into subulate, erect teeth. Anthers terminated by a membrane; pollen masses erect, fixed by the base to the back of the corpuscles. Stigma apiculated.—A twining? or decumbent shrub. Leaves opposite, oblong, acuminated, fleshy. Flowers rather large. Corolla deeply 5-cleft; with linear-lanceolate segments, and a pilose tube. Margins of the leaflets of the corona conniving, as the wings of butterflies are when sitting. This genus is nearly allied to *Hòya,* both in habit, and in the structure of the flowers, differing principally, in having foliaceous instead of fleshy leaflets of corona, and in the dorsal not lateral attachment of the pollen masses.

1 P. acumina'ta (Wight, l. c.) ♄. ⌒. S. Native of Silhet. —Wall. ascl. no. 129, without a name.

Acuminated-leaved Pterostelma. Shrub?

Cult. See *Hòya,* above, for culture and propagation.

XXV. PHYSOSTE'LMA (from *φυσα, physa,* a bladder; and *στελμα, stelma,* a crown; leaflets of corona inflated.) Wight, contrib. ind. bot. p. 39.

Lin. syst. *Pentándria, Dygýnia.* Corolla rotate, spreading, repandly, 5-toothed. Stamineous corona 5-leaved; leaflets inflated, opposite the anthers. Anthers terminated by a membrane. Filaments bipartite from the base to the apex, each alternate part bearing an anther, close together, alternating with the leaflets of the corona. Pollen masses fixed by the base, erect, nearly cylindrical. Stigma depressed.—A twining shrub. Leaves opposite, ovate-lanceolate, acuminated, glabrous, fleshy. Umbels lateral, on longish peduncles, few-flowered. Flowers large. This curious genus is allied to *Hòya* in habit; but is at once distinguished from it, and every other, by the remarkable division of the filaments; there being 10 filaments and 5 anthers.

1 P. Wallíchii (Wight, contrib. ind. bot. p. 40.) ♄. ⌒. S. Native of Singapore. Wall. ascl. no. 130, without a name.

Wallich's Physostelma. Shrub tw.

Cult. For culture and propagation see *Hòya,* above.

XXVI. TYLO'PHORA (*τυλος, tylos,* a swelling, and *φορεω, phoreo,* bear; in reference to the ventricose pollen masses). R. Br. in mem. wern. soc. 1. p. 28. prod. p. 460.—Hòya species, Spreng. syst. 1. p. 843.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate, 5-parted. Stamineous corona 5-leaved; leaflets simple, fleshy: having the inner angles simple and toothless. Anthers terminated by a membrane; pollen masses erect, fixed by the base, with simple margins, transverse or ascending, minute, ventricose. Stigma mutic. Follicles smooth, attenuated at the apex, compressed, rather angular on one side. Seeds comose.—Twining herbs or subshrubs. Leaves opposite, membranous, flat. Umbels interpetiolar, or disposed alternately along a common peduncle. Flowers usually small.

The extreme minuteness of the pollen masses renders it difficult to determine the situation this genus ought to occupy in the order. The form of the gynostegium and the leaves of the corona readily distinguish it from every other genus except *Iphísia,* but which differs in the pendulous pollen masses. As now defined, this genus is quite distinct from *Hòya,* to which Mr. R. Brown considered it so closely allied. Arnott. and Wight, contrib. ind. bot. p. 50.

§ 1. *Leaflets of stamineous corona depressed, fleshy, toothless inside, shorter than the gynostegium.—Species natives of New Holland.*

1 T. grandiflòra (R. Br. prod. p. 460.) umbels nearly sessile, simple, few-flowered; pedicels glabrous; leaves cordate-ovate, acute, and are, as well as the branches, downy. ♄. ⌒. S. Native of New South Wales, about Port Jackson. Hòya grandiflòra, Spreng. syst. 1. p. 843.

Great-flowered Tylophora. Fl. Ju. Jul. Clt. 1822. Sh. tw.

2 T. barba'ta (R. Br. l. c.) umbels usually twin; common peduncles shorter than the leaves; corolla bearded; leaves ovate, acute, quite glabrous. ♄. ⌒. S. Native of New South Wales, about Port Jackson. Hòya barbàta, Spreng. syst. 1. p. 843.

Bearded Tylophora. Fl. June, Jul. Clt. 1822. Shrub tw.

3 T. flexuòsa (R. Br. l. c.) umbels alternate, sessile; common peduncles flexuous; leaves cordate-oblong, veiny; corolla beardless. ♄. ⌒. F. Native of New Holland, within the tropic. Hòya flexuòsa, Spreng. syst. 1. p. 843.

Flexuous Tylophora. Shrub tw.

4 T. velutìna; stem twining; leaves cordate-ovate, acuminated, tomentose; flowers cymose; throat of corolla naked. ♄. ⌒. S. Native of New Holland. Pergulària velutìna, Spreng. syst. 1. p. 844.

Velvety Tylophora. Shrub tw.

5 T. panicula'ta (R. Br. l. c.) panicles dichotomous; segments of corolla ligulate above: leaves ovate, acuminated, smoothish: lower ones subcordate. ♄. ⌒. S. Native of New South Wales, about Port Jackson. Hòya paniculàta, Spreng. syst. 843.

Panicled-flowered Tylophora. Shrub tw.

§ 2. *Leaflets of stamineous corona very blunt, or bluntly*

acuminated, destitute of cusps or points inside, shorter than the gynostegium.

6 T. carnòsa (Wall. ascl. no. 49. Wight, cat. no. 1537. contrib. ind. bot. p. 49.) twining, glabrous; stems and branches slender; leaves fleshy, ovate, or subcordate, mucronate, shining, pale beneath; peduncles flexuous, bearing at the flexures many filiform pedicels; flowers small; leaflets of corona fleshy, nearly orbicular; pollen masses ascending; stigma convex; follicles glabrous, usually solitary by abortion. ♄. ⌒. S. Native of the Burmese empire, at Amherst; and of Ceylon, at Colombo; and of the province of Tanjore, in sandy places. Leaves 1-2 inches long, and 6-9 lines broad. Flowers purple inside.

Fleshy Tylophora. Shrub tw.

7 T. tenuíssima (Wight and Arnott, contrib. ind. bot. p. 49.) twining, glabrous; branches slender; leaves oblong-lanceolate, somewhat cordate at the base, cuspidate, veinless, with subrevolute edges; peduncles flexuous, bearing many filiform pedicels at the flexures; flowers small; leaflets of corona ovate-oblong; pollen masses ascending; stigma convex; follicles diverging, glabrous. ♄. ⌒. S. Native of the peninsula of India, Wight; Bengal, Roxb. Wight, cat. no. 1538. Asclèpias tenuíssima, Roxb. fl. ind. 2. p. 41. mus. ind. or. t. 1383. Leaves 2-3 inches long and 3-6 lines broad. There is a variety of this, having the leaves twice the length and much narrower in proportion.

Very slender Tylophora. Shrub tw.

8 T. pauciflòra (Wight and Arnott, l. c.) twining, glabrous; branches slender; leaves on longish petioles, broadly ovate, from the base, or somewhat cordate, gradually attenuated to the apex, rather waved on the edges; peduncles shorter than the leaves, flexuous, bearing filiform, twin, or tern pedicels at the flexures; flowers small; segments of calyx and corolla obtuse; leaflets of corona broad-elliptic, obtuse; pollen masses ascending; stigma convex; follicles glabrous. ♄. ⌒. S. Native of the East Indies, at Courtallum, Wight; northern provinces of Bengal, Royle; Wight, cat. no. 1539. This species is easily distinguished from the rest by the almost triangular form of the leaves.

Few-flowered Tylophora. Shrub tw.

9 T. hirsu'ta (Wight, contrib. ind. bot. p. 49.) twining, downy; leaves broad-ovate, acuminated; peduncles about equal in length to the leaves, flexuous, bearing sessile umbels at the flexures; pedicels filiform; flowers small; segments of corolla ovate, obtuse, undulated; leaflets of corona ovate, somewhat acuminated, obtuse; pollen masses transverse; stigma obtuse; follicles slender. ♄. ⌒. S. Native of Nipaul, at Chandaghiry, and Sanko. Gymnèma hirsùtum, Wall. tent. fl. nep. p. 50. ascl. no. 46. Leaves 3-5 inches long, and 2-3 broad.

Hairy Tylophora. Shrub tw.

10 T. mollíssima (Wall. ascl. no. 47. Wight, cat. no. 1540. contrib. ind. bot. p. 49.) twining, downy; leaves oval, or cordate-ovate, acuminated, mucronate; peduncles twice or thrice longer than the leaves, flexuous, bearing sessile umbels at the flexures; pedicels filiform; flowers small; segments of corolla ovate, obtuse, undulated; leaflets of corona truncate at apex or roundish; pollen masses transverse; stigma obtuse; follicles downy. ♄. ⌒. S. Native of the East Indies, on the Neelgherry mountains, and on those of Dindygul. Perhaps this is too nearly allied to the preceding, from which it seems to differ principally in the size of the leaves. Leaves 1-2 inches long, and about 1 broad.

Very soft Tylophora. Shrub tw.

11 T. rotundifòlia (Hamilt. herb. no. 759. Wall. ascl. no. 120. ex Wight and Arnott, contrib. ind. bot. p. 50.) twining, downy; leaves round or roundish-ovate; peduncles shorter than the leaves; pedicels long, filiform, usually disposed in 2 fascicles near the top of the peduncle; flowers rather large, glabrous; leaflets of corona fleshy, short, adnate to the middle of the gynostegium; pollen masses transverse; stigma obtuse. ♄. ⌒. S. Native of the East Indies, in elevated fields, east of Camrup and at Dongtala, and Hebora. Leaves about 2 inches broad.

Round-leaved Tylophora. Shrub tw.

12 T. fasciula'ta (Hamilt. herb. no. 758. Wall. ascl. no. 55. Wight and Arnott, l. c.) erect or twining a little; leaves approximate, ovate, bluntish, rather fleshy, decreasing towards the tops of the branches; peduncles erect, flexuous, bearing 2-3 few-flowered fascicles at the flexures; leaflets of corona oblong-ovate, bluntish; pollen masses transverse; stigma apiculated. ♄. ⌒. S. Native of the East Indies. The corpuscles of the stigma in this species alone are herbaceous, and slightly united, but loose and divaricate at both ends. Leaves 1-2 inches long and 1 broad.

Var. α, parviflòra (Wight and Arnott, l. c.) twining a little at top; flowers minute. ♄. ⌒. S. Native of the woods of Mithila, at Sukanagur. T. fasciculàta, Herb. Ham. no. 758. Wall. ascl. no. 55.

Var. β, macrántha (Wight and Arnott, l. c.) root fascicled; stems woody, erect; fascicles approximate; flowers rather large; segments of corolla ligulate. ♄. S. Native at Neelgherry.—Wight, cat. no. 1541. Wall. ascl. no. 31. without a name.

Fascicled-flowered Tylophora. Shrub tw. or erect.

13 T. longifòlia (Wight, contrib. ind. bot. p. 50.) twining, glabrous; leaves oblong-lanceolate, acute, rather cordate at the base; panicles shorter than the leaves, many-flowered, composed of flexuous branches, bearing a small umbel of flowers at each flexure; segments of corolla obtuse; leaflets of corona almost one half shorter than the gynostegium, broadly elliptic, obtuse; pollen masses transverse; stigma convex. ♄. ⌒. S. Native of Silhet.—Wall. ascl. no. 48. without a name. Leaves 6-8 inches long, and $1\frac{1}{2}$ broad.

Long-leaved Tylophora. Shrub tw.

14 T. exìlis (Colebr. in Lin. trans. 12. p. 358. t. 16. Wight and Arnott, contrib. ind. bot. p. 50.) twining, glabrous; leaves ovate-lanceolate, acuminated; panicles rather large, twice or thrice longer than the leaves: having the branches flexuous, bearing umbellate pedicels at the flexures; segments of corolla acutish; leaflets of corona broad-elliptic, very obtuse, shorter than the gynostegium; pollen masses transverse; stigma apiculated. ♄. ⌒. S. Native of Silhet. Pergulària exìlis, Spreng. syst. 1. p. 844.—Wall. ascl. no. 51. unnamed. Leaves 2-3 inches long and 1 broad. Very nearly allied to the preceding species.

Thin Tylophora. Fl. June, July. Clt. 1823. Shrub tw.

15 T. micra'ntha (Nouv. ann. mus. 3. p. 377.) glabrous; leaves narrow or ovate-lanceolate, acute, rounded at the base, petiolate; cymes shorter than the leaves; calycine segments rounded, with membranous edges, shorter than the corolla; segments of corolla longish, obtuse; follicles acuminated, glabrous. ♄. ⌒. S. Native of the island of Timor.

Small-flowered Tylophora. Shrub tw.

16 T. villòsa (Blum. bijdr. p. 1061.) corollas bearded; umbels usually twin; leaves elliptic-oblong, acute, a little cordate at the base, hairy on both surfaces; branches sarmentose, villous. ♄. ⌒. S. Native of the west side of Java, on the mountains, where it is called *Aroy Katuk*.

Villous Tylophora. Fl. year. Pl. tw.

17 T. cissioìdes (Blum. bijdr. p. 1061.) corollas glabrous; corymbs trichotomous; pedicels subumbellate; leaves ovate-oblong, acuminated, rather cordate at the base, smooth. ♄. ⌒. S. Native of Java, at the foot of Mount Salak.

Cissus-like Tylophora. Fl. year. Pl. tw.

18 T. TE'NUIS (Blum. bijdr. p. 1062.) corollas glabrous; panicles axillary; pedicels subumbellate; leaves lanceolate, acuminated, sometimes cordate at the base, 3-nerved, glabrous; follicles very acute. ♄. ◠. S. Native on the west coast of Java, at the bottom of mountains.

Slender Tylophora. Fl. year. Pl. tw.

19 T. RUPE'STRIS (Blum. bijdr. p. 1062.) leaves ovate-cordate, acuminated, quintuple-nerved, glabrous; follicles bluntish. ♄. ◠. S. Native of Java, among the Parang mountains, on rocks. Nearly allied to *T. ténuis.*

Rock Tylophora. Pl. tw.

§ 3. *Leaflets of stamineous corona rather membranous, finely acuminated, acute, without any cusp or point inside, longer than the gynostegium.*

20 T. TENE'RRIMA (Wight, contrib. ind. bot. p. 50.) twining, slender, smoothish; leaves narrow-lanceolate, attenuated at the apex; peduncles filiform, much longer than the leaves, bearing distant, 2-3-flowered fascicles; corolla deeply 5-cleft; leaflets of corona exceeding the gynostegium, ovate, finely acuminated at the apex; pollen masses transverse; stigma obtuse. ♄. ◠. S. Native of Nipaul, at Purpuhna; and the Himalaiah. Homolóstyles tenérrima, Wall. ascl. no. 96. 118. Leaves 1-2 inches long and 1-4 lines broad.

Very tender Tylophora. Shrub tw.

§ 4. *Leaflets of corona depressed, fleshy, clasping the base of the gynostegium, each drawn out into a cusp-formed, erect toothlet at the apex, inside.*

21 T. CAPPARIDIFÒLIA (Wight and Arnott, contrib. ind. bot. p. 51.) twining, glabrous; branches slender; leaves elliptic-oblong, mucronately acuminated, coriaceous, reticulately veined; racemes umbel-formed, almost sessile, few-flowered; flowers small; segments of corolla obtuse, glabrous; leaflets of corona roundish, fleshy, furnished on the inside at the apex with a short, acute toothlet. ♄. ◠. S. Native of Mysore. Wight, cat. no. 1542. Asclèpias ténuis, Heyne, herb. Wall. ascl. no. 122. Leaves 1½ to 2 inches long, and 5-7 lines broad.

Capparis-leaved Tylophora. Shrub tw.

22 T. PURPU'REA (Wall. ascl. no. 50. ex Wight and Arnott, contrib. ind. bot. p. 51.) twining, glabrous; branches slender; leaves subcordate-oblong, mucronately acuminated; peduncles filiform, about equal in length to the leaves, bearing each 2-3 small fascicles of flowers; segments of corolla acute; leaflets of corona roundish, clasping the base of the gynostegium, furnished with a short toothlet inside at the apex; pollen masses transverse; stigma obtuse. ♄. ◠. S. Native on the banks of the Irrawaddi.

Purple Tylophora. Shrub tw.

23 T. ASTHMA'TICA (Wight and Arnott, contrib. ind. bot. p. 51.) twining, downy; branches slender; leaves ovate-roundish, acuminated, usually cordate at the base, glabrous above, downy beneath; peduncles shorter than the leaves, bearing each 2-3 sessile, few-flowered umbels towards the apex; flowers rather large, on long pedicels, purplish; segments of corolla acute; leaflets of corona fleshy, depressed, clasping the base of the gynostegium, furnished with an erect, elongated tooth inside at the apex; pollen masses transverse, minute; stigma obtuse; follicles glabrous, divaricate. ♄. ◠. S. Native of the East Indies. Asclèpias asthmática, Roxb. fl. ind. 2. p. 33. Willd. spec. p. 1270. Asclèpias tunicàta, Wall. ascl. no. 117. Ascl. vomitòria, Kœnig. in herb. Banks. Roxb. mus. ind. or. t. 608. Cynánchum ipecacuánha, Willd. spec. 1. p. 1270. Cynánchum vomitòrium, Lam. dict. 2. p. 235. Cynánchum viridiflòrum, Sims, bot. mag. t. 1929. Spreng. syst. 1. p. 852. Hòya planiflòra, Wall. ascl. no. 117. b. V. Tylóphora pubéscens, Wall. ascl. no. 117. a., also Wall. ascl. nos. 119. 121. 148. unnamed.—Pluk. t. 336. f. 7. This plant is said to have been figured as Hòya viridiflòra in some foreign work. The roots are used on the coast of Coromandel as a substitute for Ipecacuanha.

Var. α, *pubéscens* (Wight, l. c.) downy in every part, except the upper surfaces of the leaves.

Var. β, *glàbra* (Wight, l. c.) glabrous in every part.

Asthmatic Tylophora. Shrub tw.

24 T. TOMENTÒSA; twining, tomentose; leaves cordate, ovate, mucronate, white from tomentum beneath; umbels about 5-flowered. ♄. ◠. S. Native of the East Indies. Cynánchum tomentòsum, Lam. dict. 1. p. 235. Perhaps belonging to the present section.

Tomentose Tylophora. Shrub tw.

Cult. For culture and propagation see *Hòya*, p. 128.

XXVII. BELOSTE'MMA (from βελος, *belos*, an arrow, and στεμμα, *stemma*, a crown). Wall. mss. ascl. no. 153. Wight and Arnott, contrib. ind. bot. p. 52.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate. Stamineous corona 5-leaved; leaflets linear-oblong, fleshy, fixed vertically to the middle of the gynostegium, averse, spreading. Anthers terminated by a membrane; pollen masses globose, rather ascending, or placed transversely under the dilated margin of the stigma; stigma mutic.—Twining, loosely downy shrubs. Leaves opposite, cordate, ovate, somewhat acuminated. Peduncles shorter than the leaves. Umbels simple, few-flowered. Flowers small. This genus differs only from *Tylóphora* in the form of the corona; in that the leaflets are close pressed on the gynostegium; in this they appear as if attached by the one end, and stand at right angles with the gynostegium, and transversely across the corolla.

1 B. HIRSU'TUM (Wall. l. c.). ♄. ◠. S. Native of Nipaul.

Hairy Belostemma. Shrub tw.

Cult. For culture and propagation see *Hòya*, p. 128.

XXVIII. MARSDE'NIA (named in honour of William Marsden, F.R.S. late Secretary to the Admiralty, and author of a "History of Sumatra," in which, though it is evident that he has not made botany his particular study, he has had the merit of turning the attention of botanists to several valuable plants, among others to the camphor tree of Sumatra (*Dryobálanops camphòra*), and to a species of this genus, the *Marsdènia tinctòria*, said to afford the best indigo in that island). R. Br. in mem. wern. soc. 1. p. 28. prod. p. 460.—Pergulària species, Spreng. syst. 1. pp. 843, 844.

Lin. syst. *Pentándria, Digýnia.* Corolla urceolate, 5-cleft, sometimes rotate. Stamineous corona 5-leaved; leaflets compressed, undivided, toothless inside. Anthers terminated by a membrane. Pollen masses erect, fixed by the base. Follicles smooth. Seeds comose.—Usually twining shrubs. Leaves opposite, broadish, flat. Cymes interpetiolar, sometimes thyrsoid. Stigma usually mutic, but sometimes beaked; beak undivided or bifid.—Plants natives of New Holland, East Indies; very few in South America and Syria. This genus differs from *Pergulària* chiefly in the want of the inner laciniæ to the corona; it is therefore an arbitrary separation, and made principally to obtain clearer characters for both. The two species with an elongated stigma are perhaps not truly of the genus, but if separated from it must form each a distinct genus. R. Br.

Sect. I. Marsde'niæ ve'ræ. Stigma mutic, or apiculated.

§ 1. *Throat of corolla naked.*

1 M. VELUTÌNA (R. Br. in wern. soc. mem. 1. p. 29. prod.

461.) stem twining, leaves cordate, broad-ovate, acuminated, tomentose, soft; cymes umbel-formed; throat of corolla naked; stigma mutic. ♄. ◠. S. Native of New Holland, within the tropic.

Velvety Marsdenia. Shrub tw.

2 M. Brunonia'na (Wight and Arnott, contrib. ind. bot. p. 40.) twining, glabrous; leaves broad-cordate, acuminated; peduncles shorter than the petioles; flowers cymose, largish, glabrous; segments of corolla obtuse; leaflets of corona attenuated, about equal in length to the gynostegium; stigma bluntly apiculated. ♄. ◠. S. Native of the East Indies, near Columala.—Wight, cat. no. 1524. The cymes are small; but the flowers are the largest of the genus.

Brown's Marsdenia. Shrub tw.

3 M. flavescens (Cunningh. in bot. mag. t. 3289.) twining; leaves oblong-lanceolate, acuminated, somewhat undulated, glabrous above, but clothed with hoary tomentum beneath; peduncles twice the length of the petioles; cymes many-flowered; corolla sub-rotate; stigma mutic. ♄. ◠. S. Native of New Holland, on the sea-shore. Flowers yellowish. Stamineous corona of 5 fleshy teeth, united to the back of the anthers, which latter are diaphanous at the extremity. Stigma flat.

Yellowish-flowered Marsdenia. Fl. Ju. July. Clt. 1823. Shrub tw.

§ 2. *Throat of corolla as well as the tube bearded. Hairs of the tube disposed in 5 reflexed fascicles.*

4 M. tinctòria (R. Br. l. c.) stems twining; leaves cordate-ovate, or oblong-acuminated, smoothish, furnished with a gland towards the base above; thyrse lateral; throat of corolla bearded; flowers small; leaflets of corona about equal in length to the gynostegium, subulate; stigma mutic. ♄. ◠. S. Native of Sumatra, Silhet, and Prome. Faroom-akkar, Marsd. sumat. p. 78. Pergulària tinctòria, Spreng. syst. 1. p. 844. Asclèpias tinctòria, Roxb. fl. ind. 2. p. 43. mus. ind. or. t. 615. M. monostàchya, Wall. mss. Flowers numerous, small, yellow. The leaves yield more and better indigo than *Indigófera tinctòria*; and Dr. Roxburgh has recommended an extensive cultivation of it.

Dyers' Marsdenia, or Sumatra Indigo. Shrub tw.

5 M. viridiflòra (R. Br. l. c. p. 30. prod. 461.) stems twining; leaves oblong-lanceolate, smoothish, obtuse at the base; tube of corolla villous inside. ♄. ◠. S. Native of New Holland, within the tropic. Pergulària viridiflòra, Spreng. syst. 1. p. 844.

Green-flowered Marsdenia. Shrub tw.

6 M. Hamiltònii (Wight, contrib. ind. bot. p. 41.) twining, glabrous; leaves cordate-oblong, acuminated; cymes subcapitate, many-flowered, shorter than the petioles; flowers small; tube of corolla ventricose, closed by hairs; leaflets of corona longer than the gynostegium, tapering at the apex; pollen masses oblong, fixed by minute corpuscles; stigma apiculated. ♄. ◠. S. Native of the East Indies, at Sukanagur. Cynánchum, Wall. ascl. no. 84. C. reticulàtum, Ham. herb. no. 750.

Hamilton's Marsdenia. Shrub tw.

7 M. Ròthii; leaves roundish-oval, obtuse, glabrous, as well as the stems, which are twining; corymbs axillary, dichotomous, hairy; corollas tomentose inside. ♄. ◠. S. Native of the East Indies. Asclèpias plicàta, Roth. nov. spec. Corolla black, beset with scattered hairs outside, and clothed with greyish tomentum inside; hardly a line in diameter.

Roth's Marsdenia. Shrub tw.

8 M. clau'sa (R. Br. l. c. p. 30.) stem twining; leaves lanceolate, acute at both ends, glabrous, wrinkled a little above; throat of corolla densely bearded. ♄. ◠. S. Native of Jamaica. Pergulària claúsa, Spreng. syst. 1. p. 844.

Closed-flowered Marsdenia. Shrub tw.

9 M. suave'olens (R. Br. l. c.) stem erectish; leaves oval-lanceolate, glabrous, veinless; corolla with a ventricose tube, and a bearded throat. ♄. ◠. S. Native of New Holland, without the tropic. Rudge, in Lin. trans. 10. p. 299. t. 21. f. 1. Ker. bot. reg. t. 489. Pergulària suavèolens, Spreng. syst. 1. p. 843. Panicles axillary, 6-8-flowered. Calycine segments ciliated. Filaments broad, inserted beneath a 5-toothed conical nectarium, ex Rudge. Flowers white.

Sweet-scented-flowered Marsdenia. Fl. July, Aug. Clt. 1816. Shrub 2 to 3 feet.

10 M. cinera'scens (R. Br. l. c.) stem erect; leaves ovate, bluntish, veiny, beset with a little scattered down, petiolate, half an inch long; corolla subrotate. ♄. S. Native of New Holland, within the tropic. Pergulària cineráscens, Spreng. syst. 1. p. 844.

Greyish Marsdenia. Shrub 2 to 3 feet.

§ 3. *Tube of corolla downy inside.*

11 M. Ròylei (Wight et Arnott, contrib. ind. bot. p. 40.) twining, tomentose; leaves broad-cordate or ovate, acuminated; cymes shorter than the leaves; calyx hairy; corolla hairy inside: throat crowned by 5 plicæ, which are opposite the sinuses; leaflets of corona much longer than the gynostegium, filiform at top; stigma bluntly apiculated. ♄. ◠. S. Native of Kenour, Royle; Simla, Countess of Dalhousie. M. velutìna, Royle, herb., but not of R. Br. The plicæ at the bottom of the recesses, between the segments of the corolla, almost resemble thickish scales.

Royle's Marsdenia. Shrub tw.

12 M. angustifòlia (Wight, contrib. ind. bot. p. 40.) twining, much branched; stem, branches, and peduncles downy; leaves almost sessile, lanceolate, glabrous in the adult state; cymes twin, few-flowered, shorter than the leaves; leaflets of corona shorter than the gynostegium; stigma truncate. ♄. ◠. S. Native on hills at Prome. Marsdènia, Wall. ascl. no. 58.—Rumph, amb. 5. t. 40. f. 1. ?

Narrow-leaved Marsdenia. Shrub tw.

§ 4. *Throat of corolla naked; tube sparingly pilose. Leaflets of corona broadish, truncate or bifid at the apex; bearing each, near the base, one acuminated lobe, and another keel-formed one. Cymes large, spreading, many-flowered; flowers rather large.—This section may eventually form a distinct genus.*

13 M. Calesia'na (Wight, contrib. ind. bot. p. 41.) twining, downy; leaves cordate, or cordate-ovate, acuminated, tomentose on both surfaces; cymes large, many-flowered; segments of corolla narrow, acute, with revolute edges; leaflets of the corona deeply bifid: one of the lobes is longer than the other, lying upon the anthers, the other shorter and keeled towards the base; stigma apiculated. ♄. ◠. S. Native of the East Indies, at Morang. Pergulària Calesiàna, Ham. herb. Wall. ascl. no. 57. e.

Cales's Marsdènia. Shrub tw.

14 M. tenacíssima (Wight and Arnott. contrib. ind. bot. p. 41.) twining; leaves cordate, acuminated, tomentose on both surfaces; cymes large; segments of corolla broad, obtuse; leaflets of corona broad, truncate, and nearly entire at the apex, or bifurcate; stigma bluntly apiculated. ♄. ◠. S. Native of the East Indies, on the hills of Rajemahl and Chittagong. Asclèpias tenacíssima, Roxb. cor. 3. p. 35. t. 240. fl. ind. 2. p. 31. mus. ind. orient. t. 1381. Asclèpias tomentòsa, Herb. madr. Asclep. echinàta, Herb. madr. Gymnèma tenacíssimum, Spreng. syst. 1. p. 844. Flowers greenish yellow. Corollas salver-shaped; segments greenish towards the centre, with the outer half

yellow. Leaves 4-6 inches long and 3-4 broad. Follicles ovate-lanceolate, downy, green, 6 inches long, and 4-5 in circumference.—The bark of the young luxuriant shoots yields a large portion of beautiful fine silky fibre, with which the mountaineers of Rajemahl make their bow-strings, on account of their great strength and durability. Their fibres, and those of the bark of a Malay plant (*Batha-calay*, or *poolas*, the *Urtìca tenacíssima*, Roxb.) are much stronger in the fibre than hemp, and even exceeding those of *Sansevèria Zeylánica*, Roxb. A line made of common hemp for a standard, broke with 150 lbs. when dry, and 190 lbs. when wet, the average of several trials. A similar line, of this substance, broke with 248 lbs. when dry, and 343 when wet, while that of *Urtìca tenacíssima* broke with 240 when dry, and 278 when wet.

Very tough Marsdenia. Clt. 1806. Shrub tw.

Sect. II. Nephra'ndra (from *νεφος, nephos*, a kidney, and *ανηρ ανδρος, aner andros*, a male; shape of anthers). Stigma beaked. Anthers kidney-shaped.

15 M. ere'cta (R. Br. l. c. p. 31.) stem erect; leaves cordate, ovate, acute; cymes umbel-formed; segments of the limb of the corolla beardless, 4-5 times longer than the tube. ♄. G. Native of Syria. Cynánchum eréctum, Lin. hort. cliff. 79. Willd. spec. 1. p. 1158. Jacq. hort. t. 38. Pergulària erécta, Spreng. syst. 1. p. 844.—Kniph. cent. 7. no. 19. Apócynum, Clus. 1. p. 124. Leaves pale green, glaucescent. Flowers numerous, white, sweet-scented, ex Jacq.

Erect Marsdenia. Fl. Jul. Aug. Clt. 1597. Sh. 3 to 6 ft.

16 M. rostra'ta (R. Br. l. c.) stem twining; leaves ovate, subcordate, acuminated, glabrous; umbels many-flowered; limb of corolla bearded. ♄. ◠. G. Native of New Holland, without the tropic. Pergulària rostràta, Spreng. syst. 1. p. 844. This species differs from all the preceding in the pollen masses being reniform, nearly transverse, fixed by the extremity, more remote from the corpuscles of the stigma.

Beaked Marsdenia. Shrub tw.

Cult. For culture and propagation see *Pergularia*, p. 133.

XXIX. COSMOSTI'GMA (from *κοσμος, kosmos*, decked; and *στιγμα*, a stigma; in reference to the stigma being adorned by a narrow wing). Wight, contrib. ind. bot. p. 41.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate. Stamineous corona 5-leaved; leaflets compressed, bifid. Anthers ventricose, terminated by a membrane; pollen masses erect, fixed by the base to the corpuscles of the stigma, hanging by long retinacula. Stigma mutic, crowned by a repand, flexuous, narrow wing. Follicles large, linear-oblong, obtuse, smooth. Seeds comose.—Twining shrubs. Leaves opposite, membranous. Corymbs usually twin, on long peduncles. Flowers small. This genus has been separated from *Marsdènia* on account of the very beautiful and peculiar stigma; the cleft leaflets of the corona allies it to the last section of that genus.

1 C. racemòsa (Wight, l. c. p. 42.). ♄. ◠. S. Native of Silhet and Chittagong. Asclèpias racemòsa, Roxb. fl. ind. 2. p. 32. mus. ind. or. t. 1818. Nèrium piscídium, Wall. cat. no. 59. but not of Roxb.

Racemose-flowered Comostigma. Shrub tw.

Cult. See *Pergulària*, p. 133, for culture and propagation.

XXX. HETEROSTE'MMA (from *ἑτερος, heteros*, variable, and *στεμμα, stemma*, a crown; the corona in each of the species has a form peculiar to itself). Wight and Arnott, contrib. ind. bot. p. 42.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate, 5-parted. Stamineous corona 5-leaved; leaflets dilated, furnished each with a process inside. Anthers lying upon the stigma, terminated by a membrane; pollen masses erect, obsoletely tetragonal, pellucid on one side. Follicles smooth. Seeds comose.—Twining shrubs. Leaves opposite, furnished above the base with a small gland. Umbels small, interpetiolar, on short peduncles. The corona being variable in the species of this genus, the principal distinction rests in the form and structure of the pollen masses, which resemble those of *Stapèlia*, and the allied genera.

1 H. Tanjore'nsis (Wight and Arnott, l. c.) twining, glabrous; leaves broadly ovate or oblong, short-acuminated, obtuse or cordate at the base; peduncles shorter than the leaves, few-flowered; leaflets of corona spreading, broad, truncate, furnished with a tongue-formed process inside; follicles divaricate, slender, glabrous, hooked at the apex. ♄. ◠. S. Native of the East Indies, in the province of Tanjore, in sand. Stapèlia involucràta, herb. madr. Leaves 2-4 inches long, and 1-2 broad.

Tanjore Heterostemma. Shrub tw.

2 H. Wallíchii (Wight, l. c.) twining; branches having a downy, lateral line on both sides; leaves ovate, acuminated, glabrous; peduncles very short, few-flowered; leaflets of corona much dilated, obcordate, furnished with an erect, fleshy process inside, lying upon the gynostegium. ♄. ◠. S. Native of Nipaul, on Sheopore. Wall. ascl. no. 154. without a name. Leaves 4-8 inches long, and 2-3 broad.

Wallich's Heterostemma. Shrub tw.

3 H. ala'ta (Wight, l. c.) twining; branches having a downy line on both sides; leaves ovate, acuminated, glabrous; umbels few-flowered, almost sessile; leaflets of corona cuspidate, furnished with a subulate tooth on the back, and a gland-formed process inside; follicles slender, glabrous, divaricate. ♄. ◠. S. Native of Nipaul, and Massooree. Hòya alàta, Wall. asclep. no. 136. Leaves 2-5 inches long, and 1-3 broad.

Winged Heterostemma. Shrub tw.

Cult. For culture and propagation see *Pergularia*, p. 133.

XXXI. PERGULA'RIA (from *pergula*, an arbour; twining plants, fit for covering arbours). R. Br. in mem. wern. soc. 1. p. 31. Blum. bijdr. p. 1055. Pergulària species, Lin.

Lin. syst. *Pentándria, Monogýnia.* Corolla salver-shaped, with an urceolate tube. Stamineous corona 5-leaved; leaflets compressed, undivided at top, and furnished each with a little segment inside. Anthers terminated by a membrane; pollen masses erect, fixed by the base. Stigma mutic. Follicles ventricose, smooth Seeds comose.—Twining plants, with broad membranous leaves; interpetiolar cymes, of yellowish, sweet-scented flowers, for which they are cultivated in China and the East Indies. Throat of corolla usually hairy.

1 P. odoratíssima (Roxb. and Smith, icon. pict. p. 16.) leaves cordate, acuminated, soft, downy; umbels shorter than the leaves; calycine segments shorter than the tube of the corolla, which is woolly inside; corona shorter than the tube of the corolla; segments of corolla short, obtuse. ♄. ◠. S. Native of China, Cochinchina, and Sumatra, where it is called *West coast creeper* by the English. Andr. bot. rep. t. 185. Pergulària mìnor, Sims, bot. mag. 755. Perg. tomentòsa, Lin. mant. 53. Cynánchum odoratíssimum, Lour. coch. p. 164. Flos Siámicus, Rumph. amb. 6. p. 58. t. 26. f. 1. The Malay name of the shrub is *Tonki* or *Tonkin*. Bark corky; young branches downy. Leaves rather downy while young, 4 inches long and 3 broad. Flowers middle-sized, greenish yellow, exceedingly fragrant. Seeds surrounded by a membranous rind, and ending in a long tuft of hairs.

Sweet-scented Pergularia. Fl. Ju. Jul. Clt. 1784. Sh. tw.

2 P. acce'dens (Blum. bijdr. p. 1056.) leaves ovate, or oval-

oblong, acuminated, rounded at the base: having the margins and veins downy; cymes pedunculate, twin; calycine segments obtuse, shorter than the tube of the corolla. ♄. ⌒. S. Native of Java, Sumatra, Madura, &c., by the sea side. It differs from *P. odoratissima* in the leaves never being cordate.

Approaching Pergularia. Fl. year. Shrub tw.

3 P. mìnor (Andr. bot. rep. 184.) leaves cordate, obtuse; with an acumen, downy while young; umbels shorter than the leaves; calycine segments about equal in length to the tube of the corolla. ♄. ⌒. S. Native of the East Indies. Curt. bot. mag. 755.? Tratt. tab. 713. P. odoratíssima, var. Smith, icon. pict. 3. p. 16. This is probably only a small variety of the first species, the leaves are rounder, with a more slender recurved acumen; and the corollas orange-coloured or yellow, but also very fragrant; and the segments of the corolla are blunter and shorter. Leaves 1½ inch broad, and the same in length.

Smaller Pergularia. Fl. May, Aug. Clt. 1790. Shrub tw.

4 P. parviflòra (Blum. bijdr. p. 1056.) leaves subcordate-ovate, acute, downy on the margins and veins beneath; umbellules pedunculate; calycine segments obtuse, shorter than the tube of the corolla. ♄. ⌒. S. Native of Java, about Kuripan, in calcareous soil.

Small-flowered Pergularia. Fl. May, July. Shrub tw.

5 P. villòsa (Blum. bijdr. p. 1057.) leaves subcordate-oval, acute, very soft beneath; umbellules simple; segments of calyx acute, shorter than the tube of the corolla. ♄. ⌒. S. Native of Java, on mount Parang, in the province of Tjanjor.

Villous Pergularia. Fl. July. Shrub tw.

6 P. pa'llida; branches downy; leaves oblong-cordate, acuminated, smooth; umbels simple or compound, on short peduncles, many-flowered; corona length of tube, but the calycine segments are shorter; segments of corolla narrow, with revolute edges; tube glabrous inside. ♄. ⌒. S. Native of the East Indies, at Gongachora and Munghir; and Penang. Asclèpias pállida, Roxb. fl. ind. 2. p. 48. P. limbàta, Wall. ascl. p. 61. P. víridis, Ham. herb. Young shoots beset with small recurved hairs. Leaves 4 inches long, and 1-2 broad. Petioles, pedicels, and peduncles villous. The flowers are pale yellow, and not fragrant, or in a very slight degree. The length and narrowness of the segments of the corolla, and want of fragrance, seem to be the most obvious marks by which this can be distinguished from *P. odoratíssima*.

Pale-yellow-flowered Pergularia. Shrub tw.

7 P. sanguinole'nta (Lindl. in hort. trans. 6. p. 72. Sims, bot. mag. 2532.) leaves ovate-lanceolate, quite glabrous; cymes many-flowered, shorter than the leaves; segments of corolla acuminated, obtuse. ♄. ⌒. S. Native of Sierra Leone. Plant trailing, full of blood-coloured juice. Corollas greenish yellow.

Bloody-juiced Pergularia. Fl. Jul. Aug. Clt. 1822. Sh. tw.

8 P. purpu'rea (Vahl. symb. 3. p. 44. Willd. spec. 1. p. 1248.) leaves cordate, acuminated, glabrous; umbels proliferous, shorter than the leaves; corolla with a villous throat, and narrow segments. ♄. ⌒. S. Native of the East Indies and China. Asclèpias cordàta, Burm. ind. p. 72. t. 27. f. 2. Branches rather villous. Pedicels and calyx downy. Flowers purple?

Purple-flowered Pergularia. Shrub tw.

9 P.? Japónica (Thunb. jap. 111. Willd. l. c.) leaves cordate, glabrous; umbels simple; calycine segments shorter than the tube of the corolla; segments of corolla obtuse, spreadingly reflexed. ♄. ⌒. S. Native of Japan. Stems glabrous. Leaflets of corona 5, subsagittate, erect, compressed, each furnished with a tooth outside. Stigma ending in a long thread. Perhaps a distinct genus, from the stigma terminating in a thread.

Japan Pergularia. Shrub tw.

10 P.? edu'lis (Thunb. prod. p. 38. fl. cap. 2. p. 151. act. nov. petrop. t. 14.) stem herbaceous, filiform, twining; leaves ovate, acuminated, glabrous; pedicels capillary, aggregate; root large, succulent, size of a human head. ♄. 4. ⌒. S. Native of the Cape of Good Hope, in Karro. Plant glabrous, with alternate branches. Leaves green above and pale beneath. Corolla an inch long. The root is eaten by the Hottentots. Perhaps a species of *Ceropègia*.

Edible-rooted Pergularia. Pl. tw.

N. B. What is *Pergulària lùcida* and *P. angustifòlia*, Fisch. hort. gorenki?

Cult. The greater number of the species of this genus are much valued for the fragrance of their flowers, and are well adapted to training up rafters or trellis work, in stoves or conservatories. They grow well in a mixture of loam, peat, and sand; and cuttings strike root readily in heat, under a hand-glass.

XXXII. DISCHI'DIA (from δις, *dis*, twice, and σχιζω, *schizo*, to cut; in reference to the bifid leaflets of the corona). R. Br. in wern. soc. mem. 1. p. 32. prod. 461. Blum. bijdr. p. 1059.

Lin. syst. *Pentándria*, *Digýnia*. Corolla urceolate, 5-cleft. Stamineous corona 5-leaved; leaflets bifid: segments subulate, spreading, recurved at apex. Anthers terminated by a membrane; pollen masses erect, fixed by the base. Stigma mutic. Follicles smooth. Seeds comose.—Herbs hanging, perennial, lactescent, besprinkled with white mealiness. Natives of the East Indies, especially of the Moluccas; and of New Holland, parasitical on trees. Stems rooting at the joints. Leaves opposite, roundish, thick, fleshy. Flowers small, subumbellate, usually white.

1 D. Bengale'nsis (Colebr. in Lin. trans. 12. p. 357. t. 15. Hook. bot. mag. 2916.) plant yellowish green, glabrous, fleshy; leaves oblong-lanceolate, 2-edged, flat; umbels few-flowered, from alternate axils, on short peduncles; corollas small, urceolate. ♄. S. Native of Silhet, on trees. D. lanceolàta Wall. ascl. no. 62.

Bengal Dischidia. Fl. Sept. Clt. 1818. Pl. creep.

2 D. cuneifòlia (Wall. l. c.) leaves cuneated, subretusely cuspidate, much attenuated at the base, and are, as well as the branches, scurfy. ♄. S. Native of the Burmese empire, on the banks of the river Attram, on trees. Nearly allied to *D. Bengalénsis*.

Cuneate-leaved Dischidia. Shrub creep.

3 D. Rafflesia'na (Wall. pl. rar. asiat. 2. p. 35. t. 184.) leaves roundish-ovate; ascidia or reservoirs crowded, pendulous, petiolate, oblong-ovate, angular, obtuse, large; lobes of corona oblong, obtuse, incurved; follicles smooth. ♄. S. Native of Singapore; also of Malacca and Salongohr, upon trees. A fleshy, pale green, glaucous plant. Umbels axillary. Corollas pale yellow.

Raffles's Dischidia. Shrub creep.

4 D. clava'ta (Wall. l. c. p. 36.) leaves roundish-ovate; ascidia or reservoirs crowded, pendulous, almost sessile, cylindrically clavate, arched, marginate, bluntly cuspidate; lobes of stamineous corona oblong, obtuse, incurved; follicles downy. ♄. S. Native of the Burmese empire, on the banks of the river Attram, in Martaban, near Assannee, on trees. Habit and mode of growth that of *D. Rafflesiàna*, but the reservoirs are of a different form.

Clavate Dischidia. Shrub creep.

5 D. nummula'ria (R. Br. prod. p. 461. Blum. bijdr. 1059.) fleshy; stem roughish; leaves roundish-ovate, mucronulate, convex on both surfaces, mealy beneath; umbellules on short peduncles; segments of corona subulate. ♄. S. Native of the East Indies, Java, and the Moluccas; also of New Holland, at Endeavour River, creeping upon trees. Col-

lỳris mìnor, Vahl. act. soc. hist. nat. hafn. 6. p. 111. ?—Rumph. amb. 5. t. 176. f. 1.

Moneywort-leaved Dischidia. Fl. year. Clt. ? Pl. creep.

6 D. Timorie'nsis (Nouv. ann. mus. 3. p. 377. t. 17.) leaves roundish-ovate, on short petioles; ascidia nearly sessile, oblong, a little arched, flattened, pendulous at the base of the branches; lobes obtuse, violaceous, downy inside; lobes of corona linear, arched, reflexed. ♄. S. Native of the island of Timor.

Timor Dischidia. Pl. creeping.

7 D. Wallìchii (Wight, contrib. ind. bot. p. 43.) fleshy, glabrous; leaves orbicular, hardly mealy. ♄. S. Native of Singapore. Wall. ascl. no. 64.—Rumph. amb. 5. t. 176. f. 2. Perhaps this is *Colly'ris mìnor*, Vahl, in which he says the leaves are oblong-ovate.

Wallich's Dischidia. Shrub creeping.

8 D. rhombifòlia (Blum. bijdr. p. 1059.) stem glabrous; leaves rhomb-ovate, obtuse, flat above and convex beneath; umbels on short peduncles; segments of corona linear, blunt. ♄. S. Native of Java, in woods on mounts Salak, Gede, and Burangrang, upon trees.

Rhomb-leaved Dischidia. Fl. year. Pl. creeping.

9 D. spatula'ta (Blum. bijdr. p. 1060.) stem glabrous; leaves spatulate, convex on both surfaces, rather mealy; umbellules nearly sessile; segments of the crown lanceolate. ♄. S. Native of the island of Nusæ-Kambanga, by the sea side, creeping upon trees.

Spatulate-leaved Dischidia. Fl. year. Pl. creeping.

10 D. cochlea'ta (Blum. bijdr. p. 1060.) stem downy; leaves roundish, convex above and wrinkled, concave beneath; umbellules on short peduncles; segments of corona obtuse, inflexed. ♄. S. Native of the island of Nusæ-Kambanga, creeping on the trunks of trees, by the sea shore.

Spoon-leaved Dischidia. Fl. year. Pl. creeping.

Cult. Vegetable mould is the best soil for the species of *Dischídia;* and they are easily increased by separating the rooted shoots.

XXXIII. LEPTOSTE'MMA (from λεπτος, *leptos*, narrow; and στεμμα, *stemma*, a crown; in reference to the corona, which is narrow.) Blum. bijdr. p. 1057.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, 5-toothed. Corolla tubular, with a constricted throat, which is sometimes closed with scales or fascicles of villi; limb semi-quinquefid. Stamineous crown of 5 free, cordate or sagittate, undivided leaflets. Anthers terminated by a membrane; pollen masses erect, fixed by the base. Stigma mutic. Follicles smooth. Seeds with a tuft of hairs at the end.—Herbs rooting on trees; with opposite or verticillate, fleshy leaves; and umbellulate flowers. An intermediate genus, between *Pergulària* and *Dischídia.*

* *Throat of corolla naked.*

1 L. lanceola'tum (Blum. bijdr. p. 1057.) leaves lanceolate, acuminated at both ends, glabrous; leaflets of corona rounded at the apex. ♄. S. Native of Java, in mountain woods.

Lanceolate-leaved Leptostemma. Fl. year. Pl. creep.

2 L. sagitta'tum (Blum. bijdr. p. 1057.) leaves lanceolate, acute or obtuse, glabrous; leaflets of corona sagittate, bluntish at the apex. ♄. S. Native of Java, upon trees, about Linga-jattie, in the province of Cheribon, where it is called *Kikondal.*

Sagittate-crowned Leptostemma. Fl. Aug. Sept. Pl. creep.

3 L. latifòlium (Blum. bijdr. p. 1058.) leaves oval-lanceolate, acute, glabrous; leaflets of corona minute, acutish, with tumid margins. ♄. S. Native of Java, on Mount Salak.

Broad-leaved Leptostemma. Fl. year. Pl. cr.

4 L. puncta'tum (Blum. bijdr. p. 1058.) leaves ovate, acuminated, convex, and glabrous on both surfaces; leaflets of corona rounded at the apex; corolla beset with elevated dots outside. ♄. S. Native of Java, in low woods.

Dotted-flowered Leptostemma. Fl. year. Pl. creep.

5 L. trunca'tum (Blum. l. c.) leaves small, ovate, acute, glabrous, rather convex beneath; leaflets of corona truncate, erose. ♄. S. Native of Java, in woods, on the higher mountains.

Truncate-crowned Leptostemma. Fl. June, July. Pl. cr.

* * *Throat of corolla closed.*

6 L. hirsu'tum (Blum. l. c.) leaves ovate, acute, hairy; throat of corolla closed by 5 scales; leaflets of corona rounded at the apex. ♄. S. Native of Java, about Rompien, in the province of Buitenzorg.

Hairy Leptostemma. Fl. May. Pl. creep.

7 L. fasciula'tum (Blum. bijdr. p. 1058.) leaves ovate, acutish, nearly glabrous; throat of corolla closed by 5 fascicles of villi; leaflets of corona rounded at the apex. ♄. S. Native of Java, on the mountains of Pant-jar, in the province of Buitenzorg.

Fascicled-flowered Leptostemma. Fl. July. Pl. creep.

Cult. For culture and propagation see *Dischídia*, above.

XXXIV. TRIPLOSPE'RMA (τριπλοος, *triploos*, triple; and σπερμα, *sperma*, a seed; the seeds are disposed in 3 ranks or series, in the follicles.) Stapèlia Cochinchinénsis, Lour. coch. p. 114.

Lin. syst. *Pentándria, Digýnia.* Corolla with a long slender tube, and a 5-parted limb; segments acute, connivent, covering the genitals. Stamineous corona fleshy, flat, stellate, of 5 acute, large, expanded leaflets. Anthers oblong, between the lobes of the corona. Stigmas 2, sessile. Follicles terete, subulate. Seeds long, terete, comose, disposed in 3 rows in each follicle. —A creeping, suffruticose plant. Stems terete, nearly simple. Leaves fleshy, opposite, ovate. Umbels large, simple, on a long, thick, common peduncle. Corollas white, funnel-shaped. Calycine segments acute.

1 T. Cochinchine'nsis. ♄. S. Native of Cochinchina, on the mountains. Hòya Cochinchinénsis, Spreng. syst. 6. p. 52. Stapèlia Cochinchinénsis, Lour. coch. 114.

Cochinchina Triplosperma. Shrub creeping.

Cult. For culture and propagation see *Dischídia*, above.

XXXV. HARRISO'NIA (named by Hooker, in compliment to Mrs. Harrison, of Ægburgh, near Liverpool, who was the first to introduce the plant from Brazil.) Hook. in bot. mag. vol. 53. t. 2699.

Lin. syst. *Pentándria, Digýnia.* Corolla urceolate, 5-toothed; with a naked throat. Stamineous corona 5-leaved; leaflets simple at top, furnished with a fleshy scale or process inside. ? —An erect, glabrous shrub. Leaves opposite, decussate, between fleshy and coriaceous, 2-3 inches long, elliptic-cordate, obtuse. Umbels pedunculate, terminal. Corollas fleshy, fine red; limb a little spreading. Hooker describes the pollen masses as erect; but we much doubt the correctness of this; but should it be so, it is a very remarkable genus among the tribe of Asclepiadeous plants, in which the pollen masses are erect, and the anthers terminated by a membrane.

1 H. loniceroìdes (Hook. l. c.) ♄. S. Native of Brazil.

Honeysuckle-like Harrisonia. Fl. Sept. Clt. 1825. Shrub erect.

Cult. For culture and propagation see *Gomphocárpus*, p. 142.

§ 2. *Stamineous corona inappendiculate outside.*

XXXVI. CONCHOPHY'LLUM (from κονχη, *conche*, a shell; and φυλλον, *phyllon*, a leaf; leaves convex above.) Blum. bijdr. p. 1060.—Collỳris, Vahl. act. hafn. 6. p. 109.

Lin. syst. *Pentándria, Digýnia.* Calyx small, 5-toothed. Corolla sub-globose, with a bearded throat; segments of the limb short. Stamineous crown, inclosed, 5-angled, inappendiculate outside. Anthers terminated by a membrane; pollen masses erect, fixed by the base. Stigma mutic. Follicles smooth. Seeds comose.—Herbs rooting on trees. Leaves opposite, somewhat imbricate, fleshy, roundish-cordate, emarginate, of a different colour beneath, convex and rather wrinkled above, and veinless beneath. Umbellules twin, pedunculate, interpetiolar.

1 C. imbrica'tum (Blum. bijdr. p. 1061.) ♄. S. Native of the island of Nusæ-Kambanga, on the sea-shore. Dischídia? Collỳris, Wall. pl. rar. asiat. 2. p. 36.—Colly'ris màjor, Vahl, in act. soc. hist. nat. hafn. 6. p. 111.—Rumph. amb. 5. t. 175. f. 3. bad.

Imbricated-leaved Conchophyllum. Fl. Nov. Pl. creeping.

Cult. For culture and propagation see *Dischídia*, p. 134.

XXXVII. GYMNE'MA (from γυμνος, *gymnos*, naked; and νημα, *nema*, a filament; the stamineous corona being absent, the filaments are left naked.) R. Br. in mem. wern. soc. 1. p. 33. prod. p. 461.

Lin. syst. *Pentándria, Monogy'nia.* Corolla sub-urceolate, 5-cleft; throat usually crowned by 5 scales, or teeth, inserted in the recesses between the segments of the corolla. Stamineous corona wanting. Anthers terminated by a membrane; pollen masses erect, fixed by the base. Follicles smooth. Seeds comose, generally marginate.—Usually twining shrubs, natives of the East Indies; tropical parts of New Holland, and Equinoxial Africa. Leaves opposite, membranous, flat. Umbels interpetiolar, cymose. In the greater number of the species, the stamens are not usually naked, but are furnished with a gland-like body, or fleshy tuft, at the base of each filament.

* § 1. *Tube of corolla pilose inside; throat crowned by 5 decurrent toothlets or scales.*

1 G. lactíferum (Rœm. et Schultes, syst. 6. p. 57. ex R. Br. l. c.) glabrous; stem erect, or twining a little, simple; leaves on short petioles, ovate, bluntly acuminated, usually unequal-sided; umbels many-flowered, shorter than the petioles; throat of small corolla crowned by 5 fleshy tubercles; tube furnished with double pilose lines, running from the tubercles. ♄. S. Native of Ceylon. Asclèpias lactífera, Lin. spec. 314. fl. zeyl. 111.—Burm. zeyl. p. 24. The milk of the plant is substituted for cow's milk, where that is scarce; and the leaves are boiled with food, ex Burm. Very nearly allied to *G. sylvéstre*.

Milk-bearing Gymnema. Shrub.

2 G. sylve'stre (R. Br. prod. l. c.) twining; clothed with soft down in every part except the upper surfaces of the leaves; leaves from oval, attenuated at the base and apex, to ovate or cordate, acute; peduncles equal in length to the petioles; umbels twin, sub-capitate, many-flowered; flowers small; stigma bluntly conical, much longer than the stamens; follicles slender, attenuated, glabrous. ♄. ◠. S. Native of the Peninsula of India, frequent in China and Ceylon. Wight, and Arnott, contrib. ind. bot. p. 44. G. parviflòrum, Wall. tent. fl. nep. p. 50. Perìploca sylvéstris, Willd. spec. 1. p. 1252. phyt. 1. p. 7. t. 5. f. 3. Asclèpias geminàta, Roxb. fl. ind. 2. p. 45. Segments of corolla ovate, acute. Scales in the throat long and thick. Hypogynous scales linear, obtuse, covering the genitals.

Wild Gymnema. Shrub tw.

3 G. gemina'tum (R. Br. prod. p. 462.) leaves ovate, smoothish; branchlets downy; peduncles shorter than the petioles; umbels twin; corolla with a crowned throat, and pilose tube. ♄. ◠. S. Native of New Holland, within the tropic, on the sea-shore.

Twin-umbelled Gymnema. Shrub tw.

4 G. hirsu'tum (Wight, and Arnott, contrib. ind. bot. p. 44.) twining, much branched; young branches, and under surfaces of leaves clothed with hairy tomentum; leaves downy above, from broad-ovate to narrow-oblong, acuminated; peduncles shorter than the petioles; umbels sub-capitate; flowers small. ♄. ◠. G. Native of the Neelgherry mountains. Wight, cat. no. 1531. Wall. ascl. no. 70. This may eventually prove a variety of *G. lactíferum*.

Hairy Gymnema. Shrub tw.

5 G. mólle (Wall. ascl. no. 72. b. 145. 151. Wight, and Arnott, contrib. ind. bot. p. 45.) twining; young branches clothed with soft pubescence; leaves from broad-cordate to ovate, acuminated, clothed with soft down beneath, smoothish above; umbels capitate, almost sessile; flowers small; stigma truncate, hardly higher than the stamina; follicles short, broad at the base, and gradually tapering to the apex, velvety. ♄. ◠. S. Native of the Burman Empire, on the banks of the Irrawaddi.

Soft Gymnema. Shrub tw.

6 G. acumina'tum (Wall. tent. fl. nep. p. 50.) twining; bark of stem corky; young branches rather tomentose; leaves oval-oblong, acuminated, glabrous above, and tomentose beneath, at length almost naked; peduncles shorter than the petioles; umbels sub-capitate; flowers small; scales of the throat exserted, one half shorter than the segments; follicles thick at the base, conical, short, woody, coriaceous, at length glabrous, 2 inches long, and 6-8 lines thick at the base; seeds large, surrounded by a membranous wing. ♄. ◠. S. Native of Chittagong, Silhet, Tavoy, and Maulmyne. Asclèpias acuminàta, Roxb. fl. ind. 2. p. 55. Cynánchum acuminàtum, Ham. herb. The specimens from Tavoy are more glabrous than the others.

Acuminated-leaved Gymnema. Shrub tw.

7 G. latifòlium (Wall. asclep. no. 68. 144. Wight, and Arnott, contrib. ind. bot. p. 45.) twining; ? young branches densely downy; leaves broad-oval, acuminated, sparingly pilose on both surfaces, parallelly veined; umbels shorter than the petioles, cyme-formed, many-flowered; flowers small; scales of throat inclosed; follicles rather slender, acuminated, warted, 3 inches long, and 2 lines thick at the base. ♄. ◠. ? S. Native of Tavoy, Silhet, Saluen, and the Peninsula of India. Leaves 4-6 inches long, and 3 broad.

Broad-leaved Gymnema. Shrub tw.

8 G. gla'brum (Wight, contrib. ind. bot. p. 45.) twining, glabrous; leaves ovate or cordate, acuminated, parallelly veined; follicles large, oblong-lanceolate, acuminated, ligneo-coriaceous, glabrous, 4 inches long, and 6 lines thick in the middle. ♄. ◠. S. Native of the East Indies. Wall. ascl. no. 150, without a name. Very nearly allied to the preceding, but quite distinct.

Glabrous Gymnema. Shrub tw.

§ 2. *Throat of corolla furnished with 5 decurrent, pilose lines.—The plants of this section have larger flowers than those of the last; and, owing to the pedicels being longer, the umbels are larger, though fewer-flowered.*

9 G. e'legans (Wight, et Arnott, contrib. ind. bot. p. 46.) twining; branches slender, glabrous, woody: the older ones rather warted; leaves cordate-ovate or oval-acuminated, with undulated edges; umbels on short peduncles, but not spirally elongated at length, as in the following species; pedicels about equal in length to the peduncles; flowers small; throat of corolla furnished with 5 pilose lines inside; stigma obtuse, longer than the stamens; follicles usually solitary, acuminated, white, 3 inches long, and 3-4 lines thick; seeds marginate. ♄. ◠. S. Native of the mountains of Dindygul, Salem, and Columala, also of Segaen.—Wight, cat. no. 1534. Wall. ascl. no. 67, 155, unnamed. Flowers white.

Elegant Gymnema. Shrub tw.

10 G. tíngens (Spreng. syst. 1. p. 844.) twining, glabrous; leaves cordate, acuminated to oval; umbels or corymbs often twin, at first shorter than the petioles, and at length spirally elongated; glands of filaments one half shorter than the stamens; follicles cylindrical, spoon-shaped; stigma simple, oval, mutic, crowning the tube of the corolla, and therefore exceeding the stamens. ♄. ⌒. S. Native of Pegu. Wight, and Arnott, contrib. ind. bot. p. 45. Asclèpias tíngens, Ham. ex Roxb. fl. ind. 2. p. 53. cor. 3. p. 34. t. 239. Asclèpias montàna, Roxb. fl. ind. 2. p. 45. mus. ind. or. t. 618. Períploca montàna, Roth. in herb. Wight. Microlòma Bidària, Ham. herb. Tylóphora Ariádnes, Ham. herb. Leaves 3-6 inches long, and 2-4 broad. Umbels compound at length. Flowers largish, numerous, pale yellow. Calyx 5-cleft to the base. Corolla having the tube as long as the column of fructification, furnished inside the rim with 5 double pilose ridges, which are ciliated with short brown hairs. Cordate divisions of the corona covering the stamens. Style simple. Follicles ovate-lanceolate, smooth and fleshy, 4 inches long, and one in diameter.

Dr. Hamilton, late Buchanan, informed Dr. Roxburgh, that from the leaves of this plant the Burmese prepare a green dye.

Staining Gymnema. Fl. July. Clt. 1823. Shrub tw.

§ 3. *Corolla ventricose; throat toothless; tube without any pilose lines inside. Filaments usually furnished with a fleshy tubercle at the base.—The plants referred to this section ought to form, perhaps, a distinct genus; they differ widely from the others in appearance. The pollen masses differ also from the rest of the genus, in being compressed and spatulate; and the retinacula are thickened, and sometimes very long.*

11 G. Nipaule'nse (Wall. tent. fl. nep. p. 50. t. 38.) leaves oval or ovate-oblong, acuminated, glabrous, glaucous beneath, and minutely reticulated with fuscous veins; common peduncles sometimes shorter and sometimes longer than the leaves; umbels compound, many-flowered; flowers subcapitate, on short pedicels. ♄. ⌒. G. Native of Nipaul. G. columnàre, Wall. ascl. no. 73. a. A large, much-branched shrub. Corollas yellow, urceolate, valvate in æstivation.

Nipaul Gymnema. Shrub tw.

12 G. columna're (Wall. ascl. no. 73. b. Wight and Arnott, contrib. ind. bot. p. 40.) leaves subcordate at the base, linear-oblong, acuminated, glabrous, pale glaucous beneath, and reticulated with fuscous veins; umbels compound, about equal in length to the leaves, many-flowered; flowers almost sessile. ♄. ⌒. S. Native of Nipaul? Very like *G. Nipaulénse*, and differs chiefly in the figure of the leaves.

Columnar Gymnema. Shrub tw.

13 G. sagitta'tum (Wall. tent. fl. nep. p. 50. ascl. no. 114. and no. 83. ?) leaves oval or oblong-ovate, attenuated at the apex, glabrous, whitish glaucous beneath, with the veins of the same colour; peduncles slender, about equal in length to the leaves; cymes compound, loose, with filiform branches: pedicels disposed along an elevated spiral line; flowers small, usually caducous; follicles slender, glabrous. ♄. ⌒. S. Native of Silhet. Anthers subsagittate. Cymes puberulous. Corolla subcampanulate, Wall. l. c.

Sagittate-anthered Gymnema. Shrub tw.

14 G. Wallíchii (Wight, contrib. ind. bot. p. 46.) leaves oval, short-acuminated, glabrous, paler beneath, with the veins of the same colour; cymes raceme-formed; pedicels disposed along an elevated spiral line; corolla ventricose, pilose inside; gynostegium furnished with 5 fleshy leaflets at the base. ♄. ⌒. S. Native of Singapore. Wall. ascl. no. 135. unnamed. The large fleshy glands or leaflets at the base of the gynostegium or column of fructification, render this a very doubtful species of *Gymnèma*, but the three preceding species have them also, but not so conspicuous.

Wallich's Gymnema. Shrub tw.

15 G. Finlaysonia'num (Wight, l. c.) twining, glabrous; leaves cordate, ovate, acuminated, glaucous beneath and reticulated with brown veins; umbels dense, many-flowered, longer than the petioles; corolla subcampanulate, glabrous; gynostegium short, naked at the base; retinacula of pollen masses elongated and spirally twisted in the middle. ♄. ⌒. S. Native of the East Indies.

Finlayson's Gymnema. Shrub tw.

16 G. trine'rve (R. Br. prod. p. 462.) stem erect; leaves oblong-lanceolate, 3-nerved, downy; umbels sessile; throat naked. ♄. S. Native of New Holland, within the tropic, on the sea shore. Perhaps the gynostegium is naked at the base.

Three-nerved-leaved Gymnema. Shrub.

17 G.? attenua'tum (Wall. tent. fl. nep. p. 50.) twining, smooth; leaves lanceolate, very much attenuated; corymbs slender, flexuous, rather longer than the leaves; corolla somewhat rotate, with a naked throat; pollen masses divaricate, almost horizontal, ovate; corpuscles bidentate at the apex. ♄. ⌒. S. Native of Silhet. Perhaps a species of *Tylóphora*.

Attenuated-leaved Gymnema. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

XXXVIII. SARCO'LOBUS (from σαρξ σαρκος, *sarx sarkos*, fleshy; and λοβος, *lobos*, a pod; the follicles are fleshy.) R. Br. in mem. wern. soc. 1. p. 34.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate, 5-parted; throat naked. Stamineous corona wanting. Anthers terminated by a membrane; pollen masses erect, fixed by the base. Stigma mutic. Follicles ventricose, fleshy or coriaceous, sometimes solitary by abortion. Seeds marginate, scabrous.?—Twining, glabrous shrubs Leaves opposite, broadish, firm. Umbels or corymbs interpetiolar, many-flowered. Follicles solitary by abortion.

1 S. Ba'nksii (Rœm. et Schultes, syst. 6. p. 58. ex R. Br. l. c.) glabrous; leaves broadish; umbels many-flowered; corolla rotate, with a naked throat; follicles fleshy. ♄. ⌒. S. Native of Java, near Batavia; and of Princes Island, where it was collected by Sir Joseph Banks. Follicles ventricose.

Banks's Sarcolobus. Shrub tw.

2 S. globòsus (Wall. asiat. res. 12. p. 577. t. 4.) leaves ovate-oblong; cymes bifid; corolla rotate, with a very short tube, villous inside; follicles large, fleshy, globose, blunt or retuse at both ends, muricated. ♄. ⌒. S. Native of the south of Bengal, in saltish places, on the shores of the Hoogly; Rangoon; and on the banks of the river Saluen.

Globose-fruited Sarcolobus. Shrub tw.

3 S. carina'tus (Wall. l. c. p. 578. t. 5.) leaves oval and oblong, rather fleshy; peduncles few-flowered; corollas rotate, with a very short tube, glabrous inside; follicles oblong, smooth, acute, keeled below. ♄. ⌒. S. Native along with the preceding species.

Keeled-fruited Sarcolobus. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

Tribe II.

GONOLO'BEÆ. Pollen masses 10, fixed by pairs to the retinacula of the stigma, transverse (f. 17. *g. h.*) adhering by the outer extremity (f. 17. *h.*), dehiscing transversely in respect to the cells, hidden by the stigmas. Stamineous corona undivided (f. 17. *d.*), lobed. Anthers terminated by a membrane.

XXXIX. GONO'LOBUS (from γονια, *gonia*, an angle; and λοβος, *lobos*, a pod; in reference to the ribbed follicles.) Rich.? in Michx. fl. bor. amer. 1. p. 119. R. Br. in werm. soc. mem. 1. p. 35.—Cynánchum species of Lin. and Jacq.

Lin. syst. *Pentándria, Digýnia.* Corolla sub-rotate, 5-parted (f. 17. *a.*) Stamineous corona saucer-shaped (f. 17. *d.*),

lobed. Anthers dehiscing transversely, terminated by a membrane; pollen masses fixed by the outer extremities, in respect to the cells (f. 17. *h.*), covered by the stigma. Stigma flattish-depressed, 5-lobed (f. 17. *e.*). Follicles ventricose, a little ribbed. Seeds comose.—Twining, suffruticose plants, natives of America, particularly within the tropics. Leaves opposite, broadish. Umbels interpetiolar, pedunculate.

1 G. marítimus (R. Br. l. c.) leaves cordate, hairy, tomentose beneath; umbels sessile; calycine segments lanceolate, acute; segments of corolla ovate, acute, hairy inside; tube very short. ♄. ⌒. S. Native of Tierra Bomba. Lindl. bot. reg. 931. Cynánchum marítimum, Lin. mant. 54. Jacq. amer. p. 83. t. 56. pict. t. 82. Corolla dark purple, ex Lin. Stem hairy. Corolla greenish, ex bot. reg.

Sea-side Gonolobus. Fl. June, July. Clt. 1826. Shrub tw.

2 G. suberòsus (R. Br. l. c.) leaves cordate, acuminated, with an open recess, rather hairy; calycine segments narrow; segments of corolla lanceolate. ♄. ⌒. S. Native of South America. Cynánchum suberòsum, Lin. hort. cliff. 79. spec. p. 310. Willd. spec. 1. p. 1255.—Dill. hort. elth. 308. t. 229. f. 296. Stem reddish, chinky at bottom. Flowers at first green, afterwards verging to blackish purple.

Corky-stemmed Gonolobus. Fl. July, Sept. Clt. 1732. Shrub tw.

3 G. crispiflòrus (R. Br. l. c.) leaves oblong, cordate, with the recess closed, nearly naked above, but villous beneath; umbels many-flowered; segments of corolla curled at apex. ♄. ⌒. S. Native of Jamaica, and at the Isthmus of Darien. Cynánchum crispiflòrum, Swartz. prod. 52. Ait. hort. kew. 1. p. 302. Swartz, fl. ind. occ. 1. p. 536.—Plum. icon. 210. t. 216. f. 1. Stem downy. There are some subulate glands at the recess of the leaf. Corolla white, painted with green lines at the base of the segments.

Curled-flowered Gonolobus. Fl. July, Aug. Clt. 1741. Shrub tw.

4 G. planiflòrus (R. Br. l. c.) leaves cordate, glabrous above, and tomentose beneath; umbels sub-compound; calycine segments lanceolate, acuminate; segments of corolla roundish-ovate, flat, spreading. ♄. ⌒. S. Native of New Spain, on the precipices of Mount de la Popa, about Carthagena; and of Trinidad. Cynánchum planiflòrum, Jacq. amer. 82. t. 86. pict. 43. t. 81. Lin. syst. 257. Leaves ciliated on the petioles, with rusty stiff pili. Corolla flat, veiny, and rusty.

Flat-flowered Gonolobus. Fl. Ju. Aug. Clt. 1818. Shrub twining.

5 G. viridiflòrus (Rœm. et Schultes, syst. 6. p. 61.) leaves ovate-cordate, or ovate, acuminated, glabrous; umbels few-flowered, shorter than the leaves; calycine segments lanceolate; segments of corolla oblong, acute. ♄. ⌒. S. Native about the Essequibo. Lindl. bot. reg. 1126. Cynánchum viridiflòrum, Meyer, prim. esseq. p. 141. G. Guianénsis, Spreng. syst. 1. p. 845. Stem hairy while young. Corolla greenish yellow. Stamineous corona margined with white. Very nearly allied to *G. planiflòrus;* but differs, in the leaves of that species being downy beneath, in the umbels being racemose, and in the calyx being longer than the corolla.

Green flowered Gonolobus. Fl. Sept. Clt. 1826. Shrub tw.

6 G. grandiflòrus (R. Br. l. c.) hairy; leaves cordate-ovate, acuminated, glaucous beneath; segments of corolla ovate, acuminated, coriaceous. ♄. ⌒. S. Native of South America. Lindl. bot. reg. t. 1053. Cynánchum grandiflòrum, Cav. icon. 1. p. 14. t. 21. Willd. spec. 1255. Stem and peduncles beset with rufous hairs. Petioles villous. Corolla coriaceous, larger than in any other species of the genus, greenish; corona purple.

Great-flowered Gonolobus. Fl. July, Aug. Clt. 1826. Shrub tw.

7 G. rostra'tus (R. Br. l. c.) hairy; leaves oblong-cordate, with the recess open; calycine segments ovate; segments of corolla narrow-lanceolate, 3 times longer than the calyx, pilose outside. ♄. ⌒. S. Native of Trinidad. Cynánchum rostràtum, Vahl, symb. 3. p. 45. Willd. spec. 1. p. 1254. Hairs of the stem retrograde. Leaves 2-3 inches long, rather pilose. Umbels few-flowered. Pedicels and petioles hairy. Corolla acuminately rostrate before expansion.

Beaked-flowered Gonolobus. Fl. Ju. Sept. Clt. 1824. Shrub tw.

8 G. nìger (R. Br. l. c.) glabrous; leaves ovate-cordate, acute; racemes few-flowered. ♄. ⌒. S. Native of Mexico. Cynánchum nìgrum, Cav. icon. 2. p. 45. t. 159. Willd. spec. 1. p. 1255. Nearly allied to *G. racemòsus;* but differs, in the ovate, acuminated leaves, and corolline segments, in the few-flowered racemes, and in the corolla being 4 times larger, and black, or very dark purple.

Black-flowered Gonolobus. Fl. Oct. Clt. 1825. Shrub tw.

9 G. racemòsus (R. Br. l. c.) glabrous; leaves ovate-cordate, acuminated; racemes simple, many-flowered; calycine segments lanceolate, concave, acute; segments of corolla lanceolate, flat, revolute and emarginate at the apex. ♄. ⌒. S. Native about Carthagena, among bushes. Cynánchum racemòsum, Lin. mant. p. 54. Jacq. amer. p. 81. t. 54. pict. t. 80. Willd. spec. 1. p. 1255. Leaves 4 inches long, rusty beneath. Flowers small, white.

Racemose-flowered Gonolobus. Fl. Ju. Aug. Clt. 1820. Shrub tw.

10 G. Caroline'nsis (R. Br. l. c.) stem and petioles hairy; leaves ovate-cordate, acuminated, downy, on longish petioles; flowers glabrous; segments of corolla oval-oblong, bluntish; follicles smooth. ♃. ⌒. F. Native of North America, on the banks of the Mississippi, in hedges. Cynánchum Carolinénse, Jacq. icon. 2. t. 342.? Flowers purplish, umbellate.

Carolina Gonolobus. Fl. Ju. July. Clt. 1806. Pl. tw.

11 G. macrophy'llus (Nutt. gen. amer. 1. p. 163.) stems and petioles hairy; leaves large, cordate, abruptly acuminated, puberulous; segments of corolla oval-oblong. ♄. ⌒. F. Native of Carolina and Virginia, in shady woods. Cynánchum macrophýllum, Michx. fl. bor. amer. 1. p. 119. Vincetóxicum gonocárpus, Walt. fl. car. 104. Gonólobus hirsùtus, Lodd. bot. cab. 365, but not of others. Asclèpias gonocárpus, Gmel. syst. p. 446. Cynánchum macrophýllum, Pers. ench. 1. p. 274. Flowers dark purple, or dirty yellow.

Large-leaved Gonolobus. Fl. June, July. Clt. 1822. Shrub twining.

12 G. hirsu'tus (Rœm. et Schultes, syst. 6. p. 63. Sweet, fl. gard. t. 1.) stems and petioles very hairy; leaves cordate-ovate, gradually acuminated, downy on both surfaces; segments of corolla linear-oblong, obtuse; follicles oblong, muricated. ♃. ⌒. F. Native from Pennsylvania to Carolina, in hedges, near rivulets. Gonolòbium hirsùtum, Michx. fl. bor. amer. 1. p. 119. Vincetóxicum acanthocárpus, Walt. fl. carol. p. 104. Asclèpias acanthocárpos, Gmel. syst. 446. Cynánchum hirsùtum. G. echinàtus, Lodd. cat. Flowers dark purple.

Hairy Gonolobus. Fl. June, July. Clt. 1806. Pl. tw.

13 G. díscolor (Rœm. et Schultes, syst. 6. p. 63.) stem hairy; leaves soft, cordate; peduncles longer than the petioles, umbellate; corollas of 2 colours: with linear-lanceolate segments. ♃. ⌒. F. Native of Virginia and Canada. Cynánchum díscolor, Sims, bot. mag. t. 1273. Cyn. Virgínicum, Herb. Banks. —Gron. virg. p. 36.? Nearly allied to *G. Carolinénsis*, and *G. suberòsus.* Corollas green outside and purple inside.

Discoloured-flowered Gonolobus. Fl. July, Aug. Clt. 1809. Pl. tw.

14 G. híRTUS (R. Br. l. c.) stems beset with rufescent hairs;

leaves ovate-cordate. ♄. ⌒. S. Native of America. Cynánchum hírtum. Lin. hort. cliff. p. 79. Willd. spec. 1. p. 1256. —Mor. hist. 3. p. 511. sect. 15. t. 3. f. 61. Stems chinky at bottom. This is a very doubtful plant. Leaves larger than in *G. suberòsus*; and the flowers are larger and purplish.

Rough Gonolobus. Shrub tw.

15 G. prostra'tus (R. Br. l. c.) stems prostrate, downy; leaves reniformly cordate, acute, tomentose beneath; umbels small, few-flowered; segments of corolla linear, obtuse. ♃. ⌒. G. Native of Mexico. Cynánchum prostràtum, Cav. icon. 1. p. 5. t. 7. Willd. spec. 1. p. 1257. Corollas green, small. Peduncles downy, almost the length of the leaves.

Prostrate Gonolobus. Fl. July, Aug. Clt. 1823. Pl. prostrate.

16 G. undula'tus (R. Br. l. c.) glabrous; leaves oblong, acuminated, attenuated at the base, undulated; umbels capitate; calycine segments ovate, concave, spreading; segments of corolla bluntish, much shorter than the tube. ♄. ⌒. S. Native near Carthagena, on Mount de la Popa. Tube of corolla depressedly globose. Corollas small, cinereous outside, and dirty purple inside.

Undulated-leaved Gonolobus. Shrub tw.

17 G. altíssimus (Rœm. et Schultes, syst. 6. p. 65.) stem tomentose or downy; leaves cordate, tomentose on both surfaces; umbels dense, capitate; calycine segments lanceolate, concave, tomentose outside, length of the tube of the corolla; segments of the corolla roundish, flat, obtuse. ♃. ⌒. S. Native of woods, about Carthagena. Cynánchum altíssimum, Jacq. amer. 84. t. 87. Vahl, ecl 2. p. 23. Corollas dirty purple.

Tallest Gonolobus. Fl.? Pl. tw.

18 G. filifórmis (Rœm. et Schultes, syst. 6. p. 65.) glabrous; leaves ovate, acuminated, shining; umbels globose; calycine segments lanceolate, concave, acuminated; segments of corolla ovate, acuminated, pilose beneath. ♃. ⌒. S. Native of Carthagena, among bushes. Cynánchum filifórme, Jacq. amer. p. 86. t. 60. f. 1. Cynánchum leucánthum, Jacq. amer. pict. t. 86. Stems filiform, shining. Peduncles twice longer than the petioles. Flowers very small, white.

Filiform-stemmed Gonolobus. Pl. tw.

19 G. a'lbus (Poir. suppl. 2. p. 815.) glabrous; leaves ovate, acute, white below; umbels many-flowered. ♃. ⌒. S. Native of Peru. Asclèpias álba, Cav. icon. p. 136. t. 310. Leaves subcordate, 2 inches long. Umbels sometimes twin. Corollas whitish-grey, ½ an inch in diameter.

White-flowered Gonolobus. Pl. tw.

20 G. obtusifòlius (Rœm. et Schultes, syst. 6. p. 66.) leaves roundish-cordate, soft and tomentose beneath. ♃. ⌒. S. Native of South America, Cayenne.? Asclèpias (Gonolòbium) obtusifòlium, Pers. ench. 1. p. 274.

Blunt-leaved Gonolobus. Pl. tw.

21 G. diadema'tus (Ker. bot. reg. t. 252.) hairy; leaves oblong-cordate; segments of corolla ovate, furnished with a corona in the throat. ♄. ⌒. S. Native of Mexico. Flowers green.

Crowned Gonolobus. Fl. Sept. Oct. Clt. 1812. Shrub tw.

22 G. oblìquus (R. Br. l. c.) stems hairy; leaves ovate-cordate, villous, acute; umbels much shorter than the leaves; pedicels length of peduncles; calycine segments narrow-lanceolate, acute, villous; segments of corolla ovate, acuminated, with oblique points, and revolute edges. ♃. ⌒. S. Native of Carolina; but the plant has never been met with by Pursh. Cynánchum oblìquum, Jacq. coll. 1. p. 148. icon. rar. 2. t. 341. Willd. spec. 1. p. 1256. Flowers fetid, an inch in diameter, brownish purple. Nectarium purplish. Anthers yellow.

Oblique-flowered Gonolobus. Fl. July, Aug. Clt. 1818. Pl. tw.

23 G. Nuttallia'nus (Spreng. syst. 1. p. 845.) glabrous; leaves reniformly cordate, acuminated, upon longish petioles, auriculate at the base; segments of corolla linear-oblong, oblique; follicles ribbed. ♃. H. Native on the banks of the Mississippi, near St. Louis. G. viridiflòrus, Nutt. gen. amer. 1. p. 163. Flowers greenish.

Nuttall's Gonolobus. Fl. July, Aug. Clt. 1822. Pl. tw.

24 G. uniflòrus (H. B. et Kunth, nov. gen. amer. 3. p. 207. t. 238.) branches and leaves downy; leaves ovate-oblong, much acuminated at the apex, and sagittately cordate at the base; peduncles solitary, 1-flowered, about the length of petioles; calycine segments lanceolate, villous; segments of corolla obliquely ovate-oblong, acuminated, bearded on one side, twice longer than the calyx. ♄. ⌒. S. Native near the town of Mexico. Flowers as large as those of *Philadélphus coronària*. Corona in the bottom of the corolla, short, annular, undulated. Very like *Cynánchum denticulàtum*, Vahl.

One-flowered Gonolobus. Fl. July. Clt. 1825. Shrub tw.

25 G. aristolochioìdes (H. B. et Kunth, nov. gen. amer. 3. p. 208.) branches downy, and leaves beneath; leaves ovate, short-acuminated at top, and deeply cordate at the base; umbels many-flowered, hardly exceeding the petioles; peduncles and pedicels downy; calycine segments ovate, acutish; segments of corolla ovate-oblong, acute, beardless, 4 times longer than the calyx. ♄. ⌒. S. Native of the province of Caraccas, in humid places, near Guigne, and at Lake Tacaragua. Corolla yellow. Corona and anthers as in *G. ripàrius*.

Aristolochia-like Gonolobus. Fl. March. Shrub tw.

26 G. floccòsus (Bertol. ex Spreng. syst. add. p. 110.) leaves cordate, acuminated, tomentose beneath; flowers glomerate; follicles echinated. ♄. ⌒. S. Native of Guadaloupe.

Floccose Gonolobus. Shrub twining.

27 G. pauciflòrus (Spreng. syst. 1. p. 846.) shrubby, glabrous; branches downy; leaves oblong, obtuse; peduncles usually 3-flowered, axillary. ♄. ⌒. S. Native of Hispaniola.

Few-flowered Gonolobus. Shrub twining.

28 G. ripa'rius (H. B. et Kunth, l. c.) branches pilose; leaves ovate, acuminated at apex, deeply cordate at base, rather pilose beneath; umbels many-flowered; peduncles and pedicels downy; calycine segments oblong-lanceolate; segments of corolla oblong-acute, beardless, 3 times longer than the calyx. ♄. ⌒. S. Native of New Granada, on the banks of the river Magdalena, between Mompox and Morales. Corolla green, with a short, undulately-curled margin.

River-side Gonolobus. Shrub tw.

29 G. barba'tus (H. B. et Kunth. l. c. p. 209. t. 239.) branches downy; leaves ovate, acuminated at top, and cordate at the base, with a wide recess, glabrous; umbels many-flowered, about the length of the leaves; pedicels glabrous, longer than the peduncle; calycine segments oblong-lanceolate, acuminated (f. 17. *a*); segments of corolla obliquely ovate, acuminated (f. 17. *b. c.*), bearded on one side, twice longer than the calyx. ♄. ⌒. S. Native of Mexico, near Campeche. Flowers as large as those of *Periploca Græ'ca*, 5-7 in each umbel. Corona very short, disk-formed, composed of short, fleshy, bidentate teeth or threads surrounding the stamens (f. 17. *d.*)

FIG. 17.

Bearded-flowered Gonolobus. Shrub tw.

Cult. For culture and propagation see *Oxypétalum*, p. 148.

XL. MATE'LEA (meaning not explained by Aublet). Aubl. guian. 1. p. 277. t. 109. f. 1. R. Br. in mem. wern. soc. 1. p. 36.—Hóstea, Willd. spec. 1. p. 1274.

LIN. SYST. *Pentándria, Digy'nia.* Corolla rotate, 5-parted. Stamineous corona saucer-shaped, lobed. Anthers dehiscing transversely, terminated by a membrane; pollen masses fixed by the exterior extremity, in respect to the cells, covering the stigma. Stigma flattish, depressed. Follicles ventricose, ribbed. Seeds naked.—Shrub erect. Leaves opposite, biglandular above the base. Flowers racemose, lateral.

1 M. PALU'STRIS (Aubl. l. c.) leaves oblong-ovate, acuminated; racemes simple. ♄. S. Native of Guiana, in marshy places. Hóstea viridiflòra, Willd. spec. 1. p. 1274. Flowers green.

Marsh Matelea. Shrub 2 to 3 feet.

2 M. LATIFÒLIA (Aubl. l. c. f. 2.) leaves ovate-oblong; flowers axillary. ♄. S. Native of Guiana. Flowers green.

Broad-leaved Matelea. Shrub 1 to 2 feet.

Cult. For culture and propagation, see *Calótropis*, p. 147.

Tribe III.

ASCLEPIE'Æ. Asclepiàdeæ veræ, part. R. Br. in mem. wern. soc. 1. p. 21. Pollen masses 10, smooth, 2 appertaining to each anther, fixed by pairs to the corpuscles of the stigma by their tops or beneath their tips, pendulous.

§ 1. *Stamineous corona appendiculate, simple, 5-leaved; leaflets opposite the anthers, sub-cucullate, seated on the top of the tube of the filaments, having 5 small segments, one between each of the larger ones, in the same series. Corolla 5-parted, reflexed.*

XLI. ASCLE'PIAS (from Æsculapius, the god of medicine; powerful medicinal effects of some species.) R. Br. in mem. wern. soc. 1. p. 36.—Asclèpias, spec. Lin. Juss. and others.

LIN. SYST. *Pentándria, Digýnia.* Corolla 5-parted, reflexed. Corona seated on the upper part of the tube of the filaments (f. 18. *a.*), 5-leaved; leaflets cucullate, having a horn-formed process protruding from the bottom. Anthers terminated by a membrane; pollen masses compressed, fixed by the tapering tops, pendulous. Stigma depressed, mutic. Follicles smooth. Seeds comose.—Erect, North American herbs. Leaves opposite, verticillate, and sometimes alternate. Umbels interpetiolar.

* *Leaves opposite.*

1 A. SYRÌACA (Lin. spec. 313. Lam. dict. 1. p. 281.) stems simple; leaves lanceolate-oblong or oval, gradually acute, tomentose beneath; umbels drooping. ♃. H. Native from New England to Virginia, in fields, and on the banks of rivers, common. Pursh, fl. amer. sept. 1. p. 180. A. Syrìaca, β, Illinénsis, Pers. ench. 1. p. 275. A. pubéscens, Mœnch. A. Apócynum, Gat. fl. montaub. p. 48. A. obovàta, and A. tomentòsa, Elliot, ex Spreng.—Blackw. t. 521.—Plenck, off. t. 255. Flowers in large, loose umbels, pale purple, sweet-scented. The nectaries, or leaflets of the corona, act as fly-traps. Lamarck has given, as the native country of this species Syria and Egypt; and adds, as a synonyme, the Apócynum erectum latifolium, incanum Syriacum; floribus parvis obsolete purpurascentibus, of Tour. inst. p. 91; as also a singular variety of the same, the Apócynum majus Syriacum rectum; caule viridi; flore axalbido, Tourn. p. 91.

Syrian Swallow-wort. Clt. 1629. Pl. 3 to 5 feet.

2 A. EXALTA'TA (Lin. amœn. acad. 3. p. 404. spec. 313. Link. enum. 1. p. 251.) stems downy; leaves oblong, acute, petiolate, downy on the nerves beneath; umbels drooping? pedicels, elongated; horns of corona elongated. ♃. H. Native of North America. A. Syrìaca, β, exaltàta, Willd. spec. 1. p. 1265. Schultes, syst. 6. p. 69. A. connìvens, Baldw. Corolla purplish outside, and white inside. Horns of corona white, incurved, longer than the corolla.

Exalted Swallow-wort. Fl. July, Aug. Clt. 1800. Shrub 2 to 3 feet.

3 A. PHYTOLACCOÌDES (Lyon, ex Pursh, fl. amer. sept. 1. p. 180.) stems erect, simple; leaves broad-ovate-oblong, acute, glabrous, paler beneath; umbels lateral and terminal, solitary, on long peduncles, drooping. ♃. H. Native of Virginia and Carolina, on the mountains; as well as on the banks of the Platte and Arkansas. Stem spotted with purple. Leaves large, with a purple midrib. Corolla green; corona white, with truncate leaflets.—Gron. virg. p. 38.

Phytolacca-like Swallow-wort. Fl. July, Aug. Clt. 1812. Pl. 3 to 4 feet.

4 A. SPECIÒSA (Torrey, in ann. lyc. new york, 2. p. 218.) plant clothed with fine tomentum; leaves ovate, cordate, obtuse, on short petioles; umbels axillary, and terminal, solitary; leaflets of corona erect, lanceolate, 3 times longer than the gynostegium, bluntish, bidentate inside, at the base. ♄. H. Native of North America, on the banks of the Canadian river. Flowers twice as large as those of *Ascl. Syrìaca*, pale purple?. Calycine segments lanceolate, spreading. Segments of corolla oblong, reflexed, obtuse. Horns of corona short, incurved, compressed.

Showy Swallow-wort. Pl. 2 to 3 feet.?

5 A. DE'BILIS (Michx. fl. amer. bor. 1. p. 116.) smoothish; stems weak, erect, simple; leaves petiolate, oval-lanceolate, acute at both ends, membranous; umbels terminal and axillary, loose-flowered; pedicels capillary. ♃. H. Native from New York to Carolina; in shady, rocky situations, near rivulets. Flowers white. Leaves large. The fibres of the stem produce a kind of flax, as all the rest of the species do, but far superior, being of a beautiful silky gloss, and extreme strength.

Weak Swallow-wort. Fl. July, Aug. Clt. 1818. Pl. 2 ft.

6 A. PARVIFLÒRA (Ait. hort. kew. 1. p. 307.) leaves lanceolate, acuminated, glabrous, attenuated at the base; umbels lateral, solitary; stems suffruticose, erect. ♃. H. Native of Carolina and Florida, in sandy fields. Pursh. fl. amer. sept. 1. p. 180. Jacq. eclog. t. 28. A. perénnis, Walt. fl. carol. p. 107. Flowers small, white.

Small-flowered Swallow-wort. Fl. July, Aug. Clt. 1774. Pl. 2 to 3 feet.

7 A. POLYSTA'CHYA (Walt. fl. car. p. 107.) leaves lanceolate, smooth, petiolate; stems suffruticose; umbels lateral and terminal. ♃. H. Native of Carolina. This plant is not mentioned by Pursh; but is probably the same as *A. parviflòra.*

Many-spiked Swallow-wort. Fl. July, Aug. Clt. 1825. Pl. 2 to 3 feet.

8 A. CURASSA'VICA (Lin. spec. 314.) stem simple, seldom a little branched; leaves oblong-lanceolate, tapering at both ends, glabrous; umbels erect, solitary, lateral. ♄. S. Native of Curassoa, Essequibo, Cumana, Trinidad, and now found in most parts of tropical America. Meyer, Ess. p. 138. Lodd. bot. cab. 349. Ker. bot. reg. 81. A. bícolor, Monch.—Sloan. hist. 2. t. 129. —Dill. elth. 34. t. 30. f. 33. —Herm. par. t. 36.? Stem rather downy. Flowers of a reddish-orange colour, or scarlet. Follicles muricated with scattered teeth, ex Lam. The

FIG. 18.

roots have been sent to England as Ipecacuanha. The juice of the plant, made into a syrup, is said to be a powerful anthelmintic; it is given to children in the West Indies, for that purpose, from a tea to table-spoonful. The juice, and pounded plant, is said to be an excellent styptic. The root, dried and reduced to powder, is frequently used by the negroes as an emetic, and hence its name of Wild or Bastard Ipecacuanha. (f. 18.)

Var. β, *albiflòra;* flowers white.

Var. γ, *ramòsa;* stem branched at top, divaricated.

N.B.—What is *A. Curassávica*, Lour. coch. 170, of which he says, that the stems are simple and twining, the leaves opposite; the flowers pale, and disposed in lateral, erect umbels; the follicles ventricose and conical; the seeds ovate, compressed, curved, and comose. A native near Canton, in China.

Curassoa Swallow-wort, or Bastard Ipecacuanha. Fl. Ju. Sept. Clt. 1692. Shrub 1 to 3 feet.

9 A. NÍVEA (Lin. spec. 313.) stems simple; leaves ovate-lanceolate, smoothish; umbels erect, terminal, solitary. ♃. H. Native from Virginia to Carolina, on the banks of rivers, in sandy and gravelly soil. Sims, bot. mag. 1187.—Dill. elth. 33. t. 29. f. 32. Flowers white, ex Pursh. Corolla green, purplish outside, with white nectaries, ex Lin. Stem nodose, puberulous. Leaves tomentose beneath, ex Sims, l. c. Very like *A. Curassávica.*

Snowy-flowered Swallow-wort. Fl. July, Aug. Clt. 1730. Pl. 1 to 3 feet.

10 A. VIRGA'TA (Balb. in cat. taur. 1813. p. 14.) stems erect, simple; leaves linear-lanceolate, glabrous; umbels erect, lateral, solitary: and terminal, twin. ♃. H. Native of America. Very like *A. nívea*, but differs in the colour of the flowers. Flowers white.

Twiggy Swallow-wort. Fl. Jul. Aug. Clt. 1820. Pl. 2 ft.

11 A. INCARNA'TA (Lin. spec. 314.) stem erect, branched and tomentose at top; leaves lanceolate, rather woolly on both surfaces; umbels numerous, usually twin; horns of corona exserted. ♃. H. Native from Canada to Virginia, in swamps, and on river banks, common. Michx. fl. bor. amer. 1. p. 115. Pursh, 1. p. 181. Jacq. hort. vind. t. 107. Ker. bot. reg. 250. Corn. can. 9. t. 93. Flowers red, or purplish.

Flesh-coloured-flowered Swallow-wort. Fl. July, Aug. Clt. 1710. Pl. 2 feet.

12 A. PU'LCHRA (Ehrh. ex Willd. enum. p. 278.) stem divided at top; leaves lanceolate; umbels erect, twin; horns of corona exserted. ♃. H. Native of North America. A. incarnàta, β, Willd. spec. 1. p. 1267. Pursh. fl. amer. sept. 1. p. 181. Flowers red, or purple. This plant is said, by Pursh, to be more hairy than *A. incarnàta*, but in every other respect no wise different. Sometimes the leaves are quite glabrous, and only downy in those on the upper part of the stem, as in it. But Willdenow says it is a very distinct species, and remains so in cultivation; the leaves are shorter, and a little broader, downy beneath, as well as the top of the stem and branches.

Fair Swallow-wort. Fl. July, Aug. Clt. 1710. Pl. 2 feet.

13 A. CITRIFÒLIA (Jacq. coll. 2. p. 290. icon. rar. t. 343.) stems erect, simple, rather hairy; leaves ovate-lanceolate, acute, repandly undulated, glaucous, and minutely hairy beneath, firm; umbels terminal and lateral, solitary, hemispherical. ♃. H. Native of America. Root thick, fleshy. Leaves 4 inches long. Flowers white, size and form of those of *A. Curassávica.*

Orange-leaved Swallow-wort. Fl. July, Aug. Clt. 1818. Pl. 1 foot.

14 A. AMŒ'NA (Lin. spec. 313.) stems simple, with 2 rows of down; leaves almost sessile, oblong-oval, downy beneath; umbels terminal, and are, as well as the foliola of corona, erect; appendages of corona exserted, red. ♃. H. Native from New England to Virginia, in wet meadows, on the edges of woods and ditches. Michx. fl. bor. amer. 1. p. 118. Pursh. 1. p. 181. A. compréssa, Monch.—Dill. elth. t. 27. f. 30. Flowers beautiful, purple. Habit of *A. Syrìaca.* Leaves white beneath, large, with a purple middle nerve, ex Dill.

Pleasant Swallow-wort. Fl. July, Aug. Clt. 1732. Pl. 2 to 3 feet.

15 A. PURPURA'SCENS (Lin. spec. 313.) stem simple, rather hairy at top; leaves ovate, villous beneath; umbels erect; foliola of corona resupinate. ♃. H. Native of Virginia and Carolina, in shady swamps.—Dill. elth. t. 28. f. 31. Flowers purple. Habit of *A. Syrìaca.* Stem brownish green at bottom. Leaves large, with a purplish middle nerve. Petals herbaceous, striped with purple at the base, ex Dill.

Purplish-flowered Swallow-wort. Fl. July, Aug. Clt. 1732. Pl. 2 to 3 feet.

16 A. VARIEGA'TA (Lin. spec. 312.) stem simple, erect; leaves ovate, petiolate, wrinkled, naked; umbels almost sessile; pedicels tomentose. ♃. H. Native from New York to Carolina, on dry, sunny hills, on the borders of woods. Sims, bot. mag. 1182.—Pluk. alm. t. 77. f. 1. Flowers in dense umbels, very handsome; petals and foliola of corona white; fructification red. A. hýbrida, Mich. fl. bor. amer. 1. p. 115. "Stem simple, rather tomentose; leaves petiolate, oval, minutely puberulous; umbels leafless, terminal." Michx. l. c. Stems variegated with purple.

Variegated-flowered Swallow-wort. Fl. July, Aug. Clt. 1597. Pl. 3 to 4 feet.

17 A. OBTUSIFÒLIA (Michx. fl. bor. amer. 1. p. 115.) leaves stem-clasping, oblong-roundish, obtuse, waved; umbels terminal, solitary, on long peduncles, many-flowered, glabrous; horns or appendages of corona exserted. ♃. H. Native of from New Jersey to Carolina, on the banks of rivers; in sandy, barren soils, along the Platte, on the Missouri, ex Torrey, in ann. lyc. new york, 2. p. 217. A. purpuráscens, Walt. fl. car. p. 105. Flowers large, purple. Perhaps the same plant as *Gonólobus obtusifòlius.*

Var. β, *latifòlia* (Torrey, in ann. lyc. new york. 2. p. 217.) leaves broad-obovate, obtuse, ending in a short mucrone, cordate at the base, glabrous on both surfaces, with flat edges; umbels almost sessile, axillary; leaflets of corona cucullate, about equal in length to the gynostegium, bidentate; horns of corona exserted. ♃. H. Native of North America, on the banks of the Canadian river. Leaves 4 inches long, and 3 broad. Flowers rather smaller than in the species. Calycine segments lanceolate, acute. Corolla reflexed, pale greenish purple. Perhaps a proper species.

Blunt-leaved Swallow-wort. Fl. June. Clt. 1820. Pl. 2 to 3 feet.

18 A. MELLIODÒRA (St. Hil. ex Spreng. syst. addenda, p. 110.) stem simple, erect; leaves petiolate, linear, elongated, acute, downy beneath; umbels lateral, many-flowered. ♃. F. Native of Brazil, on the banks of the Rio Grande.

Honey-scented Swallow-wort. Pl.

19 A. ACUMINA'TA (Pursh, fl. amer. sept. 1. p. 182.) stems erect, glabrous, simple; leaves ovate, sub-cordate, acuminated, on short petioles: superior ones sessile; umbels lateral, solitary, erect. ♃. H. Native from New Jersey to Florida, in deep cedar swamps, and on the banks of rivers. A. cordàta, Walt. fl. car. p. 105. A. periplocæfòlia, Nutt. gen. amer. 1. p. 106. Leaves glabrous, but rough on the edges, acute. Flowers red and white. Roots very large, resembling those of *A. tuberòsa.* Horns of corona inclosed.

Acuminated-leaved Swallow-wort. Fl. July. Clt. 1826. Pl. 2 feet.

20 A. LAURIFÒLIA (Michx. fl. bor. amer. 1. p. 117.) stems erect, glabrous; leaves almost sessile, oval-lanceolate, gradually

narrowed, very acute, glabrous, roughish above, on the edges. ♃. H. Native of Georgia, on the river Athamaha. Flowers purple. Allied to *A. amœ'na.*

Laurel-leaved Swallow-wort. Fl. July. Pl. 2 feet.

21 A. cine'rea (Walt. fl. carol. p. 105. Gmel. syst. 5. p. 446.) stems erect, simple, with an alternating downy line; leaves nearly linear, smooth, with revolute edges; umbels lateral, few-flowered; horns of corona inclosed. ♃. H. Native of Carolina. Enslènia cinèrea, Spreng. syst. 1. p. 850. Flowers white. This species is placed between *A. acuminàta*, and *A. paupércula*, by Walt., but is not mentioned by Pursh.

Grey Swallow-wort. Fl. July, Aug. Clt. 1825. Pl. 1 foot.

22 A. rubricau'lis (H. B. et Kunth, nov. gen. amer. 3. p. 148.) stems erect, simple, reddish, downy at top; leaves nearly sessile, erect, linear, with revolute edges, nerved, glabrous. ♃. F. Native of Mexico, on the declivities of mountains, near La Vente del Perigrino. Umbels many-flowered. Flowers white, a little larger than those of *A. galioìdes;* segments of corolla oblong-elliptic, flat, sub-emarginate. Appendages of corona exserted. The revolute edges of the leaves of this species, and the two following, are perhaps occasioned by drying, and are, therefore, probably flat in the recent state.

Red-stemmed Swallow-wort. Fl. April. Pl. ½ to 1 foot.

23 A. ròsea (H. B. et Kunth, nov. gen. amer. 3. p. 189.) stems erect, almost simple, downy at top; leaves erectish, linear, 1-nerved, with revolute edges, puberulous above, and clothed with hoary down beneath; umbels 15-flowered. ♃. G. Native of Mexico, near the town of Chilpancinga. Flowers structure and size of those of *A. rubricaúlis*, but rose-coloured; and the appendages of the corona rather shorter.

Rose-coloured-flowered Swallow-wort. Fl. June, Aug. Clt. 1824. Pl. ½ to 1 foot.

24 A. linifòlia (Hort. madr. ex H. B. et Kunth, l. c. p. 190.) stem suffruticose?, branches having a downy line on one side only; leaves on very short petioles, spreading, linear or lanceolate, acute, with rather revolute edges, veiny, membranous, glabrous; umbels about 10-flowered; peduncles downy on one side; appendages of corona hardly exserted. ♃. G. Native of Mexico, between the city and Chapollepeque. A. salicifòlia, Lodd. bot. cab. 272. Flowers white, size of those of *A. nívea.*

Flax-leaved Swallow-wort. Fl. July, Aug. Clt. 1818. Shrub 2 to 3 feet.

25 A. glauce'scens (H. B. et Kunth, l. c. p. 190.) stems erect, simple, glabrous; leaves on very short petioles, linear-oblong, acute, somewhat cordate, flat, veiny, thickish, glabrous; glaucescent beneath; umbels interpetiolar and terminal. ♃. G. Native of New Spain, betwixt Acapulco and La Vente de la Moxonera. Leaves 3½ inches long. Interpetiolar umbels solitary, and the terminal ones twin? Flowers size of those of *A. Syrìaca*, sweet-scented. Pedicels and peduncles downy. Corollas white; appendages of the corona sublunate, compressed, a little exserted. Follicles hairy or downy in the immature state.

Glaucescent-leaved Swallow-wort. Pl. 1 to 2 feet.

* * *Leaves verticillate.*

26 A. quadrifòlia (Pursh, fl. amer. sept. 1. p. 183.) stems erect, simple, glabrous; leaves ovate, acuminated, petiolate; those in the middle of the stem larger, and 4 in a whorl, the rest opposite; umbels twin, terminal, loose-flowered; pedicels filiform. ♃. H. Native from New York to Virginia, on limestone rocks. Jacq. obs. 2. p. 33. Lodd. bot. cab. 1258. Flowers small, sweet-scented, with white petals, and red nectaries.

Four-leaved Swallow-wort. Fl. May, July. Clt. 1820. Pl. 1 foot.

27 A. verticilla'ta (Lin. spec. 315.) stems erect, often branched, having a downy line on one side; leaves very narrow, linear, thick, quite glabrous, usually verticillate, but sometimes scattered; appendages of corona exserted. ♃. H. Native from New Jersey to Carolina; and on the upper part of the Arkansas. Michx. fl. bor. 1. p. 116. Pursh, 1. p. 183. Lodd. bot. cab. 1067.—Pluk. mant. t. 336. f. 4. Corollas with yellowish green petals and white nectaries.

Verticillate-leaved Swallow-wort. Fl. July, Aug. Clt. 1759. Pl. 1 to 2 feet.?

28 A. Mexica'na (Cav. icon. 1. p. 42. t. 58.) stems erect; leaves linear-lanceolate, with revolute edges; lower ones 4-6 in a whorl: upper ones 3 in a whorl, or opposite; umbels many-flowered. ♃. G. Native of Mexico. Follicles furrowed. Involucrum of many short leaves. Corollas white, size of those of *A. nívea.* It differs from *A. verticillàta*, in the leaves being much broader, and in the flowers being larger.

Mexican Swallow-wort. Fl. July, Aug. Clt. 1821. Pl. 2 to 3 feet.

29 A. galioìdes (H. B. et Kunth, nov. gen. amer. 3. p. 148.) stem shrubby, branched, furnished with 4 rows of hairs; leaves 4 in a whorl, almost sessile, erect, linear, with revolute edges, 1-nerved, glabrous; appendages of corona awl-formed, and exserted. ♄. G. Native of New Spain, in temperate parts, between Valladolid de Mechoacan, and Lake Cuiseo. Leaves 2½ inches long. Flowers size of those of *A. nívea*, white. Follicles solitary from abortion. Umbels about 10-flowered.

Galium-like Swallow-wort. Fl. July, Sept. Shrub.

* * * *Leaves alternate or scattered.*

30 A. lina'ria (Cav. icon. 1. p. 42. t. 57.) stem shrubby? branched?; leaves scattered, approximate, sessile, linear, filiform, acutely mucronate, with revolute edges, smooth, H. B. et Kunth, nov. gen. amer. 3. p. 192; "leaves linear, subulate, channelled; umbels pedunculate, drooping, lateral, many-flowered," Cav. l. c. ♄. G. Native of Mexico, at Chalco, and elsewhere. Flowers white. Appendages of corona clavate, ex Cav.; small, horn-formed, ex Kunth; corona yellowish. Branches downy, ex Kunth. Kunth's character of this plant does not exactly agree with that of Cavanilles.

Linaria-leaved Swallow-wort. Fl. July. Clt. 1802. Pl. 2 ft.

31 A. arma'ta (Spreng. syst. 1. p. 849.) stem suffruticose, beset with retrograde prickles; leaves ovate-oblong, glabrous; peduncles cymose, lateral; horns exserted. ♄. S. Native of New Granada, Bertero.

Armed-stemmed Swallow-wort. Shrub erect.

32 A. lanuginòsa (H. B. et Kunth, nov. gen. amer. 3. p. 193.) stem simple?; leaves alternate, petiolate, ovate-lanceolate, rounded at the base, woolly on both surfaces, white beneath; umbels extra-axillary and terminal, sometimes proliferous; appendages of corona inclosed. ♃. G. Native of Mexico, between Cassava and Pachuca. Herb fetid. Peduncles woolly. Plant downy at top. Flowers about the size of those of *A. Curassávica*, white; segments emarginate.

Woolly Swallow-wort. Pl. 1 to 2 feet.

33 A. ru'bra (Lin. spec. 316.) leaves alternate, ovate, acuminated; umbels compound; stem erect, simple. ♃. H. Native of Virginia. Gron. virg. 27. Flowers red.

Red-flowered Swallow-wort. Fl. July, Aug. Clt. 1825. Pl. 1 to 2 feet.

34 A. tuberòsa (Lin. spec. 316.) stems erectish, divaricately branched at top, very hairy; leaves scattered, oblong-lanceolate, hairy; umbels disposed in a terminal, sub-corymb. ♃. H. Native of North America, in stony, sandy fields, and woods, common. Pursh, 1. p. 184. Ker. bot. reg. 76. Lodd. bot.

cab. 1297.- Dill. elth. t. 30. f. 34. Flowers very showy; corolla and corona bright orange; fructification yellow. Umbels disposed as if they were in a terminal corymb.

Tuberous-rooted Swallow-wort. Fl. June, July. Clt. 1690. Pl. 1 to 2 feet.

35 A. DECU'MBENS (Mill. dict. no. 10. Willd. spec. 1. p. 1218.) stems decumbent, hairy; leaves lanceolate, very hairy; umbels lateral. ♃. H. Native of Carolina, in barren fields. A. tuberòsa, β. decúmbens, Pursh, 1. p. 184. Flowers showy; having the petals and nectaries bright orange-coloured; and the fructification yellow. "Leaves ovate, obtuse, almost sessile, villous; stem decumbent, hairy." Gron. virg. 27.

Decumbent Swallow-wort. Fl. July, Aug. Clt. 1731. Pl. decumbent.

† *Species not sufficiently known.*

36 A. VANÍLLA (Rafin. in amer. month. journ. 4. nov. 1818. p. 39.) stem simple, downy at top; leaves opposite, lanceolate, downy at the base, glabrous, ciliated; umbels axillary, erect. ♃. H. Native of Kentucky, on the banks of the green river. Flowers lilac, having the smell of Vanilla.

Vanilla-scented Swallow-wort. Pl. ?

37 A.? KLAPROTHIA'NA (Rœm. et Schultes, syst. 6. p. 82.) leaves opposite, oblong, acuminated, downy beneath; umbels axillary, few-flowered. ♃. H. Native of North America, Klaproth. A. acuminàta, Willd. reliq. mss. ex Rœm. et Schultes, l. c.

Klaproth's Swallow-wort. Pl. ?

38 A.? REPA'NDA (Gmel. syst. 1. p. 445. ex Schultes, l. c.) leaves revolutely-repand, hairy. ♃. H. Native of? Leaves opposite, with revolute edges.

Repand-leaved Swallow-wort. Pl.

39 A. LU'TEA (Rafin. journ. bot. 1. p. 229.) leaves petiolate, oblong, acute, narrowed at the base; umbels erect; petals procumbent: horns furnished with a subulate appendage. ♃. H. Native of Philadelphia.

Yellow Swallow-wort. Pl. ?

40 A.? MARGARATA'CEA (Hoffmansegg in Willd. reliq. mss. ex Schultes, syst. 6. p. 86.) leaves oblong-lanceolate, acuminated at both ends, glabrous; stem simple; umbels erect, lateral, solitary. ☉. S. Native of Brazil.

Pearl-flowered Swallow-wort. Pl.

41 A.? TRUNCA'TA (Willd. enum. suppl. p. 13. Link. enum. 1. p. 252.) leaves petiolate, opposite, cordate-oblong, acuminated, quite glabrous, whitish beneath. ♄. S. Native country unknown. The flowers of this plant have not been seen.

Truncate Swallow-wort. Clt.? Shrub.

†† *Plants referred to Asclèpias by authors, but none of them evidently belong to the genus. Leaves of all opposite.*

42 A. MUCRONA'TA (Thunb. prod. 1. p. 47. fl. cap. 2. p. 155.) stems erect, herbaceous, hairy; leaves oblong, obtuse, mucronate, glabrous; umbels axillary. ♃. G. Native of the Cape of Good Hope, beyond Kamton's river, and near Krum river. Peduncles shorter than the leaves; pedicels downy.

Mucronate-leaved Swallow-wort. Pl. 1 foot.

43 A. CONVOLVULA'CEA (Willd. spec. 1. p. 1269.) stem twining; leaves roundish-cordate, rather pilose as well as the stems: lobes distant; umbels compound. ♄. ◠. S. Native of Guinea. Very like *A. fœ'tida*. Common peduncles longer than the leaves, pilose.

Convolvulus-like Swallow-wort. Shrub tw.

44 A. FILIFÓRMIS (Lin. suppl. 169. Thunb. prod. 1. p. 47. fl. cap. 2. p. 154.) stem erect; leaves filiform, glabrous; umbels lateral, on long peduncles, 5-6-flowered, length of leaves. ♃. G. Native of the Cape of Good Hope, at Krum river. Margins of leaves revolute. Follicle solitary, elliptic. This and *Cynánchum filifórme* and *Apócynum filifórme* are probably one and the same plant.

Filiform Swallow-wort. Pl. 1 to 2 feet.

45 A. GRAMÍNEA (Lam. dict. 1. p. 283.) stem branched; leaves linear, grassy, glabrous, with revolute edges; horns of corona erect, mucronate. ♃. S. Native of the East Indies. Stem rather angular. Leaves an inch long. Corolla white, with undulated edges. Calyx villous outside.

Grassy-leaved Swallow-wort. Pl. 1 to 2 feet.

46 A. SPIRA'LIS (Forsk. ægypt. p. 49. no. 66.) stem shrubby; leaves petiolate, oval-oblong; flowers solitary, axillary; petals linear, spiral, hairy inside; corona of 5 ovate, erect leaflets, white. ♄. G. Native of Arabia Felix, on the road to Djalia and Meneira, among *Pánicum dichótomum*. Segments of calyx linear-lanceolate. Corolla spreading, with greenish yellow segments, and white corona. Stigma operculate. Follicles edible. Shrub not milky.

Spiral-petalled Swallow-wort. Shrub.

47 A. CANE'SCENS (Willd. nov. act. am. nat. cur. 3. p. 418.) stems ascending at top, but procumbent at the base, downy; leaves ovate, veiny, acute, downy; umbels few-flowered, axillary, on short peduncles; follicles ovate, acuminated, downy. ♃. H. Native of Cappadocia and Galatia. Asclèpias orientàlis, flore viridi, Tourn. cor. 2.—Buxb. cent. 3. p. 17. t. 30. Flowers green.

Canescent Swallow-wort. Pl. procumbent.

48 A. PARVIFLÒRA (Humb. et Bonpl. in Willd. rel. mss. ex Schultes, syst. 6. p. 82.) stems scandent; branches fascicled; leaves elliptic; flowers solitary, terminal. ♄. ◠. S. Native of South America.

Small-flowered Swallow-wort. Shrub tw.

49 A. CLUSIÆFÒLIA (Horsfield, in Willd. rel. mss. ex Schultes, syst. 6. p. 82.) leaves obovate, fleshy: umbels axillary; stems twining. ♄. ◠. S. Native of Java.

Clusia-leaved Swallow-wort. Shrub tw.

50 A. FERRUGÍNEA (Humb. et Bonpl. in Willd. rel. mss. ex Schultes, syst. 6. p. 83.) clothed with rusty hairs; leaves ovate-cordate; stems twining; umbels axillary. ♄. ◠. S. Native of Caraccas.

Rusty Swallow-wort. Shrub tw.

51 A. FORSKŒ'LII (Schultes, syst. 6. p. 85.) twining; corolla campanulate, green, twisted; petals linear. ♃. H. Native of Arabia Felix, at Lohaja. A. nívea, Forsk. ægypt. 51. no. 73. A. nivàlis, Gmel. syst. p. 444.

Forskœl's Swallow-wort. Pl. tw.

52 A. MACROPHY'LLA (Humb. et Bonpl. in Willd. rel. mss. ex Schultes, syst. 6. p. 86.) stems twining; leaves elliptic-cordate, acute; umbels nearly sessile. ♄. ◠. S. Native at Cumana.

Long-leaved Swallow-wort. Shrub tw.

53 A. CYNANCHOÌDES (Humb. et Bonpl. l. c.) leaves oblong-lanceolate, acute, glabrous; umbels terminal. ♄. ◠. S. Native of Caraccas.

Cynanchum-like Swallow-wort. Shrub tw.

54 A. HASTA'TA (Bunge, in mem. acad. petersb. 2. p. 117.) stems twining, glabrous; leaves opposite, petiolate, hastately cordate, acuminated, rather hispid above, and smoothish beneath, the basilar lobes rounded: umbels axillary, pedunculate, many-flowered. ♃. ◠. G. Native of China, on the mountains of Zui-wey-scan. Flowers white, sweet-scented. Perhaps a species of *Dœ'mia*. ?

Hastate-leaved Swallow-wort. Pl. tw.

Cult. *Asclèpias* is a genus of extremely handsome border flowers. They thrive best in peat earth, or light rich soil: they are generally increased by dividing at the root in spring,

and sometimes by seeds. Rare or scarce species should always be grown in peat soil, and have a little protection during severe frost by mulching the roots. The greenhouse and stove species require the same treatment as other common stove and greenhouse plants.

XLII. POLYO'TUS (from πολυς, *polys*, many, and ους ωτος, *ous otos*, an ear; leaflets of corona auriculate at the base). Nutt. in amer. phil. soc. trans. vol. 5. new ser. p. 199.—Aceràtes, Elliott.—Asclèpias species of authors.

Lin. syst. *Pentándria*, *Digýnia*. Corolla rotate, 5-parted, reflexed. Corona simple, 5-parted; segments ovate, concave, without any horn-formed process inside, auriculate at the base. Anthers terminated by a membrane; pollen masses compressed, pendulous, fixed by their tapering apices. Stigma depressed, mutic. Follicles smooth or villous. Seeds comose.—Erect herbs. Leaves scattered, or nearly opposite. Umbels interpetiolar or terminal.

1 P. heterophy'llus (Nutt. l. c.) erect, villous; leaves opposite, oblong-ovate, generally acute; umbels globose, interpetiolar; corona nearly equal to the gynostegium in height. ♃. H. Native of Pennsylvania and Virginia, in dry fields, ex Pursh; and of the Arkansas territory, from Fort Smith to Red River. Asclèpias viridiflòra, Pursh, fl. 1. p. 181. Gomphocárpus viridiflòrus, Spreng. syst. 1. p. 849. Ascl. lanceolàta, Juss. Corolla greenish, with yellowish green corona. Umbels nearly sessile.

Var. β, lanceolàta; leaves from oval to ovate-lanceolate, flat or undulated, downy or smooth. ♃. H. Found at New Haven. Corolla greenish, with a brownish corona.

Variable-leaved Polyotus. Fl. June, July. Pl. 2 to 3 feet?

2 P. lanuginòsus (Nutt. l. c. p. 200.) decumbent, hairy; leaves ovate, scattered; umbels generally solitary, terminal. ♃. H. Native of the Arkansas territory, below the confluence of the White river with the Missouri. Asclèpias lanuginòsus, Nutt. gen. amer. 1. p. 168. Asclèpias Nuttalliàna, Torrey. in ann. lyc. new york, 2. p. 217. Root tuberous. Stem 4-6 inches high. Flowers greenish. A doubtful species, which requires to be examined in a living state.

Woolly Polyotus. Pl. ½ foot, decumbent.

3 P. longifòlius (Nutt. l. c.) puberulous; stems erectish; leaves scattered, long-linear, acute; umbels interpetiolar, pedunculate; corona stipitate, shorter than the gynostegium; follicles villous. ♃. H. Native from Illinois and Missouri to Red river, on the margins of ponds; and in places overflowed by rain in winter. It is also to be found in swamps near the Atlantic sea coast; from Sussex county and Delaware to Georgia. Asclèpias longifòlia, Michx. fl. bor. amer. 1. t. 116. Aceràtes longifòlia, Ell. sketch. bot. p. 317. Asclèpias incarnàta, Walt. fl. car. p. 106. Ascl. floridàna, Lam. dict. 1. p. 284. A. paupércula, Nutt. gen. amer. 1. p. 167. Gomphocárpus longifòlium, Spreng. syst. 1. p. 849. Umbels loose, nearly globose. Leaves 6 inches long, and ½ an inch broad, downy beneath. Flowers small, greenish; petals tipped with obscure purple. Segments of corona oblong, concave, with a purplish line near the base. Fructification yellow.

Long-leaved Polyotus. Fl. Ju. Jul. Clt. 1816. Pl. 2 to 3 ft.

4 P. angustifòlius (Nutt. l. c. p. 201.) stems erect; leaves linear, nearly opposite; umbels interpetiolar, nearly sessile; corona rather longer than the gynostegium, sessile; leaflets of corona tridentate at the apex. ♃. H. Native of the Arkansas territory, in dry prairies, from Fort Smith to the Red River. Stems naked at bottom. Leaves somewhat revolute and scabrous on the edges, acute. Umbels 3-4-8-flowered. Flowers greenish, with a mixture of white. Leaflets of corona concave and auriculate below: having the central tooth of each small. This species is nearly allied to *Gomphocárpus* and *Asclèpias*, particularly to *Ascl. cinèrea*.

Narrow-leaved Polyotus. Pl. 1½ foot.

5 P. obova'tus (Nutt. l. c.) leaves obovate, mucronate, tomentose beneath; umbels almost sessile; corona twice as long as the gynostegium. ♃. H. Native of Georgia. Asclèpias obovàta, Ell. sketch. p. 321. Flowers greenish.

Obovate-leaved Polyotus. Pl.

Cult. For culture and propagation see *Asclèpias*, above.

XLIII. ENSLE'NIA (so named after Aloysius Enslen, an assiduous and practical botanist, patronized in his researches in the United States by Prince Lichtenstein). Nutt. gen. amer. 1. p. 164. and in amer. phil. soc. trans. 5. p. 203.

Lin. syst. *Pentándria*, *Digýnia*. Corolla 5-parted, erect. Corona simple, 5-parted, petaloid, flat, truncate: the segments ending in a bifid thread. Stigma conical, sub-bilamellate. The rest as in *Asclèpias*.—A twining herb. Leaves opposite. Flowers umbellate.

1 E. a'lbida (Nutt. gen. amer. l. c. amer. phil. soc. trans. l. c.). ♃. ◠. H. Native near Fort Smith, and other places along the banks of the Arkansas; found also on the banks of the Potomac, Scioto and Ohio, &c.

Whitish-flowered Enslenia. Pl. tw.

Cult. For culture and propagation see *Asclèpias*, above.

XLIV. GOMPHOCA'RPUS (from γομφος, *gomphos*, a club, and καρπος, *karpos*, a fruit; in reference to the ventricose follicles). R. Br. in mem. wern. soc. 1. p. 37.—Asclèpias species, Lin. and Thunb.

Lin. syst. *Pentándria*, *Digýnia*. Corolla 5-parted, reflexed. Corona seated on the top of the tube of the filaments; 5-leaved; foliola cucullate, furnished with a tooth on both sides, empty inside. Anthers terminated by a membrane; pollen masses compressed, fixed by their tapering tops, pendulous. Stigma depressed, mutic. Follicles ventricose, echinated by soft spines. Seeds comose.—Erect shrubs or subshrubs, natives of South Africa. Leaves opposite, with usually revolute edges. Umbels interpetiolar.

1 G. arbore'scens (R. Br. l. c. p. 38. and in Hort. kew. ed. 2. vol. 2. p. 79.) stem villous, branched; leaves ovate-oblong, glabrous, with an acumen. ♄. G. Native of the Cape of Good Hope. Asclèpias arboréscens, Lin. mant. 216. Willd. spec. 1. p. 1271. Thunb. fl. cap. 2. p. 156. Jacq. schœnbr. 1. p. 25. t. 50. Asclèpias crassifòlia, Hort. par. Asclèpias pubéscens, Lin. mant. 215. exclusive of the synonymes which belong to *G. crispa*.—Burm. afr. 31. t. 13.—Pluk. amalth. 18. t. 359. f. 3. Peduncles, pedicels, and calyxes villous. Corollas white, glabrous.

Arborescent Gomphocarpus. Fl. Dec. Clt. 1714. Shrub 4 to 6 feet.

2 G. fruticòsus (R. Br. l. c.) stem downy; leaves linear-lanceolate, glabrous. ♄. G. Native of the Cape of Good Hope, beyond the first range of mountains, abundant. Sims, bot. mag. 1628. Asclèpias fruticòsa, Lin. spec. 313. Thunb. fl. cap. 2. p. 154. A. glàbra, Mill. dict. no. 12. fig. 45. Apócynum salicifòlium, Medic. act. parl.—Herm. par. 23. t. 24. Plukn. alm. 36. t. 138. f. 2.—Asclèpias crassifòlia, Lin. syst. p. 214. Branches slender. Leaves 4-5 inches long and an inch broad. Flowers white. Peduncles and pedicels downy.

Shrubby Gomphocarpus. Fl. June, Sept. Clt. 1714. Sh. 5 to 7 feet.

3 G. setòsus (R. Br. l. c.) branches villous; leaves glabrous. ♄. G. Native of Arabia Felix. Asclèpias setòsus, Vahl, symb. 1. p. 23. t. 8. Forsk. desc. p. 51. Leaves an inch

long. Peduncles and pedicels villous. Flowers green. Follicles bristly.

Bristly Gomphocarpus. Shrub.

4 G. crísPUS (R. Br. l. c.) branches downy; leaves lanceolate-cordate, undulated, hispid. ♄. G. Native of the Cape of Good Hope. Asclèpias críspa, Lin. suppl. 170. mant. 215. Thunb. prod. 1. p. 47. fl. cap. 2. p. 154.—Commel. rar. t. 17. —Pluk. phyt. t. 139. f. 1.—Mor. hist. sect. 15. t. 3. f. 37. Peduncles and calyxes pilose. Flowers greenish yellow. Lam. Umbels solitary, terminal, pedunculate, purple, ex Lin.

Curled-leaved Gomphocarpus. Fl. July. Clt. 1714. Shrub 1 to 2 feet.

5 G. angustifòlius (Link, enum. 1. p. 251.) stem erect, downy; leaves linear-lanceolate, flat, glabrous. ♄. G. Native of Mexico. Asclèpias angustifòlia, Willd. enum. 13. Schultes, syst. 6. p. 70. Asclèpias lineàris, Hort. Leaves 2 inches long. Umbels dense, terminal, or nearly so. Corolla small, flesh-coloured or white.

Narrow-leaved Gomphocarpus. Fl. July, Aug. Clt. 1817. Shrub 2 to 3 feet.

Cult. These are very elegant shrubs when in blossom. They are of easy culture, growing most freely in a light soil; and are increased by seed, which ripen in abundance.

XLV. OTA'RIA (from *ους ωτος, ous otos*, an ear; the leaves of the corona are biauriculate at the base). Kunth, nov. gen. amer. 3. p. 149.—Asclèpias auriculàta, H. B. et Kunth, l. c.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted. Corolla 5-parted, reflexed. Corona 5-leaved, seated on the upper part of the tube of the filaments; leaflets cucullate, each running from the bottom into a horn-formed process, biauriculate on the inside at the base. Anthers terminated by a membrane; pollen masses compressed, fixed by the tapering apices, pendulous. Stigma concave, mutic.—An erect, herbaceous plant. Leaves opposite, petiolate, reticulately veined, membranous. Umbels interpetiolar. Flowers greenish yellow.

1 O. auricula'ta. ♃. G. Native of Mexico, near Ario, in groves. Asclèpias auriculàta, H. B. et Kunth, nov. gen. amer. 3. p. 149. t. 228. Branches terete, downy. Leaves oblong, acute, rounded at the base, flat, membranous, glabrous. Umbels involucrated by many downy bracteas. Style pilose at top.

Auricled Otaria. Pl. 3 to 4 feet.

Cult. For culture and propagation see *Gomphocárpus*, above.

XLVI. OXYSTE'LMA (from *οξυς, oxys*, sharp, and *στελμα, stelma*, a crown; in reference to the foliola of corona being acute). R. Br. in wern. mem. 1. p. 40. prod. fl. nov. holl. p. 462.—Periploca species, Roxb.

Lin. syst. *Pentándria, Digynia.* Corolla rotate, spreading. Column exserted. Stamineous corona 5-leaved; leaflets acute, undivided. Anthers terminated by a membrane. Pollen masses compressed, fixed by their attenuated apices, pendulous. Stigma mutic. Follicles smooth. Seeds comose.—Suffruticose, twining, glabrous shrubs. Leaves opposite. Racemes or umbels interpetiolar.

1 O. escule'ntum (R. Br. l. c.) leaves linear-lanceolate, veiny, smooth; racemes longer than the leaves; corolla fringed with hairs; follicles oblong, acuminated. ♃. ◠. S. Native of the East Indies, in hedges, and amongst bushes on the banks of water courses. Periploca esculénta, Lin. suppl. 168. Roxb. cor. 1. p. 13. t. 11. Asclèpias ròsea, Roxb. fl. ind. 2. p. 40. —Pluk. alm. 19. t. 359. f. 6. Root composed of filiform fibres. Leaves deciduous during the dry season, 4-6 inches long. Flowers large, beautiful white, with a tinge of rose colour. Roxburgh does not find that the natives ever eat any part of this plant; but cattle, however, eat it. It is the *Dooghdika* of the Sanscrit, see Jones, asiat. res. 4. p. 268.

Esculent Oxystelma. Clt. 1816. Shrub tw.

2 O. Wallíchii (Wight, contrib. ind. bot. p. 54.) leaves narrow, linear-lanceolate; margins of corolla ciliated; follicles short, oval, obtuse. ♄. ◠. S. Native of the East Indies, on the banks of the Ganges and Irawaddi; and of the province of Tanjore, near Pathacottah. This is very nearly allied to *O. esculéntum*, only differing in the sharper and shorter follicles.

Wallich's Oxystelma. Shrub tw.

3 O. carnòsum (R. Br. prod. 462.) leaves fleshy, suboval, mucronate, glabrous; fascicles of flowers umbel-formed, pedunculate; segments of corolla linear. ♄. ◠. S. Native of New Holland, within the tropic. This species differs considerably from the rest, both in the form of the corolla, and in that of its corona.

Fleshy-leaved Oxystelma. Shrub tw.

4 O. Zippelia'num (Blum. bijdr. p. 1053.) leaves narrow-linear-lanceolate, cuspidate, smoothish; peduncles 2-3-flowered at the apex; corolla having the base and margin bearded. ♄. ◠. S. Native of Java, about Batavia, collected in the gardens of Zippeli.

Zippeli's Oxystelma. Fl. Oct. Shrub tw.

5 O. Hooperia'num (Blum. bijdr. p. 1053.) leaves cordate, acuminated, smoothish; fascicles many-flowered; corolla glabrous. ♄. ◠. S. Native of Java, about Kuripan, in the garden of James Hooper; and at the foot of Mount Salak, where it is called *Aroy tjapu tuhur*.

Hooper's Oxystelma. Fl. year. Shrub tw.

6 O. Bornoue'nse (R. Br. in append. to Clapp. and Denh. trav. p. 34.) flowers racemose; segments of corolla semi-ovate; follicles inflated; leaves lanceolate, cordate at base. ♄. ◠. G. Native of north Africa, in Bornou. This species differs from *O. esculénta* in the inflated follicles, and in the leaves being cordate at the base.

Bornou Oxystelma. Pl. tw.

Cult. For culture and propagation see *Oxypétalum*, p. 148.

XLVII. IPHI'SIA (meaning unknown to us). Wight and Arnott, contrib. ind. bot. p. 52.

Lin. syst. *Pentándria, Dygýnia.* Corolla rotate, 5-cleft. Stamineous corona 5-leaved; leaflets fleshy, suddenly narrowed to the apex. Anthers terminated by a membrane; pollen masses ventricose, fixed by their tops to the extremities of ascending, filiform appendiculi, or retinacula, pendulous. Stigma mutic. Follicles smooth, attenuated at the apex, glabrous. Seeds comose.—Erectish or twining herbs or subshrubs. Leaves opposite. Flowers small. Umbels interpetiolar, simple, aggregate, or almost sessile at the bends of the peduncles. This genus is very nearly related to *Tylóphora*, both in habit and structure of the flowers, but is separated on account of the truly pendulous pollen masses.

1 I. multiflòra (Wight and Arnott, l. c.) suffruticose, twining, glabrous; leaves oval, cuspidately-acuminated, petiolate; umbels sessile at the flexures of the common peduncle, disposed alternately; segments of corolla short; retinacula or appendiculi elongated, bent upwards at the base and downwards at the apex. ♄. ◠. G. Native of the Neelghery mountains.

Many-flowered Iphisia. Shrub tw.

2 I. Gova'nii (Wight, contrib. ind. bot. p. 52.) erectish; leaves almost sessile from broad, oval, acuminated, to lanceolate acute; umbels simple, aggregate, few-flowered; pedicels as long as the peduncles; segments of corolla lanceolate, glabrous inside and hairy outside; retinacula or appendiculi short, at first erectish. ♄. G. Native of the Himalaiah.

Govan's Iphisia. Shrub or herb.?
Cult. For culture and propagation see *Calótropis*, p. 147.

XLVIII. PENTA'TROPIS (from πεντε, *pente*, five, and τροπις, *tropis*, a keel). R. Br. in Salt. trav. append. ex Wight and Arnott, contrib. ind. bot. p. 52.—Asclèpias microphýlla, Roxb.

Lin. syst. *Pentándria*, *Digýnia*. Corolla rotate, 5-cleft. Stamineous corona 5-leaved; leaflets opposite the anthers, adnate vertically to the gynostegium, averse, loose or free at apex; pollen masses ventricose, pendulous, fixed beneath their tops. Stigma mutic. Follicles smooth. Seeds comose.—Twining subshrubs. Leaves rather fleshy, flat. Umbels interpetiolar, few-flowered, almost sessile. Follicles obsoletely trigonal, flattish on one side.

1 P. microphy'lla (Wight and Arnott, l. c.) twining, glabrous; leaves rather fleshy, ovate, mucronate, rounded at the base or subcordate; umbels almost sessile, few-flowered; pedicels long-filiform; calyx minute; corolla spreadingly reflexed; segments acute; leaflets of corona broad, averse at the base, cuspidate and incurved at the apex, equal to the gynostegium. ♄. ⌒. S. Native of Coromandel and Bengal, on argillaceous banks of rivers; particularly the river called Yamuna, in Bengal. Asclèpias microphýlla, Roxb. fl. ind. 2. p. 35. Schultes, syst. 6. p. 85. Asclep. tenuiflòra, Roxb. mus. ind. or. t. 610. Oxystélma caudàta, Ham. herb. Wall. ascl. no. 110.—Asclep. alexiàca, Jacq. may be this plant, but the figure in Rheed. mal. 9. t. 13., to which he refers his plant, has no affinity with this. Roxburgh supposes that synonyme to be *Tylóphora asthmática*, but there are many obvious reasons against that affinity.

Small-leaved Pentatropis. Shrub tw.

2 P. cynanchoìdes (R. Br. in append. to Salt. trav.) ♄. ⌒. G. Native of Abyssinia. We know nothing of this plant but the name.

Cynanchum-like Pentatropis. Shrub tw.
Cult. For culture and propagation see *Oxypétalum*, p. 148.

XLIX. RAPHISTE'MMA (from ῥαφις, *raphis*, a needle, and στεμμα, *stemma*, a crown; in reference to the narrow, elongated leaflets of the corona). Wall. pl. asiat. rar. 2. p. 40. t. 163. Wight and Arn. contrib. ind. bot. p. 54.—Asclèpias pulchélla, Roxb.

Lin. syst. *Pentándria*, *Digýnia*. Corolla campanulate; limb 5-parted; staminal corona 5-leaved: leaflets compressed, elongated. Anthers terminated by a membrane; pollen masses fixed beneath their apexes, pendulous. Stigma bluntly conical. Follicles solitary by abortion, somewhat ventricose. Seeds comose.—A glabrous twining shrub. Leaves largish, cordate. Flowers white, corymbose. Corona exserted, equal to the limb of the corolla. This genus, Dr. Wallich suggests, is very nearly allied to *Kanàhia*, the difference appearing more in habit and country than any character afforded by the flower.

1 R. pulche'llum (Wall. l. c. t. 163.). ♄. ⌒. S. Native of Silhet, Gualpara, Tavoy, Pegu, near Rangoon. Asclèpias pulchélla, Roxb. fl. ind. 2. p. 54. Pergulària? campanulàta, Hamilt. herb. Flowers large.

Neat Raphistemma. Shrub tw.
Cult. For culture and propagation see *Oxypetalum*, p. 148.

L. UROSTE'LMA (from ουρα, *oura*, a tail, and στελμα, *stelma*, a crown; in reference to the tails of the gynostegium). Bunge, in mem. acad. petersb. 2. p. 118.

Lin. syst. *Pentándria*, *Digy'nia*. Calyx 5-parted; with lanceolate, acute segments. Corolla campanulate, deeply 5-cleft; segments villous inside, and at length revolute. Corona simple, shortly 5-lobed: lobes obtuse; gynostegium furnished with 5 membranous processes, and each of these processes is furnished with a long filiform appendage, which is pentagonal at the base. Pollen masses twin, solid, pendulous. Follicles muricated. Seeds comose.—A scandent or twining plant. Leaves cordate, waved, acuminated. Racemes axillary, pedunculate. Flowers pale, dirty reddish white.

1 U. Chine'nse (Bunge, l. c.). ♄. ⌒. G. Native of China.
China Urostelma. Pl. tw.
Cult. For culture and propagation see *Oxypétalum*, p. 148.

LI. ANA'NTHERIX (from α, priv. and ανθερις, *antherix*, an awn; there are no horn-formed processes from the base of the leaflets of the corona, as in *Asclèpias*). Nutt. gen. amer. 1. p. 169. and in amer. phil. soc. trans. 5. p. 201.—Asclèpias species of authors.

Lin. syst. *Pentándria*, *Digýnia*. Corolla subcampanulate, 5-cleft. Corona simple, 5-lobed; lobes compressed, empty inside (not furnished with a horn-formed process, as in *Asclèpias*), incurved, furnished with a little segment inside, longer than the gynostegium, which is sometimes pedicellate. The rest as in *Asclèpias*.—Erect, herbaceous plants. Leaves alternate or opposite, sometimes subverticillate, and the axils sometimes spinulose. Flowers large, umbellate, or panicled, terminal. Follicles muricated or smooth. This genus is very nearly allied to *Calótropis*, but differs essentially in the insertion of the corona, and in the form and character of its segments.

Sect. I. Lepiste'lma (from λεπις, *lepis*, a scale; and στελμα, *stelma*, a crown; in reference to the scales inside the corona). Segments of corona furnished each with a little scale or segment inside. Gynostegium sessile. Follicles usually muricated.

1 A. víridis (Nutt. gen. amer. 1. p. 169. amer. phil. soc. trans. 5. p. 201.) leaves opposite, sessile, obovate-oblong, mucronulate, smoothish; umbels cauline, subpanicled, few-flowered; segments of corona very long. ♃. H. Native of the Arkansas territory, in damp pine barrens, near St. Mary's; and Carolina. Asclèpias víridis? Walt. fl. car. p. 107. Ascl. connìvens, Baldw. in Ell. sketch. p. 320. Podostígma víridis, Ell. sketch. 327. Gomphocárpus víridis, Spreng. syst. 1. p. 849. Corolla green. Corona purplish; fructification white.

Green-flowered Anantherix. Fl. Aug. Sept. Clt. 1812. Pl. ½ to 1 foot.

2 A. panicula'tus (Nutt. in amer. phil. soc. trans. 5. p. 203.) leaves scattered, ovate-oblong, bluntish, mucronulate; umbels divided, subpanicled; corona one half shorter than the corolla; follicles muricated. ♃. H. Native of the Arkansas territory, in cedar swamps, near Fort Smith; and also near the Red river. Asclèpias víridis, Walt. fl. carol. p. 137. Pursh, fl. 1. p. 183. Stem angular. Leaves scabrous on the margins, 4-5 inches long, and 1-1½ broad. Umbels several, terminal. Corolla yellowish-green. Corona variegated with purple and white.

Panicled-flowered Anantherix. Pl. 1 to 2 feet.

3 A. decu'mbens (Nutt. l. c.) leaves scattered, nearly opposite, ovate-lanceolate, very long, acute; umbels nearly globose, terminal; corona about equal in length to the corolla. ♃. H. Native of the Arkansas territory, on dry hills, near the confluence of the Kiamesha with the Red river. Stem rather angular, 1 to 1½ inches long. Leaves scabrous on the edges, Umbels solitary. Peduncles downy. Corolla greenish. Corona brownish. Follicles muricated.

Decumbent Anantherix. Pl. decumbent.

Sect. II. Styla'ndra (from στυλος, *stylos*, a column, and ανηρ ανδρος, *aner andros*, a male; in reference to the gynostegium being pedicellate). Nutt. in amer. phil. soc. trans. 5. p. 203. Segments of corona destitute of the little segment

inside. Column of fructification or gynostegium pedicellate. Follicles smooth.

4 A. pu'milus (Nutt. in amer. phil. soc. trans. 5. p. 203.) leaves linear, nearly opposite, sessile; segments of corolla almost 3 times longer than the corona. ♃. H. Native of Georgia, in pine barrens, in Effingham county, Elliott; near St. Mary's, Balwyn; near Charleston, Fraser; on dry sandy fields, South Carolina, Walter; near Fort Barrington, Lyon. Stylándra pùmila, Nutt. gen. amer. 1. p. 170. Podostígma pubéscens, Ell. sketch. 1. p. 326. Asclèpias pedicellàta, Walt. fl. car. p. 106. Pursh, fl. 1. p. 182. Leaves downy, rough from dots above. Segments of corona lunulate. Flowers greenish yellow. Plant 3 inches high.

Dwarf Anantherix. Fl. June, Aug. Clt. 1824. Pl. $\frac{1}{4}$ ft.

5 A. Bu'ngei; stems simple, erect, glabrous; leaves opposite, lanceolate-linear, acute, glabrous beneath; but having the margins rather hispid above; panicle terminal, dichotomous, loose, many-flowered. ♃. H. Native of China, at the foot of the mountains near Lun-zuan-ssy. Asclèpias paniculàta, Bunge, in mem. acad. petersb. 2. p. 117. Petals oblong, bluntish, greenish, glabrous. Cuculi concave, obtuse.

Bunge's Anantherix. Pl. $\frac{1}{2}$ foot.?

† *Doubtful species.*

6 A. Torreya'nus; leaves ovate. ♃. H. Native of North America, among the Rocky Mountains. Anántherix, nov. spec. Nutt. mss. ex Torrey. ann. lyc. new york, 2. p. 219.

Torrey's Anantherix. Pl.?

7 A. Nuttallia'nus; leaves linear-lanceolate, obtuse at the base, petiolate. ♃. H. Native along with the preceding. Anántherix, nov. spec. Nutt. mss. ex Torrey. l. c.

Nuttall's Anantherix. Pl.?

Cult. For culture and propagation see *Asclèpias*, p. 142.

LII. XYSMALO'BIUM (*ξυσμα, xysma*, a thread, and *λοβος, lobos*, a pod; in reference to the follicles being clothed with ramenta). R. Br. in mem. wern. soc. 1. p. 38.—Asclèpias spec. Lin. and Thunb.

Lin. syst. *Pentándria, Digýnia.* Corolla 5-cleft, spreading. Stamineous corona seated on the top of the tube of the filaments, in a simple series of 10 parts; 5 of the segments or parts are fleshy, roundish, naked inside, and opposite the anthers, the other 5 are small. Anthers terminated by a membrane; pollen masses compressed, fixed by their apexes, pendulous, with broadish connecting processes. Stigma mutic. Follicles ventricose, ramentaceous. Seeds comose—Erect shrubs, natives of south Africa. Leaves opposite. Umbels interpetiolar. Flowers largish: having the limb sometimes bearded.

1 X. undula'tum (R. Br. l. c.) stems villous, simple; leaves sessile, oblong-lanceolate, undulated, glabrous; petals ciliated. ♄. G. Native of the Cape of Good Hope, on hills, about Paradys, in Kamanasie, and elsewhere. Asclèpias undulàta, Lin. spec. 312. Thunb. prod. 1. p. 47. fl. cap. 2. p. 155. Asclèpias ciliàta, Lin. syst. ed. 15. p. 271.—Commel. rar. t. 16. Lower leaves a span long. Umbels frequently sessile. Corolla bearded, "greenish," ex Lam.

Waved-leaved Xysmalobium. Fl. July. Clt. 1783. Shrub 1 to 2 feet.

2 X. grandiflòrum (R. Br. l. c.) stems simple, hairy; leaves petiolate, oblong, hairy; umbels pedunculate. ♄. G. Native of the Cape of Good Hope, in Kamanasie and elsewhere. Asclèpias grandiflòra, Lin. suppl. p. 170. Thunb. prod. 1. p. 47. fl. cap. 2. p. 156. Leaves 2 inches long. Flowers large, checquered like those of *Fritillària melèagris*, ex Lin.; large, glabrous, variegated with purple, ex Thunb.

Great-flowered Xysmalobium. Shrub 1 foot.

Cult. For culture and propagation see *Gomphocárpus*, p. 144.

LIII. CALO'TROPIS (from *καλος, kalos*, beautiful, and *τροπις, tropis*, a keel; the flowers are beautiful, and the leaflets of the corona are keeled). R. Br. in mem. wern. soc. 1. p. 39.—Asclèpias species of Lin. and Roxb.

Lin. syst. *Pentándria, Digýnia.* Corolla subcampanulate, with an angular tube; angles saccate; limb 5-parted. Stamineous corona 5-leaved: leaflets keel-formed, length of the tube of the filaments (gynostegium), and adnate to it, recurved at the base. Anthers terminated by a membrane; pollen masses compressed, fixed by their tapering apexes, pendulous. Stigma mutic. Follicles ventricose, smooth. Seeds comose.—Erect, glabrous shrubs, natives of the East Indies, Africa, and Persia. Leaves broad, opposite. Umbels interpetiolar. Flowers large, showy.

§ 1. *Leaves almost sessile, cuneate-oblong or broad-ovate, retuse, or subcordate at the base.*

1 C. proce'ra (R. Br. in hort. kew. ed. 2. vol. 2. p. 78.) leaves obovate-oblong, on short petioles, whitish from wool; segments of corolla spreading. ♄. S. Native of Persia. Asclèpias procèra, Ait. hort. kew. ed. 1. vol. 1. p. 305. Willd. spec. 1. p. 1263. Schneevogt. icon. t. 18. Asclèpias gigantèa, Andr. bot. rep. t. 271. Lam. dict. 1. p. 280.—Badelsar, Alp. egypt. 85. t. 86. and Zja Rack, Brun. trav. 315. t. 184. probably belongs to the present plant. Corollas white; petals marked at top by a purple spot.

Tall Calotropis. Fl. July, Sept. Clt. 1714. Shrub 6 feet.

2 C. gigante'a (R. Br. l. c.) shrub hoary; leaves stem-clasping, oblong-ovate, downy beneath; segments of corolla reflexed, with revolute edges; corona shorter than the gynostegium, obtuse, circinnately recurved at the base; incurved and subtridentate at the apex. ♄. S. Native of the East Indies, common; and now become almost indigenous to South America and Africa; as we have seen it growing in great profusion on rocks in St. Jago, and in sand about the Gambia, Senegal, and the island of Goree. Asclèpias gigantèa, Lin. spec. p. 312.? Ait. hort. kew. ed. 1. vol. 1. p. 305. Willd. spec. 1. p. 1264. Roxb. fl. ind. 2. p. 30. Jacq. obs. 3. p. 17. t. 69. Asclèpias gigantèa *β*, Lam. dict. 1. p. 280.—Seb. thes. 1. p. 41. t. 26. f. 1. Erìcu, Rheed. mal. 2. p. 53. t. 31. Madòrus, Rumph. amb. 7. t. 14. f. 1. Bark ash-coloured; young shoots covered by soft woolly down. Leaves decussate, broad, wedge-shaped, bearded on the upper side at the base, pretty smooth on the upper surface, but clothed with woolly down on the under side, 4-6 inches long, and 2-3 broad. Umbels sometimes, though rarely, compound, surrounded by several involucral scales. Flowers beautiful, a mixture of rose colour and purple. *Nella jeberoo* is the Telinga name of this plant, *Urku* the Sanscrit name, and *Aknnea* the Bengalese name. The milky juice which flows from this plant when wounded is applied to various medicinal purposes by the natives; besides which they employ the plant itself, and preparations thereof, to cure all kinds of fits, epileptic, convulsive, spasmodic, and paralytic, as well as poisonous bites and venereal complaints. A fine sort of silky flax is prepared from the young shoots in some places. A large species of gryllus feed upon the leaves. It is the Mador and Mudor plant, from which the late Dr. Duncan, of Edinburgh, obtained that singular substance called Mudarine, which possesses the property of congealing by heat, and becoming again fluid on exposure to cold.

Var. β; albiflòra; flowers white. ♄. S. Native of the East Indies, along with the species. Belèricu, Rheed. mal. l. c, *Zella Jeeleereo* of the Telingas; *Swetakind* of the Bengalese, and *Ulurka* in Sanscrit.

Giant Calotropis. Fl. Jul. Sept. Clt. 1690. Sh. 6 to 10 ft.

3 C. Hamiltònii (Wight. contrib. ind. bot. p. 53.) segments of corolla erect; leaflets of corona equal in length to the gynos-

tegium, acuminated at the base and recurved, but bipartite and spreading at the apex. ♄. S. Native of the East Indies, in various parts. C. procèra, Ham. in Lin. trans. 14. p. 426. exclusive of the synonyms. Wall. ascl. no. 92. Asclèpias Madàre, Hort. bot. calc. The Persian *C. procèra* is quite distinct from the Indian one.

Hamilton's Calotropis. Shrub 6 to 10 feet.

4 C. Wallíchii (Wight. l. c.) segments of corolla spreading; leaflets of corona exceeding the gynostegium, obtuse at the base, and recurved, but incurvedly 2-lobed above the stigma at the apex. ♄. S. Native of the East Indies, at Melloon. C. gigantèa, Wall. ascl. no. 91. b. In addition to the above marks of distinction, this differs in habit from all the preceding species; the flowers are in loose, long-peduncled panicles, in place of contracted cymes or umbels.

Wallich's Calotropis. Shrub.

5 C. heterophy'lla (Wall. ascl. no. 91. a.) segments of corolla erectish; leaflets of corona equal in length to the gynostegium, obtuse and recurved at the base, having the margins lying on the top of the stigma, 2-lobed: lobes thickish, subdiverging. ♄. S. Native on the banks of the Irrawaddi. The flowers are smaller than in other species, and are disposed in small, compact, long-peduncled umbels.

Various-leaved Calotropis. Shrub.

§ 2. *Leaves petiolate, cuneate, or elliptic-oblong.*

6 C. Sussue'la; succulent and smooth; leaves petiolate, oblong, acuminated; umbels few-flowered; corolla flat, fleshy; corona short. ♄. S. Native of the Moluccas. Asclèpias Sussuèla, Roxb. fl. ind. 2. p. 31. Coròna Ariádnes, Rumph. amb. 5. t. 182. Corolla nearly 3 inches in diameter when fully expanded, ex Roxb.

Sussuela Calotropis. Shrub.

7 C. herba'cea; herbaceous, erect, smooth; leaves petiolate, oblong; umbels compound; corolla with a globular tube, which incloses the corona; segments or petals triangular, spreading; leaflets of corona shorter than the gynostegium, acute, and spreadingly recurved at the base, but tridentate at the apex, and lying upon the gynostegium. ♃. S. Native of the interior parts of Bengal. Padmarka, Jones, asiat. res. 4. p. 267. Stems nearly simple. Young shoots green. Leaves pale green, paler beneath, furnished with a few bristly glands on the middle nerve on the upper side at the base. Peduncles longer than the pedicels, mixed with subulate bracteas. Flowers large, a mixture of purple, red, and white Very like *C. gigantèa*. Root woody.

Herbaceous Calotropis. Pl. 2 to 3 feet.

Cult. All the species of *Calótropis* bear handsome, large flowers, and on that account are worth cultivating in every collection of stove plants. A mixture of loam, sand, and peat, is a good soil for them; and young cuttings, thinly planted in a pot filled with sand, strike root freely under a hand-glass, in heat. If care is not taken with them, they are very liable to rot, as the least injury causes them to decay.

LIV. OXYPE'TALUM (from *οξυς, oxys*, sharp, and *πεταλον, petalon*, a petal; in reference to the long, sharp-pointed petals). R. Br. mem. wern. soc. 1. p. 41. H. B. et Kunth, nov. gen. amer. 3. p. 197. Mart. nov. gen. bras. 1. p. 48.—Gothofrèda, Vent. choix. p. 7. t. 60.

Lin. syst. *Pentándria, Digýnia.* Corolla with a short ventricose tube, and a 5-parted limb (f. 19. *c.*); segments ligulate at top (f. 19. *c.*). Stamineous corona 5-leaved; leaflets roundish, simple, fleshy (f. 19. *f.*). Anthers terminated by a membrane; pollen masses linear, pendulous, fixed to the curvitures of the processes, at length ascending. Stigma terminated by an elongated, bipartite acumen (f. 19. *e.*). Follicles unknown.—Twining shrubs, natives of South America. Leaves opposite. Umbels interpetiolar, subcorymbose or cymose. Flowers sweet-scented.

* *Twining shrubs.*

1 O. Ba'nksii (Schultes, syst. 6. p. 91. Mart. nov. gen. bras. 1. p. 48. t. 29.) twining; leaves ovate-cordate, downy; peduncles many-flowered, subcorymbose; segments of corolla linear-lanceolate, acuminated, reflexed; leaflets of corona roundish; retinacula of anthers naked at top. ♄. ⌒. S. Native of Brazil, near Rio Janeiro, where it was first discovered by Sir Joseph Banks in 1768. Corolla yellowish, or cream-coloured; segments much longer than the tube.

Banks's Oxypetalum. Shrub tw.

2 O. appendicula'tum (Mart. l. c. p. 48. t. 30.) twining; leaves ovate, acuminated, cordate, downy; peduncles cymose, usually 4-flowered; segments of corolla narrow-lanceolate, acute, erectly spreading; leaflets of corona roundish; retinacula of anthers furnished with a membranous appendage at apex. ♄. ⌒. S. Native of Brazil, in the province of Minas Geraes, among bushes, near Lagoa, between St. Joao d'El Rey and Villa Rica. Flowers pale yellow.

Appendiculate-flowered Oxypetalum. Clt. 1823. Sh. tw.

3 O. ripa'rium (H. B. et Kunth, nov. gen. amer. 3. p. 154. t. 231. Mart. l. c. p. 49.) twining; leaves ovate, cordate, acuminated, downy; peduncles 2-6-flowered, subcorymbose; segments of corolla long-linear; leaflets of corona emarginately 2-lobed; retinacula of anthers naked at top. ♄. ⌒. S. Native of New Granada, on the banks of the river Mayo, near Mamendoy; Mexico at Misantla; also of Brazil, in the province of Minas Geraes, near St. Joao Baptista. Corollas cream-coloured, or pale yellow. (f. 19.)

FIG. 19.

River-side Oxypetalum. Shrub tw.

4 O. monta'num (Mart. l. c. p. 49.) twining; leaves lanceolate, acute, petiolate; peduncles many-flowered, cymose; petals linear, erect, reflexed at top; leaflets of corona acute; retinacula of anthers sagittately dilated at top. ♄. ⌒. S. Native of Brazil, on the top of Mount Itambe da Villa do Principe. Flowers cream-coloured.

Mountain Oxypetalum. Shrub tw.

5 O. Berteria'num (Spreng. syst. 1. p. 850. add. p. 111.) leaves elliptic, mucronate, downy; cymes lateral, crowded; flowers small. ♄. ⌒. S.. Native of New Granada, Bertero.

Bertero's Oxypetalum. Shrub tw.

6 O. Megapota'micum (Spreng. syst. add. p. 111.) twining; leaves cordate-lanceolate, acuminated, smooth; peduncles cymose, clothed with hoary down. ♄. ⌒. S. Native of Brazil, at Rio Grande.

Rio Grande Oxypetalum. Shrub tw.

7 O. Gothofre'da (Schultes, syst. 6. p. 92.) twining; leaves cordate, ovate, tomentose; racemes few-flowered, axillary and terminal; segments of corolla lanceolate, acute, 4 times longer than the tube. ♄. ⌒. S. Native of New Spain, at Santa Fe de Bogota. Gothofrèda cordifòlia, Vent. choix, p. 7. t. 60. Glands solitary at the base of the petioles.

Gothofreda's Oxypetalum. Shrub tw.

* * *Erect shrubs.*

8 O. foliòsum (Mart. l. c. p. 50.) villous; stems erect, her-

baceous; leaves approximate, nearly sessile, ovate-cordate, acute; peduncles many-flowered, cymosely corymbose, approximate towards the tops of the branches; segments of corolla erect, linear, acute; leaflets of corona emarginately 2-lobed; retinacula of anthers naked at top. ♃. S. Native of Brazil. Corolla cream-coloured, with a violaceous base. Corona rose-coloured.

Leafy Oxypetalum. Shrub erect.

9 O. ERE'CTUM (Mart. l. c.) stems erect, herbaceous; leaves ovate-cordate, acute, downy; peduncles 1-flowered; segments of corolla linear-lanceolate, spreading; leaflets of corona emarginately bidentate; retinacula of anthers naked. ♃. S. Native of Brazil, in the province of Minas Geraes, in fields at Capao and Villa Rica. Corollas cream-coloured.

Erect Oxypetalum. Pl. erect.

10 O. STRÍCTUM (Mart. l. c.) stem erect, herbaceous, straight; leaves lanceolate, cordate, almost sessile; segments of corolla lanceolate, acute; leaflets of corona profoundly bifid; membranes of anthers elongated, but the retinacula are naked. ♄. S. Native of Brazil, in fields, at the river Paraopeba, between St. Joao d'El Rey, and Villa Rica. Corolla yellow. Corona white.

Straight Oxypetalum. Pl. erect.

11 O. CAPITA'TUM (Mart. l. c.) stem herbaceous, erect; leaves lanceolate, acute, villous; flowers crowded, in globose umbels; leaflets of corona bifid; retinacula naked. ♃. S. Native of the Brazils, in the Mine provinces, near Contendas, in St. Philip. Flowers pale yellow.?

Capitate-flowered Oxypetalum. Pl. erect.

Cult. The species answer well for training up the rafters, in a stove, or warm part of a greenhouse. A mixture of loam, sand, and peat, or any light rich soil, suits them well; and cuttings strike root freely in sand, under a hand-glass, in heat.

LV. SCHUBE'RTIA (named after H. B. Schubert, a professor at Erlang). Mart. nov. gen. bras. 1. p. 55.

Lin. syst. *Pentándria, Digýnia.* Corolla funnel-shaped; tube gibbous at the base; limb 5-parted, spreading. Stamineous corona inclosed in the tube, 5-leaved; leaves adnate to the tube of the filaments, lanceolate, connivent. Anthers terminated by a membrane; pollen masses pendulous, fixed by their attenuated apexes. Stigma turbinate, plano-convex at top. Follicles? Seeds comose.—Twining hairy shrubs, natives of South America, in shady places. Leaves opposite, petiolate, cordate. Umbels pedunculate, interpetiolar. Corollas rather fleshy, usually bearded inside.

1 S. MULTIFLÒRA (Mart. l. c. p. 56. t. 33.) leaves cordate-obovate, acute; umbels many-flowered; tube of corolla glabrous inside, shorter than the segments, which are linear. ♄. ◠. S. Native of Brazil, in shady places, among granite rocks, in the province of Pernambuco. Cynánchum multiflòrum, Spreng. syst. add. p. 110. Corollas white.

Many-flowered Schubertia. Shrub tw.

2 S. GRANDIFLÒRA (Mart. l. c. p. 57.) leaves cordate, obovate, acute; umbels few-flowered; tube of corolla bearded inside, equal to the segments of the limb. ♄. ◠. S. Native of Brazil. Corollas white.?

Great-flowered Schubertia. Shrub tw.

3 S. LONGIFLÒRA (Mart. l. c.) leaves cordate, obovate, acute, villous; umbels many-flowered; tube of corolla very hairy inside, 3 times longer than the segments, which are lanceolate. ♄. ◠. S. Native of Carthagena, in woods. Cynánchum longiflòrum, Jacq. amer. 85. t. 59. ed. pict. p. 45. t. 85. Macroscèpis longiflòra, Spreng. syst. 1. p. 851. Corollas greenish white.

Long-flowered Schubertia. Shrub tw.

Cult. For culture and propagation see *Oxypétalum*, above.

LVI. LACHNO'STOMA (from λαχνη, *lachne*, wool; and στομα, *stoma*, a mouth; throat of corolla bearded.) H. B. et Kunth, nov. gen. amer. 3. p. 198. t. 232.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted. Corolla somewhat salver-shaped, with a short tube, a 5-parted spreading limb; and a bearded throat; segments of the limb ovate-oblong, acute, rather unequal-sided. Stamineous corona inserted in the throat of the corolla, 5-leaved; leaflets lunately 2-lobed, fleshy. Anthers terminated by a membrane; pollen masses compressed, laterally fixed by their tapering tops, pendulous. Stigma mutic, peltate.—A twining shrub; with opposite leaves; and interpetiolar racemes. Flowers twin, approximating in an umbellate manner. This genus is allied to *Cynánchum* on one hand, and *Oxypétalum* on the other; but is distinguished from them, in the form of the corolla, and corpuscles, as well as by the mutic stigma, and in the corona being inserted in the throat of the corolla; and from both, in the filaments being adnate to the tube of the corolla, and in the throat being bearded.

1 L. TIGRÌNUM (H. B. et Kunth, l. c.) ♄. ◠. S. Native of New Granada, near Santa Fe de Bogota. Stems densely clothed with rusty hairs, as well as the petioles and peduncles and calyxes. Leaves elliptic-oblong, acuminated, rounded at the base, villous on both surfaces, and beset with rusty hairs on the nerves and veins beneath. Petioles 4-5 inches long, and 2 broad. Calyx hairy. Corolla hairy outside; segments elegantly and reticulately spotted.

Tiger-spotted-flowered Lachnostoma. Shrub tw.

Cult. For culture and propagation see *Oxypétalum*, above.

LVII. MACROSCE'PIS (from μακρος, *macros*, long; and σκεπω, *skepo*, to cover; in reference to the calyx being larger than the corolla.) H. B. et Kunth, nov. gen. amer. 3. p. 200. t. 233.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, exceeding the corolla a little, bracteate at the base. Corolla thickish, with a globose-ventricose tube, and a spreading, 5-parted limb; segments of limb obliquely ovate, obtuse. Corona of 5 fleshy scales, inserted in the throat of the corolla. Gynostegium saucer-shaped, hardly exceeding the tube of the corolla. Filaments connate, adnate to the tube of the corolla. Anthers terminated by a membrane; pollen masses compressed, pendulous, fixed by their tops. Stigma mutic, peltate. Follicles unknown.—A twining plant, with hairy branches. Leaves opposite, obovate, cordate, hairy. Peduncles interpetiolar, 2-flowered; pedicels involucrated by bracteas. This genus is very nearly allied to *Lachnóstoma*, from which it is distinguished by the large calyx, by the structure of the corona, gynostegium, and beardless throat. There is also considerable affinity between this genus and *Gonólobus*.

1 M. OBOVA'TA (H. B. et Kunth, l. c. p. 201. t. 233.) ♄. ◠. S. Native of New Spain, on the shore, about Campeche. M. pàtens, Spreng. syst. 1. p. 851. Cynánchum hirsùtum, Vahl. Leaves $3\frac{1}{2}$ inches long, and 2 broad. Petioles and midrib of leaves on the under side beset with rusty hairs. Segments of calyx pilosely ciliated. Corolla glabrous.

Obovate-leaved Macroscepis. Shrub tw.

Cult. For culture and propagation see *Oxypétalum*, above.

LVIII. ARAU'JIA (named after Antonio de Araujo, a great promoter of botany in Portugal.) Brot. in Lin. trans. 12. p. 62. Physiánthus, Mart. nov. gen. bras. 1. p. 53.

Lin. syst. *Pentándria, Digýnia.* Calyx large, 5-parted (f. 20.

a.) Corolla campanulately urceolate (f. 20. *b.*) with 5 swellings outside at the base, and a corresponding number of cavities inside; limb spreading a little, 5-cleft. Column inclosed. Stamineous corona of 5 leaves; leaflets cucullate, furnished each with a horizontal scale outside. Anthers terminated by a membrane; pollen masses pendulous, fixed by their tapering tops. Stigma ovate, 2-horned at the apex. Follicles ovate, ventricose, bent downwards, semi-bilocular; dissepiment or placenta covered with numerous lamellæ. Seeds comose, adhering to the lamellæ of the dissepiment.—Twining, herbaceous plants. Leaves opposite, cordate. Racemes interpetiolar, few-flowered, cymose. Flowers white.

FIG. 20.

1 A. sericófera (Brot. l. c. p. 62. t. 1.) leaves cordate, glabrous, glandular at the top of the petioles; racemes cymose, pendulous, few-flowered; root creeping. ♄. ⁀. S. Native of Peru, from which place it was received by Brotero, under the name of *Apócynum Peruviànum*. Flowers white. (f. 20.)

Silk-bearing Araujia. Fl.? Clt.? Shrub tw.

2 A. a'lbens; herbaceous; leaves acute at the apex, cordately truncate at the base; white and pruinose beneath; flowers sub-dichotomously cymose. ♄. ⁀. S. Native of Brazil, in the province of St. Paul. Physiánthus álbens, Mart. nov. gen. bras. 1. p. 54. t. 32. Graham, in bot. mag. t. 3201. Lindl. bot. reg. t. 1759. Leaves tomentose beneath, and beset with fine scattered pili above. Corolla downy, white, with a tinge of red; tube length of calyx.

Whitish-flowered Araujia. Fl July, Aug. Clt. 1830. Sh. twining.

3 A. Megapota'mica; twining, glabrous; leaves sagittately cordate, acuminated; peduncles 1-flowered; lobes of corona denticulated. ♄. ⁀. S. Native of Brazil, at Rio Grande. Physiánthus Megapotámica, Spreng. syst. add. p. 112.

Rio Grande Araujia. Shrub tw.

Cult. For culture and propagation see *Oxypétalum*, p. 148.

LIX. KANA'HIA (the plant is called Kanakk by the Arabs.) R. Br. in. mem. wern. soc. 1. p. 38. Asclèpias species, Forsk.

Lin. syst. *Pentándria, Digýnia.* Corolla campanulate, with a 5-parted limb. Column half-inclosed. Stamineous corona, seated on the top of the tube of the filaments, 5-leaved; leaflets thickened from the base, subulate, undivided. Anthers terminated by a membrane. Pollen masses ventricose, fixed by their apexes, pendulous. Stigma mutic. Follicles slender, striated. Seeds comose?—An erect shrub, native of Arabia. Leaves opposite, flat. Peduncles interpetiolar, bearing at their apexes many-flowered fascicles; pedicels imbricate, unibracteate at the base.

1 K. laniflòra. ♄. G. Native of Arabia Felix and Abyssinia. K. Kánnah, Rœm. et Schultes, syst. 6. p. 95. Asclèpias laniflòra, Forsk. descrip. p. 51. Vahl, symb. 1. p. 23. t. 7. Kanakk of the Arabs. Leaves 3 inches long, quite glabrous, tapering to both ends. Leaves of involucrum subulate, unequal.

Woolly-flowered Kanahia. Shrub.

Cult. For culture and propagation see *Calótropis*, p. 147.

LX. DIPLO'LEPIS (from διπλοος, *diploos*, double; and λεπις, *lepis*, a scale; leaflets of corona furnished each with a scale inside.) R. Br. in. mem. wern. soc. 1. p. 41.

Lin. syst. *Pentándria, Digýnia.* Corolla with a short, urceolate tube; and a 5-parted limb. Stamineous corona 5-leaved; leaflets obtuse, furnished with a scale each inside. Anthers terminated by a membrane. Pollen masses ventricose, fixed near their apexes, pendulous. Stigma mutic, elongated, undivided. Follicles unknown.

1 D. Menzie'sii (Rœm. et Schultz, syst. 6. p. 95.) ♄. ⁀.? S. Native of Chili, near Valparaiso. This is the only certain species of the genus. The Asclèpias vomitòria, Konig. mss. agrees with this genus in many respects, especially in the form, and insertion of the pollen masses; but differs considerably in habit, and in having a blunt stigma.

Menzies's Deplolepis. Shrub twining?

2 D.? apicula'ta (Lindl. in hort. trans. 6. p. 68.) leaves roundish-elliptic, cordate, apiculated, shining, very villous, as well as the stems; stigma depressed. ♄. ⁀. G. Native of China. Flowers greenish.

Apiculated-leaved Diplolepis. Fl. Ju. July. Clt. 1821. Shrub tw.

Cult. For culture and propagation see *Oxypétalum*, p. 148.

§ 2. *Gynostegium appendiculate. Corona simple, of one piece; having its tube sometimes furnished with segments or keels inside. Corolla sub-rotate.*

LXI. HOLOSTE'MMA (from ὁλος, *holos*, entire; and στεμμα, *stemma*, a crown; the corona is almost entire.) R. Br. in mem. wern. soc. 1. p. 42. Asclèpias species of authors.

Lin. syst. *Pentándria, Digýnia.* Corolla subrotate, 5-cleft. Stamineous corona inserted in the gynostegium, simple, annular, obsoletely 5-lobed. Anthers terminated by a membrane. Pollen masses pendulous, compressed, fixed by their tapering tops. Stigma mutic. Follicles ventricose, smooth. Seeds comose —Glabrous, twining shrubs. Leaves opposite, broad. Umbels interpetiolar, on short peduncles. Flowers showy, white.

1 H. Rhe'edii (Spreng. syst. 1. p. 851. Wall. pl. asiat. rar. 2. p. 51.) leaves broad-ovate, cordate. ♄. ⁀. S. Native of Malabar, Mysore, Samulcottah, and the Circars; also at Gualpara, and Kinour. H. A'da Kòdien, Rœm. et Schultes, syst. 6. p. 95. Asclèpias annulària, Roxb. fl. ind. 2. p. 37. mus. ind. orient. t. 613. Asclèpias convolvulàcea, Heyne, herb. Cynánchum annulàre, Heyne, herb. C. cordifòlium, and C. grandiflòrum, Russ. herb. Sarcostémma annulàre, Roth. nov. spec. p. 178. Rœm. et Schultes, syst. 6. p. 115. Gomphocárpus volùbilis, Hamilt. herb. Corollas yellowish or whitish, tinged with red. Follicles smooth.

Rheede's Holostemma. Shrub twining.

2 H. fra'grans (Wall. pl. asiat. rar. 2. p. 51.) leaves oblong-cordate: upper ones oblong-lanceolate, sagittately cordate at the base: lobes imbricating. ♄. ⁀. S. Native of the Burmese Empire, on mountains on the banks of the Irrawaddi, at Scendya, and Prome, also on mount Taong Dong, not far from Ava.

Fragrant Holostemma. Shrub twining.

3 H. tubercula'tum (Blum. bijdr. p. 1055.) leaves membranous, ovate, acute, deeply cordate at the base, paler beneath; follicles tubercular. ♄. ⁀. S. Native of Java, on mountains.

Tubercular-follicled Holostemma. Fl. year. Shrub tw.

4 H. murica'tum (Blum. bijdr. p. 1055.) leaves membranous, ovate-oblong, acuminated, deeply cordate at the base, glaucescent beneath; follicles muricated. ♄. ⁀. S. Native of Java, on the mountains, where it is called *Tjaput tuhur*.

Muricated-follicled Holostemma. Fl. Nov. Dec. Shrub tw.

5 H. læ've (Blum. bijdr. 1055.) leaves coriaceous, oblong, acuminated, obliquely sub-cordate at the base; follicles smooth. ♄. ⁀. S. Native of Java, on Mount Salak, in shady places.

Smooth Holostemma. Fl. Feb. April. Shrub tw.

Cult. See *Oxypétalum*, p. 148. for culture and propagation.

LXII. CYNA'NCHUM (from *κυων κυνος, kyon kynos*, a dog; and *αγχω, ancho*, to strangle; poisonous effects of some species.) R. Br. in mem. wern. soc. 1. p. 43. Wight, and Arnott, contrib. ind. bot. p. 55. Cynánchum species, Lin. and others.

LIN. SYST. *Pentándria, Digýnia.* Corolla sub-rotate, 5-parted. Stamineous corona, 5-20-lobed; when only 5-lobed, the lobes are opposite the anthers. Anthers terminated by a membrane. Pollen masses ventricose, pendulous. Stigma usually apiculated, but sometimes mutic, rarely rostrate. Follicles smooth. Seeds comose.—Herbs or sub-shrubs, for the most part twining. Leaves opposite. Umbels interpetiolar.

§ 1. *Stamineous corona tubular, with a 5-10 cleft border, inclosing the gynostegium; the 5 inner segments opposite, and parallel with the anthers and exterior lobes. Pollen masses inserted beneath their apexes. Follicles cylindrical, much divaricate.—Stems twining. Leaves cordate.*

1 C. DALHÒUSIÆ (Wight, contrib. ind. bot. p. 55.) twining, smoothish; leaves linear-lanceolate, attenuated, broadest at the base, cordate, pale beneath, and marked with brown veins; umbels few-flowered; pedicels longer than the peduncles; segments of corolla oval, obtuse; corona equal in length to the corolla, 10-lobed: alternate lobes the smallest: the inner segments small, obtuse, tooth-formed; stigma sub-apiculated, undivided. ♄. ⌒. H. Native at Simla, Countess of Dalhousie; Mussorie, Royle. Leaves 4-6 inches long, and 4-12 lines broad at the base.

Countess of Dalhousie's Cynanchum. Shrub tw.

2 C. ACU'TUM (Lin. spec. p. 310., exclusive of the synonymes. R. Br. mem. wern. soc. 1. p. 44.) herbaceous twining, glabrous; leaves oblong, ovate-cordate, acute; segments of corolla oblong, obtuse; stigma apiculated, semi-bifid; follicles cylindrical, divaricate. ♃. H. Native of Italy, Spain, Tauria, Astrachan, &c. Bieb. fl. taur. 1. p. 177. Jacq. misc. 1. p. 16. t. 1. Schkuhr. handb. 1. p. 166. t. 54. C. Monspelìacum, Brot. fl. lus. 1. p. 411. C. Monspelìacum, β, Lam. dict. 1. p. 235. C. Sibíricum, Willd. act. nov. am. N. C. berol. 1799. t. 6. f. 2. Pers. 1. p. 273.—Tourn. inst. 93.—Clus. hist. 125.—Trew. ehrh. 44. t. 82. Flowers white.

Acute-leaved Cynanchum. Fl. July. Clt. 1596. Pl. tw.

3 C. PUBE'SCENS (Bunge, in mem. acad. petersb. 2. p. 118.) corona double; outer one 10-cleft, having the alternate segments acute, ovate; the rest filiform and elongated; inner corona 5-cleft, with shorter, filiform segments; segments of corolla linear, obtuse; leaves cordate, acute, downy; stems herbaceous, twining. ♃. ⌒. F. Native of China, in hedges. Flowers minute, white. Nearly allied to *C. acùtum*.

Downy Cynanchum. Pl. twining.

4 C. EXCE'LSUM (Desf. fl. atl. 1. p. 212.) herbaceous, twining, glabrous; leaves cordate-lanceolate, acute, glabrous; follicles long, narrow, flattish, very acute. ♃. ⌒. H. Native of Barbary, on the shore about Tozzer. Leaves like those of *C. acùtum*, 1-2 inches long.

Tall Cynanchum. Fl. July. Clt. 1816. Pl. tw.

5 C. MONSPELÌACUM (Lin. spec. p. 311., exclusive of the synonymes. R. Br. l. c.) herbaceous, twining, glabrous; leaves reniform, coarctate at top, and semi-lanceolate; segments of corolla lanceolate, bluntish; stigma apiculated, semi-bifid; follicles cylindrical. ♃. ⌒. H. Native of Italy, south of France, Spain, and Greece, by the sea side. Cav. icon. 1. p. 44. t. 60. Jacq. coll. 4. p. 106. icon. 2. t. 340. St. Hil. 35. t. 6.—Tourn. inst. 93.—Clus. hist. 1. p. 126. Flowers white, but flesh-coloured, according to Jacquin.

Montpelier Cynanchum. Fl. Aug. Sept. Clt. 1596. Shrub twining.

6 C. LONGIFÒLIUM (Martens, ex Spreng, syst. add. p. 110.) herbaceous, twining; leaves cordate, acuminated, nerved; segments of corolla acute; exterior corona 10-leaved: the 5 alternate lobes lanceolate, acute, and the other 5 sub-crenated and obtuse. ♃. H. Native about Venice.

Long-leaved Cynanchum. Pl. twining.

7 C. CHINE'NSE (R. Br. in mem. wern. soc. 1. p. 44.) herbaceous, twining, glabrous?; leaves ovate-cordate, with a short acumen; segments of the corolla linear, acute, compressedly filiform, entire. ♃. ⌒. H. Native of China, in the province of Peckley, Sir G. Staunton. Stigma ending in semi-bifid point. Follicles cylindrical.

Chinese Cynanchum. Pl. twining.

8 C. BIROSTRA'TUM (Hook. and Arn. in Beech. voy. pt. bot. p. 35.) leaves narrow, cordately-sagittate, with oblong-obtuse lobes, sub-coriaceous, glabrous; umbels many-flowered; pedicels and calyxes downy; tube of corolla urceolate; segments of the limb lanceolate, downy outside; stamineous corona simple, of 5 bifid segments; stigma long-beaked, deeply bifid. ♄. ⌒. F. Native of Chili, about Conception. Flowers white. Leaves resembling those of *C. acùtum*.

Birostrate Cynanchum. Shrub twining.

§ 2. *Stamineous corona tubular, with a 5-10-cleft border, inclosing the gynostegium; the 5 inner keels simple, or drawn out into segments. Pollen masses fixed beneath their apexes. Follicles ventricose, angular, spreading. Stems twining. Leaves cordate, rounded or acute at the base.*

9 C. CORYMBÒSUM (Wight, l. c. p. 56.) twining, glabrous; leaves cordate-ovate, acuminated, glaucous beneath; corymbs longer than the petioles, many-flowered; corona equal in length to the corolla, 10-cleft, with the alternate lobes smaller, and the inner carinæ simple; pollen masses fixed beneath their apexes; stigma apiculated, bifid. ♄. ⌒. S. Native of Silhet. Cynánchum, Wall. ascl. no. 81.

Corymbose-flowered Cynanchum. Shrub tw.

10 C. PEDUNCULA'TUM (R. Br. in mem. wern. soc. 1. p. 97. prod. p. 463.) twining; common peduncles longer than the leaves; leaves cordate, smoothish; axils 2-leaved; inner carinæ of the corona drawn out into segments; stigma apiculated, emarginate. ♄. ⌒. G. Native of New Holland, within the tropic. C. Browniànum, Rœm. et Schultes, syst. 6. p. 97.

Pedunculate Cynanchum. Shrub twining.

11 C. FLORIBU'NDUM (R. Br. l. c.) twining; common peduncles shorter than the leaves; leaves cordate, acuminated, quite glabrous; axils without leaves; inner keels of the corona drawn out into segments; stigma apiculated, emarginate. ♄. ⌒. G. Native of New Holland, without the tropic.

Bundle-flowered Cynanchum. Shrub twining.

12 C. ERUBE'SCENS (R. Br. l. c.) twining; common peduncles about equal in length to the petioles; leaves cordate, acute; axils usually 2-leaved; branchlets and flowers clothed with fine down outside; inner carinæ of the 10-cleft corona shorter than the corolla, simple. ♄. ⌒. G. Native of New Holland, within the tropic.

Reddish Cynanchum. Shrub twining.

13 C. BONPLANDIA'NUM (Rœm. et Schultes, syst. 6. p. 98.) twining; branches marked by a downy line; leaves lanceolate, acuminated, glabrous, membranous; umbels almost sessile; calyxes downy; corona 10-lobed: the alternate lobes the longest, and alternating with the segments of the corolla: stigma conical, convex, emarginate. ♄. ⌒. S. Native of New Andalusia. C. lanceolàtum, H. B. et Kunth. nov. gen. amer. 3. p. 203. Flowers minute, white. Corolla rotate, with ovate-acute segments.

Bonpland's Cynanchum. Shrub twining.

14 C. MONTEVIDE'NSE (Spreng. syst. 1. p. 851.) herbaceous, twining; leaves cordate-oblong and lanceolate, acute, and are, as

well as the umbels, glabrous; segments of corolla elongated and spreading; alternate teeth of corona shorter. ♃. ◠. S. Native of Montevideo.

Montevideo Cynanchum. Pl. twining.

15 C. mucrona'tum (H. B. et Kunth, nov. gen. amer. 3. p. 203. t. 335.) twining; branches furnished with 2 rows of down; leaves oblong, cuspidately-mucronate, acute at the base, glabrous; umbels almost sessile; calyxes glabrous; corona 5-parted, with ovate segments, which are ligulate at the apex, alternating with the segments of the corolla; stigma terminated by an emarginate tubercle. ♄. ◠. S. Native of New Granada, on the declivities of Mount Avila. Leaves 8-9 lines long. Corolla white, glabrous, with obliquely-oblong acute segments, having the middle nerve green.

Mucronate-leaved Cynanchum. Shrub twining.

16 C. microphy'llum (H. B. et Kunth, nov. gen. amer. 3. p. 204. t. 204.) twining; branches furnished with 2 rows of down; leaves ovate, acute, mucronate, rounded at the base, glabrous; flowers solitary, twin or tern, or by fours; calyxes glabrous; corona 5-parted, with emarginately-bidentate, concave segments, alternating with the lobes of the corolla; stigma terminated by an emarginate tubercle. ♄. ◠. S. Native of New Granada, in frigid places, near the town of Pasto. Leaves very small. Petioles furnished with interpetiolar cilia. Corolla white, rotate, with obliquely ovate, acute segments.

Small-leaved Cynanchum. Shrub twining.

17 C. serpyllifòlium (H. B. et Kunth, nov. gen. amer. 3. p. 205.) twining; branches marked by a downy line; leaves ovate-oblong, acuminated, rounded at the base, ciliated a little; umbels sessile; calyx rather pilose; corona 5-parted: with the segments bifid at the apex; stigma convex, emarginate?. ♄. ◠. S. Native near Quito, in shady places; and on the declivities of Mount Pichincha. Very like *C. microphýlla*, but is larger, in the leaves and flowers: and also differs in the flowers being umbellate, in the structure of the corona and gynostegium. Corolla campanulate, white, with ovate-oblong, hardly oblique segments.

Wild Thyme-leaved Cynanchum. Shrub twining.

§ 3. *Stamineous corona tubular, with a 5-10-cleft border, inclosing the gynostegium; inner segments or carinæ wanting. Pollen masses usually fixed by their apexes. Stigma terminated by a bifid point. Stems twining. Leaves sub-cordate.*

18 C. pauciflòrum (R. Br. in mem. wern. soc. 1. p. 45.) twining, glabrous; leaves ovate, acuminated, reniformly cordate at the base: the auricles diverging; umbels few-flowered; peduncles shorter than the petioles; flowers glabrous, on short petioles; corona equal to the corolla, with a 10-cleft, plicate border, naked inside: the lobes opposite the anthers, lanceolate, acuminated, bifid at top, the alternate ones very short, and emarginate or truncate; pollen masses fixed beneath their apexes; stigma apiculated, obtuse, hardly emarginate. ♄. ◠. S. Native of the East Indies, frequent in hedges. Periploca tunicàta, Retz, obs. 2. p. 15. Willd. phyt. 1. p. 7. no. 23. t. 5. f. 3. Asclèpias tunicàta, Roxb. fl. ind. 2. p. 35. mus. ind. or. t. 609. This plant has been removed by Wight, and Arnott, from the section in which Mr. R. Brown placed it. As there are no interior keels, but only folds of the corona, which arise from contractions of its mouth, and disappear when expanded. Follicles ventricose. Perhaps this, and *C. angustifòlium*, ought to have been described with 5 lobes to the corona, the alternate ones being so very short.

Few-flowered Cynanchum. Fl.? Clt. 1820. Shrub twining.

19 C. Wallíchii (Wight, l. c.) twining, glabrous; leaves oblong-ovate, acuminated, cordate at the base, auricled: auricles a little incurved; corymbs shorter than the leaves, many-flowered; pedicels equal in length to the peduncles, or exceeding them; corona equal to the corolla, somewhat 10-cleft; the lobes opposite the anthers, longer, and bifid; pollen masses fixed beneath their apexes; stigma mutic. ♄. ◠. S. Native of the East Indies, at Jentaga and Chuna-Poonjee. Cynánchum, Wall. ascl. no. 80. Very closely allied to *C. pauciflòrum*.

Wallich's Cynanchum. Shrub twining.

20 C. calliala'tum (Hamilt. herb. no. 767, ex Wight, and Arnott, contrib. ind. bot. 56.) twining, glabrous; leaves ovate or oval, acuminated, cordate at the base, with a narrow recess, glaucous beneath; umbels shorter than the petioles; pedicels equal to the peduncle in length; corona 10-lobed, almost twice as short as the corolla: the lobes opposite the anthers, bifid at apex: the alternate ones very short; stigma sub-apiculated, entire; follicles winged. ♄. ◠. S. Native on the banks of the Ganges, and at Columala. Wall. ascl. no. 83. C. auriculàtum, Hamilt. herb. no. 768. Wall. ascl. no. 85. Periploca tunicàta, Herb. madr. Wall. ascl. no. 75. b. c.

Beautiful-winged-podded Cynanchum. Shrub twining.

21 C. ala'tum (Wight, and Arnott, contrib. ind. bot. p. 57.) twining, smoothish; leaves of the older branches cordately auricled at the base: of the young floriferous branches, oval, cuspidate, cordate at the base, or emarginate, glaucous beneath; umbels about equal in length to the petioles; pedicels longer than the peduncles; corona shorter than the corolla, with a crenately 10-lobed, truncate border: the alternate lobes rather the smallest; stigma apiculated, bifid; follicles flattish on one side, with the angles marginately winged. ♄. ◠. S. Native of Coromandel. Wight, cat. no. 1552. Asclèpias truncàta, Roxb. in herb. Banks. The winged follicles, and truncate corona, will readily distinguish it from all other species of this section.

Winged-follicled Cynanchum. Shrub twining.

22 C. ovalifòlium (Wight, l. c.) twining, glabrous; leaves oblong-oval, acuminated; cymes many-flowered; peduncles longer than the petioles; corona about equal in length to the corolla, 10-cleft; stigma apiculated, somewhat emarginate. ♄. ◠. S. Native of Penang. Cynánchum, Wall. ascl. no. 82. The oval leaves, and cymose inflorescence, readily distinguish this species.

Oval-leaved Cynanchum. Shrub twining.

23 C. angustifòlium (Wight, and Arnott, l. c.) twining, smoothish; petioles rather hairy, reflexed; leaves linear-lanceolate, cuspidate, more or less cordate at the base; umbels short, many-flowered; corona 10-lobed, the lobes opposite the anthers, broadly linear-oval, about equal in length to the corolla; the alternate ones very short, and inconspicuous, all truncate and emarginate; stigma apiculated, somewhat emarginate. ♄. ◠. S. Native of Coromandel. Wight, cat. no. 1553. Leaves 3-5 inches long, and 4-6 lines broad.

Narrow-leaved Cynanchum. Shrub twining.

§ 4. *Gynostegium or column of fructification stipitate. Stamineous corona tubular, inserted at the base of the stipe of the gynostegium, 5-cleft, without any segments or inner carinæ inside. To this section, remarkable for the elongation of the torus or stipe of the gynostegium, belong also a species from the Cape of Good Hope.*

24 C. gracíllimum (Wall. asclep. no. 86. Wight, and Arnott, l. c.) twining, glabrous; branches slender; leaves cordate, acuminated, incurvedly auricled at the base; umbels few-flowered; peduncles about equal in length to the petioles, but longer than the pedicels; segments of corolla lanceolate; stalk of gynostegium exceeding the corona, which is 5-cleft, and naked inside; pollen masses fixed by their apexes; stigma beaked, equal, 5-furrowed, truncate, equal to the membranes of the anthers. ♄. ◠. S. Native of the East Indies, at Segaen. Wall. ascl. no. 86.

Very-slender Cynanchum. Shrub twining.

§ 5. *Stamineous corona deeply 5-cleft; segments opposite the anthers, furnished each with a parallel segment inside. Pollen masses fixed by their apexes, or beneath them.*

25 C. auricula'tum (Royle, ex Wight, contrib. ind. bot. p. 58.) twining; leaves cordate-ovate, acuminated, ciliated, auricled at the base; umbels cyme-formed, on long peduncles, few-flowered; corolla 5-parted; corona deeply 5-cleft: segments obtuse, exceeding the gynostegium, furnished each with a little parallel segment inside. ♄. ⌒. F. Native of Kinour and Kamaon. Wall. ascl. no. 137.

Auricled Cynanchum. Shrub twining.

26 C. Ròylei (Wight, l. c.) twining?, downy; leaves broad-cordate at the base, and auricled, gradually tapering into a subulate apex; umbels on long peduncles, many-flowered; corolla 5-cleft; corona deeply 5-cleft: segments obtuse, about equal to the gynostegium, furnished each with a small parallel segment, inside. ♄. ⌒. F. Native of Kinour, Ròyle.

Royle's Cynanchum. Shrub twining.

§ 6. *Stamineous corona tubular, inclosing the gynostegium; with a 10-cleft border; without any segments or carinæ inside. Stigma terminated by an entire point. Stems erect.*

27 C. ròseum (R. Br. in mem. wern. soc. 1. p. 47.) leaves lanceolate-linear, undulated, smoothish; pedicels and calyxes pilose; corona 10-cleft; stigma entire. ♃. H. Native of Dahuria, among rocks. Asclèpias Dahùrica, Willd. spec. 1. p. 1272.?—Gmel. sib. 4. p. 78. t. 42. Root thick, sweet, creeping. Flowers beautiful, purple.

Rose-coloured-flowered Cynanchum. Fl. July, Aug. Clt. 1818. Pl. 1 to 1½ foot.

28 C. orienta'le (Willd. herb. ex Spreng. syst. 1. p. 851.) herbaceous, twining; leaves deeply-cordate, oblong, acute, glabrous, as well as the umbels and peduncles. ♃. ⌒. H. Native of Asia Minor.

Eastern Cynanchum. Pl. twining.

§ 7. *Stamineous corona saucer-shaped, fleshy, 5-10-lobed, simple inside. Pollen masses fixed beneath their apexes. Stigma terminated by an entire, very short point. Follicles smooth. Stems erectish, or twining a very little.*

29 C. vincetóxicum (R. Br. in mem. wern. soc. 1. p. 47.) stems erect; corollas beardless; umbels simple; pedicels 3 times longer than the peduncle; corona 5-lobed. ♃. H. Native of Europe, in gravelly places, between the 59° and 40° of latitude, as well as of Sweden, Denmark, &c. &c. Asclèpias vincetóxicum, Lin. spec. p. 314. Willd. spec. 1. p. 1268. Oed. fl. dan. t. 849. Heyne, term. bot. t. 42. f. 3. Schkuhr. handb. t. 55. Bull. herb. t. 96. Plenck, icon. t. 154. Jaume, St. Hil. 21. t. 6. Ludw. eclyp. t. 25. Asclèpias álba, Mill. dict. no. 1. fig. t. 53. Vincetóxicum officinàle, Mœnch. meth. p. 317. Stem furnished with a downy line on each side. Leaves ovate, acuminated, finely ciliated on the edges when young. Corollas white.

Var. β, mìnus; all parts of the plant are one half smaller than those of the species. ♃. H.

Vincetoxicum Cynanchum. Fl. May, Aug. Clt. 1596. Pl. 1 to 3 feet.

30 C. lu'teum (Spreng. syst. 1. p. 852.) erect, glabrous; leaves ovate, nearly sessile, rather fleshy, veiny; umbels axillary; corolla coriaceous, with bearded edges. ♃. H Native of Crete, Sieber. Flowers yellow.

Yellow-flowered Cynanchum. Pl.

31 C. me'dium (R. Br. l. c. p. 48.) stems twining at tops; corollas beardless; umbels often divided; pedicels hardly longer than the peduncle; corona 5-lobed. ♃. H. Native country unknown. Asclèpias mèdia, Hort. Allied to the *C. nìgrum.*

Intermediate Cynanchum. Fl. May, Aug. Clt.? Pl. 2 to 3 feet.

32 C.? villòsum (Schultes, syst. 6. p. 103.) leaves ovate-oblong, villous beneath, undulated; lower ones cordate; umbels erect, simple; corollas bearded. ♃. H. Native country unknown. Asclèpias villòsa, Willd. enum. 1. p. 278. Balb. misc. 15. t. 4. Flowers white.?

Villous Cynanchum. Fl. Ju. Aug. Clt. 1821. Pl. 2 to 3 feet.

33 C. nìgrum (R. Br. l. c. p. 48.) stems twining at tops; corollas bearded; umbels simple; pedicels hardly longer than the peduncles; corona semi-10-cleft. ♃. H. Native of the south of Europe. Sims. bot. mag. 2390. Asclèpias nìgra, Lin. spec. p. 315. Willd. spec. 1. p. 1269. Leaves ovate-lanceolate, acuminated, finely ciliated on the edges, narrower than those of *C. vincetóxicum.* Flowers brown.

Black-flowered Cynanchum. Fl. July, Aug. Clt. 1596. Fl. 2 to 3 feet.

34 C. mela'nthos (Hort. par. ex Poir. suppl. 2. p. 430.) stems twining at tops, rather hairy; leaves ovate-cordate, acute, rather downy: with rounded, closed lobes. ♃. H. Native country unknown. Flowers dark purple.

Black-flowered Cynanchum. Fl. July, Aug. Clt. 1818. Pl. 2 to 3 feet.

35 C. fusca'tum (Link. enum. 1. p. 250.) stems twining at tops; corolla bearded; umbels simple. ♃. H. Native of the south of Europe, as of Spain. Asclèpias fuscàta, Willd. enum. suppl. p. 29. Horn. hort. hafn. suppl. 29. C. vincetóxicum, β, Schultes, syst. 6. p. 104. Asclèpias lùtea, Mill. dict. Flowers yellow. This is intermediate between the *C. vincetóxicum* and *C. nìgrum*, but is more nearly allied to the latter.

Brownish-flowered Cynanchum. Fl. July, Aug. Clt. 1817. Pl. 2 to 3 feet.

§ 8. *Stamineous corona deeply 5-cleft; segments simple. Pollen masses fixed beneath their apices.—Decumbent or erect plants, sometimes twining a little. Umbels sessile, or nearly so.*

36 C. glau'cum (Wall. ascl. no. 133. Wight, and Arnott, contrib. ind. bot. p. 58.) herbaceous, erect, glabrous or downy; stems rather compressed, and rather angular; leaves broad-ovate, or oblong-oval or lanceolate, obtuse, pale glaucous beneath; umbels almost sessile; corolla 5-cleft: segments hairy inside; corona deeply 5-cleft: segments obtuse; pollen masses fixed beneath their apexes; stigma obtuse, apiculated. ♃. H. Native of Nipaul.

Var. α, latifòlium (Wight, contrib. ind. bot. p. 58.) leaves broad-ovate, obtuse; umbels many-flowered. ♃. H. Native of Nipaul. C. glaúcum, Wall. asclep. no. 133.

Var. β, oblongifòlium (Wight. l. c.) leaves oblong-oval; umbels few-flowered. ♃. H. Native of Nipaul. Wall. ascl. no. 132, unnamed.

Var. γ, lanceolàtum (Wight, l. c.) leaves oblong-lanceolate, obtuse; umbels sessile, many-flowered. ♃. H. Native of the Peninsula of India, and at Simla. Wight, cat. no. 1554. Wall. ascl. no. 134, unnamed.

Glaucous Cynanchum. Pl. 2 to 3 feet.?

37 C. Kinourie'nse (Wight, contrib. ind. bot. p. 58.) herbaceous, erect; stems and petioles hairy; leaves oval, cuspidate, on short petioles, downy above towards the margins, and on the nerves and veins, hairy beneath on the nerves, which are conspicuous, and veins; umbels few-flowered: corona deeply 5-cleft, equal to the gynostegium; segments obtuse, separated by broad recesses; pollen masses fixed by their apexes; stigma obtuse. ♃.

H. Native of Kinour, Royle. In this species the rhizoma is short, thick, and abrupt.

Kinour Cynanchum. Pl.

38 C. Arnottia'num (Wight, l. c.) herbaceous, erect, glabrous; leaves oblong-oval, obtuse or emarginate, mucronate, on short petioles; umbels sessile, many-flowered; corolla brownish purple outside, 5-cleft; segments beset with white hairs inside; corona deeply 5-cleft, equal to the gynostegium: segments obtuse, separated by broad recesses; pollen masses fixed beneath their apexes; stigma apiculated. ♃. H. Found by Mr. Royle, on his journey to Cashmere. The colour of the flowers will readily distinguish this from other allied species.

Arnott's Cynanchum. Pl.

39 C. na'num (Hamilt. herb. no. 765. Wight, and Arnott, l. c. p. 59.) herbaceous, erect, glabrous; leaves on short petioles, linear-acutish, sub-auriculated at the base; umbels almost sessile, many-flowered, involucrated; corolla rather large, 5-parted: segments obtuse; corona deeply 5-cleft, equalling the gynostegium: with obtuse segments; pollen masses fixed by their apexes; stigma apiculated. ♃. H. Native of the East Indies, north of Camrupa, among reeds, Hamilt. Leaves 4-5 inches long, and 2-5 lines broad.

Dwarf Cynanchum. Pl. dwarf.

40 C.? Heynea'num (Rœm. et Schultes, syst. 6. p. 101.) leaves oval, mucronate, ciliated at the base, as well as the petioles, discoloured beneath, and reticulated; umbels few-flowered, length of the petioles; stems glabrous. ♄. ⌒. S. Native of the East Indies. Periploca reticulàta, Roth. nov. spec. p. 126.

Heyne's Cynanchum. Fl.? Clt. 1825. Shrub twining.

41 C. Sibíricum (R. Br. in mem. wern. soc. 1. p. 48.) stems decumbent, herbaceous; leaves lanceolate-linear, opposite, or 3 in a whorl; umbels on short peduncles; corona deeply 5-cleft; pollen masses fixed beneath their apexes; stigma an emarginate papilla; follicles ventricose. ♃. H. Native of Siberia and China. Asclèpias Sibírica, Lin. spec. p. 315. Gmel. sib. 4. p. 77. no. 21. Murr. comm. gœtt. 1779. p. 23. t. 7. Plant white from fine down. Flowers greenish white, smelling like those of the lime tree.

Siberian Cynanchum. Fl. Ju. July. Clt. 1775. Pl. dec.

42 C. pilòsum (R. Br. in mem. wern. soc. 1. p. 46.) twining; leaves ovate, acutish, and are, as well as the calyxes, hairy; umbels short; corona 10-cleft, length of the corolla; stigma terminated by a bifid point. ♄. ⌒. G. Native of the Cape of Good Hope. Ker. bot. reg. 111. Periploca Africàna, Lin. spec. 309 exclusive of the synonymes. Thunb. prod. 1. p. 47. fl. cap. 2. p. 152. Andr. bot. rep. t. 557. Jacq. misc. 1. p. 13. t. 1. f. 3. —Commel. rar. t. 18.—Plukn. phyt. 37. t. 137. f. 4.—Morr. hist. 3. p. 611. sect. 15. t. 3. f. 62. The whole plant is hairy. Corollas purple; corona white. Follicles ventricose.

Var. β; leaves flat, sinuate; flowers pale green; follicles thick, glabrous. Burm. afr. t. 14. f. 2.

Pilose Cynanchum. Fl. Ju. Sept. Clt. 1726. Shrub tw.

43 C. crassifòlium (R. Br. l. c.) twining; leaves ovate, subcordate, obtuse, with a mucrone, fleshy, and are, as well as the calyxes, glabrous; umbels drooping, on short peduncles; corona 10-cleft, length of corolla; stigma terminated by a bifid point. ♄. ⌒. G. Native of the Cape of Good Hope, in woods. C. obtusifòlium, Lin. suppl. 169? Thunb. prod. 1. p. 46. fl. cap. 2. p. 159. Flowers green?

Thick-leaved Cynanchum. Fl.? Clt. 1818. Shrub tw.

44 C. Cape'nse (R. Br. l. c.) twining; leaves ovate-cordate, obtuse, with a mucrone, and are, as well as the stems, glabrous; calyxes downy; corona 5-cleft, twice shorter than the corolla; stigma terminated by a bifid point. ♄. ⌒. G. Native of the Cape of Good Hope. C. Capénse, Lin. suppl. 168.? Thunb. prod. 1. p. 47. fl. cap. 2. p. 159. Flowers white.?

Cape Cynanchum. Fl. July. Clt. 1820. Shrub tw.

45 C. fœ'tidum (H. B. et Kunth, nov. gen. amer. 3. p. 202.) twining, shrubby; leaves ovate, acuminated, cordate, glabrous; racemes pedunculate, equal in length to the leaves; calyx downy; corolla campanulately rotate: segments oblique, obtuse; corona 5-parted, with 3-lobed segments: the middle lobe elongated, longer than the gynostegium; pollen masses fixed beneath their apices by short stipes; stigma naked, convex. ♄. ⌒. G. Native of Mexico, near Queretaro. Asclèpias fœ'tida, Cav. icon. 2. p. 45. t. 158. descript. p. 135. Flowers greenish yellow, or white, fetid. Branchlets puberulous.

Fetid Cynanchum. Fl. July, Aug. Clt. 1820. Shrub tw.

46 C. fimbria'tum (H. B. et Kunth, nov. gen. amer. 3. p. 203. t. 234.) twining, shrubby, pilose; leaves ovate-cordate, sub-acuminated, pilose above, and puberulous beneath; umbels sessile; calyx pilose; corolla sub-campanulate: with oblong, obtuse segments; corolla 5-cleft, ciliately fringed in the sinuses: with bidentate segments, short; stigma terminated by capitate point, and densely beset with minute, clavate caruncles, equal to the corona in length; pollen masses fixed beneath their apices. ♄. ⌒. S. Native in shady places near Cumana. Metapléxis fimbriàta, Spreng. syst. 1. p. 854. Leaves membranous, on long petioles. Calycine segments oblong, acute. Corollas white, glabrous, with a red throat. Perhaps a distinct genus.

Fringed-crowned Cynanchum. Fl. July, Aug. Clt. 1826. Shrub tw.

47 C.? læ've (Nutt. gen. amer. 1. p. 164.) stem erect, somewhat sarmentose, marked with an alternating downy line; leaves smooth, subcordate-ovate, acuminated: having the recess at the base nearly closed; margins and nerves minutely downy beneath; petioles very short; umbels interrupted, compound, on long peduncles; segments of corolla ovate-oblong, obtuse; corona cylindrical, retusely 5-toothed, nearly entire. ♃. H. Native of North America. Gonólobus læ'vis, Michx. fl. bor. amer. 1. p. 119. Habit of *C. vincetóxicum*. Flowers small, greenish white.

Smooth Cynanchum. Pl. erect.

48 C. angustifòlium (Nutt. gen. amer. 1. p. 164.) twining, smooth; leaves narrow-linear, thickish; umbels on long peduncles; segments of corolla lanceolate; corona cylindrical, bluntly 5-toothed. ♃. ⌒. H. Native from Carolina to Florida, in marshes. Ceropègia palústris, Pursh 1. p. 184. Flowers small and greenish. Follicles unknown.

Narrow-leaved Cynanchum. Pl. tw.

49 C. Humboldtia'num (Schultes, syst. 6. p. 105.) twining, shrubby; branches furnished with 2 rows of down; leaves oblong, acute at both ends, somewhat mucronate, glabrous; umbels sessile; calyx rather downy; corolla campanulate: with oblong acutish segments; corona 5-parted, with linear segments, rather longer than the gynostegium, and about equal to the corolla in length; stigma convex. ♄. ⌒. S. Native near Cumana. C. suberòsum, H. B, et Kunth, nov. gen. amer. 3. p. 205. Bark of stems corky, white. Calycine segments oblong, acutish.

Humboldt's Cynanchum. Shrub twining.

† *Doubtful species; the greater number of which do not probably belong to the genus.*

* *Species natives of South America.*

50 C. tene'llum (Lin. suppl. p. 168. Willd. spec. 1. p. 1253.) stems sub-herbaceous, twining; leaves ovate-oblong, smooth, small; umbels irregular, lateral, sessile, shorter than the leaves; follicles subulate, length of a finger. ♃. ⌒. S. Native of New Granada, Mutis. Leaves about the size of chickweed. Flowers about the size of a *Gàlium*. Stem filiform. Branches alternate.

Slender Cynanchum. Pl. twining.

51 C. funa'le (Poir. suppl. 2. p. 427.) stems filiform, twin-

ing, branched; leaves very narrow, wedge-shaped, retuse; flowers small, lateral, umbellate; umbels sessile. ♄. ⌒. S. Native of St. Domingo, Poiteau. Leaves small, hardly petiolate, 5-6 lines long. Follicles compressed, an inch long.

Rope Cynanchum. Shrub twining.

52 C. pedunculà're (Lam. dict. 2. p. 236.) stem twining; leaves ovate, glabrous on both surfaces; umbels solitary, axillary, on long peduncles. ♄. ⌒. S. Native of Guiana. Apócynum scándens, &c. Plum. cat. 2. Burm. amer. t. 27. f. 2, Aubl. guian. p. 273. Peduncles a foot long, bearing each an umbel of white flowers at the apex.

Long-peduncled Cynanchum. Shrub twining.

53 C. tomentòsum (Lam. dict. 2. p. 236.) twining, villous; leaves oval, sub-cordate, mucronate, clothed with white tomentum beneath; umbels few-flowered. ♄. ⌒. S. Native of the East Indies.

Tomentose Cynanchum. Shrub twining.

54 C. denticula'tum (Vahl, eclog. 2. p. 23.) stems twining, beset with retrograde hairs; leaves cordate, oblong, acuminated, denticulated, ciliated, smoothish, except on the ribs and veins, paler beneath; peduncles axillary, solitary, 3-flowered; petals lanceolate, flat. ♄. ⌒. S. Native of Guiana. Leaves ½ inch long. Pedicels longer than the peduncles. Corolla rotate, greenish yellow, ciliated. Very like *Gonólobus rostràtus*.

Denticulated-leaved Cynanchum.

55 C. hirsu'tum (Vahl, eclog. 2. p. 24.) every part of the plant clothed with yellow hairs, except the corolla; leaves cordate-oblong, short-acuminated; corolla rotate, glabrous, with roundish segments. ♄. ⌒. S. Native of Trinidad. Calycine segments acute, a little longer than the corolla. Leaves 3-4 inches long, petiolate.

Hairy Cynanchum. Fl.? Clt. 1825. Shrub twining.

56 C. pictum (Vahl, eclog. 2. p. 24.) twining, glabrous; leaves oblong, shining; umbels axillary, pedunculate; segments of corolla villous inside, at the apex. ♄. ⌒. S. Native of Cayenne. Leaves 1½ inches long, obscurely nerved above, veinless, very obtuse at the base; pale green beneath, and simply veined; nerves and veins purplish, as well as the petioles. Peduncles longer than the petioles. Pedicels longer than the peduncle. Calycine segments ovate, obtuse; of the corolla, ovate, acute.

Painted-leaved Cynanchum. Shrub twining.

57 C. acumina'tum (Humb. et Bonp. in Willd. rel. mss. ex Schultes, syst. 6. p. 111.) leaves oblong, much acuminated, downy beneath; umbels pedunculate; stems twining. ♄. ⌒. S. Native of New Spain, on the banks of the river Atabapo.

Acuminated-leaved Cynanchum. Shrub twining.

58 C. angustifòlium (Pers. ench. 1. p. 274.) stems twining; leaves linear-narrow; umbels on long peduncles. ♃. ⌒. G. Native of Carolina.

Narrow-leaved Cynanchum. Pl. twining.

* * *Species natives of Africa.*

59 C. crìspum (Thunb. prod. 1. p. 46. fl. cap. 2. p. 158.) stem erect, downy, simple; leaves lanceolate, curled; flowers lateral. ♄. G. Native of the Cape of Good Hope, in Karro. Leaves pilose, tapering into the petioles. Flowers axillary, few or many; peduncles pilose capillary. Corolla whitish yellow, sub-campanulate, 5-parted; segments ovate, drawn out into long, purple, filiform points. Corona many-toothed, tubular. In the description of this plant, given in Jacq. fragm. p. 31. t. 36. f. 5, the root is said to be tuberous, fleshy, a foot long. The stems are said to be numerous, weak, branched, rather villous, 2 feet high. The leaves petiolate, stiff, shining, obtuse, with villous margins; the peduncles short, twin, 1-flowered; the flowers sweet-scented; the calyxes villous, with ovate, acute segments; the corolla green, with a white campanulate corona, and linear-obtuse segments.

Curled-leaved Cynanchum. Shrub 1 to 2 feet.

60 C. filifórme (Lin. suppl. 169. Thunb. prod. 1. p. 46. fl. cap. 2. p. 157.) stem erect, simple, pilose; leaves sessile, flat, linear, pilose; umbels hairy, ex Thunb.; flowers verticillate, ex Lin.; corona tubular, erect, shorter than the corolla. ♄. G. Native of the Cape of Good Hope, on hills at the foot of the mountains at Krum river. C. verticillàre, Lam. dict. 2. p. 237. Leaves an inch and more long, but still shorter than the internodes. Corona yellowish. Follicles linear oblong, glabrous, a finger long.

Filiform Cynanchum. Shrub 1 foot.

61 C. pe'ndulum (Poir. suppl. 2. p. 429.) stem twining, rough from stiff hairs; leaves ovate-cordate, almost glabrous; racemes axillary, very long, pendulous. ♄. ⌒. S. Native of Senegal. Leaves on long petioles, pendulous, 2 inches long, Calyx glabrous. Corolla white. Pedicels almost an inch long.

Pendulous-flowered Cynanchum. Shrub twining.

62 C. hasta'tum (Lam. dict. 1. p. 236.) stem twining, much branched; branches rather filiform; leaves hastately linear, acute, glabrous. ♄. ⌒. G. Cynánchum, H. R. ex Oriente, D'Andre.

Hastate-leaved Cynanchum. Shrub twining.

63 C. arbòreum (Forsk. ægypt. 53. no. 80. Lam. dict. 2. p. 237.) stem twining; leaves varying in the same plant, often ovate, linear-lanceolate or sub-hastate; corolla rotate. ♄. ⌒. G. Native of Arabia. A non-lactescent tree. Flowers green.

Tree Cynanchum. Shrub twining.

64 C. oleæfòlium (Nectoux, voy. en egypt. t. 3.) erect; leaves coriaceous, ovate-lanceolate, acute, and are, as well as the stem and calyxes, downy, ex Nectoux, glabrous, ex Delile; peduncles very long, bifid, 5-6-flowered; flowers small, umbellate, ex Nectoux; flowers axillary, cymose, ex Delile. ♄. G. Native of Upper Egypt. C. A'rghel, Delile, mem. sur egypt. descrip. de l'egypt. t. 2. f. 20. Leaves white, glaucous beneath, ex Delile. Calycine segments lanceolate. Corolla white, a little longer than the calyx. The follicles are used like senna.

Olive-leaved Cynanchum. Shrub erect.

65 C. ra'dians (Lam. dict. 1. p. 236.) stem erect; leaves cordate, acute, undulated, villous on both surfaces, but most so beneath; umbels terminal; calyx rusty, villous; corona cylindrical, white, longer than the calyx: having 5 linear, obtuse, flat, horizontal teeth, radiating from the centre above the fructification; follicles ovate, villous. ♃. G. Native of Arabia Felix, in dry places, about Beit el Fakih, rare. Asclèpias ràdians, Forsk. ægypt. 49. no. 67. Leaves with white veins. Corolla with a rusty, violaceous, cylindrical tube, having 5 pits at the top, between the segments of the limb, which are shorter than the tube, compressed at the base, spirally twisted at the apex, linear-lanceolate, glabrous, violaceous outside, and of an obscure yellow inside.

Radiating-crowned Cynanchum. Pl. ½ foot.

* * * *Species natives of Asia.*

66 C. reticula'tum (Retz. obs. 2. p. 15. Willd. spec. 1. p. 1258.) stems twining, corky at bottom; leaves ovate, acuminated, glabrous, flat; umbels axillary; follicles ovate, smooth. ♄. ⌒. S. Native of the East Indies. Perhaps the same as *C. inodòrum*, Lour.

Reticulated-leaved Cynanchum. Shrub twining.

67 C. inodòrum (Lour. coch. p. 166.) stems twining, corky at bottom; leaves ovate, acuminated, glabrous; peduncles subdivided. ♄. ⌒. S. Native of Cochinchina.? Flowers small, yellow, scentless. Corolline segments linear, twisted, longer than the tube; corolla more salver-shaped than rotate. Co-

rona cylindrical, 5-cleft. Follicles oblong, acuminated, tomentose. Stigma sessile, ovate-oblong, large.

Scentless-flowered Cynanchum. Shrub twining.

68 C. fu'scum (Schultes, syst. 6. p. 111.) stem rooting at the base, and branched at the apex; leaves cordate-lanceolate, small, bearded at the base; umbels axillary, twin. 4. G. Native of Cochinchina, on old walls, and among ruins. Asclèpias fúsca, Lour. coch. p. 170. Leaves small. Flowers brownish purple, small; corona of 5 auricles, without horns. Follicles 2, small, subulate, ventricose outside, and flat inside. Seeds curved, comose.

Brown-flowered Cynanchum. Pl. creeping.

69 C. mucrona'tum (Andr. bot. rep. t. 515.) stems hairy; leaves subcordate, mucronate; umbels interpetiolar, axillary, compound; corollas rotate, greenish purple; segments acute, reflexed, twisted. ♄. ⌒. S. Native of Trinidad. Pollen masses pendulous.

Mucronate-leaved Cynanchum. Fl. July, Aug. Clt. 1804. Shrub tw.

70 C. versícolor (Bunge, in mem. acad. petersb. 2. p. 118.) corona simple, bluntly 5-lobed; segments of corolla ovate, acute, downy; umbels axillary, sessile; leaves oblong-ovate, or cordate, acute, downy; stem twining. ♄. ⌒. G. Native of China, on mountains, near Lun-zuan-ssy, and Zui-wey-skan. Corolla at first greenish, then brown. Nearly allied to *C. viridiflòrum*.

Parti-coloured-flowered Cynanchum. Pl. twining.

71 C. atra'tum (Bunge, l. c. p. 119.) corona simple, bluntly 5-lobed; corolline segments oblong, emarginate at the apex, downy outside; calyxes and pedicels tomentose; umbels axillary, sessile; leaves on short petioles, broad-ovate-oblong, acute, with undulated edges, densely downy above, tomentose beneath, as well as the stems. 4. ⌒. G. Native of China, near Ssi-juissy, and Tan-schan. Flowers dark brown.

Dark-flowered Cynanchum. Pl. 1 to 2 feet.

N.B.—What is C. cirrhòsum, Swartz, in cat. hort. Dorp. 1810, and Hort. Gorenk.

Cult. For the culture and propagation of the hardy species, see *Asclèpias*, p. 143.; and for that of the tender species see *Pergulària*, p. 133.

LXIII. METAPLE'XIS (from *μετα*, *meta*, with, and *πλεκω*, *pleco*, to fold; in reference to the cucullate leaflets of corona). R. Br. in wern. soc. mem. 1. p. 48.

Lin. syst. *Pentándria*, *Digýnia*. Corolla subrotate. Stamineous corona 5-leaved; leaflets small, cucullate, alternating with the anthers. Anthers terminated by a membrane; pollen masses ventricose, pendulous, fixed by their sides. Stigma furnished with an undivided elongated beak. Follicles unknown. —A twining glabrous subshrub. Leaves cordate, opposite. Racemes pedunculate, interpetiolar. Limb of corolla bearded.

1 M. Stauntònii (Rœm. et Schultes, syst. 6. p. 111.). ♄. ⌒. G. Native of China, in the province of Peckeley, Sir G. Staunton. The only certain species.

Staunton's Metaplexis. Shrub tw.

2 M.? mucrona'ta (Spreng. neuw. entd. 1. p. 269. syst. 1. p. 854.) leaves subcordate-oblong, mucronate, glaucous, glabrous; peduncles umbellately 6-flowered, shorter than the petioles. ♄. ⌒. S. Native of the Cape of Good Hope. Ascl. mucronàta, Thunb. Corolla urceolate, white inside; teeth alternating with the pollen masses, which are cream-coloured and oblong, united under the plicæ of the column into a fulvous heap.

Mucronate-leaved Metaplexis. Shrub tw.

Cult. See *Pergulària*, p. 133. for culture and propagation.

§ 3. *Gynostegium appendiculate. Corona compound, in 2-3 series; each series with a distinct insertion. Throat of corolla without scales.*

LXIV. DITA'SSA (from *δις*, *dis*, double, and *τασσω*, *tasso*, to dispose; in reference to the double corona). R. Br. in mem. wern. soc. 1. p. 49. Mart. nov. gen. bras. 1. p. 51.

Lin. syst. *Pentándria*, *Digýnia*. Corolla subrotate. Stamineous corona double: outer one 5-parted; the segments acuminated; inner one 5-leaved, shorter, opposite the exterior ones and anthers. Anthers terminated by a membrane; pollen masses ventricose, fixed beneath their apexes, pendulous. Stigma ending in an obtuse point. Follicles smooth?—Twining, glabrous shrubs, natives of Brazil. Leaves opposite, flat. Umbels interpetiolar.

1 Ba'nksii (Rœm. et Schultes, syst. 6. p. 112.) glabrous; leaves flat; flowers umbellate. ♄. ⌒. S. Native of Brazil, near Rio Janeiro, where it was collected by Sir Joseph Banks.

Banks's Ditassa. Shrub tw.

2 D. decussa'ta (Mart. nov. gen. bras. 1. p. 51. t. 31. f. 1.) shrubby, erect; leaves sessile, approximate, ovate-cordate, with reflexed sides, inversely navicular, wrinkled, hairy; peduncles many-flowered; flowers subcymose. ♄. S. Native of Brazil, in the diamond district of the province of Minas Geraes, in rugged mountainous places, at Lavras da Pindaiba. Stem villous. Corolla whitish green outside.

Decussate-leaved Ditassa. Shrub erect.

3 D. mucrona'ta (Mart. l. c. p. 52. t. 31. f. 2.) frutescent; stem twining; branches usually erect; leaves ovate-lanceolate, downy, on short petioles, bluntish, but mucronate, with reflexed edges; flowers umbellate, larger than those of the preceding species. ♄. ⌒. S. Native of Brazil, in the province of Minas Geraes, on hills at Morro de Villa Rica.

Mucronate-leaved Ditassa. Shrub tw.

4 D. passerinoìdes (Mart. l. c. p. 53.) frutescent, erect; leaves cordate at the base, ovate-lanceolate, acute, quite entire, almost sessile, approximate, with reflexed edges; umbels few-flowered. ♄. S. Native of Brazil, on the alps in the diamond district of the province of Minas Geraes. Very like *D. decussàta*, and probably only a variety of it.

Passerina-like Ditassa. Shrub erect.

5 D. aceròsa (Mart. l. c.) frutescent, erect; leaves linear, somewhat acerose, sometimes 3-4 in a whorl, villous; flowers umbellate. ♄. S. Native of Brazil, on mount Itambe da Villa do Principe.

Acerose-leaved Ditassa. Shrub erect.

6 D. læ'vis (Mart. l. c.) frutescent, nearly erect; branches loose; leaves on short petioles, linear-lanceolate, mucronate, flat, glabrous on both surfaces; umbels many-flowered; peduncles shorter than the flowers. ♄. S. Native of Brazil, on the ascent to mount Itambe, in the province of Minas Geraes.

Smooth Ditassa. Shrub erect.

7 D. linea'ris (Mart. l. c.) suffrutescent, twining; leaves on short petioles, linear, acute, mucronate, flat, glabrous on both surfaces; umbels few-flowered; pedicels equal to the flowers. ♄. ⌒. S. Native of Brazil, in Morro de Villa Rica. Flowers larger than any of its congeners.

Linear-leaved Ditassa. Shrub tw.

8 D. retu'sa (Mart. l. c.) frutescent, twining; leaves petiolate, obovate-lanceolate, retuse, mucronate, glabrous, with flat edges; flowers umbellate. ♄. ⌒. S. Native of Brazil, in the province of Minas Geraes, on the ascent to Serra do Caraca.

Retuse-leaved Ditassa. Shrub tw.

9 D. obcorda'ta (Mart. l. c.) frutescent, twining; leaves petiolate, ovate-roundish, reflexed, complicate, glabrous on both

surfaces; flowers umbellate. ♄. ◠. S. Native of Brazil, in the province of Minas Geraes, in grassy places of the diamond district.

Obcordate-leaved Ditassa. Shrub tw.

Cult. For culture and propagation see *Calótropis*, p. 147.

LXV. DÆ'MIA (altered from the Arabic name of *D. Forskæ'li*). R. Br. in wern. soc. mem. 1. p. 50.—Asclèpias species of authors.—Cynánchum species, Jacq.

Lin. syst. *Pentándria, Digýnia.* Corolla subrotate, with a short tube. Stamineous corona double: outer one short, 10-parted; the alternate segments short: inner one of 5 leaves; leaflets loose at the base, undulated at apex. Anthers terminated by a membrane; pollen masses compressed, fixed by their apexes, pendulous. Stigma mutic. Follicles ramentaceous. Seeds comose.—Stems twining. Leaves opposite, cordate. Flowers umbellate. Natives of the East Indies, and equinoctial Africa.

1 D. exte'nsa (R. Br. in mem. wern. soc. 1. p. 50. Wight and Arnott, contrib. ind. bot. p. 59.) shrubby, twining; leaves roundish-cordate, acuminated, acute, auricled at the base, downy, glaucous beneath; peduncles and pedicels elongated, filiform; margins of corolla ciliated. ♄. ◠. S. Native of the East Indies, in various parts, as well as on the banks of the Ganges; and at Sumbata, in the Himalaiah. Cynánchium cordifòlium, Retz. obs. 2. p. 15. Asclèpias echinàta, Roxb. fl. ind. 2. p. 44. mus. ind. or. cent. t. 616. Cynánchum exténsum, Jacq. icon. rar. t. 54. Ait. hort. kew. ed. 1. vol. 1. p. 303. Cynánchum bícolor, Andr. bot. rep. 562. Flowers white.

Extended Dæmia. Fl. July, Aug. Clt. 1777. Shrub tw.

2 D. corda'ta (R. Br. l. c.) shrubby, twining; leaves reniformly cordate, acute, villously tomentose, as well as the branches, &c.; umbels corymbose; pedicels hairy, ½ inch long. ♄. ◠. S. Native of Arabia Felix, and in the deserts about Cairo, and on arid hills in Barbary, about Kerouan, Asclèpias cordàta, Forsk. arab. p. 49. but not of Burm. fl. zeyl. p. 72. which is *Pergulària odoratíssima*. Pergulària tomentòsa, Lin. mant. p. 53. Vahl. symb. 1. p. 23. Desf. fl. atl. 1. p. 209. Corolla livid or rusty green, 4 times longer than the calyx. Corona white.

Cordate-leaved Dæmia. Fl. July, Aug. Clt. 1824. Sh. tw.

3 D. Guinee'nsis; shrubby, twining, hairy; leaves cordate; lobes rounded behind; petioles long: umbels racemose, downy. ♄. ◠. S. Native of Guinea, in various parts. Asclèpias scándens, Beauv. fl. d'owar. 1. p. 92. t. 56. Dæ'mia scándens, G. Don, in Loud. hort. brit. p. 94. Flowers white, in crowded umbels.

Guinea Dæmia. Fl. July, Aug. Clt. 1824. Shrub tw.

4 D. Forskœ'li (Schultes, syst. 6. p. 113.) shrubby, twining; leaves cordate, acute. ♄. ◠. S. Native of Arabia Felix. Asclèpias Dæ'mia, Forsk. ægypt. 51. no. 72. Flowers white. Follicles terete, subulate, 2 inches long, a little incurved, green, hispid from bent bristles. Perhaps distinct from Asclèpias (Gonólobus) setòsus.

Forskœl's Dæmia. Shrub tw.

5 D. gla'bra (Schultes, syst. 6. p. 113.) shrubby, twining; leaves ovate, acuminated, flat, quite glabrous; flowers umbellate, white. ♄. ◠. S. Native of Arabia Felix, at Taaes. Asclèpias glàbra, Forsk. ægypt. 51. no. 74. Probably distinct from the preceding.

Glabrous Dæmia. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXVI. SARCOSTE'MMA (from σαρξ σαρκος, *sarx sarcos*, flesh, and στεμμα, *stemma*, a crown; in reference to the leaflets of the inner corona being fleshy). R. Br. in mem. wern. soc. 1. p. 50. Wight and Arnott, contrib. ind. bot. 59.—Asclèpias species of Lin. and others.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate. Stamineous corona double; outer one cup-shaped or annular, crenated: inner one 5-leaved, higher than the outer one; leaflets fleshy. Anthers terminated by a membrane; pollen masses fixed by their apexes, pendulous. Stigma mutic or apiculated. Follicles slender, smooth. Seeds comose. Stems twining or decumbent, leafless, articulated; or with distant opposite leaves. Flowers umbellate, lateral, or terminal. Natives of the East Indies and New Holland, as well as of South America.

* *Species natives of the East Indies.*

1 S. vimina'le (R. Br. in mem. wern. soc. 1. p. 51. Wight and Arnott, contrib. ind. bot. p. 59.) twining, leafless; umbels terminal; calyxes and pedicels canescent; outer corona 10-plicate, 10-toothed: teeth nearly equal: leaflets of the inner corona flattish, exceeding the anthers; stigma apiculated, bifid. ♄. ◠. S. Native of the East Indies. Wall. ascl. no. 99. c. Wight, cat. no. 1556. Cynánchum viminàle, Lin. syst. p. 257. Willd. spec. 1. p. 1252. Lam. dict. 2. p. 233.? Euphórbia viminàle, Lin. spec. 2. p. 649. Mill. dict. no. 15. Apócynum viminàle, Bass. act. bonn. Telfel-Tavil, Alpin. ægypt. 190.? Flowers white, sweet-scented.

Twiggy Sarcostemma. Fl. July. Clt. 1731. Shrub tw.

2 S. Brunonia'na (Wight and Arnott, contrib. ind. bot. p. 59.) twining, leafless; umbels lateral, sessile; calyx and pedicels canescent; outer corona subplicate, with a 10-crenated border: the alternate crenæ almost obsolete; inner corona shorter than the anthers; stigma apiculated, nearly entire. ♄. ◠. S. Native of the south of Coromandel.

Brown's Sarcostemma. Shrub tw.

3 S. brevistígma (Wight and Arnott, l. c.) twining, leafless; umbels terminal, or terminating the short lateral branches; calyx and pedicels glabrous; outer corona 10-plicate, 10-crenate; leaflets of inner corona gibbous on the back, equal to the gynostegium; stigma mutic. ♄. ◠. S. Native of Coromandel. Wight, cat. no. 1558. S. viminàle, Wall. ascl. no. 99. b. Asclèpias ácida, Roxb. fl. ind. 2. p. 31. Asclèpias aphýlla, Roxb. in mus. ind. orient. t. 607.

Short-stigmaed Sarcostemma. Shrub tw.

** *Species Natives of New Holland.*

4 S. austra'le (R. Br. prod. p. 463.) leafless, articulated, decumbent, sometimes twining; umbels lateral or terminal, having the stem drawn out beyond the umbel in the same direction; common receptacle of pedicels convex, excentric. ♄. ◠. S. Native of New Holland, on the south shore and within the tropic. Very nearly allied to *S. viminàle*. According to Wight and Arnott, in contrib. ind. bot. p. 59. the character given to this species is applicable to them all, and perhaps even it contains two species, one with lateral and the other with terminal inflorescence.

Southern Sarcostemma. Shrub tw. or decumbent.

*** *Species natives of Africa.*

5 S. Thunbe'rgii; leafless, erect, branched; geniculately flexuous; flowers solitary, pedunculate. ♄. G. Native of the Cape of Good Hope, in Karro, beyond the Hartequas Kloof, near Hexrivier. S. aphýllum, Schultes, syst. 6. p. 116. Asclèpias aphýlla, Thunb. prod. 1. p. 47. fl. cap. 2. p. 153. Branches alternate. Follicles lanceolate, a hand long.

Thunberg's Sarcostemma. Shrub erect.

6 S. pyrote'chnicum (R. Br. in mem. wern. soc. 1. p. 51.) leafless, erect, branched, glabrous; peduncles axillary, tubercled, solitary, twin or tern, bearing each a capitate head of flowers

at top; exterior corona cup-shaped. ♄. G. Native of Arabia. Cynánchum pyrotéchnicum, Forsk. ægypt. p. 53. no. 79. Lam. dict. 2. p. 236. Microlòma pyrotéchnicum, Spreng. syst. 1. p. 855. Branches and stem green. Pedicels filiform, yellowish. Calyx campanulate, 5-cleft. Segments of corolla yellow above, green beneath and at the base, lanceolate, with reflexed edges. Follicles terete, curved, attenuated at the base. In Arabia the medulla of the plant is used as tinder.

Tinder Sarcostemma. Shrub.

7 S. stipita'ceum (Rœm. et Schultes, syst. 6. p. 116.) leafless, branched, diffuse, articulated, rather mealy; umbels terminating the short opposite branches, or at the tops and sides of the main branches; outer corona membranous, cup-shaped, pentagonal; leaflets of inner corona thick, incurved, longer than the gynostegium. ♄. G. Native of Arabia Felix, at Yemen, in woods. Asclèpias stipitàcea, Forsk. arab. 50. no. 69. Lam. dict. 1. p. 285. Stems of an obscure blue colour; joints 3 inches long. Pedicels filiform, about 12 in an umbel. Calyx small, 5-parted. Corolla with green segments; having reflexed edges, and a white corona. Follicles slender, flat on one side and convex on the other, 3 inches long.

Stipitate Sarcostemma. Shrub 3 feet.

8 S. Forskœlia'num (Rœm. et Schultes, l. c. p. 117.) leafless, twining, glabrous, green, articulated, branched; corymbs or umbels twin, on short branches, forming corymbs at the joints of the stems. ♄. ◠. S. Native of Arabia Felix, and in woods near mount Melhan. Asclèpias aphýlla, Forsk. ægypt. p. 5. no. 68. Lam. dict. 1. p. 285. Stems fleshy, green. Joints a span long. Peduncles twin, on short branches, and corymbose at the joints. Flowers pedicellate, white, crowded into a globose corymb. Corona as in *Calótropis gigantèa*, ex Forsk. Perhaps not distinct from *S. viminàle*.

Forskœl's Sarcostemma. Shrub cl. or tw.

* * * * *Species natives of tropical America. Umbels interpetiolar. Those species contained in this section differ materially in habit from the other species; and may probably form hereafter a distinct genus.*

9 S. glau'cum (H. B. et Kunth, nov. gen. amer. 3. p. 194. t. 229.) twining; branches terete, and are as well as the peduncles and leaves glabrous; leaves lanceolate, acuminated, acute at the base, glabrous beneath; calyx ciliated; umbels interpetiolar, on long peduncles; segments of corolla fringed, acute; outer corona undulated, annular, fleshy, 5-parted: lobes fringed; leaflets of the inner corona ovate-oblong, obtuse, fleshy, higher than the anthers. ↄ. ◠. S. Native of La Guayra, Mayqueties, and Cabo Blanco, by the sea side. Cynánchum pedunculàre, Lam. dict. 2. p. 236. Leaves membranous, revolute, green above. Flowers size of those of *Asclèpias Syrìaca*, white. Gynostegium twice as long as the tube of the corolla. Pollen masses subclavate, yellow, angular at the base, and geniculately inflexed. Stigma terminated by a subconical, 2-lobed point.

Glaucous-leaved Sarcostemma. Shrub tw.

10 S. pube'scens (H. B. et Kunth, l. c. p. 195.) twining; branches, peduncles, and calyxes clothed with silky down; leaves lanceolate, acuminated, rounded at the base, membranous, having the margins and middle nerves downy; segments of corolla ciliated, downy outside, many-nerved; outer corona narrow; leaflets of inner corona ovate-oblong, obtuse, fleshy, flat, equal in height to the gynostegium, but three times shorter than the corolla, green. ↄ. ◠. S. Native along with *S. glaúcum*. Flowers size of those of *S. glaúcum*. Pollen masses linear-oblong, obtuse, the rest as in *S. glaúcum*. Leaves nearly 2 inches long and ½ an inch broad. Stigma terminated by a conical, 2-lobed point.

Downy Sarcostemma. Pl. tw.

11 S. Cumane'nse (H. B. et Kunth, l. c.) twining; branches and peduncles glabrous; leaves linear-lanceolate, acuminated, obtuse at the base, membranous, puberulous; calyxes downy; outer corona narrow, undulated; segments of corolla ovate, acute; leaflets of inner corona oblong, obtuse, fleshy; gynostegium as in the preceding. ↄ. ? ◠. S. Native near Cumana, in sandy places. Leaves 2 inches long and 2½-3 lines broad. Corolla white.

Cumana Sarcostemma. Pl. tw.

12 S. Brównii (Meyer. prim. esseq. p. 139.) twining, glabrous; leaves lanceolate, acuminated, glabrous; umbels interpetiolar; pedicels, calyxes, and corolla downy; segments of corolla ovate, bluntish, concave, glabrous inside; outer corona an entire, narrow ring; leaflets of inner corona ovate, bluntish, glabrous, a little higher than the gynostegium. ♄. ? ◠. S. Native of Carthagena, Jacq.; island of Arowabish, in hedges, ex Meyer. S. claúsum, Rœm. et Schultes, syst. 6. p. 114. Cynánchum claúsum, Jacq. amer. 1. p. 87. t. 60. f. 2. ed. pict. t. 87. Asclèpias viminàlis, Willd. spec. 1. p. 1270. ?—Plum. icon. t. 27. f. 2. ? Lower leaves larger and broadish ovate-oblong; the upper ones becoming gradually narrower, with revolute edges: painted with white on the nerves, and greenish blue on the veins. Calyx small. Pollen masses oblong, a little curved, hairy, hanging by short pedicels rising from blackish glands. Pedicels furnished with minute villous bracteas at the base.

Browne's Sarcostemma. Shrub tw.

13 S. Swartzia'num (Rœm. et Schultes, syst. 6. p. 115.) twining, filiform, glabrous; leaves lanceolate, glabrous; umbels interpetiolar, many-flowered; segments of corolla ovate, acute, concave, ciliated; outer corona? leaflets of inner corona sessile, ovate-conical. ♄. ◠. S. Native of the south of Jamaica, in sandy arid places, among bushes by the sides of rivulets. Asclèpias viminàlis, Swartz, prod. p. 53. fl. ind. occ. 1. p. 539. Willd. spec. 1. p. 1270. ? Asclèpias scándens, Mill.—Sloan. jam. 89. hist. 1. p. 207. t. 131. f. 1. Plum. icon. 27. f. 2. Pedicels naked. Corolla white. Follicles oblong, acuminated, compressed at the base, downy, hoary.

Swartz's Sarcostemma. Clt. 1820. Shrub tw.

14 S. linea're (Spreng. syst. 1. p. 853.) plant erectish, herbaceous; leaves almost sessile, linear, glabrous; umbels axillary, many-flowered. ↄ. S. Native of Cumana.

Linear-leaved Sarcostemma. Pl. erect.

Cult. For culture and propagation see *Ceropègia*, p. 112.

LXVII. PHILIBE'RTIA (named after J. C. Philibert, who has written some works on elementary botany). H. B. et Kunth, nov. gen. amer. 3. p. 195.

Lin. syst. *Pentándria, Digýnia.* Corolla urceolately rotate, sinuately 5-lobed; lobes acute, intersected by as many teeth. Corona double; outer one ring-formed, in the bottom of the corolla, entire, fleshy, undulated; inner one inserted higher up with the tube of the filaments, 5-leaved: leaflets entire. Anthers terminated by a membrane; pollen masses clavately cylindrical, fixed beneath their apexes, pendulous. Stigma biapiculated. Follicles unknown.—A twining shrub. Leaves opposite, cordate, soft, tomentose. Umbels interpetiolar, involucrated.—This genus is very nearly allied to *Sarcostémma*, from which it principally differs in the urceolate, sinuately 5-lobed corolla.

1 P. solanoides (H. B. et Kunth, l. c. p. 196. t. 230.) ♄. ◠. S. Native on the banks of the river Amazon, near Tomependa. Leaves green above and hoary beneath, 1 inch and more long, 4-5 lines broad. Umbels 8-10-flowered, about equal in length to the leaves. Corollas large, downy outside.

Solanum-like Philibertia. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXVIII. EUSTE'GIA (from *ευ, eu,* well, and *στεγω, stego,* to cover; in reference to the triple corona). R. Br. in mem. wern. soc. 1. p. 51.—Apócynum species of Thunb.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate. Corona triple, each composed of 5 leaves; outer one inserted in the throat of the corolla, having its leaflets opposite the segments of the limb; the leaflets of the rest alternating with those of the outer, but opposite the anthers; leaflets of the middle corona tripartite, of the inner one undivided. Anthers terminated by a membrane; pollen masses fixed by their tapering apexes, pendulous. Stigma submutic. Follicles unknown.—Dwarf decumbent herbs. Leaves opposite, hastate. Flowers subumbellate. Umbels interpetiolar.

1 E. hasta'ta (Rœm. et Schultes, syst. 6. p. 119.) branches decumbent; leaves hastate, ciliated. ♃. G. Native of the Cape of Good Hope. Spreng. neue. entd. p. 268. t. 5. f. 5-10. Apócynum hastàtum, Thunb. prod. 1. p. 47. fl. cap. 2. p. 164. act. nov. petrop. 14. p. 514. t. 9. f. 6. A. minùtum, Lin. suppl. p. 169. Branches and peduncles downy. Leaves glabrous.

Hastate-leaved Eustegia. Fl. June, July. Clt. 1816. Pl. dec.

2 E. filifórmis (Rœm. et Schultes, syst. 6. p. 120.) stems decumbent; leaves linear-filiform. ♃. G. Native of the Cape of Good Hope, in sandy fields at Swartland. Apócynum filifórme, Thunb. prod. 1. p. 47. fl. cap. 2. p. 160. Stems, peduncles, and pedicels downy. Leaves glabrous.

Filiform-leaved Eustegia. Pl. dec.

Cult. For culture and propagation see *Ceropègia*, p. 112.

§ 4. *Stamineous tube or gynostegium naked. Corona wanting.*

LXIX. METASTE'LMA (from *μετα, meta,* instead, and *στελμα, stelma,* a crown; the throat is crowned by 5 exserted teeth instead of a corona). R. Br. in mem. wern. soc. 1. p. 52.—Cynánchum species of authors.

Lin. syst. *Pentándria, Digýnia.* Corolla subcampanulate; throat crowned by 5 exserted teeth, which are opposite the recesses between the segments, and running down the tube inside. Stamineous corona wanting. Anthers terminated by a membrane; pollen masses compressed, fixed by their attenuated apexes, pendulous. Stigma mutic. Follicles unknown.—A perennial, twining, glabrous plant. Leaves opposite, membranous. Umbels interpetiolar, almost sessile. Flowers small.

1 M. parviflòrum (R. Br. l. c.). ♃.? ◠. S. Native of the West Indies, among bushes on the mountains. Cynánchum parviflòrum, Swartz, prod. p. 53. fl. ind. occ. 1. p. 537.—Plum. icon. 215. f. 1. Leaves ovate, subulate at top. Stems bluntly tetragonal. Flowers small, whitish green.

Small-flowered Metastelma. Pl. tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXX. MICROLO'MA (from *μικρος, micros,* small, and *λωμα, loma,* a fringe; in reference to the fascicles of hairs in the tube of the corolla). R. Br. in mem. wern. soc. 1. p. 53.—Ceropègia species, Lin. and Thunb. Lam. ill. t. 179.

Lin. syst. *Pentándria, Digýnia.* Corolla urceolate, with a ventricose angular tube, a naked throat, and a short limb. Scales 5, inclosed, inserted in the middle of the tube under the recesses, alternating with as many fascicles of hairs. Stamineous corona none. Anthers sagittate, terminated by a membrane; pollen masses compressed, fixed by their apexes, pendulous. Stigma apiculated. Follicles unknown.—Twining subshrubs. Leaves opposite. Umbels interpetiolar.

1 M. sagitta'tum (R. Br. l. c.) leaves sagittate, downy; limb of corolla acutish. ♄. ◠. G. Native of the Cape of Good Hope, on sandy hills. Ceropègia sagittàta, Lin. mant. 215. Thunb. prod. 1. p. 37. fl. cap. 2. p. 148. nov. act. petrop. t. 14. Jacq. hort. schœnbr. 1. p. 17. t. 38.—Burm. afr. 36. t. 15. Stems villous or tomentose. Corolla scarlet, ex Lin.; purple, but green at the base and apex, ex Thunb.

Sagittate-leaved Microloma. Fl. July, Aug. Clt. 1775. Shrub tw.

2 M. linea're (R. Br. l. c.) leaves linear, glabrous; limb of corolla very blunt. ♄. ◠. G. Native of the Cape of Good Hope, on hills. Ceropègia tenuiflòra, Lin. syst. 211. Thunb. prod. 1. p. 37. fl. cap. 2. p. 147. Periploca tenuiflòra, Lin. spec. p. 310. Ceropègia tenuifòlia, Pers. ench. 1. p. 277.—Burm. afr. 37. t. 16. f. 1.?—Plukn. mant. 17. t. 335. f. 5. Stems glabrous. Corollas blood-coloured, ex Thunb.

Linear-leaved Microloma. Fl. July, Aug. Clt. 1823. Sh. twining.

Cult. For culture and propagation see *Ceropègia*, p. 112.

LXXI. ASTE'PHANUS (from *α* priv. and *στεφανος, stephanos,* a corona; corona none). R. Br. in mem. wern. soc. 1. p. 54.—Apócynum species, Lin. fil. and Thunb.

Lin. syst. *Pentándria, Digýnia.* Corolla subcampanulate, having the throat and tube without scales. Stamineous corona wanting. Anthers terminated by a membrane; pollen masses pendulous. Stigma cordate or mutic. Follicles unknown.—Perennial, usually twining plants. Leaves opposite. Umbels interpetiolar. Flowers small. This genus differs chiefly from *Microlòma* in the want of scales within the tube of the corolla.

1 A. triflòrus (R. Br. l. c. Schultes, syst. 6. p. 122.) stems twining, pilose; leaves lanceolate, villous beneath; umbels generally 3-flowered. ♄. ◠. G. Native of the Cape of Good Hope. Cynánchum triflòrum, Lin. fil. suppl. 169. Thunb. prod. 1. p. 47. fl. cap. 2. p. 161. Corollas white. Filaments and anthers connate.

Three-flowered Astephanus. Fl. July, Aug. Clt. 1816. Shrub tw.

2 A. linea'ris (R. Br. l. c. Schultes, syst. 6. p. 123.) stems twining, glabrous; leaves linear-lanceolate; umbels trichotomous, lateral, and terminal. ♄. ◠. G. Native of the Cape of Good Hope, in Swartland. Cynánchum lineàre, Lin. fil. suppl. 169. Thunb. prod. 1. p. 47. fl. cap. 2. p. 160. Leaves an inch long. Corollas white.

Linear-leaved Astephanus. Fl. July, Aug. Clt. 1816. Shrub tw.

3 A. lanceola'tus (R. Br. l. c. Schultes, l. c.) stems twining, glabrous; leaves lanceolate, glabrous; umbels usually 3-flowered. ♄. ◠. G. Native of the Cape of Good Hope. Apócynum lanceolàtum, Thunb. prod. 1. p. 47. fl. cap. 2. p. 162. Corollas white. Leaves rounded at the base.

Lanceolate-leaved Astephanus. Shrub tw.

4 A.? corda'tus (R. Br. l. c. Schultes, l. c.) stems twining, hairy; leaves ovate, rounded at the base, villous beneath and glabrous above; umbels interpetiolar. ♄. ◠. G. Native of the Cape of Good Hope, in woods. Apócynum cordàtum, Thunb. prod. 1. p. 47. fl. cap. 2. p. 163. Leaves more than an inch long. Calycine segments laciniated, acute. Corolla greenish, 5-parted to the base; segments ovate, concave, obtuse. Filaments distinct; anthers combined; stigmas obtuse. Follicles 2, oblong. Styles 2, filiform.

Cordate-leaved Astephanus. Shrub tw.

5 A. Massònii (Schultes, syst. 6. p. 124. ex R. Br. l. c.) shrubby; branches spinescent; leaves small, opposite, distant, cordate; corolla more urceolate than campanulate, the orifice of the tube furnished with deflexed hairs. ♄. G. Native of the Cape of Good Hope, where it was detected by Masson. The pollen masses are fixed by their attenuated apexes. The follicles are nearly cylindrical, and smooth, with the seeds of the usual structure.

Masson's Astephanus. Shrub.

6 A. Cube'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 206. t. 237.) stems twining, glabrous, or beset with recurved pili; leaves lanceolate, a little acuminated, glabrous, ciliated; umbels many-flowered; corollas bearded inside. ♄. ⌒. S. Native of Cuba, near Regla. Períploca parviflòra, Willd. herb. P. Humboldtiàna, Schultes, syst. 6. p. 129. Leaves 12-14 lines long. Petioles 2 lines long, slender. Umbels furnished with many oblong-ovate bracteas, shorter than the leaves. Corolla 5-cleft, white; with an inflated globose tube; ovate, lanceolate segments, which are narrow linear at top, fleshy and connivent. Column short. Pollen masses clavate, yellow. Stigma conical. Perhaps a separate genus.

Cuba Astephanus. Shrub tw.

7 A. Berte'rii (Spreng. syst. 1. p. 855.) twining, glabrous; leaves cordate-oblong, acute; peduncles usually 1-flowered; corolla rotate, glabrous, 5-parted. ♄. ⌒. S. Native of New Granada, Bertero.

Bertero's Astephanus. Shrub tw.

Cult. For culture and propagation see *Ceropègia*, p. 112.

LXXII. PENTASA'CME (from πεντε, *pente*, five, and ακμη, *akme*, a point; in reference to the 5 scales in the throat of the corolla). Wall. ascl. no. 74. Wight et Arnott, contrib. ind. bot. p. 60.

Lin. syst. *Pentándria*, *Digýnia*. Corolla subrotate, 5-cleft; throat crowned by 5 scales, which alternate with the segments; æstivation valvate. Stamineous corona wanting. Anthers free, simple, or acuminated at the apex. Pollen masses pendulous, fixed above their middle, with coarctate pellucid tips. Stigma mutic or apiculated.—Slender, erect, much-branched herbs. Leaves opposite, flat, membranous. Umbels almost sessile, few-flowered. Segments of corolla 2-3 times longer than the tube, narrow-linear. This genus is allied, in many points, with *Leptadènia*, but is distinguished by the form of the corolla, by the pendulous pollen masses, and by the different habit.

1 P. cauda'tum (Wall. ascl. no. 75. Wight and Arnott, l. c.) leaves lanceolate, long-attenuated; segments of corolla subulate; scales in the throat largish, 4-cleft; anthers obtuse; stigma mutic. ♃. G. Native of Silhet, and the mountains of Lahore.

Tailed-leaved Pentasacme. Pl.

2 P. Wallíchii (Wight, contrib. ind. bot. p. 60.) leaves lanceolate, acuminated; umbels almost sessile, few-flowered; segments of corolla linear, obtuse; scales in the throat small, gland-formed; anthers acuminated; stigma beaked. ♃. G. Native of Silhet. Wall. ascl. no. 74. unnamed.

Wallich's Pentasacme. Pl.

Cult. For culture and propagation see *Calótropis*, p. 147.

LXXIII. HYBANTHE'RA (from ὑβος, *hybos*, a curve, and ανθηρα, *anthera*, an anther; anthers gibbous on the back). Endlicher, prod. ins. norf. fl. p. 59.

Lin. syst. *Pentándria*, *Digýnia*. Corolla rotate. Corona none. Anthers gibbous on the back, terminated by a membrane; pollen masses pendulous, fixed by their tips. Stigma mutic. Follicles unknown.—A twining shrub, with opposite leaves and interpetiolar umbels of flowers.

1 H. biglandulòsa (Endl. l. c. Bauer. pl. ins. norf. t. 162.) ♄. ⌒. G. Native of Norfolk Island. Leaves ovate-oblong, petiolate, cuspidately mucronate, 2 inches long, glabrous, shining above and pale beneath. Umbels interpetiolar, racemose, 4-8-flowered, a little longer than the petioles. Corollas pale green.

Biglandular Hybanthera. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

Tribe IV.

SECAMONE'Æ (this tribe contains genera agreeing with *Secamòne* in several particular characters). Pollen masses 20, smooth, fixed by fours to the top of each of the corpuscles of the stigma, which are exsulcate. Filaments connate, appendiculate outside.

LXXIV. SECAMO'NE (*Squamouna* is the Arabic name of *S. Ægyptìaca*). R. Br. in mem. wern. soc. 1. p. 55.—Períploca species of Lin. and others.

Lin. syst. *Pentándria*, *Digýnia*. Corolla rotate. Stamineous corona 5-leaved; leaflets laterally compressed, fixed lengthwise by their margins, averse, simple. Pollen masses erect. Stigma coarctate at top. Follicles smooth.—Erect or twining, glabrous shrubs. Leaves opposite. Cymes dichotomous, interpetiolar. Flowers minute.—Natives of Africa, the East Indies, and New Holland. From the extreme minuteness of the parts, no genus is more difficult to determine than this.

* *Species natives of the East Indies.*

1 S. eme'tica (R. Br. l. c. Schultes, syst. 6. p. 124. Wight and Arnott, contrib. ind. bot. p. 60.) twining, glabrous; leaves from elliptic to narrow-lanceolate; cymes shorter than the leaves; corolla glabrous; leaflets of corona cultriform, nearly one half shorter than the gynostegium; follicles slender, attenuated at the apex. ♄. ⌒. S. Native of the East Indies, at the roots of mountains, among other bushes. Wall. ascl. no. 102. Wight, cat. no. 1559. Períploca emética, Retz, obs. 2. p. 14. Willd. phyt. 1. p. 6. t. 5. f. 2. Períploca cymòsa, Roxb. Cynánchum vomitòrum, Lam. 2. p. 235. ex Poir.? ined. The other species mentioned by R. Br. l. c. is probably the *Toxocárpus Roxbúrghii*. The roots of this plant are used in place of ipecacuanha.

Emetic Secamone. Clt. 1816. Shrub tw.

2 S. Finlaysonia'na (Wight and Arnott, contrib. ind. bot. p. 61.) twining, glabrous; leaves oval, acuminated, almost sessile; cymes longer than the leaves, with flexuous branches; corolla glabrous; leaflets of corona about equal in length to the gynostegium. ♃. ⌒. S. Native of the East Indies, where it was collected by Dr. Finlayson.—Wall. ascl. no. 103. unnamed.

Finlayson's Secamone. Shrub tw.

3 S. marítima (Blum. bijdr. p. 1050.) flowers villous inside, disposed in dense cymes; leaves elliptic-oblong, acute at both ends, smoothish, veinless above; stem twining. ♄. ⌒. S. Native of the island of Nusæ Kambanga, by the sea side.

Sea side Secamone. Fl. Nov. Shrub tw.

4 S. auricula'ta (Blum. bijdr. p. 1051.) flowers glabrous, disposed in corymbose panicles; leaves oval, acutish, obsoletely biauriculate at the base, veiny, glabrous; stem twining. ♄. ⌒. S. Native of Java, on the Salak mountains.

Auricled-leaved Secamone. Fl. Oct. Nov. Shrub tw.

5 S. linea'ta (Blum. bijdr. p. 1051.) flowers glabrous, disposed in loose panicles; leaves elliptic-oblong, acuminated, rather emarginate at the base, glabrous, full of fine parallel veins; stem twining. ♄. ⌒. S. Native of Java, in shady places, on mount Salak, where it is called *Aroy kakawalan*.

Lined-leaved Secamone. Fl. June, Sept. Shrub tw.

6 S. lanceola'ta (Blum. bijdr. p. 1051.) flowers glabrous, subcorymbose; leaves lanceolate, acuminated, finely veined, glabrous, shining; stem twining; branches nodose at the insertion of the leaves. ♄. ⌒. S. Native of Java, in calcareous soil, frequent.

Lanceolate-leaved Secamone. Fl. May, June. Shrub tw.

7 S. villòsa (Blum. bijdr. p. 1050.) flowers disposed in dichotomous cymes; throat of corolla villous; leaves oval-oblong, acutish, veinless above, and rather villous beneath; stems twining, terete, clothed with fulvous tomentum. ♄. ⌒. S. Native of Java, among bushes, about Batavia.

Villous Secamone. Fl. year. Shrub tw.

8 S. macrophy'lla (Blum. bijdr. p. 1050.) flowers disposed in spicate panicles; corolla villous outside; leaves ovate, acutish, coriaceous, glabrous, veiny; stems twining, tetragonal. ♄. ⌒. S. Native of Java, in mountain woods.

Var. β, *fúlva* (Blum. l. c.) leaves acuminated, clothed with fulvous tomentum beneath, as well as the branches and peduncles. ♄. ⌒. S. Native of Java, in calcareous earth, about Kuripan.

Long-leaved Secamone. Fl. Jan. May. Shrub tw.

* * *Species natives of Africa.*

9 S. Ægypti'aca (R. Br. in hort. kew. 2. p. 75.) twining, glabrous: leaves elliptic-lanceolate, or oblong, acuminated, on very short petioles; cymes panicled, shorter than the leaves; corolla villous inside. ♄. ⌒. S. Native of Egypt, as well as the Cape of Good Hope, in woods. S. Alpínii, Schultes, syst. 6. p. 125. Perípoca Secamòne, Lin. mant. p. 216. Thunb. prod. 1. p. 45. fl. cap. 2. p. 153. Poir. encycl. 5. p. 189. Secamòne, Alp. ægypt. p. 135. t. 134. Leaves paler beneath and transversely veined. Flowers copious, minute. The Egyptian and Cape plants are probably distinct species, and even perhaps not of the same genus.

Egyptian Secamone. Fl. July. Clt. 1752. Shrub tw.

* * * *Species natives of New Holland.*

10 S. ellíptica (R. Br. prod. p. 464.) stem erect; leaves elliptic, acuminated, glabrous; peduncles and pedicels tomentose; corolla beardless. ♄. S. Native of New Holland, on the sea shore, within the tropic.

Elliptic-leaved Secamone. Clt. 1824. Shrub erect.

11 S. ova'ta (R. Br. l. c.) stem divaricate; leaves ovate, acute, glabrous; peduncles and pedicels smoothish; corollas beardless. ♄. S. Native of New Holland, within the tropic, on the sea shore.

Ovate-leaved Secamone. Shrub erect.

* * * * *A species native of the West Indies.*

12 S. occidenta'lis (Spreng. syst. 1. p. 837.) corollas downy; peduncles axillary, solitary; leaves oval, mucronulate, villous; stem twining. ♄. ⌒. S. Native of Hispaniola and Cuba.

Western Secamone. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXV. TOXOCA'RPUS (from τοξον, *toxon*, a bow, and καρπος, *karpos*, a fruit; in reference to the arched follicles). Wight and Arnott, contrib. ind. bot. p. 61.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate, 5-cleft. Stamineous corona 5-leaved; leaflets flattish on the back, furnished with a little segment inside each. Pollen masses 20, erect, fixed by fours to the tops of the corpuscles of the stigma, which are exsulcate. Stigma rostrate, rarely apiculated, undivided. Follicles smooth, divaricate. Seeds comose.—Twining shrubs. Corymbs interpetiolar, usually opposite, dichotomous, spreading, many-flowered.

1 T. Kle'inii (Wight and Arnott, l. c.) stems glabrous; young branches downy; leaves elliptic, acuminated; corymbs nearly sessile, with divaricate branches, longer than the leaves; flowers pedicellate; segments of corolla ligulate, glabrous; throat rather hairy; leaflets of corona ovate, bidentately truncate, bearing each on the inside at the apex, a flat, linear, much exserted segment, which exceeds the anthers, and is somewhat tridentate at the apex; stigma rostrate, bifid at apex, exceeding the tube of corolla a little; follicles arcuately reflexed. ♄. ⌒. S. Native of the East Indies, in hedges, at Vellangany, near Nepatam.—Wight, cat. no. 1560. Perípoca glàbra, Roxb. in herb. Banks. Echìtes racemòsa, Herb. madr. Wall. ascl. no. 113. unnamed.

Klein's Toxocarpus. Shrub tw.

2 T. Roxbu'rghii (Wight and Arnott, l. c.) branches clothed with rusty down; leaves broad, oval, acuminated; corymbs on short peduncles, with divaricate branches, about equal in length to the leaves; flowers almost sessile; throat of corolla hairy; segments ligulate, glabrous; leaflets of corona ovate, acutish, bearing each a short, thick, acute, hardly exserted segment inside, which is equal in length to the anthers; stigma beaked, twisted, equal to the tube of the corolla. ♄. ⌒. S. Native of the Circars. Wight, cat. no. 1561. Asclèpias longistígma, Roxb. fl. ind. 2. p. 46. mus. ind. orient. t. 619. Asclèpias micrántha, Roxb. in herb. Banks. Echìtes dichótoma, herb. Klein. et Rottler. Wall. ascl. no. 113. b. The flowers are much smaller than in the last species.

Roxburgh's Toxocarpus. Shrub tw.

3 T. crassifòlius (Wight, contrib. ind. bot. p. 61.) branches sparingly pubescent; leaves on short petioles, oval, acuminated, coriaceous, glabrous; corymbs panicle-formed, sessile, with elongated, slightly branched branches, and are, as well as the calyxes, clothed with fuscous down; flowers sessile, in fascicles, small; segments of corolla densely clothed with white villi; leaflets of corona reflexed at the sides, cohering at top, and forming a dorsal keel, having the inner segment acuminated and much exserted, equalling the stigma in length; stigma rostrate, higher than the gynostegium and tube of the corolla. ♄. ⌒. S. Native of Silhet. Secamòne crassifòlia, Wall. ascl. no. 101.

Thick-leaved Toxocarpus. Shrub tw.

4 T. laurifòlius (Wight, l. c.) glabrous; leaves oval, sometimes obtuse, but usually acuminated, coriaceous; corymbs sessile, divaricately and trichotomously branched; flowers small, very numerous; segments of corolla reflexed, bearded with white hairs inside; leaflets of corona rather fleshy, short, roundish-ovate, acutish: having the inner segments a little exserted, about equal to the gynostegium; tips of anthers large, broad, sub-aristate, obconically apiculated above the stigma, which is obtuse, inclosed, and incurved; follicles slender, diverging horizontally. ♄. ⌒. S. Native of Chittagong and Tipperah; and at Cawnpore, &c. Asclèpias laurifòlia, Roxb. fl. ind. 2. p. 49. mus. ind. orient. t. 1814. Wall. ascl. no. 100. A. micrántha, Roxb. in herb. Banks. fl. ind. 2. p. 50.

Laurel-leaved Toxocarpus. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXVI. GONIOSTE'MMA (from γωνια, *gonia*, an angle, and στεμμα, *stemma*, a crown; stamineous corona 5-angled). Wight, contrib. ind. bot. p. 62.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate, 5-parted. Stamineous corona tubular, 5-angled, 5-lobed, adhering to the gynostegium at the base. Pollen masses 20, erect, fixed by fours to each corpuscle of the stigma, which are exsulcate. Stigma rostrate. Follicles.?—A twining shrub, with warted bark. Leaves opposite, oblong-elliptic, acuminated at both ends, glabrous, shining above. Cymes interpetiolar, panicle-formed, loose, many-flowered. Segments of corolla ligulate, downy inside at the middle, glabrous above. Corona shorter than the gynostegium, fleshy; lobes naked inside. Stigma cylindrical,

about one half shorter than the corolla. This genus is allied to both *Secamòne* and *Toxocárpus*, but differs from both in the structure of the corona, as also in habit. Brown's character of *Secamòne* was probably intended to include all three genera.

1 G. acumina'tum (Wight, l. c.). ♄. ◠. S. Native of Silhet. Wall. ascl. no. 127. unnamed.

Acuminated-leaved Goniostemma. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

Tribe V.

PERIPLO'CEÆ (this tribe contains genera agreeing with *Períploca* in particular characters). R. Br. in mem. wern. soc. 1. p. 56. Wight and Arnott, contrib. ind. bot. p. 62. Pollen masses 5-20, granular, fixed singly, or by fours, to a dilated appendage, composed of 2 combined ones, which rises from the top of each corpuscle of the stigma, but are at length applied to it. Filaments partly or altogether distinct. Anthers conniving, in the manner of a cupola, over the stigma.—In all the genera of this tribe, examined by Wight and Arnott, (except perhaps *Cryptostègia*) the corpuscle is dilated at the base into a kind of gland, similar to those found at the base of the pollen masses of an *Orchis;* and in all, with the above exception, both the corpuscle and its appendage are at length readily detached from the stigma.

LXXVII. HEMIDE'SMUS (from ἡμισυς, *hemisus*, half, and δεσμος, *desmos*, a tie; filaments joined at base and free at apex). R. Br. in mem. wern. soc. 1. p. 56. Wight and Arnott, contrib. ind. bot. p. 62.—Períploca species, Lin.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate; having 5 mutic scales inserted under the recesses between the segments. Filaments connate at the base, distinct at top, inserted in the tube. Anthers cohering, free from the stigma, beardless, simple at top. Pollen masses 20, granular, applied by fours to the reniform, solitary, appendage of each corpuscle. Stigma flattish, peltate, mutic. Follicles cylindrical, divaricate, smooth. Seeds comose.—Twining shrubs. Leaves opposite, shining above. Cymes interpetiolar. Flowers small. Corollas between coriaceous and fleshy. The pollen masses are 4 to each anther; these remain for some time in their cells, but at length adhere to a viscid dilated corpuscular appendage.

1 H. I'ndicus (R. Br. in hort. kew. 2. p. 75.) glabrous; leaves from cordate-ovate, cuspidate, to narrow-linear, acute, usually oblong-lanceolate; cymes usually almost sessile, but sometimes pedunculate; scales of corolla adhering to the tube from the base to the apex; follicles slender, straight. ♄. ◠. S. Native every where in the peninsula of India, among bushes. Wall. ascl. no. 104. 105. Wight, cat. 1562. Períploca I'ndica, Willd. spec. 1. p. 1251. Roxb. mus. ind. orient. t. 212. Asclèpias pseudosársa, Roxb. fl. ind. 2. p. 39. exclusive of many synonymes.—Rheed. mal. 10. t. 34.—Burm. zeyl. p. 187. t. 83. f. 1.—Pluk. t. 359. f. 2. (with broad leaves) and t. 361. f. 1. (with narrow leaves). This is a very polymorphous plant, varying much in shape, and size of the leaves; and when the varieties are better known may hereafter form several species.

Indian Hemidesmus. Clt. 1796. Shrub. tw.

2 H. pube'scens (Wight and Arnott, contrib. ind. bot. p. 63.) branchlets slender, clothed with hairy pubescence; leaves lanceolate, acute, downy as well as the peduncles and calyxes; cymes sessile; scales of corolla fixed to the tube. ♄. ◠. S. Native of the East Indies, at Vandalore. Wall. ascl. no. 105. cl. unnamed. Wight, cat. no. 1563.

Downy Hemidesmus. Shrub tw.

3 H. Wallíchii (Wight, l. c.) glabrous; leaves narrow linear-lanceolate, acute; cymes few-flowered; scales of corolla subulate, free from the tube, but cohering with the base of the filaments. ♄. ◠. S. Native on hills, about Prome. Wall. cat no. 106. unnamed.

Wallich's Hemidesmus. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXVIII. BRACHY'LEPIS (from βραχυς, *brachys*, short, and λεπις, *lepis*, a scale; in reference to the 5 short truncate scales in the throat of the corolla). Wight and Arnott, contrib. ind. bot. p. 63.

Lin. syst. *Pentándria, Digýnia.* Corolla subrotate, 5-parted; segments spreading; scales in the throat 5, short, truncate, flat, mutic; tube short, fully clothed by a broad, fleshy, adnate ring inside. Filaments very short, broad, distinct, inserted in the upper part of the throat along with the scales; anthers glued by the base to the margin of the stigma, simple and cohering at top, the rest distinct and beardless. Pollen masses 20, granular, applied by fours to the dilated loose appendage of each corpuscle. Stigma mutic. Follicles divaricate, cylindrical, smooth.—A twining shrub; branches downy. Leaves opposite, oval, abruptly acuminated, rather downy while young, glabrous in the adult state, and shining above, parallelly nerved beneath. Cymes interpetiolar, small, tomentose, shorter than the leaves. Flowers small, crowded. Corolla hairy outside, glabrous inside, subrotate; segments spreading; or the corolla is subcampanulate.

1 B. nervòsa (Wight and Arnott, l. c.). ♄. ◠. G. Native of the Neelgherries.—Wight, cat. no. 1565. Streptocaúlon nervòsum, Wight, mss.—Wall. ascl. no. 107. unnamed.

Nerved-leaved Brachylepis. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXIX. STREPTOCAU'LON (from στρεπτος, *streptos*, twisted, and καυλος, *kaulos*, a stem; stems twisted). Wight and Arnott, contrib. ind. bot. p. 64.—Períploca species, Wall. ascl.

Lin. syst. *Pentándria, Digy'nia.* Corolla rotate, 5-parted; throat crowned by 5 short scales, which alternate with the segments, aristate; awns flexuously erect, filiform, straight at the apex. Filaments distinct, inserted in the tube; anthers adhering by the base to the margin of the stigma, free above, simple and beardless at the apex. Pollen masses granular, solitary (or composed of 4 confluent ones), applied to the dilated loose appendage of each corpuscle. Stigma mutic. Follicles cylindrical, divaricate, smooth. Seeds comose.—Twining, or rarely decumbent plants, usually downy or tomentose, rarely glabrous. Leaves opposite. Cymes interpetiolar, usually spreadiug, and much branched. Flowers small. This genus is intermediate between *Períploca*, as limited by Mr. Brown, and his *Gymnèma*. It differs from *Períploca* in the beardless anthers, which character is laid particular stress on by most authors. It differs from *Gymnanthèra* in several respects, by the stigma, pollen masses, and shape of corolla, and its scales. Perhaps most of Poiret's species of *Períploca* belong to this genus. What his *P. Mauritiàna* may be it is impossible to say, as the synonymes adduced are very different from each other; thus Plukn. t. 336. f. 7. is *Tylóphora asthmática;* and Rheed. mal. 9. t. 11. is *Cryptólepis Buchanàni*, Rœm. et Schultes.

1 S. tomentòsum (Wight, contrib. ind. bot. p. 64.) branches pubescent; leaves obovate-lanceolate, acuminated, somewhat cordate at the base, hispid above and tomentose beneath; cymes large, diffuse; flowers on short pedicels, crowded on the tops of the branches; calyx and pedicels densely clothed with down; filaments very short. ♄. ◠. S. Native of mount Taong Dong, near Ava; and of Cochinchina. Períploca tomentòsa, Wall. ascl. no. 125. and no. 126.

Tomentose Streptocaulon. Shrub tw.

2 S. Kleínii (Wight, and Arnott, l. c. p. 65.) branches downy; leaves almost sessile, cuneate-oblong or obovate, mucronate, cordate at the base, rather hispid above, but clothed with soft, white tomentum beneath; cymes diffuse, shorter than the leaves; calyxes and pedicels densely downy. ♄. ⌒. S. Native of the Peninsula of India, but the locality is not mentioned. Wight. cat. 1564. Wall. ascl no. 157, unnamed.

Klein's Streptocaulon. Shrub twining.

3 S. Wallíchii (Wight, l. c.) branches pubescent; leaves elliptic, attenuated at the base and apex, cuspidate, clothed with soft down above, and fuscous, velvety down beneath; cymes diffuse and branched, many-flowered, longer than the leaves: having the ultimate branches raceme-formed; pedicels filiform, and are, as well as the calyxes, glabrous, ♄. ⌒. S. Native of Penang and Singapore.—Wall. ascl. no. 124, unnamed.

Wallich's Streptocaulon. Shrub twining.

4 S. exte'nsum (Wight, l. c.) glabrous; leaves oval, acuminated; cymes panicle-formed, much longer than the leaves; flowers scattered, pedicellate; pedicels filiform, glabrous. ♄. ⌒. S. Native of Rangoon and Tavoy. Periploca exténsa, Wall. ascl. no. 128.

Extended Streptocaulon. Shrub twining.

5 S. sylve'stre (Wight, l. c.) procumbent, or twining a little; stems rather villous; leaves almost sessile, roundish-ovate, cuspidate, cordate at the base, rather velvety on both surfaces, but most so beneath; cymes few-flowered, shorter than the leaves; pedicels and calyxes pubescent. ♄. ⌒. S. Native of the East Indies, at Sanastrygota. Periploca? sylvéstris, Ham, herb. no. 763. Wall. ascl. no. 140.

Wild Streptocaulon. Shrub twining.

6 S. calophy'llum (Wight, l. c.) glabrous; leaves narrow-lanceolate, long attenuated, transversely-veined, with sub-undulated edges; cymes almost sessile, few-flowered; flowers on short pedicels; follicles slender, apiculated, about 6 inches long. ♄. ⌒. S. Native of Nipaul. Periploca? Wall. asclep. no. 123. This plant differs in habit from the other species, but the structure of the flowers is quite the same.

Beautiful-leaved Streptocaulon. Shrub twining.

† *Species not sufficiently known.*

7 S. Mauritia'num; glabrous; leaves ovate, long-acuminated, transversely veined, on short petioles; racemes axillary, composed of short divaricate branches; pedicels furnished with short, obtuse scales at the base; follicles sub-articulated, subulate. ♄. ⌒. S. Native of the Mauritius; and of the East Indies. Periploca Mauritiàna, Poir. encyc. 5. p. 188.—Cynánchum Mauritiànum, Lam. dict. 2. p. 236.—Funis papius, Rumph. amb. 5. p. 14. t. 10, and perhaps t. 11. Leaves like those of *P. Græ'ca;* but the flowers are much smaller, and disposed in short racemes.

Mauritian Streptocaulon. Shrub twining.

8 S. a'lbicans; glabrous; leaves ovate, sub-acuminated, small, on short petioles; cymes few-flowered; stems corky, white; tube of corolla hardly the length of the calycine teeth; segments oblong, nearly subulate, acute. ♄. ⌒. S. Native of the East Indies. Periploca álbicans, Poir. encyc. 5. p. 191. Leaves myrtle-formed. Flowers small, cream-coloured, nearly sessile, on the branches of the common peduncle.

Whitish Streptocaulon. Shrub twining.

9 S. parviflòrum; glabrous: leaves small, ovate, obtuse, mucronate; flowers small, twin or tern, almost sessile, on the tops of short, axillary peduncles; stems filiform, very tough. ♄. ⌒. S. Native of the East Indies. Periploca parviflòra, Poir. encycl. suppl. 5. p. 192. Leaves approximate. Flowers whitish.

Small-flowered Streptocaulon. Shrub twining.

10 S. virga'tum; glabrous; leaves lanceolate, obtuse; stems twiggy, furnished with many lateral branches, which bear the flowers along their tops, in small fascicles, disposed in the manner of a spike; flowers small. ♄. ⌒. S. Native of the East Indies. Periploca virgàta, Poir. suppl. 5. p. 192. Leaves small. Flowers white.

Twiggy Streptocaulon. Shrub twining.

11 S.? Cochinchine'nsis; arboreous; leaves fleshy, cordate-oblong, large, glabrous; racemes short, terminal. ♄. G. Native of Cochinchina. Periploca Cochinchinénsis, Lour. coch. 167. Wood flaccid. Branches spreading. Flowers pale blue. Segments of calyx lanceolate, expanded. Nectary girding the genitals, of 5 erect, filiform leaflets, which are curved at the base. Follicles 2, oblong. Seeds numerous. roundish.

Cochinchina Streptocaulon. Tree.

12 S.? Chine'nsis; twining; leaves ovate-oblong, obtuse, glabrous; peduncles many-flowered; segments of corolla glabrous, linear, elongated, twisted. ♄. ⌒. G. Native of China. Pergulària Sinénsis, Lour. coch. p. 169. Periploca Chinénsis, Spreng. syst. 1. p. 836. Corolla yellow. Corona of 5 arrow-shaped stipitate leaflets; stigma conical, 5-furrowed; follicles oblong; seeds naked.

China Streptocaulon. Shrub twining.

13 S. divarica'ta; shrubby, erect; branches short; leaves oblong-lanceolate, undulated; peduncles terminal, 2-flowered, divaricate; segments of corolla subulate, elongated. ♄. G. Native of China. Pergulària divaricàta, Lour. coch. p. 169. Periploca divaricàta, Spreng. syst. 1. p. 836. Flowers yellow, suffused with red. Corolla somewhat salver-shaped; furnished with 5 arrow-shaped scales at the mouth of the tube. Follicles oblong; seeds naked.

Divaricate-panicled Streptocaulon. Shrub.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXX. DECA'LEPIS (from δεκα, *deka*, ten; and λεπις, *lepis*, a scale; there are 10 scales, 5 in the throat, and 5 in the tube of the corolla.) Wight, and Arnott, contrib. ind. bot. p. 64.

Lin. syst. *Pentándria, Digýnia.* Corolla sub-rotate, 5-parted; throat crowned by 5 oblong-oval, flat, mutic scales, alternating with the segments; tube furnished with 5 linear-obtuse scales, opposite the segments. Filaments distinct, inserted in the upper part of the throat, along with the 5 upper scales, and cohering with them to the middle. Anthers glued by the base to the margin of the stigma, distinct at top, beardless, terminated by a sub-dilated appendage. Pollen masses granular, solitary (probably composed of 4 confluent ones), applied to the dilated, loose appendage of each corpuscle. Stigma mutic.—A twining,? smoothish shrub. Leaves opposite, oval, bluntly acuminated. Cymes small, on longish peduncles, and shorter than the leaves, composed of raceme-formed branches. Flowers small. Limb of corolla villous inside.

1 D. Hamiltònii (Wight, and Arnott, l. c.) ♄. ⌒.? S. Native of the East Indies, but the locality is unknown. Wight, cat. no. 1566. Streptocaúlon Hamiltònii, Wight, mss. Apócynum, reticulàtum, Herb. madr. Wall. ascl. no. 139. This plant belongs to the Madras herbarium, and not to Hamilton's, as Dr. Wight supposed, when he suggested the specific name.

Hamilton's Decalepis. Shrub twining.?

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXXI. FINLAYSO'NIA (named in memory of the late Dr. Finlayson, a surgeon in the service of the East India Company; who made many collections of objects of natural history during his residence in the East Indies.) Wall. pl. rar. asiat. 2. p. 48. t. 162. Wight, and Arnott, contrib. ind. bot. p. 65.

Lin. syst. *Pentándria, Digýnia.* Corolla rotate; throat

crowned by 5 awned tubercles, alternating with the segments; awns capillary, erect, hooked at the apex. Filaments distinct, inserted in the throat, within the tubercles. Anthers glued by the base to the middle of the stigma, beardless, terminated by a broad-ovate point; pollen masses 20, granular, at length applied, by fours, to the dilated appendiculus of each corpuscle, which is slender. Stigma large, ovate, tetragonal at the base. Follicles divaricate, ovate-ventricose, smooth, uncinately beaked at the apex. Seeds rather fleshy.—A twining, fleshy, lactescent, glabrous shrub. Leaves opposite, petiolate, obovate, very blunt, sometimes retuse, with a broad, acute point. Corymbs large, many-flowered, shorter than the leaves, much lengthened out while bearing the fruit. Flowers small. Corolla glabrous outside; segments roundish-ovate, naked on one side, inside, and clothed with white villi on the other.

1 F. obova'ta (Wall. l. c.) ♄. ⌒. S. Native at the mouth of the Ganges. Gurùa obovàta, Ham. herb. no. 757.

Obovate-leaved Finlaysonia. Shrub twining.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXXII. PERI'PLOCA (from *περιπλεκω*, *peripleco*, to wrap about; twining stems.) R. Br. in mem. wern. soc. 1. p. 57.—Perìploca species, Lin.

Lin. syst. *Pentándria*, *Digýnia*. Corolla rotate. Throat furnished with 5 awned scales, which alternate with the segments of the corolla. Filaments distinct; anthers cohering, bearded on the back; pollen masses applied to the dilated tops of the corpuscles of the stigma, solitary, or composed of 4 confluent ones. Stigma almost mutic. Follicles cylindrical, much divaricate, smooth. Seeds comose.—Twining, glabrous shrubs. Leaves opposite, shining. Flowers sub-corymbose, interpetiolar.

1 P. Græ'ca (Lin. spec. p. 309.) leaves from ovate to lanceolate; corymbs on long peduncles; flowers hairy inside. ♄. ⌒. H. Native of the south of France; of Bithynia, in hedges, about Bursa; and on mount Athos. Jacq. misc. 1. p. 11. t. 1. f. 2. Smith, fl. græc. t. 249. Ker, bot. reg. 803. Schkuhr, handb. t. 53. P. maculàta, Mœnch.—Schmidt, œst. baum. 1. t. 46. Jaume, St. Hil. livr. 8. t. 6. Duham, arb. 2. p. 104. t. 21. Hort. angl. t. 15. Branches brown. Segments of corolla linear, rounded at the apex, greenish outside, and brownish inside, and clothed with copious short hairs. Leaves deciduous, 3-4 inches long.

Grecian Periploca. Fl. July, Aug. Clt. 1597. Shrub tw.

2 P. læviga'ta (Ait. hort. kew. 1. p. 301.) leaves oblong-lanceolate, veiny, smooth, glabrous, permanent; cymes trichotomous; corolla glabrous: with linear-obtuse segments. ♄. H. Native of the Canary Islands, and the Cape of Good Hope.? P. punicæfòlia, Cav. icon. 3. p. 9. t. 217. Corolla greenish-yellow inside; segments marked each with a fulvous spot on the upper surface. Leaves much smaller than those of the preceding species.

Smooth Periploca. Fl.? Clt. 1779. Shrub tw.

3 P. angustifòlia (Labill. pl. syr. dec. 2. p. 13. t. 7.) leaves veinless, narrow-lanceolate, glabrous, evergreen; cymes trichotomous. ♄. H. Native of Tunis, on mount Schibel Jsekel; and of the island of Lampedosa, at the sea side, near Laodicea. P. rígida, Viv. P. lævigàta, Vahl. Flowers purplish inside, pale yellow beneath, and round the mouth, with a white spot in the middle. Leaves 1 inch long.

Narrow-leaved Periploca. Fl.? Clt. 1800. Shrub twining.

4 P. Afze'lii; leaves oblong, acuminated, glabrous, thick, deep green, rather cordate at the base, on short petioles; corymbs axillary. ♄. ⌒. S. Native of Sierra Leone, on the mountains. Corollas large, black. Perhaps *P. nigréscens*, Afz.

Afzelius's Periploca. Shrub twining.

† *The following species are not known, except by name; none of which are true species of Periploca.*

5 P. pube'scens (Humb. et Bonp. mss. in Willd. rel. ex Schultes, l. c.) leaves cordate, oblong, downy beneath; flowers racemose; calyx larger than the corolla. ♄. ⌒. S. Native of South America.

Downy Periploca. Shrub twining.

6 P. oblonga'ta (Humb. et Bonpl. in Willd. rel. ex Schultes, syst. 6. p. 129.) leaves oblong, acute, glabrous; umbels few-flowered, almost sessile; corollas glabrous. ♄. ⌒. S. Native of South America.

Oblong-leaved Periploca. Shrub twining.

7 P. mucrona'ta (Humb. et Bonpl. in Willd. rel. ex Schultes, syst. 6. p. 129.) leaves elliptic-obovate, mucronate; umbels axillary, few-flowered, almost sessile; corollas glabrous. ♄. ⌒. S. Native of South America.

Mucronate-leaved Periploca. Shrub twining.

8 P. tenuifo'lia (Humb. et Bonpl. in Willd. rel. ex Schultes, l. c.) leaves narrow-lanceolate, acute, glabrous; umbels few-flowered, almost sessile; corolla glabrous. ♄. ⌒. S. Native of South America.

Fine-leaved Periploca. Shrub twining.

9 P. se'pium (Bunge, in mem. acad. petersb. 2. p. 117.) plant rather scandent, shrubby; leaves oblong, or ovate-lanceolate, acuminated, glabrous; panicles dichotomous, few-flowered; segments of corolla oblong, very villous inside at the edges; follicles elongated, arched, cohering at top. ♄. ⌒. G. Native of China, on the mountains near Pekin, in hedges.

Hedge Periploca. Shrub climbing.

Cult. *P. Græca* and *P. angustifòlia* are handsome, hardy, twining shrubs, well fitted for covering bowers or trellis work, or for training against a wall; these grow freely in common garden soil, and are increased readily by layers or cuttings. The *P. lævigàta* will require protection in winter, either by being planted in a greenhouse, or against a south wall, in which latter situation it will require to be protected by mats in frosty weather, in winter.

LXXXIII. PHYLLANTHE'RA (from *φυλλον*, *phyllon*, a leaf; and *ανθηρα*, *anthera*, an anther; in reference to the anthers being dilated and foliaceous at the apex.) Blum. bijdr. p. 1048.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx small, 5-cleft. Corolla deeply 5-parted, fleshy, discoid inside at the base, without any corona; filaments 5, erect, distinct; anthers conniving, naked on the back, and dilatately foliaceous at the apex; pollen masses clavate, applied singly to the dilated tops of the corpuscles of the stigma. Ovarium didymous. Style one, bisulcate at the base; stigma capitate, mutic.—A twining shrub; with opposite, lanceolate, glabrous, transversely-veined leaves; and axillary, solitary, bifid peduncles. This genus is nearly allied to *Periploca*.

1 P. bífida (Blum. bijdr. p. 1048.) ♄. ⌒. S. Native of Java, on the top of the Salak mountains, where it is called *Aroy Krawatan* and *Willen Aroy*.

Bifid Phyllanthera. Fl. year. Shrub cl.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXXIV. LEPO'SMA (from *λεπος*, *lepos*, bark; and *οσμη*, *osme*, a smell; bark when stripped.) Blum. bijdr. p. 1049.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx turbinate, 5-toothed. Corolla rotate, having the tube inflated in the middle, and the limb 5-parted, and oblique. Corona none, unless the 5 fleshy scales which are inserted in the tube of the corolla, and lying above the genitals, be considered as such. Anthers 5, inclosed, inserted above the base, in the tube of the corolla, ovate,

downy on the back, lying upon the stigma; polliniferous pedicels 10, linear, horny, dehiscing outwardly, erect, propped by corpuscles at the base, and applied to the furrows of the stigma; pollen granular. Stigma 5-angled, and having 5 deep furrows. Ovarium didymous. Style one, thick —A twining shrub, with opposite, elliptic-oblong, acutish, veiny, glabrous leaves, which are paler beneath. Peduncles interpetiolar, bifid. This genus differs from *Periploca* in the anthers being sessile and inclosed, and from the number and singular form of the polliniferous pedicels.

1 L. Java'nicum (Blum. bijdr. 1049.) ♄. ⌒. S. Native of Java, about Kuripan.

Java Leposma. Fl. May, Ju. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXXV. GYMNANTHE'RA (from γυμνος, *gymnos*, naked; and ανθηρα, *anthera*, an anther; in reference to the anthers being beardless.) R. Br. in mem. wern. soc. 1. p. 58.

Lin. syst. *Pentándria, Digýnia.* Corolla salver-shaped. Corona faucis 5-leaved. Filaments distinct, inserted in the throat of the corolla; anthers beardless; pollen masses applied by fours to the dilated tops of the corpuscles of the stigma. Stigma apiculated, bifid. Follicles cylindrical, smooth, divaricate. Seeds comose.—A twining, glabrous shrub. Leaves opposite, shining. Peduncles lateral, sub-dichotomous. Flowers whitish green, beardless.

1 G. nítida (R. Br. prod. 464.) ♄. ⌒. S. Native of New Holland, within the tropic. Scales 5, cut, inserted inside the calyx, under its sinuses. Albumen none.

Shining-leaved Gymnanthera. Shrub twining.

Cult. For culture and propagation see *Pergulària*, p. 133.

LXXXVI. CRYPTOSTE'GIA (from κρυπτος, *cryptos*, concealed; and στεγω, *stego*, to cover; in reference to the scales in the throat covering the anthers.) R. Br. in bot. reg. 435. Wight, and Arnott, contrib. ind. bot. p. 65.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted; segments elongated, lanceolate, with undulated margins. Corolla campanulately funnel-shaped; tube furnished with 5 inclosed, narrow bipartite scales inside, which cover the anthers, being opposite them; segments of the scales subulate. Stamens inclosed. Filaments distinct, very short, inserted in the bottom of the tube; anthers inclosed, adhering by the base to the margin of the stigma; pollen masses solitary, composed of many free granules heaped together, glued at first, but at length applied to the spatulate appendicula of each corpuscle. Stigma globosely conical, obscurely bi-apiculate. Follicles divaricate, acutely triquetrous, with a bluntly-attenuated incurved apex. — A twining, glabrous, lactescent shrub. Leaves opposite, on short petioles, elliptic, bluntly-acuminated, shining on both surfaces, minutely-reticulated with brown beneath. Corymbs trichotomous, terminal. Flowers large, showy, reddish purple. Corolla twisted in æstivation.

1 C. grandiflòra (R. Br. l. c.) ♄. ⌒. S. Native of the East Indies, but the particular locality is unknown. Wall. cat. no. 1635. Wight, cat. no. 1660. Nèrium grandiflòrum, Roxb. fl. ind. 2. p. 10. mus. ind. orient. t. 1957.

Great-flowered Cryptostegia. Fl. July, Aug. Clt. 1824. Shrub tw.

Cult. For culture and propagation see *Pergulària*, p. 133.

Order CLIV. LOGANIA'CEÆ (this order only contains plants agreeing with the genus *Logània* in important characters). Loganièæ, R. Br. ex Mart. nov. gen. bras. 1. p. 203. Gentiàneæ, sect. III. Capsùla bipartíbilis, R. Br. prod. p. 455.

Flowers of equal parts. Calyx free, 5-parted. Limb of corolla equal or unequal, convolute in æstivation. Stamens 5 or 1, rising from the corolla; pollen vittately 3-lobed (in *Pagàmea*). Stigma simple. Fruit a 2-celled, bipartible capsule; having placenta adnate on both sides to the segment of the ventral suture, many-seeded; or a drupe, containing 1-2 1-2-seeded pyrenæ. Albumen fleshy or cartilaginous. Embryo straight.—Herbs, shrubs, or trees. Leaves opposite, quite entire, usually stipulate. Stipulas combined into intrapetiolar sheaths. Flowers racemose, corymbose, or solitary, usually white.

This order is distinguished from *Gentiàneæ* in the capsule being divisible into 2 1-celled parts or drupaceous, in the placentation of the seeds, in the æstivation of the corolla, in the stipulate leaves, and in the fleshy or cartilaginous albumen, &c.

Synopsis of the genera.

1 Loga'nia. Calyx 5-cleft. Corolla subcampanulate, with a villous throat. Stamens 5, shorter than the limb of the corolla. Stigma capitate. Capsule bipartible. Seeds peltate.

2 Geniósтoma. Calyx 5-parted. Corolla subcampanulate, with a bearded throat. Stamens 5, shorter than the limb. Stigma thick, obtuse or didymous. Capsule bipartible. Seeds angular.

3 Uste'ria. Calyx 4-cleft, one of the segments large. Corolla salver-shaped. Stamen 1. Capsule bipartible. Seeds with winged edges.

4 Paga'mea. Calyx 4-toothed. Corolla urceolate, villous inside. Anthers 4, nearly sessile, inclosed. Style bifid from the base. Drupe 2-celled; each cell containing a 2-celled, 2-seeded pyrenæ.

5 Gærtne'ra. Calyx 5-toothed. Corolla funnel-shaped. Stamens 5, inclosed. Style exserted, bifid. Berry drupaceous, containing 2 pyrenæ.

6 Labórdia. Calyx 5-cleft. Corolla funnel-shaped. Stamens 5, inclosed. Style inclosed, thick. Stigma conical, triangular. Fruit capsular, 3-celled.

7 Codona'nthus. Calyx 5-cleft, ciliated. Corolla campanulately urceolate. Stamens 5, inclosed. Style bifid. Stigmas round. Fruit unknown.

8 Anaba'ta. Calyx small, entire. Corolla campanulate. Anthers 5, sessile. Style exserted. Stigma simple. Fruit unknown.

I. LOGA'NIA (in memory of James Logan, author of Experimenta de Plantarum Generatione. 8vo. London, 1747.). R. Br. prod. 1. p. 455. Ray. steudt. 1. t. 2. gen. 1. p. 151.—Euósma, Andr. bot. rep. 520.—E'xacum, Labill. nov. holl. 1. t. 51.

Lin. syst. *Pentandria, Monogynia.* Calyx 5-parted. Corolla subcampanulate; with a rather villous throat; and a 5-parted limb. Stamens 5, shorter than the limb. Style 1, permanent; stigma clavately capitate. Capsule bipartible. Placenta adnate on both sides to the segment of the ventral suture, at length free, many-seeded. Seeds peltate.—Shrubs or herbs. Leaves quite entire, usually stipulate, sometimes exstipulate. Stipulas when present intrapetiolar or lateral, distinct, or combined into a sheath. Flowers terminal or axil-

lary, oppositely corymbose or racemose; sometimes solitary. Corollas white, sometimes veiny. Albumen fleshy.

Sect. I. Loga'niæ-ve'ræ (this section is considered to contain the legitimate species of the genus). R. Br. prod. 455. Calyx obtuse. Stamens inclosed, inserted in the middle of the tube. Stipulas combined into intrapetiolar sheaths.—Shrubs.

1 L. crassifòlia (R. Br. prod. p. 455.) leaves ovate or roundish, mucronate, thick, coriaceous: flowers corymbose: branches scabrous; stem diffuse. ♄. G. Native of New Holland, on the south coast. Flowers white.

Thick-leaved Logania. Shrub 3 to 4 feet.

2 L. latifòlia (R. Br. l. c.) leaves obovate, acutish at both ends; flowers corymbose; branchlets smooth; stem erect. ♄. G. Native of New Holland, on the south coast. E'xacum vaginàle, Labill. nov. holl. 1. p. 37. t. 51. Leaves coriaceous, 2-3 inches long. Flowers disposed in terminal panicles, composed of opposite, dichotomous, and trichotomous peduncles. Corollas white. Calycine segments ovate, a little ciliated. Segments of corolla nearly orbicular.

Broad-leaved Logania. Clt. 1816. Shrub 3 to 4 feet.

3 L. ova'ta (R. Br. l. c.) leaves ovate, nearly sessile, obtuse at the base; flowers corymbose; branchlets smooth; stem erect. ♄. G. Native of New Holland, on the south coast. Corollas white.

Ovate-leaved Logania. Shrub 2 to 3 feet.

4 L. ellíptica (R. Br. l. c.) leaves oval-elliptic, acutish at both ends, nearly sessile, shorter than an inch; flowers corymbose; branchlets smooth; stem erect. ♄. G. Native of New Holland, on the south coast. Corollas white.

Elliptic-leaved Logania. Shrub.

5 L. longifòlia (R. Br. prod. p. 456.) leaves lanceolate, acute, flat, from 1-2½ inches long; interpetiolar sheaths truncate: corymbs trichotomous; pedicels glabrous. ♄. G. Native of New Holland, on the south coast. Corollas white.

Long-leaved Logania. Shrub.

Sect. II. Euósma (from *ευ, eu*, well or good, and *οσμη, osme*, a smell; flowers sweet smelling). Andr. rep. t. 520. R. Br. prod. p. 456. Calyx obtuse. Stamens inclosed, inserted in the middle of the tube of the corolla. Stipulas setaceous, lateral, distinct, or wanting.—Shrubs.

6 L. floribu'nda (R. Br. l. c.) leaves lanceolate, attenuated at both ends, smooth; stipulas lateral, setaceous; racemes axillary, compound, shorter than the leaves; pedicels downy. ♄. G. Native of New South Wales. Euósma albiflòra, Andr. bot. rep. t. 520. Corollas white.

Bundle-flowered Logania. Fl. April, May. Clt. 1797. Shrub 2 to 3 feet.

7 L. revolu'ta (R. Br. l. c.) leaves linear, with recurved margins, rather scabrous above; racemes axillary, simple, shorter than the leaves; pedicels downy; stem erect. ♄. G. Native of New South Wales. Corollas white.

Revolute-leaved Logania. Fl. April, May. Clt. 1826. Sh. 2 to 3 feet.

8 L. fascicula'ta (R. Br. l. c.) leaves spatulate-linear, obtuse, flat, smooth; corymbs terminal, few-flowered; branchlets roughish; stem diffuse. ♄. G. Native of New Holland, on the south coast. Corollas white.

Fascicled-flowered Logania. Shrub diffuse.

9 L. angustifòlia (Sieb. ex Spreng. syst. add. p. 59.) leaves linear-lanceolate, cuspidate, tomentose beneath; stipulas obsolete; flowers axillary, corymbose. ♄. G. Native of New Holland.

Narrow-leaved Logania. Shrub.

Sect. III. Stoma'ndra (from *στομα, stoma*, a mouth, and *ανηρ ανδρος, aner andros*, a male; in reference to the stamens being inserted in the mouth of the corolla). R. Br. prod. p. 456. Calyx acute. Stamens inserted in the throat of the corolla, semi-exserted.—Herbs or sub-shrubs.

10 L. serpyllifòlia (R. Br. l. c.) suffruticose; leaves ovate; stipulas interpetiolar, and are, as well as the calyxes, ciliated; flowers terminal, subcorymbose. ♄. G. Native of New Holland, on the south coast. Corollas white.

Wild-thyme-leaved Logania. Shrub small.

11 L. pusílla (R. Br. l. c.) herbaceous; leaves elliptic; stipulas interpetiolar, triangular; flowers axillary, solitary. ♃. G. Native of New South Wales. Corolla white.

Least Logania. Pl. small.

12 L. campanula'ta (R. Br. l. c.) herbaceous; leaves linear, exstipulate; flowers terminal; peduncles and calyxes downy. ♃.? G. Native of New Holland, on the south coast. Corollas white.

Campanulate-flowered Logania. Pl.?

Cult. The species of this genus are all well worth cultivating, for the sake of their beauty when in blossom. A mixture of loam, peat, and sand is the best soil for them; and ripened cuttings of them will strike root if planted in sand, having a hand-glass placed over them.

II. GENIO'STOMA (from *γενειον, geneion*, a beard; and *στομα, stoma*, a mouth; mouth of corolla bearded). Forst. gen. p. 24. t. 12. Juss. gen. p. 460. Lam. ill. t. 133. f. 2. Spreng. gen. 1. p. 151. Anásser, Juss. gen. 150. Anássera, Rœm. et Schultes, syst. 4. p. xxi.

Lin. syst. *Pentándria, Monogýnia.* Calyx turbinate, 5-parted; with acute segments. Corolla tubularly-campanulate or urceolate, with a bearded throat; having the tube widening gradually into a 5-parted, spreading limb. Stamens 5, inserted in the throat of the corolla, with very short filaments, shorter than the limb. Style 1, permanent; stigma thick, cylindrical, obtuse, furrowed. Capsule bipartible; valves entire, with inflexed narrow margins, which cohere to the 2 placentas, and remain after the dehiscence of the valves. Seeds angular, peltate?—Trees, with opposite, entire leaves, interpetiolar stipular sheaths, and axillary and terminal corymbs or cymes. Corollas usually white, sometimes tinged with red.

1 G. rupe'stre (Forst. prod. p. 103.) branches angular; leaves oblong-lanceolate, attenuated at both ends, veiny, glabrous; cymes axillary, pedunculate. ♄. S. Native of the island of Tanna. Calycine segments spreading, subulate. Corolla reddish: with involute segments. Stigma capitate, furrowed. Pedicels furnished with twin, subulate bracteas in the middle. Leaves ½ an inch long.

Rock Geniostoma. Tree.

2 G. Brasilie'nse (Spreng. syst. 1. p. 588.) branches nodose; leaves oblong, attenuated at both ends, membranous; cymes pedunculate, terminal, bracteate. ♄. S. Native of Brazil, Sello. Corolla urceolately funnel-shaped. Style didymous.

Brazilian Geniostoma. Tree.

3 G. spine'scens (Spreng. l. c.) branches nodose, spinescent; leaves oblong, attenuated at both ends, rather coriaceous, of a different colour beneath, triple-nerved; corymbs terminal, pedunculate. ♄. S. Native of Brazil, Sello. Corolla urceolately funnel-shaped. Style didymous.

Spinescent Geniostoma. Tree.

4 G. febri'fugum (Spreng. l. c.) leaves ovate-oblong, bluntish, loosened at the base, nerved, coriaceous, villous beneath; panicles lateral. ♄. S. Native of Brazil. Anássera febrífuga, Mart. nov. reise, bras. p. 278. Stigma didymous.

Febrifugal Geniostoma. Tree.

5 G. Borbónicum (Spreng. l. c.) leaves ovate, bluntish, glabrous; corymbs lateral or axillary; corolla urceolate; stigma didymous. ♄. S. Native of the isle of Bourbon. Anássera Borbónica, Lam. ill. 2. p. 40. no. 2452. Anásser. Borbónicus, Gmel. syst. 1. p. 333. Jaum. St. Hil. exp. 1. p. 339. Lower leaves caducous.

Bourbon Geniostoma. Tree.

6 G. acumina'tum (Wall. ex Spreng. add. p. 59.). branches tetragonal, climbing a little; leaves oblong-lanceolate, acuminated, cuspidate, coriaceous, shining above, strigose beneath; umbels axillary, shorter than the leaves. ♄. S. Native of Malacca.

Acuminated-leaved *Genióstoma*. Shrub cl.

Cult. A mixture of loam, peat, and sand is a good soil for the species; and ripened cuttings strike root freely, if planted in sand, with a hand-glass placed over them, in heat.

III. USTE'RIA (named by Willdenow in honour of Paulus Usteri, author of Annalen der Botanik, 1791-1793). Afz. gen. pl. guin. ups. 1804. with a figure of the fruit. Willd. in beob. der berl. naturf. t. 2. Kœn. in ann. bot. 1. p. 364. t. 7. f. 3. Rœm. et Schultes, syst. 1. p. 5. Spreng. gen. 1. p. 9. Monodynàmis, Gmel. syst. p. 10.

Lin. syst. *Monándria, Monogy'nia.* Calyx 4-cleft; the fourth or outer segment very large and petal-formed. Corolla salver-shaped, 4-parted. Stamen 1. Capsule oblong, 2-celled, divisible into 2 valves, which open inside, with a fleshy placenta in each division. Seeds numerous, imbricate, with winged margins, fixed to the placentas. Albumen thin. Embryo with roundish, foliaceous cotyledons.—A glabrous shrub, with opposite purplish branches. Leaves opposite, roundish ovate, entire, 2 inches long. Flowers disposed in terminal corymbs. Stipular sheath an obsolete margin.

1 U. Guinee'nsis (Willd. l. c. Vahl, enum. 1. p. 5.). ♄. S. Native of Guinea, where it was collected by Isert. Monodynàmis Isérti, Gmel. syst. p. 10.

Guinea Usteria. Shrub.

Cult. For culture and propagation see *Genióstoma* above.

IV. PAGA'MEA (Aublet does not give the derivation of this word). Aubl. guian. 1. p. 112. t. 44. Juss. gen. p. 232. Lam. ill. t. 88. Spreng. gen. 1. p. 114.

Lin. syst. *Tetrándria, Digy'nia.* Calyx turbinate, 4-toothed. Corolla urceolate, 4-cleft, villous inside. Anthers 4 nearly sessile, in the tube of the corolla, inclosed. Style bifid from the base, capillary. Drupe half inferior, 2-celled; cells containing two 2-seeded, 2-celled nuts; one of the seeds usually abortive.—A glabrous shrub. Leaves opposite, attenuated at both ends, oblong, quite entire; stipulas interpetiolar, sheathing. Flowers disposed in loose, axillary, and terminal racemes, white.

1 P. Guiane'nsis (Aubl. l. c.). ♄. S. Native of Guiana, and the north of Brazil, as of Maranham and Para, &c.

Guiana Pagamea. Shrub, 7-8 feet.

Cult. For culture and propagation see *Genióstoma* above.

V. GÆRTNE'RA (named in honour of the celebrated botanist Joseph Gærtner, author of De Fructibus et Seminibus Plantarum, 2 vols. 4to. Leipsic. 1788-1791.; his son, Charles Frederick Gærtner, published Supplementum Carpologiæ, in 1 vol. 4to, which is generally called the third volume of his father's work). Lam. ill. t. 167. Gærtn. fruct. 1. t. 191. Spreng. gen. 1. p. 131.—Andersònia, Willd. herb.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, 5-toothed, propped by 2 bracteas at the base. Corolla funnel-shaped; with a 5-parted limb. Stamens 5, inclosed, inserted in the tube; with very short filaments, and oblong erect anthers. Style exserted, bifid at apex. Berry drupaceous, containing 2 1-seeded pyrenæ.—A glabrous tree. Leaves opposite, oblong, tapering to both ends, coriaceous. Stipulas sheathed, interpetiolar, truncate, ending in bristles. Panicles terminal, strict. Bracteas connate. Flowers white.?

1 G. vagina'ta (Lam. l. c.). ♄. S. Native of the island of Mascaren. Andersònia vaginàta, Willd. herb.

Sheathing-stipuled Gærtnera. Tree.

Cult. For culture and propagation see *Genióstoma* above.

VI. LABO'RDIA (named by Gaudichand after M. Labord, one of the officers under Freycenet, who died on a voyage to the Isle of France). Gaud. in Freyc. voy. pt. bot. p. 449.

Lin. syst. *Pentándria, Monogy'nia.* Calyx campanulate, 5-cleft; segments lanceolate, nearly equal. Corolla tubularly funnel-shaped, hypogynous, 5-cleft, regular, ventricose at the base; segments lanceolate, spreading, rather villous in the throat inside. Stamens 5, inserted in the throat, alternating with the segments of the corolla; filaments short; anthers ovate-oblong, obtuse, cordate, inclosed, 2-celled, dehiscing lengthwise inside. Ovarium free, sessile, ovate, trigonal, 3-celled; with 1 placenta in each cell, which are fixed to the inner angles, oblong, fleshy, beset with ovula on all sides. Ovula minute. Style short, thick, triangular, continuous with the ovarium: stigma conical, triangular, downy. Fruit capsular?, 3-celled, many-seeded.—A glabrous shrub: with opposite, terete branches. Leaves opposite, entire. Stipulas opposite, adnate by the back to the base of the petioles. Flowers terminal, pedunculate, umbellate, whitish-yellow. Pedicels bibracteate in the middle. Bracteas linear. Calyx greenish yellow.

1 L. fagræoi'dea (Gaud. l. c. p. 450. t. 60.). ♄. S. Native of the Sandwich Islands.

Fagræa-like Labordia. Shrub.

Cult. For culture and propagation see *Genióstoma* above.

VII. CODONA'NTHUS (from *κωδων, kodon,* a bell, and *ανθος, anthos,* a flower; flowers bell-shaped.)

Lin. syst. *Pentándria, Digy'nia.* Calyx 5-cleft; segments ovate, acute, ciliated. Corolla campanulately urceolate, oblong-ventricose; with a 5-cleft erect limb. Stamens 5, inserted in the tube of the corolla. Style bifid; stigmas 2, rounded. Ovarium ovate. Fruit unknown.—A middle-sized branched tree. Leaves opposite, oblong-lanceolate, entire, undulated, on short petioles; flowers axillary, 2-3 together, pedicellate, pendulous, white. Bracteas subsagittate.

1 C. Africa'na. ♄. S. Native of Sierra Leone, on the mountains, but rare.

African Codonanthus. Tree 20 to 30 feet.

Cult. For culture and propagation see *Genióstoma* above.

VIII. ANABA'TA (meaning unknown to us). Willd. rel. ex Rœm. et Schultes, syst. 4. p. lx. Sulzèria, Rœm. et Schultes, l. c.

Lin. syst. *Pentándria, Monogy'nia.* Calyx small, campanulate, entire. Corolla campanulate; with a 5-parted limb; segments lanceolate, acuminated, spreading. Anthers sessile, inserted in the tube of the corolla. Style exserted; stigma simple. Fruit unknown.—A climbing shrub, with white flowers, smelling like jasmine.

1 A. odora'ta (Willd. l. c.). ♄. ◡. S. Native on the banks of the Orinoco, near Esmeralda. Sulzèria odoràta, Rœm. et Schultes, syst. 4. p. 707.

Sweet-scented-flowered Anabata. Shrub cl.

Cult. For culture and propagation see *Genióstoma* above.

ORDER CLV. MENYANTHA`CEÆ (this order contains plants agreeing with *Menyánthes* in important characters). Genera Gentianeis affinia, R. Br. prod. 456. Menyánthes, Lin. and others.

Calyx 5-parted. Corolla subrotate; with a 5-parted, spreading limb; segments with a flat disk, which is bearded or squammulose at the base, or bearded lengthwise; having ascending or simple margins, inflexed in æstivation. Stamens 5, alternating with the segments of the corolla. Style 1. Stigma 2-lobed: lobes toothed. Hypogynous glands 5, alternating with the stamens. Capsule 1-celled, many-seeded, 2-valved, but in aquatic species valveless; axils of valves seminiferous; that is, the seeds are attached to parietal placentas on the edges of the valves. Floating aquatic or marsh herbs. Leaves simple or trifoliate, alternate, rarely opposite, entire, or toothed in most of the species, dotted: having the petioles dilated and sheathing a little at the base. Flowers subumbellate, axillary, sometimes seated on the petioles, or panicled and terminal. Corolla yellow, white, or reddish; having the margins of the segments entire or fringed. This order agrees with *Gentiàneæ* in the parietal seeds, and in their internal structure; and moreover, the cotyledons are half discrete, as in *Astèrias lùtea*, and finally, there are scales in the throat of the corollas, as in *Swértia;* but it differs particularly from *Gentiàneæ* in the leaves being alternate, and often toothed or divided. In the true *Gentiàneæ*, as in *Apocýneæ* and *Rubiàceæ*, the leaves are always entire and opposite, and verticillate, with very few exceptions. Like *Gentiàneæ*, the properties of this order are tonic, stomachic, and febrifugal; their bitterness being extreme.

Synopsis of the genera.

1 MENYA'NTHES. Segments of corolla bearded lengthwise, with simple margins. Leaves trifoliate.

2 VILLA'RSIA. Segments of corolla bearded or scaly at the base; with ascending margins.—Leaves simple.

I. MENYA'NTHES (*μενυανθες, menyanthes*, is reckoned by Theophrastus and Dioscorides, and *Minyanthes* by Pliny, among coronary trefoils. Linnæus derives the name from *μην, men*, a month, and *ανθος, anthos*, a flower; because the flowers continue open about that time). Tourn. inst. t. 15. Gærtn. fruct. 2. p. 158. t. 114. R. Br. prod. p. 457. Rœm. et Schultes, syst. 4. p. XVII. Menyánthes species, Lin. gen. 202. Juss. gen. p. 98. &c. Acòpa, Mor. hist.

LIN. SYST. *Pentándria, Monogy'nia.* Calyx 5-parted. Corolla funnel-shaped; with a spreading equal limb: segments bearded or crested lengthwise, with flat margins. Stigma capitate, 2-lobed, bearded. Capsule 1-celled, 2-valved; valves placentiferous at the axis. Seeds numerous, ovate or obovate, surrounded with a membranous ciliated margin, fixed on each side of the valves in a double row, parietal.—Aquatic glabrous herbs. Stems green, rooting. Leaves alternate, trifoliate. Flowers white inside and reddish outside, disposed in an axillary pedunculate thyrse. Segments with finely ciliated edges.

* *Leaves trifoliate. Flowers white.*

1 M. TRIFOLIA`TA (Lin. spec. 208.) leaves trifoliate; racemes thyrsoid, axillary; segments of corolla bearded lengthwise. ♃. W. H. Native throughout Europe and Siberia, near Salair, and Bernaoul, in ponds and lakes; plentiful in Britain. Woodv. med. bot. 5. t. 2. Curt. lond. 4. t. 17. Oed. fl. dan. t. 541. Smith, engl. bot. 495. Stev. et Church, med. bot. t. 46. Bulliard, herb. f. 131. Sabb. hort. 1. t. 88. Zorn. icon. 13. Bieb. cauc. 1. p. 141. Bess. vohl. p. 10. Trifòlium màjus, Tabern. icon. t. 520. f. 2. Trifòlium palústre, Bauh. pin. 327. Blackw. t. 474. Trifòlium paludòsum, Ger. emac. 1194. Acòpa Dioscóridis, Mor. hist. 3. p. 604. sect. 15. t. 2.—Gmel. sib. 4. p. 97. no. 55. Roots creeping, jointed. Stem procumbent, covered by the sheaths of the leaves. Leaflets ovate, obtuse. Peduncles axillary, terminating in a thyrse of white bearded flowers, which are rose-coloured outwardly. Anthers purplish, with the tips curved inwards. This plant was formerly called *Marsh Trefoil*, and *Marsh Claver* or *Clover*. It is now generally called *Buck-bean*, or *Bog-bean*, from the German *Bocshohne*, or *Bitterklee*, and the Danish *Bukkeblade*. The whole plant, and particularly the root, has an intensely bitter taste, which resides chiefly in an extractive matter, soluble in water and spirit. Given in small doses, of about 10 grains, imparts vigour to the stomach, and strengthens digestion. Its virtues were formerly properly estimated; and strange it is that so excellent and cheap a tonic should be so little employed. It gives out its virtues to boiling water, and a tincture may be made from it quite equal in its effects to that of gentian. Large doses, either in substance or decoction, produce vomiting, like many other vegetable bitters. Boerhaave was relieved from gout from drinking the juice of the plant, mixed with whey. An infusion of the leaves are extremely bitter, and of late years has been in common use as an alterative and aperient. A drachm of the powder is aperient and emetic; and it is sometimes used as an anthelmintic. As an active and eccophrotic bitter, it seems not ill adapted to supply the want of bile; and thus may be of use in protracted jaundice and other biliary obstructions. Cullen mentions several instances of its good effects in some cutaneous diseases of the herpetic and seemingly cancerous kind. In a scarcity of hops this plant is used, in the north of Europe, to give a bitter to the beer: 2 ounces will supply the place of a pound of hops. The powdered roots are sometimes used, in Lapland, instead of bread, but they are unpalatable. Some say that sheep will eat it, and that it cures them of the rot.

Var. β, Americàna (G. Don, in Loud. hort. brit. p. 58.) plant much more robust, but not otherwise distinct. ♃. W. H. Native of North America. Menyánthes trifoliàta, Pursh, fl. amer. sept. 1. p. 139. Native of New Jersey, Virginia, and Canada, and of the island of Sitcha, in bogs and stagnant waters. This is a much more robust plant than the European species. The flowers are pale red and very handsome.

Trifoliate Menyanthes, Buck-bean, or Bean-trefoil. Fl. May. Britain. Pl. aquatic.

** *Leaves simple.*

2 M. CRÍSTA-GA'LLI (Menzies, mss. ex Hook. bot. misc. 1. p. 45. t. 24.) leaves radical, on long petioles, reniform, crenated; scapes or peduncles corymbose; segments of corolla undulated, and crested lengthwise. ♃. B. H. Native of the north-west coast of America, in marshy mountain pastures, at Prince William's Sound, and about Cape Edgecombe; and of the island of Sitcha. Bongard. in mem. acad. petersb. 2. p. 156. Roots or rhizoma horizontal. Scapes a foot high, reddish at top. Corollas white. The crests on the segments of the corolla are exactly similar to those of *M. cristàta*, Roxb. which has also white flowers; but with the habit and mode of growth of *Villársia*.

Cockscomb Buckbean. Pl. 1 foot.

3 M. crista'ta (Roxb. cor. 2. p. 3. t. 105.) leaves radical, petiolate, cordate, undulately crenulated on the edges; petioles viviparous and floriferous below the leaves; pedicels several together, umbellate; segments of corolla undulately jagged, crested lengthwise. ♃. W. S. Native of the East Indies, floating in pools of sweet water, in which the roots often do not reach the bottom. Cumùda, Roxb. asiat. res. 4. p. 254. Tsjeroea Citámbel, Rheed. mal. 11. p. 57. t. 29. It is called by the Bengalese *Chooli*, and by the Telingas *Antara-Tamara*. Leaves variable in size, purplish green on the upper side. Petioles various in length, and on the upper side about 2 inches below the leaf, there is a viviparous tuberosity, which produces the flowers as well as other leaves and roots; the old leaf and the parent petiole decaying, leave this a new plant, each petiole in succession doing the same. Pedicels many, 1-flowered from the above-mentioned tuberosity, sufficiently long to raise the flowers above the water, afterwards they drop into the water, and there ripen their seeds. Flowers pure white, about an inch in diameter. Corona triple: the exterior one consisting of white ramose filaments, crowning the mouth of the tube, as in *Nèrium*; the middle one of 5 beautiful yellow glandular bodies, which nearly fill the mouth of the tube, standing alternately with the filaments; and the interior one of 5 hairy yellow bodies, surrounding the base of the ovarium. Seeds compressed, scabrous.

Crested-flowered Buckbean. Pl. floating.

Cult. The species are all elegant aquatic plants. The first species is of the most easy culture, requiring only to be planted or thrown into a pond, where it will grow freely; the second, being only a bog plant, will require to be grown in a pot filled with peat earth, and the pot placed in a deep pan of water: it will require protection from severe frost in winter, by placing it in a greenhouse or frame; but should it become plentiful, it may be planted in a natural or artificial bog in the open air, where it will probably endure our winters. The third species, being a native of a warm country, will require to be kept in a cistern or tub of water in a stove.

II. VILLA'RSIA (named in honour of D. Villars, a celebrated French botanist; author of Histoire des Plantes du Dauphiné, 3 vols. 8vo. Grenoble, 1786-1788, &c.) Vent. choix. no. 9. p. 2. R. Br. prod. p. 456. H. B. et Kunth, nov. gen. amer. 3. p. 187. Waldschmídia, Wigg. Nymphoìdes, Tourn. hist. t. 67. Menyánthes species, Lin. and others. Lam. ill. t. 100. f. 2.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla subrotate; with a spreading limb; segments with a flat disk, bearded or squamulose at the base, with ascending margins. Stigma 2-lobed; lobes toothed. Hypogynous glands 5. Capsule 1-celled, 2-valved, or valveless. Seeds girded by a membranous margin, or naked, fixed to the edges of the valves in a double row.—Floating aquatic plants or marsh herbs. Leaves alternate, rarely opposite, entire, or toothed, usually dotted beneath. Flowers axillary, or seated on the petioles, subumbellate, or in terminal panicles. Corolla usually yellow; margins of segments fringed or entire.

Sect. I. Aqua'ticæ. *Capsule valveless. Floating water plants.*

§ 1. *Flowers terminal.*

1 V. nymphoìdes (Vent. choix. no. 9. p. 2.) natant; leaves opposite, cordate-orbicular, or orbicularly reniform, repand; umbels sessile, terminal, or in the forks of the stem; segments of corolla ciliated. ♃. W. H. Native of Europe, as of Denmark, Holland, Sweden, Germany, Piedmont; and of Siberia, in ditches and slow running streams. In England, as in the Thames, particularly in little recesses of the shores near Walton Bridge, near Botley Bridge, Godstowbridge, and Hinksey Ferry; and in the fens near Ely, frequent, &c. Menyánthes nymphoìdes, Lin. spec. 207. syst. 194. Smith, engl. bot. t. 217. Oed. fl. dan. 337. Sabb. hort. 2. p. 67. Smith, fl. græc. 1. p. 128. t. 446. Jaume, St. Hil. 12. livr. t. 6. Limnánthemum peltàtum, Gmel. act. petrop 1769. 14. p. 567. t. 17. f. 2. Meynánthes nàtans, Lam. fl. fr. 2. p. 203. Waldschmídia nymphoìdes, Wigg. prim. p. 20. Drev. et Hayne, abb. zergl. 1. p 33. t. 6. Schweyckhérta nymphoìdes, Gmel. 1. p. 447.—Dalech. hist. 1010. f. 1. Petiv. brit. t. 71. f. 4. Stem dichotomous, creeping under water. Leaves of a livid colour beneath, and dotted. Corolla yellow; segments bearded at bottom. Seeds ciliated.

Nymphæa-like Villarsia. Fl. June, July. Britain. Pl. fl.

2 V. ova'ta (Vent. choix. t. 9.) erect; leaves ovate, erect; flowers racemosely panicled; segments of corolla ciliated. ♃. B. G. Native of the Cape of Good Hope, in boggy watery places. Sims, bot. mag. 1909. Menyánthes ovàta, Lin. syst. 194. suppl. 133. Pers. ench. 1. p. 171. Menyánthes Capénsis, Thunb. prod. p. 34. Reneálmia Capénsis, Houtt. pfl. syst. 4. p. 319. t. 47. f. 1.? Leaves elliptic, obtuse, from the neck of the root, full of pellucid dots, with subundulated edges, and obscure glands. Stem longer than the leaves, furnished with 2-3 leaves at base, but naked and panicled at top. Corollas of an orange yellow colour. Perhaps belonging to the section *Paludòsæ*.

Ovate-leaved Villarsia. Fl. May, July. Clt. 1786. Pl. 1-2 feet.

§ 2. *Petioles bearing the flowers below the leaves.*

3 V. pelta'ta (Rœm. et Schultes, syst. 4. p. 178.) floating; leaves peltate; petioles bearing the flowers beneath the leaves. ♃. W. H. Native of Japan, floating in water. Menyánthes peltàta, Thunb. nov. act. ups. 7. p. 142. t. 4. f. 2. Menyánthes nymphoìdes, Thunb. fl. jap. p. 82. Leaves nearly orbicular, thin, glabrous, broader than long.

Peltate-leaved Villarsia. Pl. floating.

4 V. I'ndica (Vent. choix. p. 9. Hook. bot. misc. 3. p. 97. t. 30.) floating; leaves reniformly orbicular, coriaceous, repand, 3-nerved, or many-nerved, scabrous from scrobicles beneath; pedicels elongated, umbellate from the tops of the petioles, scabrous; segments of corolla hairy at top; capsule round, crustaceous; seeds globose, echinated, ex Hook.; roundish, compressed, size of millet, with a shining crustaceous testa, ex D. Don. ♃. W. S. Native of the East Indies, and the Cape of Good Hope, floating in sweet water lakes. Menyánthes I'ndica, Lin. fl. zeyl. spec. 207. Roxb. fl. ind. 2. p. 31. M. macrophýlla, Roth. nov. spec. p. 105. Thunb. fl. cap. 167. Cumada or Cumud, Jones, in asiat. res. 4. p. 254. no. 30. Nedel-Ambel, Rheed. mal. 10. p. 55. t. 28. Nymphæ'a Cerámica, Rumph. amb. 6. p. 173. t. 72. f. 3. Corolla with a yellow tube, and white segments. Petioles floriferous and viviparous, as in *Meynánthes cristàta*. Segments of corolla lanceolate, the upper side clothed with long white hairs their whole length. Stigma 3-lobed, curled. *Antara-Tamara* is the Telinga name of the plant, and *Bura-chooli* is the Bengalee name. Leaves very variable in size; having the hind lobes connivent.

Indian Villarsia. Fl. May, Aug. Clt. 1792. Pl. floating.

5 V. mìnor (D. Don, mss.) natant; leaves reniformly orbicular, smooth beneath: having the hind lobes divaricate; peduncles smooth, short; capsule globose, crustaceous. ♃. W. S. Native of the Himalaiah. Plant 4 times smaller in every part than *V. I'ndica*.

Smaller Villarsia. Pl. floating.

6 V. Símsii; natant; leaves reniformly cordate, subcrenated: hind lobes rounded, divaricate; pedicels elongated, umbellate, rising from the tops of the petioles; calycine segments lanceolate; segments of corolla bearded their whole length. ♃. W. S. Native of Nipaul. Menyánthes I'ndica, Sims, bot. mag. t. 658. Flowers yellow. Wallich states this plant to be a native of Nipaul, and that the young stalks are there employed in making curries. Sir James Smith describes his *V. I'ndica* as having yellow flowers, and as being a native of the Cape of Good Hope; it is probably the same as the present plant, or a new species.

Sims's Villarsia. Fl. May, Aug. Clt. 1792. Pl. floating.

7 V. Swa'rtzii; natant; leaves orbicular, deeply cordate, subcrenated; petioles floriferous; flowers fasciculate; segments of corolla bearded lengthwise inside. ♃. W. S. Native of the West Indies, floating in sweet water. Menyánthes I'ndica, Swartz, obs. 78. Meyer, ess. p. 94. Rodsch. obs. p. 73.—Browne, jam. 151.—Sloan. jam. t. 251. Corolla white, pilose inside, with a yellow base. Anthers reddish brown.

Swartz's Villarsia. Fl. May, Aug. Clt.? Pl. floating.

8 V. Humboldtia'na (H. B. et Kunth, nov. gen. amer. 3. p. 187.) natant; leaves deeply cordate, quite entire; umbels seated on the petioles; capsule valveless, shorter than the calyx; seeds lenticular, smooth, with naked edges; segments of corolla bearded inside lengthwise, fringed on the edges. ♃. W. S. Native of New Granada, near Guaduas, in marshes, floating amongst *Jussiæ'a*. Hind lobes of leaves spreading. Leaves red beneath and dotted. Umbels sessile. Corolla funnel-shaped, with a short, cylindrical yellow tube, and white recurved limb. Seeds lenticular.

Humboldt's Villarsia. Pl. floating.

9 V. Senegale'nsis; natant; leaves peltate; segments of corolla ciliated on the margins; petioles viviparous and floriferous. ♃. W. S. Native of Senegal, floating in water. Menyánthes I'ndica β, Desrous. in Lam. dict. 4. p. 90. Flowers yellow.?

Senegal Villarsia. Pl. floating.

10 V. lacunòsa (Vent choix. p. 10.) floating; leaves reniform, peltate, lacunose beneath; petioles floriferous and viviparous; corollas glabrous. ♃. W. H. Native from New Jersey to Carolina, floating in ponds and lakes. V. aquática, Gmel. syst. 447. V. cordàta, Ell. sketch. Menyánthes trachyspérma, Michx. fl. bor. amer. 1. p. 126. Anónymos aquática, Walt. fl. car. p. 109. Capsule scabrous. Flowers white. Appendages of the tube of the corolla prominent. This plant is dioecious and polygamous.

Pitted-leaved Villarsia. Fl. June, July. Clt. 1812. Pl. fl.

11 V. parviflòra (Wall. cat. no. 4351.) creeping; radical leaves sagittately cordate, obtuse, on thick, flattened petioles; floriferous leaves reniformly cordate, entire, on long slender petioles, which bear sessile umbels of flowers at the tops below the leaves: with the hind lobes divaricate, obtuse; seeds brown, a little flattened, with a smooth glossy testa. ♃. B. S. Native of Tavoy, in bogs. Flowers small. Capsule oblong-obovate, mucronate by the style.

Small-flowered Villarsia. Pl. creeping.

§ 3. *Runners creeping. Peduncles racemose or panicled, opposite the leaves.*

12 V. gemina'ta (R. Br. prod. p. 457.) creeping; leaves broadly cordate, entire; racemes opposite the leaves; pedicels twin; capsule equal in length to the calyx; seeds with naked margins. ♃. W. G.

Var. α; leaves rather coriaceous, often discoloured beneath, 2 inches in diameter. ♃. W. G. Native of New South Wales.

Var. β; leaves membranous, of the same colour on both surfaces, 6-10 lines in diameter. ♃. W. S. Native of New Holland, within the tropic. Perhaps distinct, sometimes stemless.

Twin-pedicelled Villarsia. Pl. floating.

13 V. sarmentòsa (Rœm. et Schultes, syst. 4. p. 180.) runners creeping; leaves cordate-orbicular, repand, dotted beneath; panicles opposite the leaves; seeds glabrous. ♃. W. G. Native of New Holland, floating in water. Menyánthes sarmentòsa, Sims, bot. mag. 1328. Corollas yellow; segments obtuse, sinuated and crenulated.

Sarmentose Villarsia. Fl. July. Clt. 1806. Pl. creeping.

Sect. II. Paludòsæ. *Capsule valvate.*

14 V. renifórmis (R. Br. prod. 457.) leaves radical, reniform, entire; stem elongated, nearly naked; flowers panicled. ♃. B. G. Native of New South Wales, in marshes about Port Jackson; and of Van Diemen's Land. Lindl. bot. reg. 1533. Flowers yellow. Nearly allied to *V. parnassifòlia.*

Kidney-shaped-leaved Villarsia. Pl. 1 foot.

15 V. parnassifòlia (R. Br. l. c.) leaves radical, ovate-cordate, repandly toothed; stem elongated, nearly naked; flowers panicled; segments of corolla with entire margins; capsule exceeding the calyx; valves bifid; seeds rather scabrous. ♃. B. G. Native of New South Wales; south coast of New Holland, Van Diemen's Land, in bogs. Swértia parnassiæfòlia, Labill. nov. holl. 1. p. 72. t. 97. This is a very polymorphous plant, from 1-3 feet high. Leaves toothed or entire, and sometimes angular. Flowers yellow.

Parnassia-leaved Villarsia. Fl. June, Oct. Clt. 1805. Pl. 1 to 3 feet.

16 V. exalta'ta; leaves radical, orbicularly cordate, subcrenated; stem panicled, almost leafless; segments of corolla toothed. ♃. B. G. Native of New South Wales. Menyánthes exaltàta. Sol. mss. Sims. bot. mag. t. 1029. Flowers yellow.

Exalted Villarsia. Fl. May, June. Clt.? Pl. 2-3 feet.

† *Doubtful species.*

17 V. orbicula'ta (Lam. ill. no. 1966.) leaves orbicular, crenated, peltate, bearing crowded, nearly sessile flowers in the centre. ♄. G. Native of Africa. Leaves bearing flowers in the manner of *Claytònia perfoliàta.*

Orbicular-leaved Villarsia. Pl. floating.?

18 V. hydrophy'llum (Rœm. et Schultes, syst. 4. p. 181.) stems filiform, creeping; leaves cordate, quite entire; flowers crowded, axillary, nectariferous. ♃. B. G. Native of Cochinchina, in watery places. Menyánthes hydrophýllum, Lour. coch. 105. Leaves petiolate, few, scattered. Flowers white, on long peduncles. Corolla campanulate, hairy; segments crenated. Nectaries 5, branched, discoloured, adhering to the base of the corolline segments. Capsule ovate, girded by the permanent calyx. Said by Loureiro to be intermediate between *Hydrophýllum* and *Menyánthes:* from the larger nectaries it is probably a species of *Hydrophýllum.*

Hydrophyllum-like Villarsia. Pl. creeping.

Cult. All the species of *Villársia* are elegant when in blossom. The hardy species require to be grown in a pond. The greenhouse and stove aquatic species should be grown in cisterns in the stove or greenhouse. *V. parnassiæfòlia, V. geminàta, V. renifórmis,* and *V. sarmentòsa,* being only bog or marsh plants, require to be grown in pots, in a mixture of peat and sand, the pots to be placed in deep pans of water. All the species are readily increased by seed or dividing.

Order CLVI. SPIGELIA'CEÆ (this order contains plants agreeing with *Spigèlia* in important characters.) Mart. nov. gen. bras. 2. p. 132.—Gentianeæ part of authors.

Flowers regular, of equal parts. Calyx free, regularly 5-parted. Limb of corolla equal, valvate in æstivation. Stamens 5, rising from the corolla; pollen trigonal, the angles globular.

Style inserted in the top of the ovarium, articulated; stigma simple. Capsule dicoccous, coccæ 2-valved: with a free central placenta. Seeds small; with an immediate placentation; testa simple. Embryo small, straight, in fleshy, copious albumen.—Shrubs or sub-shrubs. Leaves opposite, quite entire, stipulate or substipulate. Flowers disposed in secund, bracteate spikes. Down or hairs on the plants simple or stellate. This order differs from *Gentiàneæ*, in the style being articulated; and in the immediate, not parietal placentation of the seeds. The plants contained in this order are highly ornamental, like those of *Gentiàneæ*. The *Spigèlia anthélmia*, and other annual species, are used as a vermifuge; and the root of *Spigèlia Marilándica*, infused in water, is anthelmintic; and the wine is febrifugal.

Synopsis of the genera.

1 Spige'lia. Calyx 5-parted. Corolla funnel-shaped, 5-parted. Style articulated. Capsule dicoccous; coccæ 2-valved; Placentas pedicellate.

2 Mitre'ola. Calyx 5-toothed. Corolla funnel-shaped, 5 parted. Style articulated, bifid at apex. Capsule 2-lobed. Placentas pedicellate. ?

3 Mitrasa'cme. Calyx 4-cleft or bifid. Corolla with an angular tube; limb 4-parted. Style bifid at the base. Capsule dehiscing between the divisions of the style.

I. SPIGE'LIA (named in honour of Adrian Spigelius, born at Brussels, 1578, professor of anatomy and surgery at Padua; died 1625. Author of Isogoge, in rem herbariam, Padua, 1606.) Lin. gen. no. 209. Juss. gen. 103. H. B. et Kunth, nov. gen. amer. 3. p. 184. Mart. nov. gen. bras. 2. p. 126.—Arapàbaca, Plum.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped; limb 5-cleft. Style articulated. Capsule didymous, dicoccous, cut round at the base; coccæ 2-valved, many-seeded. Seeds attached to the central placenta, which is pedicellate from the base.—Sub-shrubs or herbs. Roots fibrous. Stems terete, or obscurely tetragonal. Leaves opposite, or sub-verticillate, sessile, connate from the confluent petioles, quite entire. Flowers disposed in terminal, secund spikes, which are revolute at top, flowering upwards from the base. Corollas rose-coloured, or purple.—Inhabitants of boggy, or hard, stony situations.

§ 1. *Suffruticòsæ. Plants suffruticose.*

1 S. pulverule'nta (Mart. nov. gen. bras. 2. p. 126. t. 192.) suffruticose; stems branched above, nearly terete, clothed with pale, rusty, stellate tomentum; leaves opposite, scabrous from powder, but at length naked, broad and sub-cordate at the base, on short petioles; spikes solitary; stamens 5 times shorter than the corolla, which is funnel-shaped; corolla and coccæ powdery. ♄. S. Native of Brazil, in the mine provinces, at the altitude of 3800 feet, on Serra de Caraca. Sp. Olfersiàna, Schlecht, in Linnæa, 1. p. 206. Corollas rose-coloured, with more obscure stripes.

Powdery Worm-grass. Shrub 2 feet.

2 S. fruticulòsa (Lam. ill. p. 474. no. 2152. Poir. ency. 7. p. 345.) shrubby, glabrous; leaves ovate-petiolate: upper ones 4 in a whorl; spikes solitary, slender; corolla funnel-shaped; stamens inclosed. ♄. S. Native of Cayenne, in woods. Habit of *S. anthélmia*. Stem and branches quadrangular. Leaves 2-3 inches long, and more than an inch broad.

Shrubby Worm-grass. Shrb 1 to 2 feet.

3 S. Sellowia'na (Schlecht. in Linnæa, 1. p. 205. Mart. l. c. p. 129.) shrubby, covered all over with yellowish, stellate tomentum; leaves opposite, on short petioles, ovate, rounded at the base, acutish, scabrous above; spikes solitary; corollas tubular; stamens exserted. ♄. S. Native of the interior of Brazil. Habit of *S. pulverulénta;* but the flowers are double the size, and more conspicuous.

Sello's Wormgrass. Shrub.

4 S. glabra'ta (Mart. l. c. p. 127. t. 193.) suffruticose, quite glabrous; branches nearly terete; leaves oblong or lanceolate, long-acuminated, tapering into the short petioles; upper ones usually 4 in a whorl; spikes aggregate; stamens 3 times shorter than the corolla, which is funnel-shaped; coccæ glabrous. ♄. S. Native of Brazil, in the province of Bahia, in shady woods, at Almada and Ilheos. Sp. laurìna, Schlecht. in Linnæa, 1. p. 204. Flowers 8-12 on each peduncle, fewer than in the last species. Corollas flesh-coloured, with more obscure stripes, about 8 lines long.

Glabrous Worm-grass. Shrub 2 feet.

§ 2. *Perennis. Herbaceous, perennial plants.*

5 S. pulche'lla (Mart. l. c. 2. p. 128. t. 194.) quite glabrous; stems furrowed-angular, almost leafless, rushy; leaves opposite, sessile, small, linear, acute; spikes solitary; stamens exserted, but 5 times shorter than the corolla, which is tubular; coccæ smooth. ♃. S. Native of Brazil, in high, rocky places, near Villa do Rio de Contas, at the elevation of 2800 feet. Corollas showy scarlet, an inch and more long.

Neat Worm-grass. Pl. 1 to 2 feet.

6 S. Schlechtendalia'na (Mart. l. c. p. 129.) stems and branches tetragonal; leaves opposite, or 4 in a whorl, sessile, narrow-lanceolate, acuminated, downy on the nerves beneath; spikes solitary; stamens inclosed, 3 times shorter than the corolla, which is funnel-shaped; coccæ smooth. ♃. S. Native of Brazil, on the top of mount Morro de Villa Rica, at the elevation of 4000 feet. Corolla 8 lines long, pale rose-coloured, marked with obscure lines.

Schlechtendahl's Worm-grass. Pl. 1 to 2 feet?

7 S. Humboldtia'na (Schlecht. in Linnæa, 1. p. 200. Mart. nov. gen. br. 2. p. 129.) herbaceous, smoothish; stem and branches tetragonal; leaves petiolate, oblong-lanceolate, or ovate, acute at the base; upper ones 4 in a whorl; spikes solitary; corolla funnel-shaped; stamens inclosed; coccæ smooth. ♃. S. Native of Brazil, in the provinces of Rio Janeiro, St. Paul, and Cisplatine; and of Mexico, in woods, at Papantla. Flowers white. Very like the following.

Humboldt's Worm-grass. Pl. 1 foot.

8 S. sca'bra (Schlecht. l. c. p. 202. Mart. l. c.) herbaceous; stem and branches tetragonal; leaves petiolate, ovate, attenuated at the base, scabrous beneath, especially on the nerves and veins; floral leaves 4 in a whorl; spikes solitary; corolla funnel-shaped; stamens inclosed; coccæ roughish. ♃. S. Native of Brazil, in the province of Cisplatine.

Scabrous Worm-glass. Pl. 1 to 2 feet.

9 S. Beyrichia'na (Schlecht. l. c. p. 203.) herbaceous, smoothish; stem and branches tetragonal; leaves petiolate, ovate, acute at both ends: floral ones 4 in a whorl; spikes solitary; corollas funnel-shaped; stamens inclosed; coccæ smooth. ♃. S. Native of Brazil, in the province of Rio Janeiro. Very nearly allied to *Sp. glabràta;* but differs, in the leaves being shorter, ovate, less hard, and smooth.

Beyrich's Worm-grass. Pl.

10 S. hamellioi'des (H. B. et Kunth, nov. gen. amer. 3. p. 185.) herbaceous, smoothish; stems simple, glabrous; leaves ovate-oblong, acuminated, glabrous above, but furnished with small, scattered, adpressed hairs beneath; upper ones 3-4 in a

whorl; spikes solitary; corolla funnel-shaped: stamens inclosed, twice shorter than the corolla; coccæ glabrous. ♃. H. Native of New Granada, near Guaduas, in temperate places. Stem sub-tetragonal. Leaves 3-4 inches long. Calycine segments linear-subulate, with hispid edges.

Hamellia-like Worm-grass. Pl. 1 foot.?

11 S. pedunculàta (Willd. mss. ex Rœm. et Schultes, syst. 4. p. 787. H. B. et Kunth, l. c.) herbaceous, glabrous; stem nearly simple; leaves oblong, long-acuminated, rather scabrous on the margins, upper ones usually 4 in a whorl; spikes solitary, on long peduncles; stamens equal in length to the corolla; corolla funnel-shaped; coccæ glabrous. ♃. S. Native on the declivities of the Andes, about Quindiu, near El Moral. Stems nearly terete. Calycine segments linear-lanceolate, with hispid edges. Corolla purple.

Peduncled-spiked Worm-grass. Pl. 1½ foot.

12 S. speciòsa (H. B. et Kunth, l. c. p. 186. t. 224.) herbaceous; stems simple, tetragonal, downy; leaves opposite, roundish, acute, sessile, glabrous, but downy on the veins beneath, and ciliated on the margins; spikes terminal, sessile, solitary; corolla funnel-shaped; stamens exserted. ♃. S. Native near the city of Mexico. Root tuberous. Veins of leaves purplish. Corolla large, flesh-coloured; with a green, revolute limb.

Showy Worm-grass. Fl. April. Pl. 1½ foot.

13 S. Maryla'ndica (Lin. syst. 197. mant. 2. p. 330.) herbaceous; stems simple, tetragonal, scabrous: leaves opposite, sessile, oval-lanceolate, glabrous; spikes solitary; corolla funnel-shaped; stamens inclosed; coccæ glabrous.? ♃. H. Native of Virginia, Maryland, Carolina, Georgia, &c. on the edges of woods, in rich moist soil; and on the banks of the Arkansas, in the forests near the first cliffs. Michx. fl. bor. amer. 1. p. 148. Pursh, 1. p. 139. Curt. bot. mag. t. 80. Lodd. bot. cab. 930. Stev. et Church. med. bot. 1. t. 7. Plench, t. 89. Heyne, term. bot. t. 44. f. 5. Garden and Hope, act. edinb. 3. 1771. p. 145-153. t. 1. Lonicèra Marylándica, Lin. spec. 2. p. 249. Catesb. car. 2. t. 78. Corollas scarlet outside and yellow inside. Calycine segments subulate. The roots are sold under the name of *worm-grass* or *pink-root*, or *Indian pink* in the shops. This is a mucilaginous plant, with a mild and not disagreeable taste. The infusion and decoction of the root and leaves afford a flocculent precipitate with alcohol. The plant was first used by the Cherokee Indians as an anthelmintic. Drs. Lining, Garden, and Chalmers first introduced it to notice; and their subsequent experience tended to confirm its utility. The root possesses the greatest activity, and is given in doses of from 10 grains, two or three times a day. If it proves purgative it is said to be most effective; and should it not, it must be combined with cathartics, which prevent the narcotic symptoms, such as stupor, head-ache, dilated pupil, flushings of the face, stiffness of the eyelids, that so frequently follow its administration. It is said to be most useful in lumbrica; and it is to its narcotic principle that Dr. Good attributes its vermifuge powers, which it possesses in common with *Spigèlia anthélmia*. Notwithstanding all that has been said in its favour, its real anthelmintic properties are somewhat equivocal. The plant is called *Unsteetla* by the Cherokee Indians.

Maryland Worm-grass. Fl. July, Aug. Clt. 1694. Pl. ½ to 1 foot.

§ 3. *Annuæ. Annual plants.*

14 S. anthe'lmia (Lin. amœn. 5. p. 133. t. 2.) herbaceous, roughish; stems nearly terete, branched; leaves on short petioles, ovate, long-acuminated, or oblong-acute: floral ones 4 in a whorl; spikes aggregate; corollas funnel-shaped; stamens inclosed; coccæ muricately scabrous. ⊙. S. Native of Guiana, Cayenne, New Granada, Trinidad, and Brazil. In New Andalusia it is called *Yerba de Lombrices*. Sims, bot. mag. 2359. Lam. ill. t. 107. Brown. jam. p. 156. t. 37. f. 3.—Plum. gen. p. 11. t. 31.—Plenck, off. t. 88. Brazeel-Parrsis, Petiv. gaz. t. 59. f. 10. Corollas pale red, small.

Anthelmintic Worm-grass. Fl. July. Clt. 1759. Pl. ½ to 1 foot.

15 S. Flemmingia'na (Schlecht, in Linnæa. 1. p. 203. Mart. nov. gen. bras. 2. p. 130.) herbaceous, glabrous; stem and branches nearly terete; leaves petiolate, oblong-lanceolate, acuminated at both ends: floral ones 4 in a whorl; spikes solitary, elongated, on short peduncles; corolla funnel-shaped; stamens inclosed; coccæ smooth. ⊙. S. Native of Brazil, within the tropic. Very like *S. anthélmia*.

Flemming's Worm-grass. Pl. ½ to 1 foot.

16 S. pusílla (Mart. l. c. p. 130.) herbaceous, downy; branches procumbent, and are as well as the stem tetragonal; leaves on short petioles, opposite, ovate, attenuated at the base, acutish; flowers few, terminal, sessile; corolla tubularly ventricose; coccæ smooth. ⊙. S. Native of Brazil, in woods, near Sebastianople. Corollas white, suffused with red. Flowers 2-3 together at the tops of the branches.

Small Worm-grass. Pl. procumbent.

Cult. All the species of this genus are very showy while in blossom, and are therefore worth cultivating in every collection. The best soil for them is an equal mixture of loam and peat. Young cuttings of the shrubby and herbaceous perennial kinds root freely, planted in the same kind of soil, with a hand-glass placed over them. *S. Marylándica* sometimes survives the winter when planted in the open ground, in a peat border. The annual kinds should be treated as other tender annuals.

II. MITRE'OLA (a dim. of *μιτρα, mitra*, a mitre; form of capsule). Rich. in Michx. fl. bor. amer. 1. p. 148. R. Br. prod. p. 450.—Cynóctonum, Gmel. syst. 443.—Anónymos, Walt. fl. car. 108. Ophiorhìza spec. Lin. Michx.

Lin. syst. *Pentándria, Monogy'nia.* Calyx 5-parted, permanent. Corolla urceolate or funnel-shaped; having the tube much longer than the calyx; a villous mouth; and ovate, acute segments. Stamens inclosed. Style articulated at the base?; bifid at apex; stigmas blunt. Capsule 2-lobed or of 2 coccæ; coccæ or lobes diverging, dehiscing inside. Seeds numerous, angular, fixed to 2 elongated placentas, one in each coccæ or cell.—Erect herbaceous plants, with opposite leaves; and terminal secund spikes of flowers.

1 M. sessilifòlia (R. Br. prod. p. 450.) stem acutely tetragonal; leaves opposite, sessile, ovate; cymes on long peduncles; flowers unilateral. ♃. H. Native of Lower Virginia and Carolina, in dry gravelly fields, by wood sides. Ophiorhìza, Mitrèola, Lin. spec. 213. Michx. fl. amer. bor. 1. p. 148. Willd. spec. 1. p. 826. Pursh, 1. p. 139. Lam. ill. t. 107. f. 1. Cynóctonum sessilifòlium, Gmel. syst. 443. Anónymos sessilifòlia, Walt. fl. car. p. 108. Flowers small, pale blue. Style bifid. Cynóctonum petiolàtum, Gmel. l. c. the Anónymos petiolàta, Walt. l. c. is probably a mere variety of this plant.

Sessile-leaved Mitreola. Fl. July. Pl. 1 foot.

2 M. Swa'rtzii; glabrous; stem tetragonal, simple, or branched, terete at top; leaves on short petioles, acute, glabrous; spikes terminal, slender, unilateral: flowers digynous, solitary in the forks. ♃. S. Native of Jamaica. Ophiorhìza Mitrèola, Swartz, obs. p. 59. t. 3. f. 2. exclusive of the synonymes. Flowers small, white, a little longer than the calyx. Styles 2.

Swartz's Mitreola. Pl. 1 foot.

3 M. paniculàta (Wall. cat. no. 4349.) erect, paniculately branched; stem and branches slightly tetragonal; leaves ovate,

acuminated, downy, as well as the young branches; leaves and petioles slightly ciliated; panicles axillary and terminal; dichotomously branched; flowers distant, secund, spicate, on very short pedicels, with one in each fork. ⊙. H. Native of Tavoy, on Mount Taong Dong, near Ava, Segaen, Prome, &c. Capsule of 2 1-celled divisions, which are incurved at top. Mitrèola oldenlandioìdes, Wall. cat. no. 4350., a native of Sukanagur, is only a smaller more glabrous variety; having the stems more decidedly quadrangular.

Panicled Mitreola. Pl. ½ to 2 feet.

Cult. See *Mitrasácme*, p. 173. for culture and propagation.

III. MITRASA'CME (from μιτρα, *mitra*, a mitre, and ακμη, *akme*, a point; form of capsule). Labill. nov. holl. 1. p. 36. t. 49. R. Br. prod. p. 452. According to R. Br. l. c. *Mitrágyne* would be a more applicable name for this genus.

LIN. SYST. *Tetrándria*, *Monogýnia*. Calyx angular, 4-cleft, rarely bifid. Corolla with an angular tube, and a 4-parted limb, deciduous. Stamens 4, equal, inclosed, rarely exserted; anthers behind. Style bifid at the base. Capsule dehiscing between the divisions of the style.—Glabrous or pilose herbs. Leaves opposite, sometimes crowded and radical, without any cauline ones; sometimes connate. Flowers terminal, umbellate, rarely axillary, solitary. Capsule dehiscing at top, not open.—According to R. Br. this genus differs from the legitimate *Gentiàneæ* a little, but nevertheless it agrees more with *E'xacum* than with *Scrophulárinæ*.

SECT. I. MITRASA'CME VE'RÆ (this section contains the legitimate species of the genus). R. Br. prod. p. 452. Calyx 4-cleft. Stamens inclosed, inserted in the middle of the tube of the corolla. Style at the time the flowers are open, bifid at the base; stigma 2-lobed.

1 M. POLYMÓRPHA (R. Br. prod. p. 452.) umbels semi-compound; peduncles elongated, and are as well as the calyxes glabrous; segments of calyx beardless at apex; leaves linear, ciliated a little, glabrous or pilose beneath; stem erect, hairy. ⊙. G. Native of New South Wales.

Polymorphous Mitrasacme. Fl. June, July. Clt. 1826. Pl. ½ foot.

2 M. SQUARRÒSA (R. Br. l. c.) umbels semi-compound; peduncles glabrous; segments of calyx beardless at tops; leaves broad-linear, crowded, recurved at tops, and ciliated at the base, with cartilaginous margins; stem multiple, pilose. ⊙. G. Native of New South Wales.

Squarrose Mitrasacme. Pl.

3 M. CINERA'SCENS (R. Br. l. c.) umbels simple, 3-4-flowered; peduncles glabrous; calycine segments beardless at apex; leaves linear-lanceolate, ciliated, glabrous, terminating in a setaceous mucrone; branches ascending, pilose: the ultimate internode the longest, and smoothish. ⊙. G. Native of New South Wales.

Greyish Mitrasacme. Pl.

4 M. CANE'SCENS (R. Br. prod. p. 453.) umbels usually 3-flowered, sessile; pedicels glabrous; calycine segments bearded at apex; leaves linear, obtuse, hairy on both surfaces; stem procumbent; branches ascending, with all the internodes pilose; root perennial. ↄ. G. Native of New South Wales.

Canescent Mitrasacme. Fl. June, Aug. Clt. 1824. Pl. procumbent.

5 M. MULTICAU'LIS (R. Br. l. c.) peduncles 2-4, 1-flowered, from the ultimate axils, shorter than the stem, pilose; tube of corolla about equal to the calyx, but twice longer than the limb; capsules ovate; stem multiple: partial ones undivided, erect, hairy. ⊙. G. Native of New Holland, within the tropic.

Many-stemmed Mitrasacme. Pl.

6 M. RAMÒSA (R. Br. l. c.) umbel terminal, 4-6-flowered; pedicels pilose; tube of corolla equal in length to the calyx, which is pilose; leaves linear, pilose; stem simple at the base, and a little branched at the apex. ⊙. G. Native of New Holland, within the tropic.

Branched Mitrasacme. Pl.

7 M. LARICIFÒLIA (R. Br. l. c.) peduncles downy, axillary, 1-flowered, longer than the stem, which is simple; tube of corolla 3 lines longer than the limb; capsules globose; leaves linear-subulate, terminating in a setaceous mucrone, glabrous, with recurved margins, which are ciliated at the base. ⊙. S. Native of New Holland, within the tropic.

Larch-leaved Mitrasacme. Pl.

8 M. PROLÍFERA (R. Br. l. c.) umbels terminal, 2-3-flowered, on as many axillary pedicels; tube of corolla globose, exceeding the limb: throat bearded; capsules globose; leaves linear-lanceolate, glabrous; stem branched, humble. ⊙. S. Native of New Holland, within the tropic.

Proliferous Mitrasacme. Pl.

9 M. ALSINOÌDES (R. Br. l. c.) peduncles solitary, lateral; leaves ovate-lanceolate, glabrous; stem dichotomous, erect. ⊙. G. Native of New South Wales.

Chickweed-like Mitrasacme. Pl.

10 M. PALUDÒSA (R. Br. l. c.) umbels 2-3-flowered, nearly terminal; corollas subrotate; anthers exserted at the apex; leaves linear-lanceolate, glabrous; branches ascending. ⊙. G. Native of New South Wales.

Marsh Mitrasacme. Pl.

11 M. PYGMÆ'A (R. Br. l. c.) scapes radical, capillary; umbels simple or compound; corolla one half longer than the calycine segments, which are setaceously mucronate; capsules ovate, exserted at apex; leaves radical, oval-oblong. ⊙. S. Native of New Holland, within the tropic.

Pygmy Metrasacme. Pl. dwarf.

12 M. ELA'TA (R. Br. l. c.) scapes radical, elongated, furnished with remote stipula-formed leaves; umbels simple or compound; corolla salver-shaped: having the tube 3 times higher than the calyx; leaves radical, stellate, oblong. ⊙. S. Native of New Holland, within the tropic.

Tall Mitrasacme. Pl.

13 M. STELLA'TA (R. Br. prod. p. 454.) scapes glabrous, longer than the stem, which is downy; umbels compound; limb of corolla one half shorter than the tube: segments semi-ovate; leaves lanceolate, linear, acute, glabrous, 1-nerved: upper ones approximate, disposed in a stellate manner. ⊙. S. Native of New Holland, within the tropic.

Starry-leaved Mitrasacme. Pl.

14 M. SERPYLLIFÒLIA (R. Br. l. c.) plant creeping, smoothish; branches diffuse or ascending; leaves ovate, petiolate, ciliated, twice as long as the peduncles, which are axillary and solitary; calyx glabrous; stigma almost undivided. ⊙. G. Native of New South Wales.

Wild-thyme-leaved Mitrasacme. Fl. June, Aug. Clt. 1826. Pl. creeping.

15 M. PILÒSA (Labill. nov. holl. 1. p. 36. t. 49. R. Br. l. c.) plant creeping, pilose: leaves ovate, petiolate, ciliated, shorter than the axillary, solitary peduncles; calyxes hispid. ⊙. G. Native of Van Diemen's Land.

Pilose Mitrasacme. Pl. trailing.

16 M. PHASCOÌDES (R. Br. l. c.) stemless; flowers 3-4-together, sessile; leaves linear-lanceolate, pilose. ⊙. S. Native of the Cape of Good Hope.

Phascum-like Mitrasacme. Pl. tufted.

SECT. II. DICHELOCA'LYX (from διχηλος, *dichelos*, bifid, and καλυξ, *calyx*, a calyx; in reference to the bifid calyx). Calyx

bifid. Stamens inclosed, inserted in the middle of the tube of the corolla. Style bifid at the base, at the time the flowers are expanded. Stigma 2-lobed.

17 M. paradóxa (R. Br. l. c.) umbels terminal: leaves linear-lanceolate; stem erect; capsule inclosed. ⊙. G. Native of New Holland, on the south coast.

Paradoxical Mitrasacme. Pl.

Sect. III. Hológyne (from ὁλος, *holos*, entire, and γυνη, *gyne*, a female; in reference to the undivided style and stigma). Style undivided at the base at the time the flowers are open. Stigma entire. Calyx 4-cleft. Stamens inclosed, inserted in the middle of the tube of the corolla.

18 M. conna'ta (R. Br. l. c.) scape terminal, glabrous, longer than the stem, which is pilose; umbels simple; limb of corolla about equal to the tube in length: with the segments linear-lanceolate; segments of calyx one half shorter than the tube; leaves 3-nerved; upper ones approximating in a stellate manner. ⊙. S. Native of New Holland, within the tropic.

Connate-leaved Mitrasacme. Pl.

19 M. capilla'ris (Wall. in Roxb. fl. ind. 1. 420. D. Don, prod. fl nep. 129.) umbels nearly simple, on elongated peduncles; pedicels and calyxes glandular; segments of corolla roundish, obtuse; leaves elliptic, mucronulate, pilose as well as the stem, which is short. ⊙. G. Native of Nipaul, in the Great Valley. Leaves decussate, obsoletely 3-nerved, connate at the base from the membranous sheathing stipulas. Pedicels very long. Flowers small, white. Segments of calyx with membranous ciliated margins. Style subulate, dilated at the base, bipartite when the capsule becomes mature. Stigma capitate, pruinose, slightly 2-lobed. Capsule 2-celled, empty at top.

Capillary Mitrasacme. Pl. ½ foot.

20 M. nudicau'lis (Reinwdt. herb. ex Blum. bijdr. p. 849.) scape radical, elongated, trifid; leaves opposite, remote, stipula-formed; umbels usually 3-flowered; corolla salver-shaped; having the tube thrice as long as the calyx; radical leaves stellate, oval-oblong, obtuse. ♃. S. Native of the island of Salor.

Naked-stemmed Mitrasacme. Fl. Aug. Sept. Pl.

Sect. IV. Plecoca'lyx (from πλεκω, *pleco*, to plait, and καλυξ, *calyx*; in reference to the plicate calyx). Calyx plicate, 4-cleft; lobes concave. Stamens exserted, inserted in the throat of the corolla. Capsule at length semi-bivalved.

21 M. ambígua (R. Br. l. c.) scapes radical, capillary, naked; umbels rather compound; leaves oblong-lanceolate. ⊙. G. Native of New Holland, within the tropic.

Ambiguous Mitrasacme. Pl.

Cult. The species of *Mitrasácme* being for the most part annual, the seeds of those which can be procured should be sown in pots, filled with an equal mixture of sand, loam, and peat, and reared in a hot-bed in spring; and when they have grown to a sufficient size, they should be thinned, if too thick, and afterwards placed in the greenhouse, or in a frame.

Order CLVII. GENTIA'NEÆ. (This order contains plants agreeing with the genus Gentiàna in particular characters.) Juss. gen. p. 141. ed. Usteri, p. 157. R. Br. 149. H. B. et Kunth. nov. gen. amer. 3 p. 167. Mart. nov. gen. bras, 2. p. 132.

Calyx 4-5 cleft, permanent. Corolla monopetalous, hypogynous, regular, marcescent or deciduous; with an equally parted limb; lobes equal in number to the calycine segments, but usually 5, sometimes from 4-8, imbricate in æstivation. Stamens epipetalous, equal in number to the segments of the corolla, and alternating with them, but some of them are abortive. Ovarium solitary, 1-2-celled, many-seeded. Styles 1 or 2, when 2 they are partly combined or altogether so; stigmas 1-2. Capsule (sometimes a berry) many-seeded, 1-2-celled, usually 2-valved; having the margins of the valves bent in and bearing the seeds in those in which the capsule is 1-celled; but the seeds are inserted in central placentas in those with 2-celled capsules. Seeds small. Embryo straight, inclosed in the axis of soft fleshy albumen. Radicle tending towards the umbilicus.—Herbs, rarely shrubs, usually glabrous. Leaves opposite, entire, exstipulate. Flowers terminal or axillary.

This order is more readily distinguished by habit alone, than by character. It is nearly allied to *Polemoniàceæ*, *Scrophulárinæ*, and *Spigeliàceæ;* from the first it is distinguished by the dehiscence of the capsule and placentation of the seeds; from the second in the flowers being regular, and in the stamens being equal in length; and from the latter in the style not being kneed, in the capsule being 1-celled, and in the seeds being fixed to the edges of the valves. It also comes near to *Apocýneæ*, but is readily distinguished from that order in the æstivation of the corolla. In *Swértia perénnis* the embryo is in the umbilical region of the seed, contrary to the assertion of Dr. Gærtner.

The species are chiefly natives of cool and mountainous regions of Europe, Asia, and America. They are mostly dwarf, herbaceous plants, with deep blue, yellow, or white flowers, the former colour prevailing. They are all pretty, and most of them beautiful in the highest degree, but, with few exceptions, they are impatient of cultivation. The medicinal properties of the root of *Astèrias lùtea*, *Coilántha rùbra*, and *C. purpùrea*, the stems and leaves of *Agathòtes alàta*, *Erythræ'a Centaúrium*, and *E. Chilénsis*, *Frasèra Waltèri*, &c., are eminently tonic, stomachic, and febrifugal; their bitterness is second only to quassia and Peruvian bark. Similar, but more feeble virtues are found in most of this order. A kind of spirit is distilled in Switzerland from the roots of *Gentiàna* macerated in water.

Synopsis of the genera.

Tribe I.

Gentianie'æ. Capsule 1-2-celled; margins of valves placentiferous. Seeds usually disposed in a double row.

Sub-tribe I. Gentia'neæ-ve'ræ. *Capsule 1-celled, 2-valved; margins of valves bearing the seeds. Anthers remaining unchanged.*

1 Swe'rtia. Corolla rotate, 4-5-parted: having 2 nectariferous pores at the base of each segment, which are ciliated with hairs. Seeds compressed, marginate.

2 Hale'nia. Corolla rotate, 4-5-parted: each segment furnished with a spur, horn or tubercle at the base. Seeds roundish, small, smooth.

3 Agathòtes. Corolla rotate, 4-parted: having 2 parallel, oblong, fringed pores at the base of each segment. Seeds minute, globose, smooth.

4 Ophe'lia. Corolla rotate, 4-5-parted; each segment furnished with 2 distinct or combined nectariferous, naked pores or glands at the base. Seeds angular, scrobiculate, scabrous.

5 Gentiane'lla. Corolla 4-cleft, salver-shaped, furnished with 4 nectariferous pores at the bottom; segments fringed. Seeds small, scobiform.

6 Frase'ra. Corolla rotate, 4-parted; each segment furnished with 1 orbicular bearded gland in the middle. Seeds imbricate, marginate.

7 Gentia'na. Corolla campanulately funnel-shaped, 4-5-cleft. Stigma 2-lobed. Seeds roundish or oblong.

8 Centaure'lla. Corolla urceolately campanulate, 4-cleft. Stigma thick, glandular, 2-lobed. Seeds small, roundish.

9 Aste'rias. Calyx spathaceous, 3-4-cleft, split on one side. Corolla subrotate, 5-cleft, furnished with a green gland at the base of each segment. Anthers at first combined, afterwards free. Seeds compressed, winged.

10 Coila'ntha. Calyx spathaceous, unequally toothed, split on one side. Corolla campanulate, 5-10-cleft. Stigma bifid. Anthers at first combined. Capsule furnished with 5-7 tubercles at the base. Seeds compressed, winged.

11 Eurytha'lia. Corolla salver-shaped: limb 4-5-cleft, with as many bearded or fringed smaller segments inside these, and attached to them at the base. Anthers incumbent. Stigma 2-lobed. Seeds compressed, roundish.

12 Pleurógyna. Corolla rotate, 4-5-cleft, with a fringed throat. Anthers incumbent. Stigmas 2, adnate to the ovarium lengthwise on both sides in the sutures. Seeds minute, globose.

13 Erica'la. Corolla funnel-shaped or salver-shaped, 8-10-cleft; the alternate or accessory segments usually the smallest. Anthers incumbent, ovate or oblong, minute. Seeds ovate or oblong, minute.

14 Pneumona'nthe. Corolla campanulate or salver-shaped, 10-cleft: the alternate or accessory segments usually the smallest. Anthers combined. Seeds small, globose, smooth.

15 Glyphospe'rmum. Flowers polygamous. Corolla tubular, 5-cleft. Anthers incumbent. Stigma capitate, 2-lobed. Seeds orbicular, full of excavated dots, disposed in a single row.

16 Sela'tium. Corolla tubular, 5-lobed. Filaments flat; anthers incumbent. Stigma 2-lobed, nearly sessile. Placentas 2, one half shorter than the ovarium.

17 Ulóstoma. Corolla funnel-shaped, 5-parted: having the tube bearded with long hairs inside. Filaments dilated: anthers incumbent. Ovarium fusiform. Stigma sessile, 2-lobed.

18 Schulte'sia. Calyx tubular, 4-cleft, 4-winged. Corolla salver-shaped, with an equal tube, and a 4-cleft limb. Stigma bilamellate. Seeds minute, angular.

19 Callopísma. Calyx 4-parted; with keeled segments. Corolla salver-shaped, 4-cleft; with an equal tube. Stigma 2-lobed, exserted. Anthers pruinose, opening by a double pore at the apex. Seeds oblong or angular.

20 Ta'chia. Calyx tubular, 5-angled, 5-toothed. Corolla funnel-shaped, 5-parted, with a wide throat. Stamens exserted, inclinate. Stigma small, round, bilamellate, exserted; margins of valves bent into the central placenta. Seeds small, viscid.

21 Prepu'sa. Calyx campanulate, 6-cleft, 6-winged. Corolla campanulate, 6-cleft. Stamens 6. Seeds minute, globose, angular.

22 Orthoste'mon. Calyx tubular, 4-toothed. Corolla with a short, 4-parted limb. Stamens 4, exserted; anthers dehiscing lengthwise. Stigmas 2, roundish.

23 Chlòra. Calyx 4-8-parted. Corolla salver-shaped, 4-5-parted. Stamens 8; filaments very short; anthers linear, erect. Stigma 2-4-cleft. Capsule oval-oblong. Seeds minute.

24 Hippion. Calyx viscid, 5-cleft. Corolla viscid, salver-shaped, swelling at the base, and contracted at the orifice; limb 5-cleft. Stamens 5, exserted. Anthers incumbent. Style declinate. Stigma capitate, slightly cloven.

25 Canscòra. Calyx cylindrical or quadrangular. Corolla funnel-shaped: with a 4-cleft unequal limb. Stamens 4, one longer than the rest. Anthers oblong-linear. Stigma 2-lobed. Seeds roundish, minute.

26 Vohìria. Calyx turbinate, 5-cleft; furnished with 2-3 scales at the base. Corolla salver-shaped, 5-cleft; tube long, narrow, tumid at the base. Anthers almost sessile. Stigma capitate, simple. Capsule oblong. Seeds scobiform.

27 Leipha'imos. Calyx small, 5-parted. Corolla funnel-shaped, 5-cleft. Anthers sagittate, nearly sessile. Stigma somewhat peltate, sub-bilabiate. Capsule lanceolate; edges of valves villous. Seeds scobiform.

28 Enicoste'ma. Calyx unequally 5-cleft. Corolla funnel-shaped, 5-cleft. Stamens 5; filaments dilated. Stigma capitate, subemarginate. Capsule oblong. Seeds scrobiculate.

29 Crawfu'rdia. Calyx tubular, 5-toothed. Corolla campanulate, 5-cleft, with or without accessory lobes. Filaments dilated; anthers erect. Hypogynous disk 5-lobed. Stigma 2-lobed, recurved. Seeds with membranous edges.

Sub-tribe II. Coutou'beæ. *Capsule 2-celled, in consequence of the margins of the valves being bent into the central column; margins of valves placentiferous. Anthers remaining unchanged, even in the old state.*

30 Coutou'bea. Calyx campanulate, 4-parted. Corolla salver-shaped, 4-parted; tube equal. Stamens 4, exserted; filaments bidentate at the base. Anthers sagittate. Stigma bilamellate. Seeds scobiform.

31 Adene'ma. Calyx 5-parted. Corolla funnel-shaped, 5-cleft. Stamens 5, inclosed; filaments short, furnished with a gland at the insertion of each; anthers incumbent. Stigma 2-lobed. Seeds scobiform.

32 Schuble'ria. Calyx 5-parted. Corolla tubularly campanulate, 5-cleft. Stamens 5, minute; anthers oblong. Stigma simple, penicellately glandular. Seeds small, ovate or obovate, angular.

33 He'lia. Calyx campanulate, 5-parted. Corolla salver-shaped; limb rather oblique, 5-parted: tube inflated in the middle. Stamens 5. Stigma of 2 cylindrical divisions. Seeds small, globose, or angular.

34 Eudóxia. Corolla campanulate, 5-cleft. Stamens 5, adnate to the tube of the corolla; filaments channelled inside; anthers linear, incumbent. Ovarium fusiform, 2-celled. Stigma sessile, 2-lobed. Ovula orbicular, peltate, concave on one side, with membranous edges.

Sub-tribe III. Chiròniæ. *Capsule 1-celled, 2-valved; margins of valves inflexed, seminiferous. Anthers changed when old.*

35 Chirònia. Calyx 5-parted. Corolla salver-shaped, 5-cleft. Stamens 5; filaments dilated; anthers oblong, erect, connivent, at length spirally twisted. Style declinate. Stigma capitate.

36 ROSLÍNIA. All as in *Chirònia*, but differs in the fruit being a succulent berry.

37 ERYTHRÆ'A. Calyx 5-cleft. Corolla funnel-shaped: with a short 4-5-parted limb. Anthers spiral in the old state. Style erect. Stigmas 2, roundish.

38 SABBA'TIA. Calyx 5-parted. Corolla with an urceolate tube, and a 5-12-parted limb. Stigmas 2, spiral. Anthers at length revolute.

SUB-TRIBE IV. LISIA'NTHEÆ. *Capsule 2-celled, in consequence of the margins of the valves being bent into the central column; margins of valves placentiferous. Anthers changed in the old state.*

39 LISIA'NTHUS. Calyx campanulate, 5-cleft. Corolla funnel-shaped; tube ventricose on one side; limb equal, 5-cleft. Anthers sagittate, incumbent, revolute in the old state. Style elongated; stigma bilamellate. Seeds small, angular.

40 IRLBA'CHIA. Calyx campanulate, 5-cleft. Corolla funnel-shaped, equal, 5-cleft. Anthers revolute when old. Lobes of stigma cylindrical. Seeds angular, small.

41 SYMBOLA'NTHUS. Calyx 5-parted, pentagonal. Corolla salver-shaped, 5-parted; tube cylindrical; segments fringed. Stamens having a small crenulated, ring-formed membrane at the base of the filaments. Anthers sagittate, but at length convolute. Lobes of stigma linear-oblong, flat.

42 EU'STOMA. Calyx 5-parted; having the segments more or less winged on the back. Corolla funnel-shaped, 5-cleft; tube contracted a little at apex. Stamens 5; filaments compressed; anthers rather sagittate. Stigma deeply 2-lobed. Seeds scobiform.

TRIBE II.

EXACIE'Æ. *Capsule 2-celled; margins of valves inflexed, inserted in the central placentas, which are at length free and bear the seeds.*

43 SEBÆ'A. Calyx 4-5-parted; segments keeled or winged. Corolla 4-5-cleft. Stamens exserted; anthers dehiscing lengthwise, when old recurved and callous at the apex. Stigmas 2.

44 E'XACUM. Calyx campanulate, 4-cleft; segments winged on the back. Corolla subrotate, 4-cleft. Stamens 4, declinate; filaments terete; anthers oblong, sub-tetragonal, emarginate at the base, erect, dehiscing by a chink at apex. Style declinate. Stigma clavate, undivided.

45 MICROCA'LE. Calyx deeply 4-cleft. Corolla salver-shaped, with a swelling tube and a 4-cleft limb. Stamens 4, filiform, erect: anthers oblong. Style declinate; stigma capitate, undivided. Capsule imperfectly 2-celled.

TRIBE III.

DESFONTAINIE'Æ. *Berry 1-celled, many-seeded; with 4-5 parietal septiform placentas, hence the berry appears many-celled; placentas with reflexed seminiferous sides. Seeds disposed without order, erect, obovate, angular, with an umbilicus at the base, and a dilated chalaza at top. Albumen fleshy, white.—Evergreen shrubs, with spiny-toothed leaves, and solitary, terminal, pedunculate flowers. Peduncles bibracteate.*

46 DESFONTA'INIA. Calyx 4-5-parted; with nearly equal obtuse segments. Corolla tubular, cartilaginous; with a 4-5-lobed limb; lobes roundish, retuse. Stamens 4-5. Anthers erect, innate, 2-celled, inserted each in a large, fleshy connective; cells dehiscing lengthwise.

† *A genus hardly known.*

47 PALLA'DIA. Corolla funnel-shaped; limb of 8 segments; tube furnished with 8 plicæ. Capsules 2, club-shaped. Stigmas 2, spreading. Seeds small, roundish, fixed to spongy receptacles.

TRIBE I.

GENTIANIE'Æ. Capsule 1-2-celled, 2-valved; margins of valves placentiferous. Seeds usually disposed in two rows, on each side of the valves.

SUB-TRIBE I. GENTIA'NEÆ-VE'RÆ. (This tribe is supposed to contain the legitimate species of the genus.) Capsule 1-celled, 2-valved. Margins of valves bearing the seeds. Anthers remaining unchanged in the old state.

I. SWE'RTIA (so named by Linnæus after Iman Sweert, a cultivator of bulbs and flowers, in Holland; author of Florilegium, Francof. 1612. fol.). Lin. gen. no. 321. Schreb. 449. Juss. 142. Gærtn. fruct. 2. p. 160. t. 114. Lam. ill. t. 109.

LIN. SYST. *Tetra-Pentándria, Monogýnia.* Calyx deeply 4-5-parted. Corolla rotate, 4-5-parted; segments furnished with 2 callous scrobicles at the base of each, which are fringed on the edges. Stamens 4-5; filaments subulate, flattened, glabrous, dilated at the base; anthers incumbent, dehiscing lengthwise, loosened at the base. Style very short. Stigmas 2, suborbiculate, flattened, minutely papillose above, with revolute edges. Capsule 1-celled, 2-valved. Seeds compressed, marginate, fixed to the edges of the valves.—Usually glabrous herbs. Leaves opposite, rarely alternate, quite entire, nerved. Flowers terminal, pedunculate, almost solitary, or racemosely panicled, blue or yellowish.

§ 1. *Pentámera* (from πεντε, *pente*, five, and μερις, *meris*, a part; parts of the flowers). *Calyx 5-parted. Corolla 5-cleft. Stamens 5.*

1 S. PERE'NNIS (Lin. spec. 328.) glabrous: stems erect, and are, as well as peduncles, tetragonal; leaves almost all radical, ovate or elliptic, obsoletely nerved; racemes panicled, terminal; segments of corolla acute. ♃. H. Native of Germany, Austria, France, Caucasus, and Siberia; and of North Wales. Jacq. austr. 243. Smith, engl. bot. t. 1441. Pall. ros. 2. p. 98. Gentiàna paniculàta, Lam. fl. fr. 2. no. 333. Gentiàna palústris, All. ped. no. 367.—Hall. helv. no. 636.—Barrel. icon. t. 91.—Morr. his. sect. 12. t. 5. f. 11. Calycine segments subulate. Corolla of a greyish purple colour; segments elliptic, acute, dotted with black, having the edges of pores bristly. Margins of valves bearing a double row of seeds. Plant very bitter. Cauline leaves opposite. Bracteas elliptic, oblong.

Perennial Felwort. Pl. July, Aug. Pl. 1 foot.

2. S. OBTU'SA (Led. act. petrop. 5. p. 526. fl. alt. 1. p. 290. Rchb. pl. crit. 5. p. 11. t. 419. f. 605.) glabrous; stems erect, and are, as well as the peduncles, tetragonal; leaves scattered, all oblong, 5-nerved, somewhat coriaceous, obtuse; flowers racemose; segments of corolla obtuse, dotless, and erose at the apex; cilia of nectary very long and loose; filaments pilose at the base. Native of Siberia, in sub-alpine humid places. S. perénnis Pall. itin. 2. p. 568. S. perénnis, β alternifòlia, Schlecht. in Linnæa. 2. p. 189-190. Stem bluish-green, tetragonal. Lower cauline leaves petiolate, oblong. Bracteas, and pedicels bluish. Corolla violaceous.

Var. β, *albiflòra* (Led. fl. alt. 1. p. 291.) flowers white. Native of Siberia.

Obtuse-leaved Felwort. Pl. 1 foot. ♃. H.

3 S. DECU'MBENS (Vahl. symb. 1. p. 24.) glabrous, decumbent; stems filiform, obscurely angular; leaves linear-lanceolate, sessile, somewhat connate at the base; pedicels twine at the tops of the branches; each furnished with a linear bractea at the base. ♃. G. Native of Arabia Felix. Willd. spec. 1. p. 1330. Parnássia polynectària, Forsk. descr. p. 207. icon. t. 5. f. 6. Stigmas 2.

Decumbent Felwort. Pl. decumbent.

4 S. JAVA'NICA (Blum. bijdr. p. 848.) stem erect, fastigiately branched; leaves linear-lanceolate, 3-nerved, sessile; peduncles tetragonal, 1-flowered; axillary ones usually twin, and the terminal ones aggregate; corollas campanulately 5-parted, about equal in length to the calyx. ♃. S. Native of Java, on the top of Mount Gede, in humid places.

Java Swertia. Fl. year. Pl.

5 S. CÆRU'LEA (Royle, herb.) lower leaves spatulate, petiolate: superior ones as well as calycine segments lanceolate, bluntish; corollas 5-parted: segments ovate, mucronate, fringed on the edges with distant, linear scrobicles. ⊙. H. Native of the Himalaiah. Flowers blue.

Blue-flowered Felwort. Pl.

§ 2. *Tetramèra* (from τετρα, *tetra*, four, and μερις, *meris*, a part; parts of the flowers). *Calyx* 4-*parted*. *Corolla* 4-*cleft*. *Stamens* 4.

6 S. DICHÓTOMA (Lin. spec. 329.) glabrous; stems branched, dichotomous, diffuse, articulated, thick; radical leaves obovate, nerved, petiolate: cauline ones elliptic, acute, 3-nerved, sessile; pedicels from the forks of the branches nutant, shorter than the internodes. ⊙. H. Native of Siberia, on the banks of the Catscha, above Krasnojarsk, &c. Lin. amœn. 2. p. 317. Pall. fl. ross. 2. p. 100. t. 91.—Gmel. sib. 4. p. 113. t. 53. f. 2. Habit of *Anagállis*. Lobes of calyx ovate-lanceolate, acute. Segments of corolla ovate, obtuse, with the nectaries hardly ciliated. Capsule obovate, compressed. Flowers green and sometimes reddish. Stem decumbent, red.

ichotomous Felwort. Pl. decumbent.

7 S. MULTICAU'LIS (D. Don, prod. fl. nep. p. 128.) stems tufted; peduncles tetragonal, 1-flowered; leaves lanceolate, obtuse, attenuated at the base; calycine segments oval, obtuse; corollas 3 times longer than the calyx: with oval-oblong, obtuse segments. ♃. H. Native of Nipaul, on the alps. Root long, fusiform. Stems tetragonal, trichotomous, 3-flowered, or simple 1-flowered. Flowers purplish, size of those of *S. perénnis*.

Many-stemmed Felwort. Pl. tufted.

8 S. PALLA'SII; glabrous; stem simple, filiform, erect; leaves lanceolate, nerved; pedicels erect, axillary, somewhat fastigiate. ⊙. H. Native of Kamtschatka, at the mouth of the river Apalla. S. tetrapétala, Pall. fl. ross. 2. p. 99. t. 90. f. 2. Each stem furnished with 4-5 pairs of leaves. Flowers small. Calycine segments linear. Segments of corolla hardly cohering at the base, deep blue; having the nectariferous scrobicles combined, notched on the edges, and of a fulvous colour, and visible on the back. Ovarium fusiform. Stamens rufescent.

Pallas's Felwort. Pl. ½ foot.

9 S. PUSÍLLA (Pursh, l. c.) glabrous; stem simple, 1-flowered; leaves oblong; corolla twice as long as calyx. ⊙. H. Native of New Hampshire, on the alpine regions of the White Hills; and of Labrador. The whole plant is scarcely an inch high, with 1-2 pairs of small leaves, and a considerable sized blue flower. Segments of corolla oblong, acuminated; of the calyx obtuse.

Least Felwort. Fl. June. Pl. 1 inch.

10 S. FASTIGIA'TA (Pursh, fl. amer. sept. 1. p. 101.) glabrous; stem branched; leaves spatulate-obovate, nerved; flowers fastigiate, aggregate, axillary and terminal; pedicels twin; corolla campanulately rotate, length of calyx. ♃. H. Native of North America, on the Missouri flats, near the Rocky Mountains, Lewis. Leaves large. Flowers sky blue.

Fastigiate-flowered Felwort. Fl. July. Pl. ½ foot.

11 S. PERFOLIA'TA (Royle, mss.) glabrous; stem erect, terete; leaves elliptic-oblong, acuminated, 7-nerved, connately sheathing; flowers racemosely panicled; segments of corolla acuminated; nectariferous scrobicules combined. ♃. H. Native of the Himalaiah. Habit and size of *Gentiàna lùtea*. Root fusiform, horizontal, dirty yellow. Stems the thickness of a finger. Lower leaves petiolate; petioles connately sheathing: upper ones sessile, connate. Flowers very numerous, drooping, blue? Pedicels filiform, furnished each with a lanceolate bractea at the base. Nectariferous scrobicles roundish, fringed with long cilia.

Perfoliate-leaved Felwort. Pl. 3 feet.

12 S. SPECIÒSA (Wall. cat. no. 4384.) glabrous; stem erect, terete?; leaves petiolate, spatulate-oblong, obtuse, 5-nerved; flowers racemosely panicled; segments of corolla obtuse; nectariferous scrobicles distinct, ciliated with threads. ♃. H. Native of Nipaul, Kamaon, and Himalaiah. Swértia petiolàris, Royle, mss. Petioles connate at the base. Leaves 2 inches long. Segments of calyx lanceolate, mucronate. Corolla yellow, almost twice longer than the calyx.

Showy Felwort. Pl. 2 to 3 feet.

13 S. CUNEA'TA (Wall. cat. no. 4380.) glabrous; stem erect, filiform; leaves spatulately oblong, petiolate, obtuse, 5-nerved; flowers racemosely panicled; segments of corolla obtuse; nectariferous scrobicles linear-oblong, distinct, ciliated with long hairs. ♃. H. Native of the Himalaiah, Royle; Kamaon, Wall. Swértia glycanthèra, Royle, mss. Root fibry, dirty yellow. Leaves 2-4 inches long: superior ones linear-oblong, almost sessile. Segments of the calyx linear, acute, 3-nerved. Segments of corolla obtuse, emarginate, 5-nerved. Corolla blue.

Cuneate-leaved Felwort. Pl. ¼ to ¾ foot.

14 S. ALTERNIFÒLIA (Royle, mss.) leaves alternate, elliptic-oblong, acuminated, 7-nerved, sheathing at the base; flowers drooping, racemosely panicled; segments of the calyx ovate, acuminated: of the corolla elliptic, obtuse; nectariferous scrobicles orbicular, fringed, contiguous. ♃. H. Native of Nipaul, Royle.

Alternate-leaved Felwort. Pl.

Cult. All the species delight in a light soil, inclining to peat; and a marshy situation. The perennial species are increased by division at the root, or by seed.

II. HALE'NIA (meaning unknown to us). Borkh. in Rœm. archiv. 1. p. 24. Swértia species of authors.

LIN. SYST. *Tetra-Pentándria*, *Digýnia*. Calyx 4-parted. Corolla subcampanulate or funnel-shaped, 4-cleft, each segment furnished with a spur, horn, or tubercle at the base. Filaments filiform or subulate; anthers incumbent, dehiscing at the sides lengthwise. Stigma sessile, 2-lobed. Capsule 1-celled, 2-valved at apex. Seeds roundish, small, smooth.—Usually glabrous herbs. Leaves opposite, quite entire, nerved: radical ones crowded. Flowers terminal and axillary, pedunculate, blue, or yellow.

1 H. SIBÍRICA (Borkh. in Rœm. arch. 1. p. 25.) stem erect, obsoletely quadrangular, simple, or branched; cauline leaves lanceolate, 3-nerved; pedicels axillary and terminal, filiform, 1-flowered; flowers nutant; corolla subcampanulate, sometimes 5-cleft; spurs divaricate, incurved, subulate. ⊙. or ♃. H. Native of Siberia, about the Genissee, and in shady places at the mouth of the river Tschulyschman. Swértia corniculàta, Lin. spec. 328. amœn. 2. p. 317. Pall. fl. ross. 2. p. 99. t. 90. f. 1. Tetragonánthus elàtior. Stell. irc. p. 122.—Gmel. sib. 4. p. 114. t. 53. f. 3. Radical leaves broad, lanceolate. Corollas greenish.

Capsule silique-formed. This plant, from its grateful bitterness, is received among the domestic remedies of the inhabitants of Siberia.

Siberian Halenia. Fl. July, Sept. Clt. 1817. Pl. ½ to 2 ft.

2 H. Michauxia'na; stem branched, quadrangular; branches short; cauline leaves ovate, 3-nerved; corollas campanulate; spurs deflexed. ♂. H. Native of Canada, in swamps, and round the lakes of the western parts of the United States. Swértia corniculàta, Michx. fl. amer. bor. 1. p. 97. Pursh, 1. p. 100. Swértia Michauxiàna, Rœm. et Schultes, syst. 6. p. 130. Swértia Americàna, Spreng. syst. 1. p. 861. Flowers greenish yellow.

Michaux's Halenia. Fl. July. Clt. 1824. Pl. ½ to 1 foot.

3 H. Pavonia'na; tufted; stems slender, tetragonal, simple or branched, nearly naked; flowers terminal, umbellate; leaves petiolate, lanceolate-linear, nerveless: cauline ones conniving at the base; corolla subcampanulate; spurs acute, diverging, longer than the corolla. ⊙. G. Native of Peru, on the Andes. Swértia umbellàta, Ruiz et Pav. fl. per. 3. p. 21. t. 242. f. b. Peduncles 5-10 together, tetragonal, rather drooping. Umbels solitary or twin. Calycine segments lanceolate, acutish, with scabrous margins. Corolla yellow; with ovate, acuminated segments. Capsule conical. Seeds lenticular.

Pavon's Halenia. Pl. 1 to 2 feet.

4 H. brevicórnis; stem erect, branched, terete; leaves linear-lanceolate, 3-nerved, on short petioles; flowers axillary and terminal, solitary, pedicellate; calycine segments linear; corolla funnel-shaped; spurs very short. ⊙. G. Native of Quito, in temperate places, near Chilla. Swértia brevicórnis, H. B. et Kunth, nov. gen. amer. 3. p. 174. Leaves 1½ inch long: superior ones sessile-linear. Corolla pale yellow: with ovate, acute segments. Capsule oblong, compressed. Seeds roundish.

Short-horned Halenia. Fl. May. Pl. ½ to ¾ foot.

5 H. parviflòra; stem erect, quadrangularly terete, simple; cauline leaves linear-lanceolate, 3-nerved, sessile; flowers paniculately spicate, twin; calycine segments linear; corolla rotately campanulate, with a tubercle at the base of each segment instead of spurs. ⊙. F. Native of Mexico, near the town of Guanaxuato. Swértia parviflòra, H. B. et Kunth, nov. gen. amer. 3. p. 175. Corolla yellow; with ovate, acute segments. Capsule oblong, compressed.

Small-flowered Halenia. Fl. Sept. Pl. ½ to ¾ foot.

6 H. gra'cilis: stem erect, tetragonally terete; leaves oblong, 3-nerved: superior ones sessile, ovate-oblong; flowers terminal and axillary, twin, pedicellate; calycine segments obovate-spatulate; corolla subcampanulate; spurs pendulous, erectish, conical. ⊙. F. Native along with the preceding. Swértia gràcilis, H. B. et Kunth, nov. gen. amer. 3. p. 176. Leaves 8-9 lines long. Corolla yellow; ? with ovate, acute segments.

Slender Halenia. Pl. ¾ foot.

7 H. plantagínea; stems erect, quadrangular, simple, or fastigiately branched; radical leaves lanceolate, 3-nerved, on long petioles: cauline leaves linear, sessile; flowers terminal and axillary, solitary, pedicellate; calycine segments linear-spatulate; corolla campanulate; spurs pendulous. ♃. G. Native of Mexico, on the burning mount Jorullo. Swértia plantagínea, H. B. et Kunth, nov. gen. amer. 3. p. 175. Radical leaves 3 inches long. Corolla yellow; with ovate obtuse segments. Seeds roundish.

Plantain-like Halenia. Fl. Sept. Pl. ¾ foot.

8 H. asclepia'dea; stems erectish, angularly terete, simple; leaves 3-nerved: radical ones lanceolate, petiolate: cauline ones linear, sessile; flowers subumbellate, pedicellate; calycine segments lanceolate; corolla campanulate; spurs conical, ascending, spreading. ♃. G. Native of New Granada, near Santa Fe de Bogota, on the declivities of mountains. Swértia asclepiàdea, H. B. et Kunth, nov. gen. amer. 3. p. 175. Leaves 20 lines long. Corolla yellow; with ovate-oblong, obtuse segments.

Asclepias-like Halenia. Fl. July. Pl. 1 foot.

9 H. hypericoìdes; stems procumbent, branched, leafy; leaves oblong-lanceolate, 3-nerved: upper ones sessile; flowers panicled, twin, pedicellate; calycine segments linear-lanceolate; corolla subcampanulate; spurs pendulous, hooked at top. ♃. G. Native of New Granada, near the mine called Zipaquira, at the altitude of 1400 hexapods. Swértia hypericoìdes, H. B. et Kunth, nov. gen. amer. 3. p. 176. Leaves 8-10 lines long; having the petioles connate, and sheathing at the base. Corolla yellow?; with ovate, acute segments. Capsule oblong, obtuse, compressed. Seeds roundish.

St. John's-wort-like Halenia. Fl. Sept. Pl. proc.

10 H. ellíptica (D. Don, mss.) stem terete, branched; leaves elliptic-obtuse, 5-nerved: lower ones petiolate; calycine segments obtuse, short; spurs filiform, longer than the corolla. ♃. F. Native of the Himalaiah and Kamaon. Swértia corniculàta, Royle, herb. Swértia centrostémma, Wall. cat. no. 4385. Stem 1-1½ foot. Leaves an inch and a half long. Flowers pale.

Elliptic-leaved Halenia. Pl. 1 to 2 feet.

11 H. elonga'ta (D. Don, mss.) leaves linear-lanceolate, acute, 3-nerved, attenuated at the base; calycine segments spatulate; spurs short, straight, shorter than the corolla. ⊙. H. Native of Mexico.

Elongated Halenia. Pl. 1 foot.

12 H. pinifòlia (D. Don, mss.) tufted; stems erect, simple; leaves linear, acute, channelled; flowers umbellate; calycine segments ovate-lanceolate, acute; spurs straight, twice shorter than the corolla. ♃. F. Native of Peru, on the Cordilleras of the Andes. Swértia pinifòlia, Ruiz et Pav. in herb. Lamb. Leaves very narrow; with scabrous edges. Flowers golden yellow.

Pine-leaved Halenia. Pl. ¼ to ½ foot.

Cult. Elegant plants, requiring almost the same treatment and soil as *Swértia*. The species require to be grown in pots, well drained with sherds, and filled with a mixture of peat and sand, placed in pans of water, in order to keep the mould constantly moist.

III. AGATHO'TES (from αγαθοτης, *agathotes*, goodness; in reference to the quality of the species). D. Don, mss. Swértia species, Wall.—Gentiàna species, Roxb.

Lin. syst. *Tetrándria, Monogýnia.* Corolla rotate, 4-parted; segments ovate, acuminated, furnished each with 2 oblong, parallel, fringed scrobicles at the base. Stamens 4; filaments subulate, glabrous, compressed. Anthers oblong, incumbent, with 2 parallel cells. Ovarium ovate. Style distinct; stigma 2-lobed: lobes roundish, thick, pruinose. Capsule 1-celled, dehiscing by 2 valves at apex. Seeds minute, globose, smooth.—Annual, erect, branched herbs. Stems terete, smooth. Leaves opposite, sessile, ovate-lanceolate, acuminated, 5-nerved, membranous, 3-6 inches long: superior ones stem-clasping. Flowers loosely panicled, drooping, greenish yellow, with a dark purple base. All the species contain an agreeable bitter.

1 A. ala'ta (D. Don, mss.) stem tetragonal, winged; leaves ovate; scrobicles of corolla orbicular, conferruminated, with downy edges. ⊙. H. Native of Nipaul. Flowers yellow.

Winged-stemmed Agathotes. Pl. 2 feet.

2 A. nervòsa; stem and branches tetragonally winged; leaves 3-nerved: lower ones ovate, obtuse, petiolate, becoming more lanceolate and smaller as they ascend the stem; scrobicles combined, ciliated on the edges. ⊙. F. Native of Nipaul, and Kamaon. Swértia nervòsa, Wall. cat. no. 4383. Flowers

racemosely panicled; pedicels solitary, axillary, and terminal; calycine segments lanceolate, acuminated, longer than the corolla. Corolline segments acuminated, broad at the base.

Nerved-leaved Agathotes. Pl. 2 to 3 feet.

3 A. CHIRAYÌTA (D. Don, mss.) stem terete; leaves ovate-lanceolate: scrobicles of corolla oblong, distinct: having the edges fringed with hairs. ⊙. H. Native of Nipaul, Kamaon, and Himalaiah. Gentiàna Chiràta, Wall. pl. asiat. rar. 3. p. 33. t. 252. Gentiàna cheràyta, Fleming. asiat. res. 2. p. 16. Roxb. fl. ind. 2. p. 71. Swértia purpùrea, Royle, herb. Swértia chiràta, Hamilt. mss. Flowers greenish yellow. Segments of calyx about equal in length to the corolla. The whole of the dried herb of this plant is in general use among the natives of Hindostan, and the mountainous countries bordering upon it to the north. It is called in the Sanscrit *Chirata*, *Chiratatikta*, and *Cherataka*, &c., and in the Bengalee *Chireta* and *Chirayta*. Dr. Wallich thinks that it contains a larger proportion and greater intensity of bitter principle than any other species of *Gentian*, and that the introduction of it into our pharmacopœia would be attended with much public benefit. A weak infusion of it, made with cold spring or rain water, should be used in small quantities, repeated several times daily, for some weeks, when it may advantageously be left off for a short time, and then resumed again. A decoction or infusion, made with hot water, Dr. Fleming says is objectionable, on account of the head-ache it generally produces. The dried herb of the *Chiràta* is met with in every bazaar in Hindostan, being a medicine in the highest repute with both the Hindu and European practitioners. It contains all the stomachic, tonic, febrifugal and antarthritic virtues which are ascribed to *Astèrias lùtea*, but in a greater degree. The efficacy of *Chiràta*, when combined with Caranga nut, the *Guilandìna Bonducélla*, in curing intermittents, has already been mentioned under that name, in vol. II. It is found equally powerful in exciting and strengthening the action of the stomach, and obviating flatulency, acidity, and redundancy of phlegm, in dyspepsia and gout. For restoring the tone and activity of the moving fibre in general debility, and in that kind of cachexy which is liable to terminate in dropsy. In *Chiràyta* will be found one of the most useful and efficacious remedies which can be employed. Infusions of the plant are the best way of administering it. Spirituous tinctures are also prepared with the addition of cardamom seeds or orange peel. The most useful purpose to which the tincture can be applied, is that of being added to the infusion to render it more agreeable.

Chirayta. Pl. 2-4 feet.

Cult. For culture and propagation, see *Ophèlia*, p. 179.

IV. OPHE'LIA (from ωφελεια, *opheleia*, service; plants serviceable in medicine). D. Don, mss.—Swértia species of authors.

LIN. SYST. *Tetra-Pentándria*, *Monogýnia*. Calyx deeply 4-5-parted, spreading. Corolla rotate, deeply 4-5-parted; nectariferous glands or pores at the base of each segment 2, distinct or combined, naked. Stamens 4-5; filaments subulate, glabrous; anthers cordate, obtuse, 2-celled. Ovarium fusiform. Style very short; stigma 2-lobed: lobes obtuse, revolute, pruinose. Capsule ovate, membranous, 1-celled, 2-valved, many-seeded, dehiscing at top. Seeds minute, angular, scrobiculate, dark brown, scabrous.—Annual branched herbs, natives of Nipaul; with quadrangular stems; opposite sessile leaves; and panicled, white, or purple flowers.

* *Segments of corolla furnished with 2 conferruminated glands or pores at the base of each.*

1 O. ANGUSTIFÒLIA (D. Don, mss.) flowers 4-cleft; leaves petiolate, linear-lanceolate, acute; calycine segments linear, mucronate; segments of corolla ovate, acuminated, hardly shorter than the calyx. ⊙. H. Native of Nipaul, at Narainhetty, and of Kamaon and Sirmore. Swértia angustifòlia, S. pulchélla, and S. dichótoma, Ham. herb. S. angustifòlia, D. Don, prod. fl. nep. p. 127. Wall. pl. rar. asiat. 3. p. 2. t. 204. Branches trichotomous. Leaves 2 inches long. Flowers pale purple, dotted with paler purple. Root fusiform, fibry. The glands or pores on the segments of the corolla are bearded above, consequently it may be a species of *Agathòtes*.

Narrow-leaved Ophelia. Pl. 1 to 2 feet.

2 O. CILIA'TA (D. Don, mss.) flowers 5-cleft; leaves linear, scabrous, with revolute margins, petiolate, ciliated; calycine segments lanceolate, mucronate; segments of corolla ovate-lanceolate, acuminated, tuberculate at the base, hardly longer than the calyx; stem nearly terete. ⊙. H. Native of the Himalaiah, Royle. Swértia ciliàta, Royle, herb. Stem scabrous at the joints.

Ciliated-leaved Ophelia. Pl. 1 foot.

3 O. WALLÍCHII; flowers 5-cleft; leaves lanceolate, acuminated, 3-nerved, ciliated at the base; segments of corolla ovate, shorter than the calyx; filaments dilated at the base. ⊙. H. Native throughout Nipaul and Kamaon. Swértia paniculàta, Wall. pl. rar. asiat. 3. p. 3. t. 205. Flowers whitish-purple. Perhaps the same as *Oph. ciliàta*.

Wallich's Ophelia. Pl. 1 to 2 feet.

4 O. TE'RES (D. Don, mss.) flowers 5-cleft; leaves lanceolate, acuminated, 3-nerved, scabrous, petiolate, ciliated; calycine segments mucronate; segments of corolla ovate-lanceolate, acuminated, longer than the calyx; filaments monadelphous; stem terete. ⊙. H. Native of Nipaul, at Gosaingsthan. Swértia racemòsa, Wall. cat. no. 4377. Flowers white, but dark purple at the base.

Terete-stemmed Ophelia. Pl. 2 to 3 feet.

5 O. FLÓRIDA; flowers 4-cleft? leaves sessile, lanceolate, 3-nerved, acuminated, becoming gradually narrower and smaller as they approach the top; calycine segments linear-setaceous, longer than the corolla before its expansion, but are afterwards about equal in length to it; segments of corolla oblong, mucronate; flowers corymbose and racemose. ⊙. S. Native of the Burmese empire, at Prome, and on mount Taong Dong. Swértia flórida, Wall. cat. no. 4382. The flowers of the plant from Prome are paniculately corymbose; and those of the plant from Taong Dong, are paniculately racemose. Lower leaves petiolate.

Flowery Ophelia. Pl. 2 feet.

6 O. CHIRA'YTA (D. Don, mss.) flowers 5-cleft; leaves sessile, ovate, acute, 5-nerved; calycine segments ovate-lanceolate, acuminated; segments of corolla oblong, bluntish, shorter than the calyx. ⊙. H. Native of Nipaul. Swértia latifòlia, Royle, herb. Flowers very pale blue.

Chirayta Ophelia. Pl. 1 to 2 feet. ?

7 O. PÓRRIGENS (D. Don, mss.) flowers 4-cleft; leaves linear, acute, glabrous: with revolute edges; calycine segments lanceolate, acuminated; segments of corolla ovate, mucronulate, longer than the calyx; stem tetragonal. ⊙. H. Native of Nipaul. Swértia pulchélla, Ham. ex Wall. cat. no. 4375. Swértia élegans, Wall. cat. no. 4376. is only a slight variety of this species.

Stretching Ophelia. Pl. 1 foot.

8 O. CORDA'TA; flowers 5-cleft? leaves ovate, cordate at the base, 5-nerved; panicles axillary and terminal, racemose; calycine segments ovate, acuminated, about equal in length to the segments of the corolla, which are also nearly similar in shape. ⊙. H. Native of Kamaon. Swértia cordàta, Wall. cat. no. 4378. Stem branched, tetragonal; angles slightly winged; wings rather scabrous.

Cordate-leaved Ophelia. Pl. 2 to 3 feet.

* * *Segments of corolla furnished each with 2 oblong, distinct glands.*

9 O. LU'CIDA (D. Don, mss.) flowers 4-cleft; superior leaves cordate, acute, stem-clasping; calycine segments linear-lanceolate, mucronulate; segments of corolla ovate, acuminated, longer than the calyx. ⊙. H. Native of Nipaul. Swértia lùcida, Royle, herb. Flowers purple.

Shining Ophelia. Pl. 2 to 3 feet.

Cult. The seeds of the species of *Ophèlia* should be reared on a hot-bed in spring, as other tender annuals; and the plants afterwards planted out in the open ground, about the end of May, in a warm situation.

V. GENTIANE'LLA (a dim. of *Gentiàna*). Borkh. in Rœm. arch. 1. p. 29. Gentiàna species of authors. Híppion species, Schmidt. in Rœm. arch. 1. p. 11. Gentiàna, sect. Crossopétalæ, Frœl. gent. 109.

Lin. syst. *Tetrándria, Digýnia.* Calyx 4-cleft. Corolla salver-shaped, 4-cleft, without any accessory segments; furnished with 4 nectariferous scrobicles at bottom, as in *Swértia.* Stamens 4; anthers incumbent. Ovarium subpedicellate, obsoletely tetragonal. Style hardly any. Stigmas broadish, revolute. Capsule fusiform, 1-celled, 2-valved, with obtuse angles. Seeds small, scobiform.—Perennial, herbaceous, glabrous plants; stems tetragonal. Leaves opposite, lanceolate, with scabrous edges, sessile. Flowers terminal, pedicellate. Segments of corolla serrated, deeply ciliated in the middle.

1 G. CILIA'TA (Borkh. in Rœm. arch. 1. p. 29. Mayrhoff. fl. mon. t. 189.) stem flexuous, tetragonal; leaves lanceolate and linear; segments of corolla serrated, deeply ciliated at the base. ♃. H. Native from the Baltic to the Mediterranean, on hills. Gentiàna ciliàta, Lin. spec. 334. Lam. dict. 2. p. 644. exclusive of the synonymes of Oeder and Gunner. Jacq. fl. austr. t. 113. Pall. fl. ross. 1. t. 92. f. 2. b. Híppion ciliàtum, Schmidt, in Rœm. arch. 1. p. 11. Lower leaves spatulate. Corolla deep or pale blue, having the nectariferous glands yellow. Filaments ciliated with white hairs. Anthers purple. Segments of corolla lanceolate, acuminate: alternate ones larger.

Var. β; stem dwarfer, few-flowered; leaves for the most part lanceolate. ♃. H. Froel. gent. p. 109.—Barrel, icon. 121. exclusive of 97. f. 1.

Var. γ; stem many-flowered, branched. ♃. H. Froel. gent. p. 109.

Var. δ; stem humble, 1-flowered; leaves all ovate-lanceolate. ♃. H. Froel. l. c.

Var. ε; segments of corolla toothed, not ciliated. ♃. H. Híppion dentòsum, Schmidt, boh. 24. exclusive of the synonymes.

Ciliated-flowered Gentianella. Fl. Aug. Sept. Clt. 1759. Pl. ½ foot.

2 G. FIMBRIA'TA; stem simple, 1-flowered, naked under the flower; leaves lanceolate; segments of corolla serrated at top, and ciliately fringed in the middle. ♃. H. Native of Caucasus, in valleys. Gentiàna fimbriàta, Willd. mss. ex Rœm. et Schultes, syst. 6. p. 175. Gentiàna ciliàta, Bieb. fl. cauc. 1. p. 99. exclusive of the definition and synonymes.—Column. ecphr. p. 222. 221. f. 1. Flowers blue. Segments of corolla oblong. This plant is said to occur in Germany with larger flowers, and with the stem leafy even to the calyx.

Fringed-flowered Gentianella. Fl. Aug. Sept. Clt. 1818. Pl. ½ foot.

3 G. MACRA'NTHA (D. Don, mss.) stem erect, branched; branches tetragonal; lower leaves spatulate: upper ones linear; peduncles tetragonal, 1-flowered; corolla turbinately campanulate; segments fringed; calycine segments unequal. ♃. H. Native of Mexico. Gentiàna ciliàta, Moc. et Sesse, mss. in herb. Lamb. Radical leaves petiolate: cauline ones sessile. Corollas large, showy, pale blue: segments oblong, mucronulate, erosely serrated at top, and fringed at the base. Filaments dilated, keeled. Anthers oblong. Ovarium fusiform, stipitate. Stigmas large, cucullate, with plicate fringed edges.

Large-flowered Gentianella. Pl. 1 foot.

4 G. CRINÌTA; stem terete; branches elongated, 1-flowered; leaves lanceolate, acute; segments of corolla obovate, deeply ciliated. ♃. H. Native from New York to Carolina, in dry pastures and woods. Gentiàna crinìta, Frœl. gent. p. 112. Pursh 1. p. 185. Curt. bot. mag. t. 2031. Sweet, fl. gard. 139. Gentiàna fimbriàta, Andr. bot. rep. 509. Gentiàna ciliàta β, Americàna, Lin. syst. 1. p. 645. Flowers azure blue, elegantly fringed on their edges. Accessory segments of corolla or inner plicæ simple, ex Pursh. Seeds cylindrical, hispid.

Long-haired Gentianella. Fl. Aug. Sept. Clt. 1804. Pl. ¼ foot.

5 G. BARBA'TA; stem acutely tetragonal; branches elongated; leaves lanceolate, acuminated; segments of corolla oblong, rounded at the apex, serrulated, deeply ciliated in the middle. ♃. H. Native of Siberia and Caucasus, in grassy, saltish alpine meadows. Gentiàna barbàta, Frœl. gent. p. 114. Willd. spec. 1. p. 1352. Led. fl. alt. 1. p. 282. Gentiàna ciliàta, Pall. fl. ross. 2. p. 101. t. 92. f. 2. a. Sims, bot. mag. t. 639. exclusive of the synonymes.—Gmel. sib. 4. p. 105. no. 73. exclusive of the synonymes. Flowers smaller than those of *G. ciliàta.* Corolla with a greenish tetragonal tube; and green nectariferous glands; segments pale blue.

Var. β, símplex (Led. fl. alt. 1. p. 282.) stems quite simple.

Bearded-flowered Gentianella. Fl. Aug. Sept. Clt. 1764. Pl. ½ foot.

6 G. DETÓNSA; stem tetragonal, erect; leaves linear, acute; segments of corolla crenulated at top, bidentate on both margins, acute or obtuse.? ♃. H. Native of Norland, Iceland, Norway, &c. Gentiàna detónsa, Rottl. in act. hafn. 10. p. 435. t. 1. f. 3. Retz, obs. 1. no. 25. Frœl. gent. p. 116. Willd. spec. 1. p. 1352. Gentiána ciliàta β, Gmel. syst. p. 462. no. 43. Retz, scan. ed. 2. p. 64. no. 220. G. ciliàta, Gunn. norv. 2. p. 88. t. 2. f. 3-5. Gentiàna serràta β, Wahl. lapp. p. 71. Very like *G. barbàta,* and probably only a variety of it. Corolla blue.

Shaven-flowered Gentianella. Pl. ½ foot.

7 G. SERRA'TA (Borkh. in Rœm. arch. 1. p. 29.) stem tetragonal; branches 1-flowered; leaves linear-lanceolate; corolla 5-cleft; segments oblong, obtuse, serrated, or ciliated on the edges. ♃. H. Native of Norland and Iceland, in pastures near the sea. Gentiàna serràta, Gunn. norv. 2. p. 101. no. 819. Frœl. gent. p. 117. Gentiàna ciliàta, Oed. fl. dan. t. 317. Gentiàna Bavárica, Zoega island. p. 235. Peduncles 2-leaved. Corolla blue. Stigmas capitate.

Serrated-flowered Gentianella. Pl. ½ foot.

Cult. The species of *Gentianélla* are extremely elegant when in blossom, and are therefore well fitted for decorating peat borders, in which soil they always succeed best. As most of the species are difficult to preserve in the open ground during winter, reserve plants of each should be kept in pots that they may be easily sheltered by a frame in winter. The species are best increased by seed, which should be sown as soon as ripe, for if kept till spring they seldom vegetate.

VI. FRASE'RA (named after John Fraser, a collector of North American plants). Walt. fl. car. p. 88. Michx. fl. bor.

amer. 1. p. 96. Pursh, fl. amer. sept. 1. p. 94. Spreng. gen. 1. p. 85.

Lin. syst. *Tetrándria, Monogy'nia.* Calyx 4-parted or 4-cleft. Corolla 4-parted, spreading; segments oval, each furnished with an orbicular bearded gland in the middle. Stamens 4, inclosed; filaments filiform. Anthers ovate, oblong; somewhat bifid at the base, at length reflexed. Stigmas 2, thick, glandular. capsule compressed, submarginated, 1-celled. Seeds few, imbricated, winged, fixed to the margins of the valves.—A tall herb, having the stem and branches tetragonal. Leaves opposite and subverticillate, oblong. Flowers verticillate, on short, 1-flowered pedicels. Corollas greenish yellow, sometimes mixed with purple.

1 F. Walte'ri (Michx. l. c. t. 97.). ♂. F. Native in swamps of Lower Carolina; and on the borders of lakes in Pennsylvania and New York; and at the sources of the Arkansas. F. Caroliniénsis, Walt. fl. car. p. 88. Flowers in aggregate clusters. The whole of the plant has a very stately appearance; its generic character approaches so near to *Swértia* that without seeing the fruit it might be considered a species of that genus.

Walter's Frasera. Fl. July, Aug. Clt. 1795. Pl. 3 to 6 ft.

Cult. This plant requires to be grown in a peat soil, in a moist situation; it will also require protection the winter after being raised from seed, or that preceding its flowering.

VII. GENTIA'NA (so named from Gentius, king of Illyria, who first experienced the virtues of some species or other). Borkh. in Rœm. arch. 1. p. 28. R. Br. prod. p. 450.—Gentiàna species of authors—Híppion species of Schmidt.

Lin. syst. *Pentándria, Monogýnia.* Calyx 4-5-cleft, Corolla funnel-shaped, rarely salver-shaped, with a naked throat; limb 5-cleft, without any accessory segments. Stamens 5; anthers free, incumbent; filaments flattened. Stigma 2-lobed, usually sessile. Capsule 1-celled. Seeds roundish or oblong.—Glabrous herbs. Leaves opposite, decussate, petiolate or sessile. Flowers terminal. This genus is easily distinguished from others broken off from *Gentiàna* by the throat of the corolla being naked, in the anthers being free, in the limb of the corolla being without any accessory segments, &c.

Sect. I. *Perennial herbaceous plants. Corollas more or less campanulately funnel-shaped, 5-cleft. Anthers incumbent. Stigma 2-lobed, sessile.*

1 G. limoselloìdes (H. B. et Kunth, nov. gen. amer. 3. p. 130. t. 220. f. 1.) procumbent; leaves spatulate, obtuse, rather veiny; flowers terminal, solitary, on long peduncles; corolla campanulately funnel-shaped, 5-cleft; throat naked. ♃. F. Native of South America, on the burning mount Antisana, in humid flats. Stem branched, quadrangular. Leaves on long petioles. Calycine segments lanceolate, acute. Ovarium linear. Lobes of stigma obtuse, spreading. Segments of corolla obovate-oblong, obtuse.

Limosella-like Gentian. Pl. $\frac{1}{4}$ to $\frac{1}{3}$ foot.

2 G. rupícola (H. B. et Kunth, l. c. t. 220. f. 2.) tufted, procumbent, branched; leaves spatulate or linear-oblong, obtuse, somewhat 1-nerved, dense; flowers terminal, solitary, pedunculate; corolla campanulately funnel-shaped, 5-parted; throat bearded. ♃. F. Native of mount Antisana, near the crater, among rocks, which are covered by perpetual snow; and of Peru, near Pasco. Gent. campanuloìdes Willd. herb. ex Rœm. et Schultes, syst. 6. p. 184. Branches densely leafy. Leaves sessile. Flowers about the size of those of *Campánula pátula*, sometimes larger, purple or blue, with obovate obtuse segments. Calycine segments lanceolate, acutish. Ovarium linear.

Rock Gentian. Pl. procumbent, tufted.

3 G. gra'cilis (H. B. et Kunth, l. c. p. 168. t. 221.) stems ascending, almost simple, 1-flowered; leaves oblong-spatulate, obtuse, nerveless: lower ones approximate; corolla campanulately funnel-shaped, 5-cleft; throat beardless. ♃. F. Native on the tops of the Andes of Quito; in Parama de Saraguru, between Rio Bamba and Loxa. Stems quadrangular, rather compressed at top. Leaves nearly sessile, smaller, and more distant to the tops of the stems. Flowers size of those of *Saxífraga granulàta;* with lanceolate, acute segments. Calycine segments lanceolate, acute. Ovarium linear, compressed.

Slender Gentian. Pl. $\frac{1}{2}$ foot.

4 G. saxifragioìdes (H. B. et Kunth, l. c. p. 168.) tufted, procumbent; sterile branches short, densely leafy: floriferous ones elongated, few-leaved, ascending, 1-2-flowered; leaves lanceolate-linear, obtuse, somewhat 1-nerved; corolla campanulately funnel-shaped, 5-cleft; throat beardless. ♃. F. Native of South America, on the Pulla mountains, between Vinajaca and Loxa, at the altitude of 1560 hexapods: and near Pasco. Stem branched, creeping. Leaves sessile. Flowers size of those of *Halèsia tetráptera,* orange-coloured or yellow in the dried state. Segments of corolla obovate-oblong, obtuse. Calycine segments lanceolate, acute. Ovarium linear, compressed. Lobes of stigma obtuse. Leaves sheathing in a very remarkable manner at the base.

Saxifrage-like Gentian. Pl. $\frac{1}{2}$ foot.

5 G. cæspitòsa (Graham, in edinb. phil. journ. may. sept. 1830.) plant creeping, tufted, ascending, branched; flowers corymbose, terminal; leaves crowded, decussate, roundish-elliptic, rather fleshy, concave, 3-nerved; calyx 5-cleft, acute, reflexed; corollas erect, campanulate, 5-toothed, obtuse; with a naked throat. ♃. H. Native of North America, on the arctic coasts; and reared from seed collected during Capt. Franklin's expedition. Stems rooting at bottom. Leaves like those of *Arenària peploìdes,* but much darker green. Flowers sessile, rarely solitary and axillary, usually 3-4 together, terminal. Corolla greenish blue, yellowish green at the base, contracted somewhat towards the mouth, 5-nerved; three of the nerves passing into each of the blunt teeth of the limb; stamens reaching the base of the teeth. Anthers sagittate, dehiscing along the sides. Stigmas sessile, revolute. Ovarium attenuated at both ends.

Tufted Gentian. Fl. June, July. Clt. 1829. Pl. 1 to 2 in.

6 G. gramínea (H. B. et Kunth, l. c. p. 169.) procumbent; branches ascending, subfastigiate, 1 or 3-flowered; leaves linear, acute, nerveless, remote; corolla campanulately funnel-shaped, 5-cleft; throat almost beardless. ♃. F. Native of Peru, near Micuipampa, in cold rocky places, at the altitude of 1820 hexapods. Stems branched, compressedly quadrangular. Leaves small at the base. Corolla white and violaceous, ex Bonpl.; with obovate-oblong obtuse segments. Lobes of stigma obtuse, spreading. Ovarium linear, compressed. Capsule oblong-linear.

Grassy Gentian. Pl. $\frac{1}{2}$ foot.

7 G. cerastioìdes (H. B. et Kunth, l. c. t. 222.) procumbent; branches ascending, few-flowered; leaves linear, obtuse, obsoletely 3-nerved: lower ones approximate; corolla campanulately funnel-shaped, 5-parted; throat bearded. ♃. F. Native of the Andes, in the province of Pasto, between Chilanguer and Guachucal, at the altitude of 1600 hexapods. Habit of a species of *Cerástium.* Branches slightly tetragonal. Leaves sessile, subconnate. Calycine segments lanceolate-linear, acute. Corolla white? or violaceous; with obovate-oblong, obtuse segments. Ovarium linear.

Chickweed-like Gentian. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

8 G. ce'rnua (H. B. et Kunth, l. c. p. 170.) stem erect, nearly simple, 1-3-flowered; leaves oblong, or ovate-lanceolate,

acutish, obsoletely 3-nerved: lower ones approximate; flowers drooping; corolla campanulate; throat a little bearded. ♃. F. Native of South America, on the declivities of mount Chimborazo. G. cistiflòra Willd. rel. ex Rœm. et Schultes, syst. 6. p. 184. Stems a little compressed. Leaves sessile, subconnate. Flowers size of those of *Pnemonánthe vulgàris*, dark purple, painted with yellow veins. Ovarium linear. Capsule oblong-linear.

Drooping-flowered Gentian. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

9 G. dianthoìdes (H. B. et Kunth, l. c. t. 223.) stems erect, simple, 4-6-flowered; leaves linear, acute, 1-nerved: lower ones approximate; flowers opposite; corolla campanulately funnel-shaped, 5-cleft; throat beardless. ♃. F. Native of the Andes of Peru, between the mine of Micuipampa and the city of Caxamarca, at the altitude of 1800 hexapods. Stem a little compressed, purplish. Leaves sessile, connate at the base. Flowers about the size of those of *Campánula pátula*, drooping, ex Bonpl.; rose-coloured. Calycine segments lanceolate, acute; segments of corolla roundish, obovate, obtuse. Ovarium linear.

Pink-like Gentian. Pl. 1 foot.

10 G. foliòsa (H. B. et Kunth, l. c. p. 170.) stems simple, leafy; leaves lanceolate, acute, 3-nerved; flowers terminal, corymbose; corolla campanulately funnel-shaped, 5-cleft; throat beardless. ♃. F. Native of Peru, in frigid places. G. coarctàta Willd. rel. ex Rœm. et Shultes, syst. 6. p. 184. Stems tetragonal. Leaves sessile, sheathing at the base. Flowers white, size of those of *Pneumonánthe vulgàris*. Calycine segments ovate-lanceolate, acute. Segments of corolla obovate-oblong, obtuse. Ovarium linear, compressed. Lobes of stigma obtuse, spreading.

Leafy Gentian. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

11 G. corymbòsa (H. B. et Kunth, l. c. p. 171. t. 224.) stem erect, simple; leaves linear-spatulate, obtuse, almost veinless; corymbs terminal, a little branched; corolla campanulately funnel-shaped, 5-parted; throat beardless. ♃. F. Native near Santa Fe de Bogota, on the mountains. Root perpendicular, branched. Stems slightly tetragonal. Leaves subconnate at the base. Flowers size of those of *Campánula pátula*, violaceous. Calycine segments lanceolate, acute; segments of corolla oblong, obtuse, narrowed at the base. Ovarium ovate-conical, compressed, stipitate.

Corymbose-flowered Gentian. Pl. $\frac{3}{4}$ foot.

12 G. liniflòra (H. B. et Kunth, l. c. p. 171.) stem erect, branched; leaves lanceolate-linear, acute, 3-nerved, remote; flowers terminal, corymbose, or umbellate; corollas rotately funnel-shaped, 5-cleft; filaments bearded at the base. ♃. F. Native of Peru, on the mountains near Ayavaca, at the altitude of 1400 hexapods. Root perpendicular. Stems slightly tetragonal. Flowers size of those of *Eurythàlia campéstris*, of a violet colour. Calycine segments lanceolate, acute. Segments of corolla oblong, obtuse. Ovarium linear, compressed. Capsule linear-oblong.

Flax-flowered Gentian. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

13 G. diffu'sa (H. B. et Kunth, l. c. p. 172.) stems diffuse, nearly simple; leaves lanceolate, obtuse, 3-nerved, remote; flowers somewhat racemose; corolla rotately funnel-shaped, 5-cleft; throat bearded. ♃. F. Native of Quito, in the fissures of rocks, near the town of Antisana. Stems numerous, erect, or procumbent. Leaves sessile, membranous. Flowers blue, size of those of *Eurythàlia campéstris*. Calycine segments lanceolate, acute. Segments of corolla ovate-oblong, acute. Lobes of stigma obtuse. Ovarium linear, compressed, sessile, as in most of the species.

Diffuse Gentian. Pl. $\frac{1}{2}$ to 1 foot.

14 G. hyssopifòlia (H. B. et Kunth, l. c.) stem erect, branched at top; leaves linear, acute, 3-nerved, remote; flowers panicled; corolla rotately funnel-shaped, 5-cleft; throat beardless. ♃. F. Native of the Andes of Quito, in cold places between Nabon and the valley of Saraguru, at the altitude of 1200 hexapods. Stem terete. Branches paniculately disposed. Leaves subconnate at the base. Corolla violaceous; with oblong obtuse segments. Calycine segments lanceolate, acute. Lobes of stigma roundish, spreading. Ovarium linear, sessile. Capsule linear-oblong, compressed.

Hyssop-leaved Gentian. Pl. $1\frac{1}{2}$ foot.

15 G.? Magella'nica (Gaud. in Freyc. voy. pt. bot. p. 449.) stems erect, branched; branches tetragonal; angles membranous; leaves spatulate-lanceolate, acutish, 3-nerved; flowers terminal, solitary, or by threes; calyx 4-cleft, equal in length to the corolla: with lanceolate segments. ♃. F. Native of the Falkland Islands.

Magellan Gentian. Pl. tufted.

16 G. Rìma (D. Don, mss.) stems numerous, ascending, leafy; leaves lanceolate, obtuse, 5-nerved; radical ones crowded, petiolate; calycine segments ligulate, oblong, obtuse; corolla subrotate, twice longer than the calyx: segments obtuse. ♃. F. Native of Peru, where it is called *Rima-Rima*. Root brown, fusiform. Pedicels terete. Corolla yellow. Stigma sessile.

Rima Gentian. Pl. $\frac{1}{2}$ foot.

17 G. pedunculà'ris (D. Don, mss.) stems erect, filiform, few-leaved; radical leaves lanceolate-acute, petiolate, 3-nerved; flowers umbellate; calycine segments lanceolate, acute; corolla rotate, twice longer than the calyx: segments obtuse. ♃. F. Native of Peru. Gentiàna lùtea, Ruiz et Pav. in herb. Lamb. Root fusiform, brown. Pedicels bractless. Corolla yellow. Stigma sessile.

Peduncular Gentian. Pl. $\frac{1}{2}$ foot.

18 G. montà'na (Forsk. prod. fl. austr. no. 133.) cauline leaves remote, sessile, elliptic or ovate, about 2 pairs: lower ones approximate, attenuated at the base; flowers peduncular, subcorymbose, or solitary; corolla 5-cleft, campanulately funnel-shaped. ♃. F. Native of Van Diemen's Land, and New Zealand. The New Zealand plant hardly differs from that of Van Diemen's Land, unless in the cauline leaves being broader and ovate. The stems are probably tetragonal.

Mountain Gentian. Pl. $\frac{1}{2}$ to 1 foot.

19 G. saxòsa (Forst. in act. holm. 1777. p. 184. t. 5. prod. fl. austr. no. 132. Lin. suppl. 1. p 175.) stems terete, simple; leaves fleshy, spatulate, coriaceous, nerveless; radical ones crowded; flowers terminal, subumbellate, pedicellate; peduncles angular, 1-flowered, axillary, and terminal; calycine segments linear-spatulate; corolla campanulate, 5-cleft; with a naked throat: and oval, obtuse, concave segments. ♃. F. Native of New Zealand, on rocks by the sea shore. Frœl. gent. p. 23. Willd. spec. 1. p. 1237. Root fibrous. Calyx angular. Corolla white. Stigma sessile, 2-lobed; lobes orbicular, reflexed. Capsule oblong, subcylindrical.

Rocky Gentian. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

20 G. macrophy'lla (Pall. fl. ros. 2. p. 108. t. 96.) stems nearly terete, almost naked in the middle; radical leaves, lanceolate, 5-nerved, length of stems; flowers terminal, verticillately aggregate, involucrated by usually 4 floral leaves; calyx 4-5-toothed; corolla tubularly campanulate, 4-5-cleft; with short, acutish segments; lobes of stigma flat, at length revolute. ♃. H. Native of Siberia, in elevated meadows frequent. Frœl. gent. p. 31. Willd. spec. 1. p. 1335. Sims, bot. mag. 1414. Hippion macrophýllum, Schmidt.—Gmel. sib. 4. p. 104. t. 52. Calyx usually cleft on one side. This plant has much the habit of *Ericàla cruciàta*, from which it differs in the flowers being small, pale blue, and without any accessory segments to the corolla.

Long-leaved Gentian. Fl. July, Aug. Clt. 1796. Pl. $\frac{1}{2}$ to 1 foot.

Sect. II. *Annual plants. Corolla campanulate; throat naked. Style short; stigma 2-lobed.*

21 G. au'rea (Lin. spec. 331.) stem erect, branched; branches tetragonal; lower leaves spatulate-oblong: upper ones ovate, acutish, all obsoletely 5-nerved; flowers axillary and terminal, on long angular pedicels; corollas campanulately funnel-shaped, 5-cleft: segments acuminated: throat naked. ⊙. H. Native of the alps of Lapland, Norway, on islands near the sea. Frœl. gent. p. 54. no. 20. Lin. fl. lapp. ed. 2. p. 65. Gmel. syst. 1. p. 461. no. 23. Gentiàna involucràta, Rottb. in act. hafn. 10. p. 434. t. 1. f. 2. A. B. Wahl. lapp. p. 67. Gentiàna quinquefòlia, Oed. fl. dan. t. 344. Híppion aúreum, Schmidt, in Rœm. arch. 1. p. 10. no. 10.—Barrel. icon. 3. t 104. f. 1. Radical leaves dense. Calycine segments ovate, mucronate, Wahl.; subulate, Lin. Flowers collected into heads of few flowers, involucrated. Corolla white, ex Wahl.; yellow in the dried state, ex Lin.; purple ex Old.; tube length of calyx. Capsule longer than the calyx.

Golden-flowered Gentian. Fl. Aug. Clt. 1823. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

22 G. quinquefloˋra (Lin. spec. 333. exclusive of the synonymes. Lam. dict. 2. p. 643.) stem tetragonal, branched; leaves stem-clasping, oval, acute, 3-nerved; flowers terminal and lateral, 3-5 together, on short pedicels; corolla tubularly campanulate, 5-cleft: throat naked: segments lanceolate, acuminated, with simple plicæ; calycine segments very short, narrow. ♂. H. Native from New York to Kentucky, on hills in shady dry places. Willd. spec. 1. p. 1339. Frœl. gent. p. 51. Gentiàna amarelloìdes, Michx. fl. bor. amer. 1. p. 175. Pursh, fl. amer. sept. 1. p. 186. Gentiàna amarelloìdes Kentuckénsis, Pers. syn. 1. p. 286. Gentiàna quinquefòlia, Lin. spec. 1. p. 333. exclusive of the synonymes. Híppion quinquefòlium, Schmidt, in Rœm. arch. 1. p. 11. Flowers small, pale blue, not yellow, as represented by Michaux. Angles of stem membranous.

Five-flowered Gentian. Fl. Aug. Clt. 1824. Pl. $\frac{1}{2}$ to 1 ft.

23 G. Aleu'tica (Cham. et Schlecht, in Linnæa. 1. p. 175.) stem tetragonal, obsoletely winged, simple or branched at the base; leaves obscurely 3-nerved: radical ones few, lanceolate-spatulate: cauline and floral ones ovate, stem-clasping; flowers on short pedicels, and as if they were involucrated by the floral leaves; corolla salver-shaped, 4-cleft; with a naked throat and lanceolate segments, which are denticulated at the edges: calyx divided, even to the middle, nearly equal: with ovate-lanceolate, acute segments. ⊙. H. Native of the island of Unalaschka, in grassy places. Gentiàna Unalaschénsis, Ledeb. mss. Spreng. syst. 1. p. 856. Plant quite glabrous. Flowers rather small, pale violet. Calycine segments cartilaginously serrulated.

Aleutian Gentian. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

24 G. Rurikia'na (Cham. et Schlecht, in Linnæa. 1. p. 176.) stem tetragonal, obsoletely winged, branched from the base; radical and lower cauline leaves lanceolate, acutish, obscurely 3-nerved, sometimes spatulate; flowers on long peduncles; corolla salver-shaped, 4-cleft, with a naked throat, more than twice longer than the calyx: having lanceolate, setaceously acuminated segments; calyx divided even to the base; segments unequal: 2 of which are very large. ☉. H. Native of Behring's Straits, on the shore. Gent. gràcilis, Cham. in litt. Cauline leaves linear-lanceolate. Branches or peduncles many-flowered. Very like *Gent. aúrea.*

Rurıki's Gentian. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

25 G. umbella'ta (Bieb. suppl. p. 188.) stem tetragonal, branched; leaves ovate-oblong, bluntish, 3-5-nerved; radical ones spatulate; peduncles terminal, umbellate, involucrated by the 4 superior leaves; flowers pedicellate; calycine segments linear-lanceolate, unequal; corolla subcampanulate, 5-cleft: with ovate-lanceolate, mucronate segments. ⊙. H. Native of Caucasus and Siberia, in humid places, near rivers. Gentiàna aúrea, Steven, in mem. soc. mosc. 3. p. 257. Flowers small, pale blue.

Umbellate-flowered Gentian. Fl. Aug. Clt. 1823. Pl. $\frac{1}{2}$ ft.

26 G. propínqua (Richards in Frankl. Journ. ed. 2d. Appen. p. 9,) radical leaves linear, obovate, cauline ones lanceolate, corollas 5-cleft, tubularly campanulate: segments subserrated at top: throat naked. ⊙. H. Native of North America. Habit of Eurythàlia praténsis.

Allied Gentian. Pl. $\frac{1}{4}$ foot.

§ 3. *Corollas tubular, 4-5-cleft, with a naked throat. Stigma sessile. Annual plants, natives of Nipaul.*

27 G. canalicula'ta (Royle, mss.) stem erect, branched, bicanaliculate; leaves sessile, ovate-lanceolate, obtuse, somewhat 5-nerved; calyx 4-5-parted: with obovate, acuminated, membranous segments; corolla tubular, 4-5-cleft; throat naked: lobes ovate, acutish. ⊙. H. Native of Nipaul. Root subfusiform, fibrous. Leaves distinct, not connate at the base. Flowers racemosely panicled, blue; pedicels bisulcate. Calyx ample. Stamens 4-5, inserted in the sinuses of the corolla; filaments very short, subulate. Anthers oblong. Capsule oblong, compressed, bipartite at apex. Seeds spadiceous, convex on one side and engraven on the other.

Channelled-stemmed Gentian. Pl. $\frac{1}{2}$ to 1 foot.

28 G. pedunicula'ta (Royle, mss.) stem erect, bicanaliculate, branched from the base; leaves sessile, elliptic-oblong, obtuse, membranous; peduncles elongated, filiform, 1-flowered; calycine segments lanceolate, acute, unequal; corolla tubular: throat naked: lobes oval, obtuse. ⊙. H. Native of Nipaul. Root fibrous. Leaves distinct at the base, not connate. Calyx 5-parted; segments foliaceous, unequal. Throat of corolla ciliately bearded inside. Stamens inserted in the tube. Filaments channelled. Anthers and ovarium oblong. Stigmas short, obtuse, minutely papillose. Capsule subcylindrical, bifid at apex. Seeds small, roundish, with excavated dots.

Peduncled-flowered Gentian. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

29 G. Moorcroftia'na (Wall. cat. no. 4390.) annual, much branched; leaves lanceolate, obtuse; flowers large, panicled; calyx campanulate: with a short tube and long, linear segments; corolla large, funnel-shaped, with elliptic, obtuse segments, and a naked throat. ⊙. H. Native from Sirinagur to Luddak. Pedicels long, 1-flowered. Flowers large, showy.

Moorcroft's Gentian. Pl. $\frac{1}{2}$ foot.

§ 4. *Anómala. An anomalous species.*

30 G. pinifòlia (Ruiz et Pav. in herb. Lamb.) stem solitary, simple, erect, densely leafy; leaves very narrow-linear, mucronulate, much crowded; raceme terminal, erect, thyrsoid; corolla tubular, longer than the calyx, with a glabrous throat, and ovate, acute segments. ♃. F. Native of Peru, on the Cordilleras of the Andes. Root thick, fusiform. Leaves an inch long. Racemes 2-3 inches long, many-flowered. Flowers fascicled, verticillate. Bracteas lanceolate, membranous. Calyx campanulate; with lanceolate, acute segments. Ovarium fusiform, stipitate. Style rather long; lobes of stigma roundish; mucronate revolute. Seeds globose, smooth. Habit of a species of *Eudóxia.*

Pine-leaved Gentian. Pl. $\frac{1}{2}$ foot.

† *Species hardly known, many of which are probably synonymous with those described above.*

31 G. CONGE'STA (Willd. herb. ex Rœm. et Schultes, syst. 6. p. 184.) leaves linear-spatulate; flowers umbellate, crowded. ♃. F. Native of South America. Humb. et Bonpl.

Crowded-flowered Gentian. Pl.?

32 G. LINIFÒLIA (Willd. l. c.) corollas campanulate, 5-parted solitary, terminal; leaves narrow-linear, acute; stems branched at the base, ascending. ♃. F. Native of South America. Humb. et Bonpl.

Flax-leaved Gentian. Pl.?

33 G. CONNA'TA (Willd. l. c.) corollas campanulate, 5-cleft; calycine teeth ovate-filiform; leaves oblong, connate; stem a little branched, erect. ♃. F. Native of South America, Humb. et Bonpl.

Connate-leaved Gentian. Pl.?

34 G. CHELONOÌDES (Willd. l. c.) corollas campanulate, 5-cleft; leaves linear-lanceolate, spreading; stem simple, erect. ♃. F. Native of South America, Humb. et Bonpl.

Chelone-like Gentian. Pl.?

35 G. STRI'CTA (Willd. l. c.) corollas campanulate, 5-cleft; leaves oblong; peduncles opposite, 1-flowered; stems simple, erect. ♃. F. Native of South America, Humb. et Bonpl.

Straight Gentian. Pl.?

36 G. RAPUNCULOÌDES (Willd. l. c.) corollas campanulate, 5-cleft; leaves oblong-lanceolate; flowers opposite: stem simple, ascending. ♃. F. Native of South America, Humb. et Bonpl. Peduncles an inch long, umbellate.

Rampion-like Gentian. Pl. ½ foot.

37 G. FLORIBU'NDA (Willd. l. c.) corollas campanulate, 5-cleft; leaves oblong-lanceolate, bluntish; peduncles 1-flowered: lower ones opposite: superior ones subverticillate; stem simple. ♃. F. Native of South America, Humb. et Bonpl.

Bundle-flowered Gentian. Pl.?

38 G. PEDUNCULA'RIS (Willd. l. c.) corollas campanulate, 5-cleft; radical leaves spatulate: cauline ones lanceolate; peduncles elongated, 1-flowered, solitary, terminal; stem ascending at the base. ♃. H. Native of South America, Humb. et Bonpl.

Peduncular-flowered Gentian. Pl.?

39 G. CHIMBORACE'NSIS (Willd. l. c.) corollas funnel-shaped, 10-cleft; leaves linear-lanceolate, spreading; flowers terminal, solitary, sessile; stem erect, branched a little. ♃. F. Native of South America, on mount Chimborazo, Humb. et Bonpl. A species of *Ericàla*.

Chimborazo Gentian. Pl. dwarf.

†† *The following plants have been described as species of Gentiàna by various authors; but none of them are legitimate species of that genus.*

40 G.? DU'BIA (Thunb. prod. 1. p. 48. fl. cap. 2. p. 174.) fructiferous stem terete, leafless, or the leaves fall off early, they are therefore unknown; panicles terminal, trichotomous, supradecompound; corolla 4-cleft.—Native of the Cape of Good Hope. Stem simple, erect. Calyx 4-parted; with small, acute segments. Corolla 4-parted, purple; segments acute. Capsule oblong, ending in 4 points. Styles 2, divisible.

Doubtful Gentian. Pl. ½ foot.

41 G.? NÍGRICANS (Lam. dict. 2. p. 645.) a small plant, with very narrow linear leaves, and slender branched stems; flowers terminal, cymose; corolla funnel-shaped, 4-cleft; limb rather downy.—Native country unknown.—Ray. hist. 3. append. 253. no. 51. Plant becoming black on drying. Stem dichotomously branched at top. Leaves capillary: lower ones nearly an inch long. Flowers small, purplish or blue, numerous. Perhaps a species of *Houstònia*.

Blackish Gentian. Pl. ½ foot.

42 G.? CALYCÌNA (Lam. dict. 2. p. 639.) stem articulated, dichotomously panicled, and rather angular at top; leaves ovate-oblong: lower ones obtuse: the rest acute; flowers solitary, terminal, on long peduncles; corolla deeply 5-6-cleft, hardly exceeding the calyx, which is large and 5-6-parted.—Native of Louisiana, ex herb. Juss. Flowers yellowish. Calycine segments linear, acute, rather unequal. Corolla rotate, with oblong obtuse segments. Stamens free. Stigmas oblong, large; style short. Capsule size of a pea, 2-valved, 1-celled.

Large-calyxed Gentian. Pl.

43 G.? MITZNOFA'NA (Rœm. et Schultes, syst. 6. p. 186.) stem erect, terete, simple; leaves sessile, cordate-ovate, acute, 7-nerved: floral ones the narrowest; flowers terminal, twin, erect; calycine segments acute, length of the tube of the corolla. —Native of Japan, in boggy places. Plánta Japanénsis, Mitznofàna, *i. e.* flos aquaticus, Cleyer, in misc. nat. cur. dec. 2. ann. 8. p. 489. f. 51. 2 icones. Frœl. gent. p. 119. Habit altogether different from *Gentiàna*. Root fibry. Corolla with a grey tube, blue limb, and obtuse segments.

Mitznofana Gentian. Pl. ½ foot.

44 G.? SCILLOÌDES (Lin. suppl. 1. p. 175.) stem 1-flowered, prostrate; leaves obovate, obtuse, 3-nerved; corolla funnel-shaped, 5-cleft; bracteas twin.—Native of the Azores, Masson, Hippion scilloìdes, Schmidt. Leaves on short petioles: the upper ones more remote. Peduncles long, naked, terminal, 1-flowered. Bracteas opposite, subulate, erect, beneath the flowers. Calycine segments linear. Tube of corolla funnel-shaped, longer than the calyx; limb 5-cleft, flat, beardless, yellow. This plant does not probably belong to the genus, from the form of the calyx and corolla; but nothing is said of the style by Linnæus. Perhaps a genus of *Campanulàceæ*.

Scilla-like Gentian. Pl. 1 foot, prostrate.

††† *What are the following species?*

1 Gentiàna màjor Mariàna, angustiori folio Gentianéllæ vernæ, floribus cœruleis plurimis in summitate congéstis. Pluk. mant. 89. Perhaps *Gentiàna cruciàta*.

2 Gentiàna angustifòlia Americàna, flore ex ochro cyaneo mixto in fastigio caulis unico. Plukn. mant. 89. Ray. suppl. p. 370. no. 4.

3 Gentiàna orientàlis, amplissimo et acutissimo asclepiadis folio. Tourn. cor. 2. Said by Cham. in Linnæa. 1. p. 175. to be the same as *Gentiàna septemfìda*.

4 Gentiàna orientàlis, foliis venosis, flore magno candidissimo, Tourn. cor. 2. var. flore exalbo-virescente. Tourn. l. c. Said by Cham. in Linnæa. 1. p. 174. to be the same as *Gentiàna gélida*.

5 Gentiàna orientàlis, minor autumnalis myrtifolia flore magno cœruleo, Tourn. cor. 2. Said by Cham. in Linnæa. 1. p. 175. to be *Gentiàna septemfìda*.

6 Gentiana rivulàris and Gentiàna pállens, Thunb. mus. nat. acad. ups. 11. p. 180. are probably a species of *Sebæ'a*.

Cult. The South American and New Zealand species of *Gentian* should be grown in pots, well drained with sherds, in a mixture of peat and sand, and placed among other alpine plants. They will require protection in winter. The seeds of annual kinds may be sown in pots, in the same kind of soil, or even in the open border. *Gentiàna macrophýlla*, the only hardy perennial, is well fitted for a border flower, but grows best in a peat soil. All the perennial species are either to be increased by dividing at the root, or by seed.

VIII. CENTAURE'LLA (a dim. of *Centaúrium*, so called from the affinity of the genera). Michx. fl. amer. bor. 1. p.

97. t. 12. Pursh, fl. amer. sept. 1. p. 94. Nutt. gen. amer. 1. p. 172.—Andrèwsia, Spreng. gen. 1. p. 85.—Bartònia species, Muhl.

Lin. syst. *Pentándria, Digýnia.* Calyx 4-parted, adpressed. Corolla urceolately campanulate, 4-cleft; segments ovate or oblong, erect or spreading. Stamens 4, inclosed; inserted beneath the recesses of the limb of the corolla. Anthers erect, subcordate, bluntish; filaments, subulate, flattened. Stigma thick, glandular, bluntly bifid. Capsule 1-celled, 2-valved, involucrated by the permanent calyx and corolla. Seeds minute, globular, attached to the edges of the valves.—Annual, glabrous, simple, or branched small plants. Leaves opposite, decussate.

1 C. verna'lis (Michx. fl. amer. bor. 1. p. 98. t. 12. f. 2.) stem simple; peduncles scattered, corymbosely elongated; segments of corolla oblong, acute, twice longer than the calyx; style longer than the ovarium. ⊙. H. Native from Virginia to Georgia, in mossy swamps. Andrèwsia vérna, Spreng. syst. 1. p. 428. Flowers white, larger than the other species.

Var. β, uniflòra (Pursh, l. c. p. 100.) small; stem 1-flowered. This may prove to be a distinct species.

Spring Centaurella. Fl. May, July. Pl. ½ foot.

2 C. æstiva'lis (Pursh, fl. sept. amer. 1. p. 100.) stem simple; peduncles opposite, simple; segments of corolla spatulate, abruptly acute, 3 times longer than the calyx; style length of ovarium. ⊙. H. Native from Carolina to Georgia, in mossy swamps. Flowers smaller than the preceding; the calyx short.

Summer Centaurella. Fl. June, Aug. Pl. ¼ to ⅓ foot.

3 C. autumna'lis (Pursh, l. c.) stem a little branched; peduncles opposite; lower ones branched; segments of corolla oval, acute, hardly longer than the calyx; style very short. ⊙. H. Native from New England to Carolina, in mossy swamps, in inundated, grassy places. C. paniculàta, Michx. fl. bor. amer. 1. p. 98. t. 12. f. 1. Bartònia tenélla, Muhl. in litt. Sagìna Virgínica, Willd. spec. 1. p. 719. Andrèwsia autumnàlis, Spreng. syst. 1. p. 428. Flowers small, greenish white.

Autumnal Centaurella. Fl. July, Sept. Pl. ½ to 1 foot.

Cult. For culture and propagation see *Eurythàlia*, p. 188.

IX. ASTE'RIAS (from *αστηρ, aster*, a star; shape of flowers.) Borkh. in Rœm. arch. 1. p. 14. Gentiàna lùtea, Lin.

Lin. syst. *Pentándria, Digýnia.* Calyx spathaceous, scarious, diaphanous, 3-4-cleft; segments short, lanceolate, unequal. Corolla with a short tube, and a 5-cleft limb, furnished with a green gland at the base of each segment; segments oblong, acute, veiny, shorter than the calyx. Stamens 5-6; anthers subulate, combined at first, but at length distinct. Stigmas oblong, flat, revolute. Capsule ovate; 4 sided, acuminated. Seeds roundish, compressed, with membranous edges, disposed in 3 series along the margins of the valves.—Showy plants, with the habit of *Veràtrum*. Leaves broad, 5-nerved; cauline ones sessile: floral ones subcordate, stem-clasping, concave, all pale green, but glaucous beneath. Flowers apparently verticillate, pedicellate, seated on common thick peduncles. Bracteas 2-4, to each whorl of flowers, 3-nerved and equal in length to them.

1 A. lu'tea (Borkh. in Rœm. arch. 1. p. 25.) corollas rotate, 5-6-cleft; flowers verticillate, subcymose; leaves broad, ovate; calyx spathaceous. ♃. H. Native of the alps of middle Europe, from the Pyrenees to Savoy. Gentiàna lùtea, Lin. spec. 367. Vill. delph. 2. p. 521. Mill. icon. t. 139. Plenck. off. t. 156. Woodv. med. bot. 3. p. 433. t. 156. Church. et Stev. med. bot. vol. 4, with a figure. Swértia lùtea, Vest. in Tratt. tab. t. 518. Radical leaves ovate-oblong: cauline ones sessile, ovate, acute. Corolla yellow, veiny, and spotted. The roots of *Gentian* are long, thick, externally of a brown colour, and wrinkled; internally spongy, and of a yellow colour, without any remarkable smell, but surpassing in bitterness all other European vegetables. Alcohol dissolves only the bitter extractive, water both the extractive and mucilage. Its bitterness depends upon a new principle discovered by Henri and Caventou, called gentianin, and is easily obtained in a crystalline form by means of ether, in which it is very soluble. It likewise dissolves in alcohol, and more sparingly in water. It appears to be neither alkaline nor acid. Gentian possesses the general virtues of bitters in an eminent degree, and it is totally devoid of astringency. On dead animal matter it acts as an antiseptic. Taken into the stomach it proves a powerful tonic, and in large doses it evacuates the intestines. It is useful in weakness of the stomach, and in general debility. Externally its powder is applied to putrid ulcers. Narcotic effects have sometimes been ascribed to it, but these are owing to the roots of *Aconite* or *Belladonna* gathered along with it.

Var. β, màjor; flowers smaller, paler; corolla 5-9-parted almost to the base, spotless. ♃. H. Native of subalpine places.

Var. γ, uniflòra (D. C. fl. fr. no. 2761.) Stem 1 flower.

Yellow Asterias or Gentian-root. Fl. June, July. Clt. 1596. Pl. 4 to 6 feet.

2 A. hy'brida; leaves ovate-lanceolate; corollas 5-8-cleft, rotate; whorls of flowers sessile; calyx membranous, unilateral, unequally 6-cleft. ♃. H. Native of the alps of Vallais. Gentiàna hýbrida, D. C. syn. fl. gall. p. 244. no. 2762. fl. fr. 2. p. 651. no. 2762. G. Thomàsii, Vill. mem. pl. hybr. in Rœm. coll. p. 189. G. campanulàta, Reyn. mem. 219. Flowers reddish yellow. Supposed to be a hybrid between *A. lùtea* and *Coilántha purpùrea.*

Hybrid Asterias. Pl. 3 to 4 feet.

Cult. This genus is composed of robust plants, with the habit of *Veràtrum*, proper for flower borders. A deep light rich soil suits them best, as it allows the roots to ascend. They are increased either by seed, or by dividing the root.

X. COILA'NTHA (from *κοιλος, koilos*, concave, and *ανθος, anthos*, a flower; in reference to the shape of corollas.) Renealm. spec. 65. Borkh. in Rœm. arch. 1. p. 24.—Gentiàna species, Lin. and others. Dasystéphana, Borkh.

Lin. syst. *Pentándria, Digýnia.* Calyx spathaceous, truncate, scarious, diaphanous, cleft inside, with 6-7 unequal lobes or teeth at apex. Corolla large, coriaceous, campanulate, 5-7-cleft; segments broad at the base, obtuse, remote. Stamens 5-7; anthers oblong, combined. Ovarium oblong, pedicellate. Stigma bifid, downy, divaricate. Capsule fusiform, with 5-7 tubercles at the base, 1-celled. Seeds many, orbicular, with winged edges.—Showy plants, with obsoletely tetragonal stems; opposite, ovate, 5-nerved, apiculated leaves, which are sheathing at the base. Flowers large, on short pedicels: terminal ones disposed in a whorl, and the axillary ones solitary. Bracteas opposite, shorter than the flowers.

1 C. purpu'rea (Borkh. in Rœm. arch. 1. p. 25.) radical leaves ovate, 5-nerved: cauline ones ovate-lanceolate: upper ones broad-lanceolate, combined and sheathing at the base; corolla 5-6-cleft; stamens 5-6; calyx membranous, spathaceous. ♃. H. Native of the alps of Norway, Switzerland, Savoy, Pyrenees, &c. Gentiàna purpùrea, Lin. spec. p. 637. Willd. spec. 1331. exclusive of the synonyme of Villars. Woodv. med. bot. 4. p. 132. t. 262. Oed. fl. dan. t. 50. Plenck. off. t. 159. Andr. bot. rep. t. 117. Frœl. gent. p. 18. no. 2. Pneumonánthe purpùrea, Schmidt, no. 1. Gentiàna punícea, Gesner. Schmidel. op. gesn. 2. p. 52. no. 92. a. t. 28. f. 92. A. a. Root yellow outside and white inside, scaly at top, very bitter. Stem purplish green. Bracteas ovate

lanceolate. Flowers from 3-8 together, terminal; and the axillary ones usually solitary. Calyx spathaceous, with 2-3 unequal teeth at the apex. Corolla coriaceous, purplish, marked with dots in lines inside; tube striated, with greenish yellow; limb 6-cleft; segments sub-ovate, obtuse. Capsule fusiform.

Var. β; corollas rose-coloured.

Var. γ; corollas without dots.

Var. δ; corollas white.

Purple Coilantha. Fl. June, July. Clt. 1768. Pl. 1 to 2 ft.

2 C. Pannónica; radical leaves ovate, apiculated; having the petioles sheathing at the base: cauline ones ovate, lanceolate: floral ones acuminated: all 5-nerved; calyx 6-7-cleft; corolla 6-7-cleft; stamens 6-7. ♃. H. Native of the alps of middle Europe, and Savoy, but not of the Pyrenees. Gentiàna Pannónica, Scop. carn. 2. no. 29. Lin. spec. 1. p. 63. exclusive of the synonymes. Lin. syst. ed. Mur. p. 265. Jacq. fl. austr. 2. t. 136. Tratt. fl. aust. fasc. 1. t. 9. Schrank, bav. 1. no. 424. exclusive of the syn. of Lin. Frœl. gen. no. 21. Gentiàna punctàta, Jacq. obs. 2. p. 17. t. 39. Pneumonánthe Pannónica, Schmidt, boh. 2. no. 112.—Barrel. icon. t. 64. Stems purplish. Flowers verticillate, axillary, and terminal. Corolla rather membranous, purple, beset with dots; with a yellowish tube; segments ovate, obtuse. Capsule fusiform. Bracteas ovate, acuminated.

Var. β; stem humble; whorls solitary, few-flowered.

Var, γ; corolla white.

Var. δ; stems tall; leaves long, acuminated.

Pannonian Coilantha. Fl. June, July. Clt.? Pl. 1 to 2 ft.

3 C. bíloba; flowers verticillate; corollas usually 6-cleft; calyx membranous, 2-lobed; lobes obtuse, entire, equal, ♃. H. Native of France, on mountains, in the province of Clarion. Gentiàna bíloba, D. C. syn. fl. gall. p. 244. no. 266. fl. fr. 2. p. 653. no. 2766. icon. fl. gall. t. 15. Gentiàna punctàta, Wahl. carp. 1. p. 72. Nearly allied to *C. punctàta* in the colour and size of the corolla, but differing in the floral leaves being twice longer than the flowers. Perhaps only a variety of *C. purpùrea*.

Two-lobed-calyxed Coilantha. Fl. June, July. Clt. 1820. Pl. 1 to 2 feet.

4 C. puncta'ta (Borkh. in Rœm. arch. 1. p. 27.) leaves ovate, acutish, 5-nerved: lower ones petiolate: superior ones acuminated, all coadunate at the base; flowers verticillate; calyx rather truncate, with 6-7 unequal lobes; corolla campanulate, usually 6-8-cleft, dotted. ♃. H. Native of the alps of middle Europe, as on the alps of Switzerland and Savoy. Gentiàna punctàta, Lin. spec. 637. Willd. spec. 1. p. 1333. Tratt. fl. austr. fasc. 3. t. 9. Jacq. austr. 5. t. 28. Gent. purpùrea, Vill. dauph. 2. p. 523. Hall. hist. 638. Pneumonánthe punctàta, Schmidt, Rœm. arch. 1. no. 4.—Gesn. in Schmidel, op. 2. p. 53. no. 92. b. t. 28. f. 92. b.—Mor. hist. t. 4. f. 2. Barrel. icon. 69. with a paler flower. Root brownish outside, white inside. Stem subtetragonal, green or purplish. Leaves pale green. Bracteas shorter than the flowers. Terminal flowers 5 in a head: axillary ones solitary. Calyx with blueish angles, and lanceolate, obtuse, short segments. Corollas large, yellow, or sulphur-coloured, blueish before expansion, dotted with numerous irregular purple spots; limb 6-7-cleft. Stamens 6-7. Seeds imbricate, winged.

Dotted-flowered Coilantha. Fl. June, July. Clt. 1775. Pl. 1 to 2 feet.

5 C. campanula'ta; leaves ovate, acutish, 5-nerved: lower ones usually 7-nerved; superior ones sessile, sheathing, acuminated; flowers verticillate, terminal, and axillary; calyx 6-7-cleft, with blueish angles and unequal triangular segments; corolla campanulate, 7-cleft; with obtuse, triangular, equal lobes, without dots. ♃. H. Native of Carinthia, Switzerland, &c., on the alps; and of the Pyrenees. Gentiàna campanulàta, Jacq. in Murr. syst. p. 267. austr. app. p. 43. t. 29. Tratt. fl. austr. fasc. 4. p. 1. Gentiàna campanulàta immaculàta, Pers. ench. 1. p. 284. Gent. Bursèri, var. α. D. C. fl. gall. no. 2763. α. Pneumonánthe campanulàta, Schmidt, l. c. Root fusiform, divided a little. Leaves pale green. Bracteas about the length of the flowers. Corolla large, sulphur-coloured. Stamens 7. Stigmas flat, obtuse. Seeds orbicular.

Campanulate-flowered Coilantha. Fl. July, Aug. Clt. 1819. Pl. 1 foot.

6 C. Sessæ'i (D. Don, mss.) stem erect, simple, terete, papillose; leaves sessile, ovate-lanceolate, 3-nerved; flowers axillary, solitary, bractless; calyx spathaceous, 5-toothed; corolla campanulate, 10-cleft; the alternate segments bicuspidate. ♃. F. Native of Mexico. Gentiàna cærùlea, Moc. et Sesse, in herb. Lamb. Leaves scabrous, 3-5-nerved: lower ones ovate, obtuse: superior ones acuminated, deep green above. Calyx cleft on the inner side. Corolla blue; lobes roundish, mucronate. Filaments flattened; anthers oblong. Styles distinct. Stigmas revolute, papillose. Capsule pear-shaped. Seeds winged.

Sesse's Coilantha. Pl. ½ to 1 foot.

7 C. Mocínni (D. Don, mss.) stem erect, simple, terete; leaves sessile, ovate-lanceolate, 5-nerved; flowers axillary, on short pedicels, usually solitary; calyx spathaceous, 5-toothed, bibracteate at the base; corolla campanulate, 10-cleft; the alternate segments bicuspidate. ♃. F. Native of Mexico. Confused with *G. cærùlea* in Moc. et Sesse. in herb. Lamb. Leaves smooth, 2 inches long. Calyx cleft on the inner side. Bracteas linear-lanceolate, acute, much longer than the calyx, connate at the base. Corolla campanulately funnel-shaped. Filaments dilated at the base. Ovarium somewhat fusiform; stigmas linear, obtuse, minutely papillose.

Mocinno's Coilantha. Pl. 1 foot.

8 C. Burse'ri; corollas usually 5-cleft, campanulate, dotted; segments lanceolate, with a small accessory tooth between each; calyx membranous, spathaceous. ♃. H. Native of the eastern and central Pyrenees, often with vars. β and γ. Gentiàna Bursèri, Lapey. fl. pyr. p. 130. abr. p. 132. D. C. fl. fr. suppl. no. 2763. Said to be very nearly allied to *C. punctàta*, but the corolla is always pale yellow, never purple. It has the leaves of *C. lùtea*, and the flowers of *C. punctàta* or *C. purpùrea*, and is probably a hybrid. Villars says, dauph. 2. p. 522. that the flowers are campanulate, verticillate, 6-cleft, acute, serrulated, dotted; and the calyx spathaceous.

Var. α; corollas dotted, bluntish. ♃. H. Native of the Pyrenees. Gentiàna Bursèri β, Lapeyr. l. c.

Var. β; corollas dotted, acutish. ♃. H. Native of Dauphiny, Pyrenees, &c. Gentiàna Bursèri γ, D. C. l. c. Gent. punctàta, Vill. dauph. p. 520. Gent. hýbrida, Vill. mem. pl. hybr. Rœm. coll. 1. p. 189. Gent. punctàta, var. lùtea, Tratt. fl. austr. fasc. 3. t. 10.?

Var. γ, *gigantèa* (Lapeyr. abr. p. 8. pyr. suppl. p. 41.). ♃. H. Native of the Pyrenees.

Burser's Coilantha. Fl. July, Aug. Clt. 1820. Pl. 2 feet.

9 C. glau'ca (Borkh. in Rœm. arch. 1. p. 26.) stems terete; leaves ovate-roundish, hardly nerved: rather fleshy: cauline ones 3-4 pairs, sessile; flowers 1-3, terminal, sessile; calycine segments unequal, blueish, subulate; corolla campanulate, 5-cleft, with short, obtuse segments, 3 times longer than the calyx. ♃. H. Native of Kamtschatka, on the tops of the alps, in humid places facing the north. Gentiàna glaúca, Pall. fl. ross. 2. p. 104. t. 93. f. 2. Frœl. gent. p. 56. Willd. spec. 1. p. 1340. Pneumonánthe glaúca, Schmidt, in Rœm. arch. 1. p. 10. no. 14. Stems simple. Radical leaves rosulate. Calyx campanulate. Corolla subventricose, blueish, but the tube pale.

Anthers white. Capsule fusiform. Perhaps a species of *Pneumonánthe*.

Glaucous Coilantha. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

10 C. asclepia'dea; leaves ovate-lanceolate, 3-5-nerved, stem-clasping, with repand edges; terminal flowers crowded, axillary ones solitary, all nearly sessile; corolla campanulate, 5-cleft; segments ovate, acute; calyx tubular, 5-toothed: teeth unequal, distant; anthers connivent. ♃. H. Native of Switzerland, Hungary, Syria, Austria, Carniola, Silesia, Piedmont, Barbary, Mount Caucasus, &c., in shady alpine places. Gentiàna asclepiàdea, Lin. spec. 329. Hall. helv. no. 640. Jacq. austr. t. 328. Sims, bot. mag. 1078. Frœl. gent. p. 48. Dasystéphana Renealm specim. 67. t. 68. Dasystéphana asclepiàdea, Borkh. in Rœm. arch. 1. p. 26. Mayerhoff. fl. monac. t. 60. Gentiàna Asclepiàdis folio, Bauh. pin. 187. Ger. emac. 433. f. 3. Corollas large, blue, 3 times longer than the calyx. Seeds winged with broad white edges.

Var. β; leaves distinct. ♃. H. Native of Carniola and Bohemia, Frœl. gent. p. 49. Scop. carn. 1. p. 298. Pneumonánthe asclepiàdea, Schmidt, boh. no. 113. no. 6. Schmidel, op. gesn. 1. t. 9. f. 80. 2. p. 40. t. 26. f. 82. Flowers sessile, solitary, secund. Leaves bifarious.

Var. γ; leaves 3 in a whorl. ♃. H. Frœl. gent. 49. Pont. comp. p. 76.

Var. δ; leaves lanceolate, long-acuminated, 3 inches long, a little smaller. ♃. H. Frœl. l. c. p. 49. Calyx subspathaceous, ex Frœl.

Var. ε; stem elongated, nutant; peduncles elongated, a little branched. ♃. H. Frœl. l. c. Clus. hist. 1. p. 312. middle figure.

Var. η; corolla white. ♃. H. Frœl. l. c. Wahl. helv. l. c. Ponted. comp. p. 76.

Var. ϑ; stem 1-flowered. ♃. H. Pneumonánthe plicàta, Schmidt, in Rœm. arch. 1. p. 10. no. 613. t. 1. f. 1. Calyx ventricose, with 3 of the segments broader than the others.

Asclepias-like Coilantha. Fl. July, Aug. Clt. 1629. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

Cult. For culture and propagation see *Astèrias*, p. 184.

XI. EURYTHA'LIA (meaning unknown to us). Renealm. spec. Borkh. in Rœm. arch. 1. p. 28. Mayerhoff, fl. mon. t. 278.—Gentiàna species of authors.—Híppion species, Schmidt, in Rœm. arch. 1. p. 32. t. 4. f. 13. fl. bohem. no. 128. Gentiàna, sect. Endótriche, Frœl. gent. p. 87. Opsántha, Renealm. spec. 71.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx 4-5-cleft. Corolla salver-shaped; with a 4-5-cleft limb, having as many bearded or fringed segments inside and attached to them at the base. Stamens 4-5; filaments filiform; anthers oblong, incumbent. Stigma 2-lobed or bifid. Ovarium pedicellate. Capsule ovate or oblong, erect, 1-celled, 2-valved. Seeds smooth, roundish, compressed.—Annual, branched or simple herbs. Leaves opposite, sessile, decussate. Flowers terminal, blue, white, or purple. This genus is readily distinguished from the rest by the beard inside the segments of the corolla at the throat.

1 E. uniflòra; stem simple, slightly tetragonal, usually 1-flowered; leaves ovate; corolla 5-cleft: with ovate, acute segments, and bearded plicæ inside, equal in length to the calycine segments. ⊙. H. Native of Savoy, Bavaria, and the Carpathian mountains. Gentiàna uniflòra, Willd. spec. 1. p. 1346. G. amarélla, var. ε, Frœl. gent. p. 87. Híppion Gentianélla, Schmidt, in Rœm. arch. 1. p. 23. t. 2. f. 4. Stem hardly higher than the corolla. Flowers larger than those of *E. campéstris*, of a violet colour.

One-flowered Eurythalia. Pl. 1 inch.

2 E. Germa'nica (Mayerhoff, fl. mon. t. 278.) stem obsoletely 6-angled, branched; branches longer than the internodes, 1 or many-flowered; leaves ovate-lanceolate, 3-nerved; corolla 5-cleft; segments of corolla ovate, acute; with bearded plicæ inside at the base, about equal in length to the calycine segments. ⊙. H. Native of middle Europe, as of Germany, in mountain meadows. Gentiàna Germánica, Willd. spec. 1. p. 1346. Schultes, fl. bav. no. 48. G. amarélla, Frœl. gen. p. 86. Schultes, fl. austr. ed. 2. no. 1016. Hall. helv. 651. and of all other botanists who have written on the German flora. G. amarélla γ, Wahl. carp. p. 76. exclusive of the syn. of Besser. G. amarélla, var. α, Lam. fl. fr. 2. p. 92. Gent. amarélla β, Bieb. fl. taur. 1. p. 23. t. 3. f. 4. G. campéstris, All. pedem. no. 354. D. C. fl. fr. no. 2776.—Barrel. icon. t. 102. Root yellow. Stem purplish. Radical leaves obovate, obtuse: cauline ones sessile, a little connate at the base, as in the rest of the species: uppermost and branch ones subcordate. Corolla purplish blue; and the beard white.

Var. β; stem branched; leaves subcordate, acuminated. ⊙. H. Barrel. icon. t. 510. f. 2. G. amarélla, var. δ, Frœl. gent. p. 86.

Var. γ; stem usually 1-flowered, short; flowers white; corollas and calyxes with scabrous edges. ⊙. H. Gentiàna amarélla β, Wahl. fl. carp. p. 76.

Var. δ; stem branched; flowers white.

German Eurythalia. Fl. Aug. Clt. 1818. Pl. $\frac{1}{8}$ to $\frac{1}{3}$ foot.

3 E. amare'lla (Borkh. l. c.) stem tetragonal, paniculately branched at top; branches shorter than the internodes; leaves ovate-lanceolate, 3-nerved; corolla 5-cleft; segments ovate, acute, with bearded plicæ inside at the base. ⊙. H. Native of Sweden, Bohemia, Hungary, Galicia, &c. in dry pastures, as well as of the islands of Unalaschka, and Sitcha; in England in dry pasture, on calcareous soils. Gentiàna amarélla, Lin. spec. 334. Smith, engl. bot. t. 236. Oed. fl. dan. 328. Frœl. gen. p. 141. Bieb. fl. cauc. 1. p. 148. Curt. fl. lond. fasc. 6. t. 31. Wahl. carp. p. 76. exclusive of the syn. G. praténsis, Besser. Gentiàna lancifòlia, Rafin. dansk. holst. fl. Schum. fl. sæl. p. 80. Pers. ench. 1. p. 286. Schultes, fl. austr. ed. 2. no. 1017. Híppion axillàre, Schmidt, boh. no. 129. Rœm. arch. 1. p. 32. t. 4. f. 13. Gentiàna tetragòna, Mayer, physt. aufs. p. 194. Gentiàna campéstris, Geners. elench. no. 234. Gentiàna amarélla β, Frœl. gent. p. 87.—Plenck. icon. t. 158. Opsántha, Renealm, spec. p. 71. Gentiàna pyramidàlis, Willd. herb. no. 5540. Híppion axillàre, Schmidt, in Rœm. arch. 1. t. 5. f. 13. Gentiàna axillàris, Rchb. icon. t. 130. Swértia corniculàta, herb. Willd. no. 5478—Barrel. icon. t. 510. f. 2. Gentiàna obtusifòlia, Willd. ex Rchb. icon. t. 129. no. 248. Peduncles axillary and terminal, 1-2-flowered. Corolla twice longer than the calyx, with a white tube and a purple limb, and beard. Calycine segments 5, uniform. Corolla 4 5-cleft. The plant is very bitter. The plant from the island of Sitcha differs from that of Unalaschka in the calycine segments being more unequal.

Var. β; a larger plant, with longer branches, larger flowers, which are constantly 5-cleft; segments of corolla broader. Bieb. l. c.

Var. γ, fùgax vérna or *præ'cox*, Ray. This differs only in the early time of flowering.

Var. δ. This, the taller autumnal *Gentian*, with Centaury-like leaves, is said by Ray to have been found near Welwyn, in Hertfordshire, and Belcham St. Paul, in Essex, but it does not differ in any thing essential from the species.

Amarella or Bitter Eurythalia. Fl. Aug. Brit. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

4 E. uliginòsa; stem tetragonal, branched, winged at the base; leaves lanceolate; corolla 5-cleft, a little longer than the calycine segments, which are nearly equal; segments of corolla ovate, acute, having the inner plicæ bearded on the inside at

the base. ⊙. H. Native of Germany, in boggy pastures. Gentiàna Amarélla, Willd. prod. berol. no. 293. bot. mag. 11. p. 37. Gent. uliginòsa, Willd. spec. 1. p. 1347. Rchb. icon. t. 58. Gent. campéstre, Leyss. hal. no. 242. Stem 1-2 inches high. Peduncles long, 1-flowered. Perhaps hardly a variety of *Amarélla*. Corolla blueish.

Bog Eurythalia. Fl. Aug. Pl. 1 to 2 inches.

5 E. obtusifòlia; stem tetragonal; leaves lanceolate, obtuse; corolla 4-5-cleft: tube equal in length to the calyx; segments of corolla having the inner plicæ bearded. ⊙. H. Native of Bavaria, Savoy, and Switzerland, on the mountains. Gentiàna obtusifòlia, Willd. spec. 1. p. 1347. Wahl. helv. p. 49. G. amarélla γ, Frœl. gent. p. 87. Híppion obtusifòlium, Schmidt, fl. boh. no. 226. Rœm. arch. 1. p. 22. t. 2. f. 3. Gentiàna spatulàta, Rchb. icon. t. 22. Gent. montàna, Nees. Lower leaves narrow, and almost petiolate: radical ones almost orbicular. Corolla purplish or blueish yellow in the dried state. Branches few, 1-flowered. Two of the calycine segments are broader than the others. This plant is considered the same as *E. Germánica* by Cham. et Schlecht. in Linnæa. 1. p. 179-180.

Blunt-leaved Eurythalia. Fl. July, Aug. Clt. 1826. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

6 E. prate'nsis; stem tetragonal, branched; leaves lanceolate, with scabrous edges, obsoletely 3-nerved; corolla 4-5-cleft: with ovate-lanceolate, obtuse segments: having the inner plicæ bearded; calycine segments nearly equal, shorter than the tube. ⊙. H. Native of Russia and Siberia at the Baikal; and of Galicia, in humid and dry places. Gentiàna praténsis, Frœl. gent. p. 88. exclusive of the syn. of Fl. dan. G. campéstris, Pall. fl. ross. 2. p. 103. Taller and more branched than *E. Germánica*; with the lower branches shorter than the internodes. Corolla not twice shorter than the largest calycine segments, of a livid blue colour. Leaves sometimes violaceous beneath. Flowers terminal, aggregate; pedicels shorter than the flowers. Said by Cham. in Linnæa. 1. p. 181. to be the same with *Amarélla*.

Meadow Eurythalia. Fl. Aug. Sept. Clt. 1817. Pl. $1\frac{1}{2}$ ft.

7 E. Cauca'sica; stem tetragonal, branched from the base; branches equal; leaves ovate-lanceolate, 3-nerved; corolla 5-cleft, with ovate, obtuse segments, and a bearded throat; teeth of calyx subulate, nearly equal. ⊙. H. Native of the alps of Caucasus, at the fountains called Jucharibasch. Gentiàna Caucásica, Bieb. fl. taur. 1. p. 198. Sims, bot. mag. t. 1038. Gent. amarélla, Pall. ross. 2. p. 104. exclusive of the syn. of Fl. dan. t. 367. Gent. collìna, Adams. in Willd. herb. Roots yellowish. Calyx shorter than the tube of the corolla. Peduncles 1-flowered, length of leaves at the tops of the branches. Corollas larger than those of *E. campéstris*, of a violaceous blue colour; beard white.

Caucasian Eurythalia. Fl. July, Aug. Clt. 1804. Pl. $\frac{1}{2}$ foot.

8 E. campe'stris (Borkh. in Rœm. arch. 1. p. 28.) stem tetragonal, pyramidally branched: leaves lanceolate, 3-nerved; corolla 4-cleft; the segments obtuse and the throat bearded; the 2 exterior segments of the calyx very large. ⊙. H. Native of Europe, from Sweden to Sicily, in dry elevated pastures. In Britain, particularly in the north of Wales and Scotland, plentiful; but more especially in marly districts. Gentiàna campéstris, Lin. spec. 334. Frœl. gent. p. 91. Smith, engl. bot. t. 237. Oed. fl. dan. t. 367. Bocc. mus. t. 181. Gent. amarélla β, Lam. fl. fr. 2. p. 892. Gent. amarélla, Allg. ped. no. 353. ex D. C. fl. fr. no. 2777. Gentiàna obtusifòlia, Schleich. Híppion campéstre, Schmidt. in Rœm. arch. 1. p. 11. This is very nearly allied to *E. amarélla*, but is more branched, and the calyx is always 4-parted and irregular. Corolla purplish blue, and sometimes pure white. According to Linnæus poor people use this plant instead of hops to beer; and according to Pallas as a medicine, in common with many other species.

Var. β, *Germánica* (Frœl. gent. p. 91.) stem acutely tetragonal, green or blueish purple at the base, 2-6 inches high, simple or branched; 2 of the calycine segments are very large and subcordate, or ovate, acute 3-nerved, the 2 smaller ones lanceolate, acuminated; corolla blueish violet, with a whitish tube, a little shorter than the calyx. Gent. campéstris, Roth. fl. germ. 2. p. 290.

Var. γ, *Neapolitàna* (Frœl. l. c.) lower branches of stem the longest, therefore corymbose; calyx 4-parted; segments acuminated, 2 of which are broader and lanceolate; the other 2 linear; corolla twice longer than the calyx: limb 4-cleft, acutish, reddish purple, but the beard is white. ⊙. H. Native of Italy.

Var. δ, *quinquéfida*; flowers 5-cleft. ⊙. H. Native of Switzerland. Gentiàna Germánica, Schleich. cent. pl. p. 21. no. 31. ex D. C. fl. fr. 2777.

Var. ε, *mínima*; plant small; corollas purple. ⊙. H. Native of the south of Europe. Híppion auriculàtum, Schmidt, fl. boh. no. 125.—Barrel. icon. 97. f. 2.—Column. ecphr. 1. p. 223. t. 22. f. 3.

Field Eurythalia. Fl. Aug. Britain. Pl. $\frac{1}{4}$ to $\frac{1}{3}$ foot.

9 E. floribu'nda; stem erect, branched; leaves lanceolate, connate, acute, downy, with pilose margins; peduncles 1-flowered, solitary, or numerous, disposed on the branches as if they were in racemes; calycine segments lanceolate, acute, downy as well as the corolla, which is deeply 5-cleft, and bearded in the throat. ⊙. H. Native of Nipaul. Gentiàna floribúnda, D. Don, prod. fl. nep. p. 127. Stem terete, glabrous. Flowers pale blue. Lobes of corolla ovate, mutic.

Bundle-flowered Eurythalia. Fl.? Pl. 1 to 2 feet.

10 E. umbella'ta (D. Don, mss.) stem erect, branched, terete; leaves lanceolate, acute, 3-nerved, or somewhat 5-nerved: lower ones petiolate; calycine segments lanceolate, acuminated; throat of corolla furnished with a jagged fringed ring; lobes of corolla elliptic, oblong. ⊙. H. Native of Peru. Gentiàna umbellàta, Ruiz et Pav. in herb. Lamb. Leaves with scabrous edges, 3-4 inches long. Flowers terminal, 3-5 in an umbel, erect; pedicels 2-edged, bractless. Corollas yellow. Filaments dilated; anthers oblong. Ovarium oblong. Stigma sessile, thick, 2-lobed.

Umbellate-flowered Eurythalia. Pl. $1\frac{1}{2}$ foot.

11 E. auricula'ta; stem subtetragonal, almost simple; radical leaves ovate: cauline ones oblong-ovate, stem-clasping, obtuse, 5-nerved; flowers terminal from the axils of the superior leaves; corolla 4-5-cleft, villous inside; alternate, calycine segments cordate. ⊙. H. Native of eastern Siberia, about the sea of Ochotsk, and of Kamtschatka, in grassy marshy places. Gentiàna auriculàta, Pall. fl. ross. 2. p. 102. t. 92. f. 1. Frœl. gent. p. 90. no. 35. Híppion auriculàtum, Schmidt. Dasystéphana auriculàta, Borkh. in Rœm. arch. 1. p. 26. Corolla twice longer than the calyx: with roundish ovate, pale blue segments, which are villous inside. Ovarium fusiform. There is a much-branched variety of this, with more violet-coloured corollas, found in salt marshes towards the sea.

Auricled Eurithalia. Pl. 1 foot.

12 E. glacia'lis; stem tetragonal, branched from the base, leafy; leaves nearly all radical, and rosulate, oblong, bluntish; corolla 4-cleft, with a bearded throat; calyx 4-parted, nearly equal; peduncles long, tetragonal, naked, 1-flowered. ⊙. H. Native of Lapland, Iceland, and through Savoy, and the Carpathian mountains, on the tops of the alps, to the alps of middle

Europe, as of Valais, even to Siberia. Gentiàna glaciàlis, Vill. dauph. 2. p. 532. Frœl. gent. p. 98. Wahl. lapp. p. 69. carp. p. 75. Gent. nivàlis, Lam. dict. suppl. 2. p. 733. no. 68. Hall. helv. 652. Hippion longepedunculàtum, Schmidt, in Rœm. arch. 1. p. 21. t. 2. f. 5. Gent. nàna, All. pedem. 1. p. 99. no. 360. Nearly allied to *E. amarélla*. Corolla deep blue, having 2 small fringed segments to each segment of the corolla. Capsule elongated.

Var. β, *tenélla;* corolla 4-cleft, bearded; stem subdichotomous; peduncles very long; leaves subovate, bluntish. ⊙. H. Native of the north of Europe. Gent. tenélla, Frœl. gent. p. 96. Willd. spec. 1349. Pers. syn. 1. p. 286. Rottb. act. hafn. 10. p. 436. t. 2. f. 6. Townson, trav. hung. t. 14. Vahl, act. soc. hafn. 2. p. 2. t. 21. Fl. dan. t. 318. Gent. tetragòna, Lam. ill. no. 2233. Gmel. syst. p. 462. Roth. germ. 2. p. 290. Hippion tenéllum, Schmidt, in Rœm. arch. 1. p. 19. Gent. Konígii, Gunn. fl. norv. no. 288. Gent. campéstris β, Lin. syst. p. 269. no. 34. Gmel. syst. p. 460. no. 7. Corollas deep blue.

Var. γ, *uniflòra;* stem simple, 1-flowered. ⊙. H. Gent. glaciàlis β, Frœl. gent. p. 98.

Icy Eurythalia. Fl. Aug. Clt. 1819. Pl. ¼ to ⅓ foot.

13 E. dichótoma; stem tetragonal, dichotomously branched; leaves subovate, acute; peduncles very long; corolla 5-cleft, with a bearded throat, and oblong, obtuse, hardly spreading segments. ⊙. H. Native of Siberia, from the Lena to the Eastern Ocean. Gent. dichótoma, Pall. fl. ross. 2. p. 110. Frœl. gent. p. 100. Hippion dichótomum, Schmidt. Gent. boreàlis, Ledeb. act. nat. soc. mosc. 3. p. 357. Gent. glaciàlis, Led. fl. alt. 1. p. 288.—Gmel. sib. 4. p. 106. t. 51. f. B. This species differs from *E. glaciàlis* in the stem being finely forked, filiform, and rather flexuous. Leaves at all the forks, and on the peduncles. Calyx divided almost to the base; segments lanceolate, acute. Corolla purplish; tube longer than the calyx. The corollas vary to 4-cleft, and to a white colour. Said by Cham. in Linnæa, 1. p. 182. to be the same as *E. glaciàlis*.

Dichotomous Eurythalia. Pl. ¼ foot.

14 E. na'na (Borkh. in Rœm. arch. 1. p. 28.) stem tetragonal, decumbent, filiform, dichotomous, leafy at bottom, with ascending, tufted branches; radical leaves obovate: cauline ones ovate, obtuse; peduncles hardly the length of the flowers; corolla 5-cleft, rarely 4-cleft, campanulate, with a bearded throat, and ovate, acutish segments. ⊙. H. Native of the alps of Carinthia and Salzburg, near the limits of perpetual snow. Gent. nàna, Wulf. in Jacq. misc. 1. p. 161. t. 18. f. 3. Frœl. gent. p. 102. Hippion nànum, Schmidt, in Rœm. arch. p. 20. t. 3. f. 10. Root yellowish. Radical leaves usually 4, rarely more, rosulate. Calycine segments ovate, lanceolate, acutish, nearly equal. Corolla with a whitish tube, nearly the length of the calyx, and a deep violaceous limb, and a white bipartite beard. Stigmas ovate.

Var. β; stem simple, shorter than the flower. ⊙. H. Frœl. gent. l. c.

Var. γ; corollas white. ⊙. H. Frœl. gent. l.

Dwarf Eurythalia. Fl. July, Aug. Pl. 1 to 2 inches.

Cult. For culture and propagation see *Pleurógyna*, below.

XII. PLEURO'GYNA (from πλευρα, *pleura*, a side, and γυνη, *gyne*, a female; in reference to the 2 stigmas being adnate longitudinally to both sides of the ovarium). Eschsch. mss. ex Schlecht. in Linnæa. 1. p. 187.—Gentiàna species of authors. —Swértia species of Linnæus.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-cleft. Corolla rotate, spreading, 5-cleft; with a fringed or scaly throat. Stamens 5; filaments filiform; anthers free, incumbent. Stigmas 2, adnate longitudinally to the sutures on both sides of the ovarium. Capsule elongated, 1-celled, 2-valved. Seeds minute, globose, scobiform.—Annual plants. Leaves opposite, decussate: radical ones rosulate. Flowers blue.

1 P. Carinthi'aca; stem short, tetragonal, dichotomous, leaves ovate-lanceolate, obtuse; peduncles very long, naked; corolla rotate, 5-cleft; with bristles in the throat. ⊙. H. Native of Carinthia, and Salzburg, on the tops of the alps. Gentiàna Carinthìaca, Frœl. gent. p. 103. Willd. spec. 1. p. 1350. Swértia Carinthìaca, Wulf. in Jacq. misc. 2. p. 53. t. 6. Lin. syst. ed. 14. Murr. p. 266. Root yellowish. Stem slender. Branches and peduncles erect or ascending. Radical leaves 4, rosulate, oblong-ovate: cauline ones twin above the base. Calycine segments cut almost to the base, ovate-lanceolate, obtuse, nearly equal, shorter than the corolla. Segments of corolla ovate, acute, sky blue above, and white and violaceous beneath. Bristles in the throat short and white. Capsule elongated, angular. Stigmas obtuse.

Carinthian Pleurogyna. Fl. July, Aug. Clt. 1817. Pl. ¼ ft.

2 P. sulca'ta; stem tetragonal, dichotomous; leaves linear; segments of corolla oblong, acute; corolla rotate, 5-cleft: with scales in the throat; calycine segments lanceolate-linear. ⊙. H. Native of Iceland and Norway. Gent. sulcàta, Willd. spec. 1. p. 1351. Swértia sulcàta, Rottb. act. hafn. 10. p. 438. t. 1. f. 4. Retz. scan. ed. 2. no. 309. Swértia rotàta, Gunn. norw. no. 1077. fl. dan. t. 343. Gent. rotàta β, Frœl. gent. p. 106. Corolla length of calyx. Stem spicately branched, many-flowered, leafy, ex Fl. dan. l. c. Ovarium compressed, furrowed.

Furrowed-capsuled Pleurogyna. Pl. ¼ to ½ foot.

3 P. rota'ta; stem simple or branched from the middle, obsoletely tetragonal; leaves ovate-lanceolate, acutish, strict; segments of calyx ovate-lanceolate, one half shorter than the corolla. ⊙. H. Native throughout Siberia, in humid places. Gentiàna rotàta, Frœl. gent. p. 105. Led. fl. alt. 1. p. 289. Swértia rotàta, Lin. spec. 1. p. 1351. Pall. fl. 2. t. 89. f. 1. and 2.—Gmel. sib. 4. t. 53. f. 1. Root yellow, fascicled. Branches sub-fastigiate. Radical leaves 4, rosulate, obovate, obtuse: cauline ones lanceolate, acutish, sub-trinerved, shorter than the internodes. Segments of calyx linear-acute, 3-nerved, a little shorter than the corolla. Corolla blue, 5-parted. Scales 10 in the throat, variously cut. Ovarium cylindrical, compressed, furrowed in the middle.

Rotate-flowered Pleurogyna. Pl. ½ to 1 foot.

4 P. Stelleria'na (Cham. et Schlecht, in Linnæa. 1. p. 188.) leaves ovate, acute; calycine segments ovate, lanceolate, acute, one half shorter than the corolla. ⊙. H. Native of eastern Siberia, Kamtschatka, and Caucasus. Swértia rotàta, Pall. fl. ross. t. 89. f. 3. Bieb. cauc. 1. p. 199.—Gmel. sib. 4. p. 112. t. 52. f. 2. Stem many-flowered, branched from the base; branches fastigiate. Corolla 5-cleft.

Steller's Pleurogyna. Pl. ¼ to ½ foot.

Cult. The species of this genus are almost uncultivatable; although several of them are extremely common in chalky parts of Britain. We would recommend the seed to be sown in chalky soil, or soil well mixed with chalk or marl, in which they will probably grow in a cultivated state.

XIII. ERICA'LA (meaning unknown to us). Renealm. specim. p. 75. t. 68. Ericoìla, Borkh. in Rœm. arch. 1. p. 27. Gentiàna species of authors. Hippion species of Schmidt.

Lin. syst. *Pentándria, Digýnia.* Calyx 3-5-cleft. Corolla funnel-shaped or salver-shaped, 8-10-cleft; the alternate segments usually smaller, entire, bifid or fringed, but never bearded. Stamens 4-5; filaments filiform. Anthers incumbent, linear

or oblong-linear. Stigma 2-lobed or bifid, minutely papillose. Capsule pedicellate. Seeds small, oblong or roundish, smooth. —Dwarf perennial or annual herbs. Leaves conduplicate. Radical leaves rosulate, imbricate: cauline ones opposite, decussate, sessile. Flowers terminal, usually solitary.

§ 1. *Perennial plants.*

1 E. ALPÌNA; corolla campanulate, about equal in length to the stem; leaves ovate, rather fleshy, obtuse, nerveless. ♃. H. Native of Dauphiny, in the Pyrenees, very plentiful. Gentiàna alpìna, Vill. dauph. 2. p. 526. no. 8. t. 10. D. C. fl. fr. suppl. no. 2770. α. Lodd. bot. cab. 476. Gent. acaúlis β, Frœl. gent. p. 57. var. γ, D. C. fl. fr. 2770. Pers. syn. 1. p. 285. Híppion alpìnum, Schmidt, in Rœm. arch. 2. p. 20.—Barrel. icon. t. 105. Leaves hardly twice as long as broad, almost round. Flowers solitary, erect, always longer than the stem, 12-14 lines long.

Alpine Ericala. Fl. May, July. Clt. 1817. Pl. ¼ foot.

2 E. ALTA'ICA (Borkh. in Rœm. arch. 1. p. 27.) stem shorter than the flower; radical leaves imbricated, compact; corolla funnel-shaped, 10-cleft; segments roundish: accessory ones roundish, jagged. ♃. H. Native of Altaia, near the limits of perpetual snow. Gentiàna Altàica, Pall. fl. ross. 2. p. 109. t. 97. f. 1. Frœl. gent. p. 62. Gent. grandiflòra, Laxm. comm. nov. petrop. 18. p. 526. t. 6. f. 1. Híppion Altàicum, Schmidt, in Rœm. arch. 1. p. 10. no. 2. Gent. longiflòra, Lam. ill. p. 485. no. 2115. Root simple, fibry. Leaves lanceolate, acutish. Flowers solitary. Segments of calyx lanceolate-acuminated, with a membranous white keel and margin. Corolla large, deep blue. Anthers yellow. Very nearly allied to *E. Pyrenàica*. Capsule obovate, pedicellate.

Var. β, *albiflòra* (Led. fl. alt. 1. p. 283.) flowers white, with 5 yellow stripes. ♃. H. Native of Siberia, in alpine places.

Altain Ericala. Fl. April, May. Clt. 1824. Pl. ¼ foot.

3 E. PYRENA'ICA (Borkh. l. c.) stem branched at bottom; leaves lanceolate-linear; flowers terminating the branches, solitary; corolla funnel-shaped, 10-cleft: accessory segments oblong, obtuse and crenulated at the apex. ♃. H. Native of the Pyrenees, and Caucasus. Gentiàna Pyrenàica, Lin. syst. 268. mant. 55. Willd. spec. 1. p. 1341. Frœl. gent. p. 63. Gouan. ill. 7. t. 2. f. 2. Waldst. et Kit. hung. t. 207. Híppion Pyrenàicum, Schmidt, in Rœm. arch. 1. p. 14. no. 1. Very nearly allied to *E. vérna*, but differs in the accessory segments being nearly equal in size to the others. Stem procumbent. Flowers length of branches. Sterile branches densely leafy. Radical leaves crowded, imbricated: cauline ones connately sheathing, acute, with white cartilaginous edges. Segments of calyx lanceolate, acute, with pale edges. Corolla pale green outside, with the limb deep blue above. There is a variety of this species with a 6-cleft corolla, with as many accessory segments, see D. C. fl. fr. no. 2775.

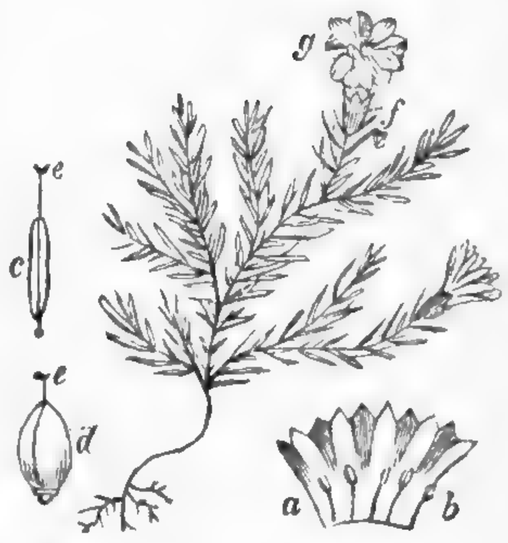
Pyrenean Ericala. Fl. April, July. Clt. 1825. Pl. ¼ foot.

4 E. PU'MILA (Borkh. in Rœm. arch. 1. p. 41.) stems 1-flowered; leaves linear-lanceolate, crowded, imbricate; corolla salver-shaped, 10-cleft; segments ovate, acute: the 5 accessory ones small, semi-bifid. ♃. H. Native of Carinthia, Austria, the Tyrol, Switzerland, &c., on the alps. Gentiàna pùmila, Lin. spec. p. 331. Jacq. vind. 215. obs. 2. p. 29. t. 49. austr. 4. t. 302. Frœl. gent. p. 81. Willd. spec. 1. p. 1345. Gent. vérna β, Lam. dict. 2. p. 639. γ. D. C. fl. fr. no. 2771. Híppion pùmilum, Schmidt, in Rœm. arch. 1. p. 10. Habit of *E. Pyrenàica* and *E. vérna*, but differs from both in the corolla. Lower leaves with subrecurved cartilaginous margins. Calyx pentagonally keeled, blueish. Corolla pale blue; accessory segments white.

Dwarf Ericala.

5 E. SEDIFÒLIA; plant tufted, procumbent; branches 1-flowered: flowers sessile; leaves lanceolate, acute, loosely imbricate; corolla funnel-shaped, 10-cleft; the accessory segments are almost equal to the others in size, all roundish ovate; calycine segments equal, linear-lanceolate, acute, with membranous, white edges; stigmas sessile, revolute at apex. ♃. F. Native on the Andes, about Quito Popayan. Gentiàna sedifòlia, H. B. et Kunth, nov. gen. amer. 3. p. 134. t. 225. Gent. cæspitòsa, Willd. herb. ex Rœm. et Schultes, syst. 5. p. 185. Leaves sessile, somewhat connate, nerveless, with diaphanous white edges. Calyx 3 times shorter than the corolla. Corolla size of *E. vérna*, blue. Capsule oblong, acute, compressed.

FIG. 21.



Stonecrop-leaved Ericala. Pl. procumbent.

6 E. TUBIFLÒRA; almost stemless, tufted; leaves crowded, mostly radical, rosulate, roundish-spatulate, sessile, small; flowers solitary, sessile, upon the tops of very short stems; calyx tubular: with triangular, acute teeth; corolla long, tubular, 10-cleft: the 5 regular segments ovate, rounded, mucronate; and the 5 accessory ones small, and also rounded. ♃. F. Native of Nipaul, at Gosainsthan. Gentiàna tubiflòra, Wall. cat. no. 4388. Flowers long, narrow, blue, large for the size of the plant. Margins of leaves cartilaginous. This is a pretty little plant.

Tube-flowered Ericala. Pl. small, tufted, 1 inch.

7 E. DEPRE'SSA (D. Don, mss.) stems 1-flowered; flowers sessile, radical; leaves lanceolate, mucronate, rosulate; of the surculi ovate; corolla campanulately funnel-shaped, 10-cleft; the 5 accessory segments ovate, erosely crenulated; the other 5 roundish, and mucronately awned. ♃. H. Native of Nipaul. Gentiàna depréssa, D. Don, prod. fl. nep. p. 126. Wall. cat. no. 4387. Root fibrous. Plant depressed, stemless, sometimes with many decumbent surculi. Leaves glaucous-green, 3-nerved, with cartilaginous edges, scabrous from papillæ. Calyx tubular, 5-cleft; with lanceolate, mucronulate keeled segments. Corolla an inch long, blue, with violaceous lines. Filaments flat, channelled. Ovarium fusiform, pedicellate. Style elongated. Stigmas lanceolate, mucronulate, approximate, papillose, as several other parts of the plant. Very nearly allied to *E. Altàica*.

Depressed Ericala. Pl. 2 inches.

8 E. CARINA'TA (D. Don, mss.) stem erect, terete, simple; leaves sessile, keeled at the base, linear-lanceolate, incurved; flowers aggregate, terminal; calycine segments linear, mucronate, with scabrous edges; corolla funnel-shaped, tubular, with a bearded throat, and a 10-lobed limb: the 5 accessory lobes sharply denticulated, much shorter than the other 5, which are lanceolate, acute. ♃. F. Native of Nipaul. Stem purplish. Leaves green, having the margins and keel cartilaginous. Filaments capillary. Stigmas revolute. Capsule cuneate-oblong, winged at apex.

Keeled-leaved Ericala. Pl. 1½ inch.

9 E. VENU'STA; stems procumbent or stoloniferous; leaves roundish-spatulate, obtuse, with cartilaginous edges; flowers sessile, terminal, 2-3 together, rarely solitary; calycine segments linear-lanceolate; corolla 10-cleft: the 5 regular segments roundish and crenated; and the 5 accessory ones small and bifid. ♃. F. Native of Kamaon. Gentiàna venústa, Wall. cat. no. 4389. Flowers blue.

Beautiful Ericala. Pl. procumbent.

10 E. angustifòlia; stem terete, simple, 1-flowered; leaves narrow-linear, spreading; corolla campanulate, with 5 ovate acute segments, and as many accessory small jagged ones. ♃. H. Native from New Jersey to Carolina, in meadows and near rivers, in sandy soil. Gentiàna angustifòlia, Michx. fl. amer. bor. 1. p. 177. Pursh, fl. amer. sept. 1. p. 186. Gentiàna purpùrea, Walt. fl. car. p. 109. Gentiàna porphýrio, Gmel. syst. p. 462. no. 37. Híppion Porphýrio, Schmidt. Calyx 5-cleft. Flowers large, azure blue, often 2 inches long. Capsule clavate, stipitate. Stigma bifid. Stems mostly simple, but sometimes 2-3-flowered.

Narrow-leaved Ericala. Pl. ½ to 1 foot.

11 E. quadrifa'ria; stem a little branched; flowers terminal, solitary, almost sessile; leaves imbricating in 4 rows, ovate, with cartilaginous edges, terminated each by a bristle; corolla funnel-shaped, 10-cleft. ♃.? G. Native of Java, on the higher declivities of Mount Gede. Gentiàna quadrifària, Blum. bijdr. p. 847. Nearly allied to *E. aquática* and *E. hùmile*.

Quadrifarious-leaved Ericala. Pl. ¼ foot.?

12 E. linea'ris; stem roughish; leaves linear-lanceolate, undulated, nerveless, ciliated, as well as the calyxes; flowers terminal, sessile, crowded; corolla campanulate, 5-cleft, with as many denticulated, accessory segments. ♃. H. Native of Pennsylvania and Virginia, on the mountains; and of the Arkansas. Gentiàna lineàris, Frœl. gent. p. 37. no. 11. Pursh, fl. amer. sept. 1. p. 186. Gentiàna pubérula, Michx. fl. bor. amer. 1. p. 176. Flowers large, blue. Segments of corolla blue.

Linear-leaved Ericala. Fl. Aug. Clt. 1816. Pl. ½ foot.

13 E. acu'ta; stems tetragonal, branched; leaves sessile, half stem-clasping, erect, oblong-ovate, very acute; flowers disposed in terminal and lateral fascicles; corolla 10-cleft: the 5 regular segments linear-lanceolate: and the 5 accessory ones small and ciliated. ⊙.? H. Native of Carolina and Canada, on high mountains. Gentiàna acùta, Michx. fl. bor. amer. 1. p. 177. Pursh 1. p. 186. Fertile branches much shorter than the sterile ones. Flowers very small, greenish yellow, on very short branches. "Flowers mostly solitary, axillary, and terminal, upon longish peduncles; calyx nearly divided to the base, 2 of the segments smaller than the others; corolla campanulate, 4-5-cleft, greenish purple; segments semi-ovate, acute; orifice ciliated:" ex Nutt. gen. 1. p. 172. Perhaps a species of *Erythàlia*, if Michaux' plant and Nuttall's be the same.

Acute-flowered Ericala. Pl. ¼ foot.

14 E. ve'rna (Borkh. in Rœm. arch. 1. p. 41.) stem branched at bottom; branches 1-flowered; leaves ovate, acutish: radical ones spreading, crowded; corolla salver-shaped, 5-cleft, with as many small bifid, accessory segments. ♃. H. Native throughout Europe, on the alps and mountains, and in humid meadows, as of Switzerland, Savoy, Piedmont, Austria, Carniola, &c. In England, in Teesdale Forest, Durham; and between Gort and Galloway, in Ireland. Gentiàna vérna, Lin. spec. p. 331. Willd. spec. 1. p. 1342. exclusive of Gent. Bavárica, Pall. Smith, engl. bot. 493. Curt. bot. mag. 491. Lodd. bot. cab. t. 62. Tratt. fl. austr. 1. t. 2. Mordant Delanay. 1. t. 1. Gentiàna prostràta, Schleich. Hall. helv. no. 644. Gent. serràta α, Lam. fl. fr. 2. p. 294. Híppion vérnum, Schmidt, fl. boh. no. 118. Rœm. arch. 1. p. 16. t. 3. f. 9.—Morr. hist. t. 5. f. 13.—Ger. emac. 436. f. 2. Gentianélla dúlcis, Gesn. in Schmidel. op. gesn. 2. p. 41. t. 22. f. 83. A. exclusive of Lin. name.—Barrel. icon. p. 98. t. 109. f. 1. Stigma finely serrated, saucer-shaped. Root creeping, Angles of calyx undulated. Segments of corolla roundish, obtuse. Corollas azure blue; accessory segments pale. Capsule fusiform, bursting when touched.

Var. β; stem hardly exceeding the corolla; segments of corolla acutely serrated. ♃. H. Native of the Noric alps, Carpathian mountains, as well as of Siberia, at the Baikal. Frœl. gent. p. 65. Gentiàna Bavárica, Jacq. obs. 3. p. 19. t. 71. Gent. vérna γ, Lam. dict. 2. p. 639. Gmel. syst. 461. Scop. carn. 1. p. 178.—Barrel. icon. 109. f. 2. Ericàla, Renealm. spec. p. 75. t. 68.

Var. γ, *elongàta* (Frœl. gent. l. c.) stem elongated, filiform, nearly naked, 1-flowered; calyx oblong, equal; radical leaves rosulate. ♃. H. Native of Austria. Gent. elongàta, Hænke, in Jacq. coll. p. 88. t. 17. f. 3.

Var. δ, *brachyphýlla* (Frœl. l. c.) leaves lanceolate-roundish, very short. ♃. H. Native of Dauphiny and Carinthia. Gentiàna brachyphýlla, Vill. dauph. 2. p. 258. no. 12. Barrel. icon. t. 103. f. 2.

Var. ε, *acutiflòra* (D. C. fl. fr. suppl. p. 427.) segments of corolla acute. ♃. H. Native of France.

Var. ζ, *ternifòlia;* cauline leaves 3 in a whorl.

Var. η, *álba;* corolla white.

Var. θ, *subacaúlis;* plant almost without a stem. ⊙. H. Native of Switzerland. Gent. vérna β, Wahl. helv. p. 47. Gent. pùmila, Sut.

Var. ι, *séxfidus;* corolla 6-cleft; calyx ventricose, tridentate. ♃. H. Híppion séxfidum, Schmidt, in Rœm. arch. 1. p. 15.

Spring Ericala. Fl. April, May. England. Pl. ¼ foot.

15 E. æstìva; stems short, 1-flowered; leaves oval, all equal, crowded; calyx ventricose; corolla funnel-shaped, 10-cleft: having the accessory segments small, bifid, and acute; stigma cup-shaped, deeply crenated. ♃. H. Native of Bohemia, Austria, and Bavaria, on the mountains, in meadows. Gentiàna æstìva, Rœm. et Schultes, syst. 6. p. 156. Híppion æstìvum, Schmidt, fl. boh. no. 119. Rœm. arch. 1. p. 16. t. 3. f. 8. Calyx more angular, and the stigma more deeply crenated than in *E. vérna*.

Var. β, *Terglovénsis* (Hacq. pl. alp. no. 4. t. 2. f. 3.) stemless; calyx short, pentagonal; accessory segments of corolla semibifid; stigma funnel-shaped, ciliated. ♃. H. Native of Terglove, near the ice.

Summer Ericala. Fl. June, July. Clt. 1818. Pl. ¼ foot.

16 E. Carpa'thica; leaves obovate, all sessile: cauline ones remote; flowers sessile; corolla 10-cleft, funnel-shaped; accessory segments unknown. ♃. H. Native of the Carpathian mountains. Gentiàna Carpáthica, Kit. in Schultes, fl. austr. ed. 2. no. 1008. Said to be nearly allied to *E. vérna*.

Carpathian Ericala. Pl. ¼ foot.

17 E. imbrica'ta; stems tufted, shorter than the flowers; flowers solitary; leaves ovate, acute, imbricated, with scabrous edges; corolla funnel-shaped, 10-cleft: having the accessory segments bifid. ♃. H. Native of Switzerland and Carinthia, on the tops of the alps. Gentiàna imbricàta, Frœl. gent. p. 74. Willd. spec. 1. p. 1344. Gent. Bavárica, Lam. dict. 2. p. 640.—Cam. hort. t. 15. f. 2.—Barrel. icon. t. 101. f. 2. ex Cam. Schmidel, op. gesn. 2. p. 43. t. 22. f. 84. This species appears to be intermediate between *E. Bavárica* and *E. prostràta*, but is very distinct from both. The tufts are more dense; lower leaves roundish. Limb of corolla broader than in *E. Bavárica*, deep blue; with ovate-lanceolate acute segments: the accessory one pale blue and rather large.

Imbricated-leaved Ericala. Fl. July, Aug. Clt. 1819. Pl. ¼ foot.

18 E. prostra'ta (Borkh. in Rœm. arch. 1. p. 41.) stem prostrate, filiform, leafy, about equal in length to the flower; leaves obtuse, crowded; corolla funnel-shaped, 10-cleft; the 5 accessory segments small and bifid. ♃. H. Native of Salzburgh, on the tops of the alps, Carniola, Unalaschka, Behring's Straits, Bay of St. Laurence, Aleutian Islands, &c. Gen-

tiàna prostràta, Hænke, in Jacq. coll. 2. p. 66. t. 17. f. 2. Tratt. fl. austr. fasc. 9. t. 8. Frœl. gent. p. 75. Willd. spec. 1. p. 1344. Híppion prostràtum, Schmidt, l. c. Very nearly allied to *E. Bavárica*, but all parts of the plant are more slender and the flowers much smaller; calyx less angular; segments of corolla lanceolate, acute, of a watery blue colour.

Prostrate Ericala. Pl. 1 to 2 inches.

19 E. angulòsa; stem shorter than the flower; leaves ovate, obtuse, 3-nerved: radical ones crowded, imbricate; calyxes keeled; corolla salver-shaped, 10-cleft; segments ovate, obtuse; the 5 accessory segments small and bluntly bifid. ♃. H. Native of Caucasus, and the Carpathian mountains, in rather humid alpine places. Gentiàna angulòsa, Bieb. fl. taur. 1. p. 197. suppl. p. 190. cent. pl. rar. ross. 1. t. 47. Gent. vérna γ, angulòsa, Wahl. carp. no. 216. Gent. utriculòsa, Wahl. helv. no. 273. Gent. Bavárica, Pall. ross. 2. p. 110. exclusive of the syn. of Lin. Gent. uniflòra, Georgi, itin. 1. p. 203. t. 1. f. 2. Habit and stature of *E. nàna*, but the flowers are larger, ānd the calyxes bladdery.

Angular-calyxed Ericala. Fl. April, June. Clt. 1824. Pl. ¼ foot.

20 E. Bava'rica (Borkh. in Rœm. arch. 1. p. 41. Schmidel, op. gesn. 2. p. 43. t. 27. f. 85.) stems 1-flowered; leaves ovate, obtuse: radical ones crowded, imbricated, larger than the cauline ones; corolla funnel-shaped, 10-cleft; segments entire, or slightly serrated: the accessory ones small, horn-formed. ♃. H. Native of middle Europe, on the alps. Gentiàna Bavárica, Lin. spec. 331. Vill. dauph. 2. p. 527. t. 10. exclusive of the syn. of Jacq. Hænke, in Jacq. coll. 2. p. 75. no. 32. Gentiana serpyllifòlia, Lam. dict. 2. p. 640. Pers. ench. 1. p. 285. Hall. helv. no. 645. Híppion Baváricum, Schmidt, bohem. no. 120. and in Rœm. arch. 1. p. 17. t. 4. f. 12. Gentiàna prostràta, Funk.—Barrel. icon. 101. f. 1.—Cam. hort. p. 65. t. 15. Differs from *E. vérna*, in the leaves being obtuse, not acute. Corolla deep blue. Ovarium pedicellate. Stigmas 2, downy.

Var. β, imbricàta; flower exceeding the stem; radical leaves crowded, roundish. ♃. H. Native of the alps of Salzburgh and Carinthia. Frœl. gen. p. 71. Gentiàna imbricàta, Schleich, ex D. C. fl. fr. suppl. p. 427. no. 2772.

Var. γ, elongàta; stem elongated, 3-4 inches long. ♃. H. Frœl. gent. l. c.

Var. ε, albiflòra; corollas white. Frœl. l. c.

Bavarian Ericala. Fl. July. Clt. 1775. Pl. ¼ foot.

21 E. crucia'ta (Borkh. in Rœm. arch. 1. p. 27.) stems ascending, terete, 2-edged at the base; leaves broad-lanceolate, 3-nerved; flowers terminal, and axillary, crowded, nearly sessile; calyx 4-toothed, unequal; corolla tubularly campanulate, 8-cleft: having the 4 regular segments acute: and the 4 accessory ones small, acutely bifid or jagged. ♃. H. Native of middle Europe, in dry, exposed, mountainous places; as well as of Caucasus and Siberia. Gentiàna cruciàta, Bauh. pin. 188. Lin. spec. 334. Jacq. austr. 4. t. 372. Pall. ross. 108. Híppion cruciàtum, Schmidt, in Rœm. arch. 1. p. 11. Mayerhoff, fl. mon. t. 153. Tretrorrhìza Renealm, specim. 74. t. 73. Hérba fullònum, Brunf. 2. p. 52.—Ger. emac. 433. f. 4.—Mor. hist. t. 5. f. 16. Leaves connate at the base. Bracteas length of flowers. Calyx cleft on one side. Corolla with a pale tube, widened upwards, and a pale blue limb, dotted with green in the throat. Capsule oblong. This species differs much in habit from the rest; and has much the appearance of *Gentiàna macrophýlla*. Seeds oblong, smooth.

Var. β, mìnor (Cam. epit. 417.)

Var. γ; stem humble; flowers smaller; segments of corolla acute. ♃. H. Frœl. gent. p. 28.

Crosswort Ericala. Fl. June, July. Clt. 1596. Pl. ½ foot.

22 E. spatha'cea; stem erect, simple, nearly terete; leaves lanceolate or oblong-lanceolate, subconnate, acute, approximate; flowers terminal, sessile, crowded; calyx 5-toothed, cleft on one side; corolla funnel-shaped; limb 10-cleft: the larger segments roundish, obtuse, and the accessory ones shorter and bifid?; stigma undivided, at length 2-lobed. ♃. H. Native of Mexico, on the eastern declivities of mountains, near Xalapa. Gentiàna spathàcea, H. B. et Kunth, nov. gen. amer. 3. p. 135. no. 15. Gent. plicàta, Willd. reliq. mss. Leaves 3-nerved, membranous. Flowers erect, size of those of *Gentiàna cruciàta*, blue. Ovarium sub-clavate, compressed. Style short.

Spathaceous-calyxed Ericala. Pl. 1 foot.

§ 2. *Annual plants.*

23 E. utriculòsa (Borkh. in Rœm. arch. 1. p. 27.) stem branched; branches alternate, 1-flowered; calyx carinately winged; radical leaves rosulate, ovate: cauline ones spatulate; corolla salver-shaped, 10-cleft: the segments linear-lanceolate, acute, and entire: the accessory ones bifid; stigma cup-shaped, crenated, nearly as in *E. vérna*. ☉. H. Native from the Baltic to the Mediterranean, in mountain pastures and subalpine places. Gentiàna utriculòsa, Lin. spec. 332. Frœl. gent. p. 69. Willd. spec. 1. p. 1343. Hall. helv. 646. Waldst. et Kit. hung. t. 206. Híppion utriculòsum, Schmidt, in Rœm. arch. 1. p. 11.—Barrel. icon. 18. t. 48. f. 2. not 1.—Column. ecphr. t. 221. Stem and branches obsoletely tetragonal. Corollas beautiful blue; tube whitish, striped with blue. Seeds scabrous. This species is easily recognized by the 5 prominent wings of the calyx, and the salver-shaped corolla. Root fusiform, yellow.

Var. β, ramòsa; stem branched at the base; branches elongated, 1-flowered. ☉. H. Native on mount Baldo. Frœl. gent. l. c.

Var. γ, uniflòra: stem simple, dwarf, 1-flowered. ☉. H. Frœl. l. c.

Var. δ, albiflòra; corolla white.

Bladdery-calyxed Ericala. Fl. April. Clt. 1822. Pl. ⅓ ft.

24 E. niva'lis (Borkh. in Rœm. arch. 1. p. 27.) stem simple or branched; branches alternate, 1-flowered; radical leaves crowded, ovate, acutish: cauline ones lanceolate; calyx tubular, 5-toothed, with acute, hardly keeled angles; corolla funnel-shaped, 10-cleft; the accessory segments bifid. ☉. H. Native of Europe, from Lapland to the Pyrenees, and Italy, on the alps. In Scotland, as on Ben Lawers. Gentiàna nivàlis, Lin. spec. 286. Frœl. gent. 1. p. 83. Willd. spec. 1. p. 1344. Smith, engl. bot. 896. Wahl. lapp. p. 68. helv. p. 48. Oed. fl. dan. 17. Hall. helv. no. 647. t. 17. enum. no. 218. t. 7. f. 5. Mor. t. 5. f. 3. Stem and branches tetragonal. Leaves elliptic: radical ones acute?. Corollas salver-shaped, blue, greenish outside. Calycine segments acuminated.

Var. β, mínima; stem branched, filiform; leaves very short. ☉. H. Native of Dauphiny. Gentiàna mínima, Vill. dauph. 2. p. 19. t. 11. f. 6.—Barrel. icon. 103. f. 2.

Var. γ, hùmile; stem humble, usually 1-flowered; leaves very short, ovate, obtuse. ☉. H. Native of Europe and Labrador. Frœl. gent. l. c. exclusive of the syn. of Vill. Híppion nivàle, Schmidt, in Rœm. arch. p. 19. t. 11. f. 6.—Barrel. icon. 103. f. 2.

Var. δ, albiflòra; corollas white.

Snowy Ericala. Fl. Aug. Scotland. Pl. ¼ foot.

25 E. squarròsa; stem dichotomously branched, beset with divaricate, glandular hairs; flowers sessile, several together; leaves remote, attenuated at both ends; calycine teeth spreading, mucronate; corolla funnel-shaped, 10-cleft: the 5 alternate or accessory segments small and bidentate. ☉. H. Native of Siberia, on dry schistous mountains, at the rivers Kerlyk and Kan. Gentiàna squarròsa, Led. mem. acad. sc. petersb. 5.

p. 527. no. 13. ill. fl. ross. t. 14. Gent. aquática, Bieb. suppl. p. 92. Gent. aquática, var. γ, Frœl. gent. p. 77.—Corolla blue, hardly exceeding the calyx. Stigmas sessile, revolute.

Squarrose Ericala. Pl. ¼ foot.

26 E. aqua'tica (Borkh. in Rœm. arch. 1. p. 27.) stem coarctate, erect, branched; flowers terminal, sessile; leaves obovate, imbricated, keeled, mucronate, cartilaginously margined; teeth of calyx adpressed, acute; corolla funnel-shaped, 10-cleft; the accessory segments small, bifid ?. ⊙. H. Native of Siberia, in sandy, alpine meadows. Gentiàna aquática, Lin. amœn. 2. p. 343. spec. 332. mosc. 3. p. 258.—Gmel. sib. 4. p. 110. no. 76.—Híppion aquáticum, Schmidt, in Rœm. arch. 1. p. 10. no. 12. Stem beset with glandular hairs. Calyx with 5 winged angles. Corolla pale azure blue. Capsule clavate, elongated. Stigmas obtuse. Thecapodium equal in length to the calyx.

Aquatic Ericala. Pl. ¼ foot.

27 E. Loureìri; stems tufted, simple, 1-flowered; leaves lanceolate; calyx acutely 5-cleft; corolla funnel-shaped, 5-cleft: the accessory segments smaller and plicate; stigmas sessile, revolute. ⊙. H. Native of China, in humid places about Canton. Gentiàna aquática, Lour. coch. 172. but not of Lin. Corollas blue, terminal, solitary.

Loureiro's Ericala. Pl. ¼ foot.

28 E. Thunbe'rgii; stem simple, 1-flowered; leaves with membranous edges: radical ones, ovate, acute, crowded: cauline ones ovate, minute, connate, ovate-oblong; calyx with 5 membranous angles; corolla funnel-shaped, 10-cleft, sessile: the accessory segments smaller and plicate. ⊙. H. Native of Japan. Gentiàna aquática, Thunb. jap. p. 115. Corolla blue.

Thunberg's Ericala. Pl. ¼ foot.

29 E. nu'tans; leaves spatulate, mucronate, connately sheathing, remote; flowers numerous, pedunculate, nutant; corolla 10-cleft, twice as long as the calyx; calycine teeth adpressed; capsule cylindrical, sub-truncate; having thecapodium exceeding the corolla. ⊙. H. Native of Siberia, on the tops of the Alps, against the river Tschuga, in humid places. Gentiàna nùtans, Bunge, in Ledeb. fl. alt. 1. p. 284.

Drooping-flowered Ericala. Pl. ¼ foot.

30 E. Royle'na; stem much branched, filiform, slender, flexuous; flowers numerous, solitary, pedicellate; radical leaves large, ovate, mucronately awned, spreading, flat, 3-nerved, glaucous beneath: cauline ones linear-lanceolate, mucronate: having the top of the keel and edges cartilaginously and minutely denticulated; corolla tubular, 10-cleft; the accessory segments obtuse, bidentate, much smaller than the other 5, which are lanceolate, acuminated. ⊙. H. Native of Nipaul; and the Himalayah, at a place called Khoree Pass, Royle. Gentiàna decémfida, D. Don, prod. p. 127. Gentiàna Royleàna, Wall. cat. no. 4393. Gentiàna ripària, Ham. herb. Root simple, fibrously branched. Calyx tubular, with long, subulate, setaceously mucronate, equal segments. Corolla twice longer than the calyx. Filaments capillary. Anthers incumbent. Ovarium stipitate, 2-edged, cuneated. Stigmas revolute, nearly terete, minutely papillose.

Royle's Ericala. Pl. ¼ to ½ foot.

31 E. margina'ta (D. Don, mss.) stem erect, branched; leaves sessile-lanceolate, mucronulate; with cartilaginous edges; flowers sessile, fascicled; corolla tubular, 10-cleft: the 5 alternate or accessory segments a little smaller, entire, acute: the other 5 obtuse. ⊙. F. Native of Nipaul, Kamaon, Silhet, &c. Gentiàna pedicellàta, Wall. cat. no. 4394. ? confused with *Gentiàna coronàta*. Root simple, branched at the base. Leaves coriaceous, nerveless. Bracteas similar to the leaves. Teeth of calyx ovate-lanceolate, mucronate, with scarious edges. Corolla azure blue. Filaments flattened. Ovarium fusiform, membranous. Style elevated; stigma 2-lobed; lobes flat, obtuse, minutely papillous. Habit of *Gentiàna Ròylei*, if Wallich and Royle's plant be the same.

Marginate-leaved Ericala. Pl. 1 to 2 inches.

32 E. hu'milis; stem much branched at the base; branches simple, 1-flowered; leaves oblong-lanceolate, imbricated; with white cartilaginous edges; calyx 5-angled, with erect, acute teeth; corolla funnel-shaped, 10-cleft: with lanceolate acute segments, the 5 accessory ones rather the smallest. ⊙. H. Native of eastern Caucasus, and Siberia, on the mountains, in humid, grassy places. Gentiàna hùmilis, Stev. mem. soc. mosc. 4. p. 258. Bieb. suppl. p. 191. G. aquática, Pall. fl. ross. 2. t. 97. f. 2. G. aquática β, Caucásica, Cav. hort. gorenk. 1812. p. 28. Gent. aquática β, Frœl. gent. p. 77. Gentiàna hùmilis aquática vérna, Amm. ruth. t. 1. f. 1. Root slender, white. Leaves glaucous, green: lower ones largest and rounder, becoming narrower and acuter as they ascend: cauline ones sheathing. Corolla blue, twice as long as the calyx. Teeth of calyx equal in length to the tube of the corolla. Capsule obovate. Very nearly allied to *E. aquática*.

Humble Ericala. Fl. April. Clt. 1824. Pl. ¼ foot.

33 E. fla'va; stems numerous, 1-flowered; leaves lanceolate, imbricated: radical ones elliptic, rosulate; corolla funnel-shaped, 10-cleft; having the 5 accessory segments small and emarginate. ⊙. H. Native of Bohemia, about Morgenstern. in dry places. Gentiàna flàva, Mayer, abh. bohem. gesselsch. 1785. p. 46. t. 1. f. 1. Schultes, oestr. fl. 2d. ed. no. 1012. Híppion imbricàtum, Schmidt, bohem. 2. p. 117. Rœm. arch. 1. p. 15. Calyx ventricose, yellowish. Corolla deep yellow, with short, subulate, spreading segments. Stigmas yellow. Said to be intermediate between *E. vérna* and *E. prostràta*.

Yellow-flowered Ericala. Pl. 1 inch.

34 E. Douglasia'na; stem branched, angular; cauline leaves sessile, broad-ovate, somewhat cordate: radical ones rosulate; flowers white, pedicellate, by threes from the tops of the branches and stem; corolla campanulate, 10-cleft, the 5 accessory segments small and bifid, the others lanceolate, bluntish. ⊙. H. Native of the island of Sitcha, and in north-west America. Gentiàna Douglasiàna, Bongard, in mem. acad. petersb. 2. p. 156. Root perpendicular, fibry. Calyx campanulate, with lanceolate, acute segments. Corolla white, twice as long as the calyx. Anthers oblong. Stigma sessile, 2-lobed. Ovarium oblong, compressed.

Douglas's Ericala. Pl. ½ to ¾ foot.

35 E. argе'ntea (D. Don, mss.) plant of a cinereous grey colour, fascicled or tufted, stemless; leaves and calyxes lanceolate, setaceously mucronate, keeled, recurved, with scariously membranous edges; flowers sessile, terminal, aggregate, bracteate; corolla length of calyx, 10-lobed: the 5 accessory segments ovate, obtuse, entire, membranous, smaller than the other 5, which are ovate, acuminated, having their margins involute above. ⊙. H. Native of the Himalaiah. Gentiàna argéntea, Royle, mss. Root filiform, descending, fibrously branched at the base. Plant composed of very short, crowded, leafy branches. Leaves crowded, recurvedly spreading, silvery, with white, finely serrulated edges. Calyx tubular; segments and bracteas lanceolate, mucronate, recurved. Filaments subulate. Anthers incumbent. Ovarium cuneate, oblong, sessile. Style elongated. Stigmas obtuse.

Silvery Ericala. Pl. 1 inch.

36 E. procu'mbens (D. Don, mss.) plant green, annual, of many procumbent stems; leaves lanceolate, mucronate, emarginate, flat: radical ones large, 3-nerved: cauline ones smaller; flowers subaggregate, terminal; calycine segments lanceolate, mucronate, recurved; corolla tubular, 10-cleft, longer than the calyx;

5 of the lobes ovate, acute, and the 5 accessory ones roundish and very short; capsule cuneate-compressed, winged at top. ⊙. H. Native of Nipaul. Gentiàna procúmbens, and G. radicàta, Royle, mss. Plant tufted; stems filiform, leafy, procumbent, 1-2 inches long. Flowers on short pedicels. Filaments subulate. Style short; stigmas semicylindrical, revolute. Capsule pedicellate: wings crested.

Procumbent Erycala. Pl. procumbent.

37 E. capita'ta (D. Don, mss.) stems simple, angular; angles winged; leaves ovate, petiolate, mucronulate, nerveless; flowers in dense terminal fascicles, sessile; calycine segments ovate, keeled, mucronate, recurved, with scarious edges; corolla funnel-shaped, 10-lobed: the 5 accessory lobes very short, and crenated: the other 5 ovate, mutic, capsule cuneated, crested at top. ⊙. H. Native of Nipaul. Gentiàna capitàta, D. Don, prod. fl. nep. p. 126. Gent. congésta and G. capitàta, Royle, mss. Roots fibry. Bracteas ovate, foliaceous, involucrating, sessile, mucronate. Flowers size of those of *Eurythàlia campéstris;* pale blue. Filaments capillary. Stigmas semicylindrical, revolute.

Capitate-flowered Erycala. Pl. ¼ foot.

38 E. corona'ta (D. Don, mss.) plant depressed, tufted, almost stemless; leaves lanceolate, acute, obsoletely 3-nerved, sessile, spreading, with cartilaginous edges; flowers aggregate, sessile, involucrated by lanceolate bracteas; calycine teeth ovate, mucronate, with scarious edges; corolla tubular, 10-cleft, crowned by a fringed ring; segments nearly equal, ovate, mucronulate. ⊙. H. Native of the Himalaiah, Royle. Gentiàna coronàta, Royle, mss. Roots filiform, branched. Bracteas connate at the base, membranous. Corolla longer than the calyx. Filaments subulate. Anthers oblong. Ovarium sessile. Style elongated. Stigmas semicylindrical, revolute.

Crowned-flowered Erycala. Pl. 1 inch, tufted.

39. E. orbicula'ta; stem tetragonal, paniculately branched at top; leaves roundish, pungently mucronate, recurved, with thick cartilaginous edges; flowers panicled, solitary, sessile, at the tops of small branches; calycine segments lanceolate, pungently mucronate, as also the segments of the corolla; accessary segments of corolla small. ⊙. H. Native of East Indies. Gentiàna orbiculàta, Heyne, herb. ex Wall. cat. no. 4395. Flowers small, blue. Habit of a species of *Triptilion*.

Orbicular-leaved Erycala. Pl. ¼ to ½ foot.

Cult. The species are small alpine plants, bearing blue flowers, which are large in comparison to the size of the plants. They should be grown in small pots, well drained with sherds, in rich light mould, or a mixture of peat, sand, and loam, and placed among other alpine plants. They are either increased by dividing at the root, or by seed, which should be sown as soon as ripe. The annual kinds require the same treatment as the perennial species.

XIV. PNEUMONA'NTHE (from *πνευμων, pneumon,* the lungs; and *ανθος, anthos,* a flower: used in disorders of the lungs.) Cord. hist. 1. p. 162. f. 2. Lob. icon. 309. Ger. emac. 438. Cyàna Renealm. specim. 69. t. 63.—Gentiàna species of Lin. and others. Pneumonánthe species, Schmidt. Dasystéphana species, Borkh. in Rœm. arch. Ciminàlis species, Borkh. l. c.

Lin. syst. *Monadelphia Pentandria.* Calyx 5-cleft. Corolla companulate, or funnel-shaped; 10-cleft, the 5 alternate segments usually small, bifid, or fringed. Stamens 5; anthers combined into a tube, or free; filaments flattened. Stigma 2-lobed or bifid. Capsule 1-celled, 2 valved: seeds angular, oblong. —Glabrous herbs. Leaves opposite, decussate. Flowers terminal, solitary or crowded.

§ 1. *Anthers combined. This section contains the true species of the genus.*

1. P. acau'lis (Schmidt, in Rœm. arch. l. c.) stems tetragonal, 1-flowered; radical leaves crowded, imbricated; corolla campanulate, 5-cleft; segments obtuse, mucronate, having as many small accessory segments. ♃. H. Native of the Alps of middle Europe, as of Austria, Hungary, and France, as well as of Siberia. Gentiàna acaúlis, Lin. spec. p. 330. Frœl. gent. p. 57. Willd. spec. 1. p. 1340. Jacq. austr. 2. t. 135, and 125. Smith, engl. bot. t. 1594. Curt. bot. mag. t. 52. Gentiàna grandiflòra, Pers. ench. 1. p. 285. Gentiàna acaúlis, var. *α*, grandiflòra, Lam. dict. 2. p. 637, no. 9. Ciminàlis acaúlis, Borkh. in Rœm. arch. 1. p. 26. Ciminàlis longiflòra, Mœnch, meth. p. 514. Ciminàlis grandiflòra, Mayerhoff, fl. mon. t. 37.—Schmidel, op. gesn. 2. p. 44. t. 27. f. 86.—Barrel. icon. t. 37. Flowers very large, blue, 2 inches long, with 5 yellow marks inside. Stigma orbicular, finely crenulated. Capsule semibifid. There are 5 melliferous tubercles at the base of the ovarium. Leaves with cartilaginous margins.

Var. β, grandiflòra (Lam. dict. l. c.) plant very dwarf; leaves) 1-nerved. ♃. H. Gentiàna acaúlis *β*, Frœl. gent. l. c. Thylactìtes, Renealm, specim. p. 70. t. 68. f. 3.

Var. γ, cauléscens (Lam. dict. 2. p. 638. no. 10.) corolla oblong-campanulate, shorter than the stem; cauline leaves shorter than the internodes. ♃. H. Frœl. gent. l. c. exclusive of the synonyme of Villars. Gentiàna acaúlis *δ*. D. C. fl. fr. no. 2770.—Barrel. icon. t. 106.—Bocc. mus. 2. t. 6.

Var. δ, angustifòlia (Rœm. et Schultes, syst. 6. p. 152.) leaves oblong-linear, nerveless: corolla campanulate, exceeding the stem. ♃. H. Gentiàna angustifòlia, Vill. dauph. 2. p. 526. no. 7. Gent. acaúlis, Lin. and Willd. ex D. C. fl. fr. no. 2770. Pneumonánthe angustifòlia, Schmidt, in Rœm. arch. 1. p. 14. no. 10.—Lob. icon. 310.—Barrel. icon. t. 110. f. 2.

Var. ε, biflòra; stem 2-flowered. ♃. H. Bauh. hist. 3. p. 523.

Var. ζ, albiflòra; corollas white, or nearly so. ♃. H. Seg. pl. ver. 3. p. 91.

Var. η, variegàta; leaves variegated.

Var. ϑ, flore-pleno; corollas double.

Stemless Calathian violet. Fl. March, May. Britain. Pl. ¼ foot.

2 P. vulga'ris (Schmidt, in Rœm. arch. 1. p. 10. no. 8.) stem tetragonal; leaves linear-spatulate, obtuse; flowers terminal and axillary, pedunculate; corolla funnel-shaped, 5-cleft, with acuminated segments. ♃. H. Native of Europe, from Norway to Sicily, Caucasus and Siberia, in low, humid meadows. In Britain, abundant in Lincolnshire and Yorkshire, in boggy parts of heaths. Found by Mr. Newtown between Clapham and Engleton; near Doncaster, by Mr. Tofield; near Milthorp, in Westmoreland, and in Lancashire, common; near Tunbridge, in Kent; on Longfield Downs, near Gravesend; near Greenhithe, Cobham, &c. in Kent; as well as at Lellingstone, and near Dartford, &c. Gentiàna Pneumonánthe, Lin. spec. 330. Smith, engl. bot. t. 20. Hall. helv. 641. Fl. dan. t. 269. Pall. ross. 2. p. 105. Bieb. fl. cauc. 1. p. 196. Plenck. icon. t. 160. Dreves and Hayne, 2. t. 7. Jaume, St. Hil. fasc. 42. t. 4. Gentiàna linearifòlia, Lam. fl. fr. 2. p. 298. Ciminàlis Pneumonánthe, Borkh. in Rœm. arch. 1. p. 26.—Schmidel. op. gesn. 2. p. 50. t. 28. f. 91.—Barrel, icon. t. 51. f. 2. t. 52. f. 1-2. and t. 122. f. 1. Gentiàna Calathiàna, Bauh. hist. 3. p. 524. f. 1. Root fibrous. Stems simple, tetragonal. Corolla deep blue, having the accessory segments small and green. At Barnaoul a tall, large-flowered, broad-leaved variety occurs.

Var. β; dwarf; leaves broader. ♃. H. Lam. dict. 2. p. 638. Schmidel. in op. gesn. 2. p. 50. t. 26. f. 90.—Barrel. icon. p. 51. right-hand figure.

Var. γ; leaves ovate, obtuse; stems 1½ foot high. ♃. H. Frœl. gent. 44.

Var. δ; stem usually 1-flowered. ♃. H. Schmidel, op. gesn. l. c. t. 28. f. 91.

Var. ε; corollas white. ♃. H. Frœl. gent. p. 44.

Var. ζ, *guttàta* (Sims, bot. mag. 1101. Pall. ross. 2. p. 211.) stems decumbent; leaves ovate-lanceolate, obtuse; segments of corolla dotted inside.

Var. η; corollas 4-cleft, with bluntish segments; accessory ones subdenticulated; leaves linear. ♃. H.

Var. ϑ, *ascéndens* (Schmidt, fl. boh. no. 115. exclusive of the synonymes), corollas 5-cleft, 5-toothed, sessile; leaves connate; linear-lanceolate; radical ones fasciculate. ♃. H. Native of Bohemia.

Common Calathian violet. Fl. Aug. Sept. Clt. Britain. Pl. ½ to 1 foot.

§ 2. *Anthers free, incumbent or erect. The greater number of the species contained in this section will be found probably to agree better with the genus Ericála than with Pneumonánthe.*

3 P. bicuspida'ta; stems numerous, procumbent, terete, leafy, 1-flowered; leaves sessile, linear, obtuse; calycine segments linear, lanceolate, mucronulate; corolla turbinately campanulate, 10-cleft; the 5 accessory segments small, bicuspidate, and the other 5 roundish, mucronate. ♃. H. Native of Mexico. Gentiàna assúrgens. Sesse, and Mocino. Habit of *P. vulgàris.* Stem purplish, 1-3 flowered. Lower leaves narrow-spatulate. Corolla blue. Filaments dilated. Anthers oblong, incumbent; cells loose at the base. Ovarium fusiform Style very short; stigmas semi-cylindrical, minutely papillose.

Bicuspidate-flowered Calathian violet. Pl. procumbent.

4 P. Michau'xii; stems terete; leaves linear-lanceolate, bluntish; terminal flowers in fascicles, axillary ones solitary, pedunculate; corolla campanulate, with roundish segments, the accessory ones small, and acutely unidentate. ♃. H. Native from Canada to Pennsylvania, on high mountains, near the borders of lakes and rivulets. Gentiàna Pneumonánthe, Michx. fl. bor. amer. 1. p. 176. Pursh. fl. amer. sept. 1. p. 185. Gent. pseùdo-pneumonánthe, Rœm. et Schultes, syst. 6. p. 146. Flowers large, dark blue.

Michaux's Calathian violet. Fl. Aug. Sept. Clt. 1800. Pl. ½ foot.

5 P. orna'ta; root composed of thick fleshy branches; stems terete, simple, numerous, ascending, 1-flowered; leaves lanceolate, obtuse, short, crowded, coriaceous; flowers solitary, sessile; calyx tubular, 5-cleft: segments obtuse, much like the leaves, with wide recesses; corolla funnel-shaped, with short, triangular, acute segments, having as many small ones between the larger ones. ♃. H. Native of Nipaul, at Gosainsthan. Gentiàna ornàta, Wall. cat. no. 4386. Corollas blue. Plant with the habit of *Pneumonánthe vulgàris.*

Decked Calathian violet. Pl. ¼ foot.

6 P. triflòra (Schmidt, in Rœm. arch. 1. p. 10. no. 15.) stem terete; leaves linear, obtuse: floral ones alternate, drawn out; flowers terminal, sessile, usually by threes; corolla campanulate, 10-cleft; the real segments sub-cordate, obtuse, slightly serrulated: the accessary ones small. ♃. H. Native of eastern Siberia, in alpine meadows beyond the Baical. Gentiàna triflòra, Pall. fl. ross. 1. p. 105. t. 93. f. 1. Frœl. gent. p. 38. no. 12. Dasystéphana triflòra, Borkh. in Rœm. arch. 1. p. 26. Superior leaves nearly 3 inches long. Calyx subspathaceous, unequally 5-cleft; segments linear, acute. Corollas pale blue.

Three-flowered Calathian violet. Fl. June, July. Clt. 1807. Pl. ½ foot.

7 P. adsce'ndens (Schmidt, in Rœm. arch. l. c.) stems procumbent, tetragonal; leaves linear; radical ones elongated, 3-nerved; terminal flowers usually by threes, sessile; axillary ones solitary, lower of these pedicellate; calyx cleft on one side, and 3-5-toothed on the other; corolla campanulate, 10-cleft, with broad acute segments: the 5 accessory ones very small and obtuse; stigmas acute. ♃. H. Native of Siberia, in dry, grassy, mountainous places. Gentiàna decúmbens, Lin. suppl. 174. Pall. ross. 2. p. 106. t. 94. Sims, bot. mag. t. 705. Frœl. gent. p. 43. no. 14. Gent. Pneumonánthe, Gmel. sib. 4. p. 103. t. 51. f. A. exclusive of the synonymes. Dasystéphana adscéndens, Borkh. in Rœm. arch. 1. p. 26. Radical leaves longer than the plant; ex Lin. Corollas large, blue. According to the figure in Bot. mag. the flowers are all pedunculate.

Var. α, *Pallàsii* (Led. fl. alt. 1. p. 281.) radical leaves narrower, shorter; stems ascending; calyx 5-toothed, foliaceous. ♃. H.

Var. β, *Geblèri* (Ledeb. l. c.) radical leaves broader, longer; stem erect; calyx spathaceous, nearly entire. ♃. H. Gentiàna Geblèri, Led. act. soc. nat. mosc. 7. consp. gen. gent. nos. 9-10.

Var. γ, *adscéndens;* stems simple, decumbent. ♃. H. Native of Siberia. Gentiàna adscéndens, Sims, bot. mag. t. 723. Flowers blue.

Ascending-stemmed Calathian-violet. Fl. July. Clt. 1799. Pl. decumbent.

8 P. frígida (Schmidt, in Rœm. arch. 1. p. 10. no. 11. t. 2. f. 2. Towns. trav. t. 13.) stems simple, tetragonal; leaves linear-oblong, obtuse, nerveless; flowers terminal, twin or tern, sessile; calyx tubular, 5-cleft, with linear-lanceolate, acutish segments; corolla campanulate, 10-cleft; with lanceolate-ovate, acute segments, which are rounded on one side; the accessory segments small and crenulated? stigma orbicularly-capitate. ♃. H. Native of Styria, on the Alps, and the Carpathian mountains. Gentiàna frígida, Hænke in Jacq. coll. 2. p. 13. Wulf. in Rœm. arch. 3. p. 341. Willd. spec. 1. p. 1337. Frœl. gent. p. 39. no. 13. with a figure. Wahl. carp. p. 72. Tratt. fl. austr. fasc. 7. t. 1. Radical leaves crowded. Corolla white, marked with fuscescent dots and stripes, or bluish. Stamens blue.

Frigid Calathian violet. Fl. June, July. Pl. ¼ foot.

9 P. a'lgida (Schmidt, in Rœm. arch. 1. p. 10.) stems obsoletely tetragonal, or nearly terete; leaves linear-lanceolate, 3-nerved; flowers terminal and lateral, pedicellate; calyx tubular, with linear segments; corolla campanulate, 10-cleft, with trigonal segments; the accessory ones small and serrated. ♃. H. Native of eastern Siberia, at the Jenessee, and the Baical, &c. as well as of the islands of Kamtschatka, and St. Lawrence, in humid places on the tops of mountains. Gentiàna álgida, Pall. fl. ross. 2. p. 107. t. 95. Gent. frígida β, Frœl. gent. p. 39. no. 13. Dasystéphana álgida, Borkh. in Rœm. arch. p. 26. Gent. punctàta var. Pall. itin. 3. append. p. 724. no. 82. t. L. f. 2. which is Gent. punctàta β, Gmel. syst. 5. p. 460. Gent. Romanzòvii Led. in act. sol. mosc. 7 consp. gent. 1812.—Gmel. sib. 4. p. 106. no. 75. Calyx purplish, membranous, cleft on one side, tetragonal, with unequal segments. Corolla large, milk coloured, marked with bluish dots and stripes, and the limb of a livid blue colour. This is said to be the same as Gentiàna frígida, by Cham. in Linnæa, 1. p. 174.

Var. β, dwarfer; corolla yellow, marked with blue spots. ♃. H. Frœl. gent. p. 39.

Algid Calathian violet. Fl. June, July. Clt. 1808. Pl. ¼ to ½ foot.

10 P. ge'lida; stems ascending, tetragonal; leaves lanceolate, 3-nerved; flowers axillary and terminal, aggregate: corolla campanulate, with bluntish segments; the 5 accessory ones short, and jagged. ♃. H. Native of Caucasus, particularly on mountains above Gandcha. Gentiàna gélida, Bieb. fl. taur. 1. p. 196. suppl. p. 188. Gent. alpìna, Adams, Hoffm. hort. mosc. 1808. no. 1487. Habit of *G. frígida*, or *P. septémfida.* Flowers size of those of *G. frígida;* cream-colour, or bluish.

Gelid Calathian-violet. Fl. June, July. Clt. 1807. Pl. ½ foot.

11 P. septe'mfida (Schmidt, l. c. no. 5.) stems tetragonal, erect, simple; leaves ovate-lanceolate, obtuse, approximate, 3-nerved; flowers terminal, 1-7, in a cluster; corolla funnel-shaped, 10 cleft, having the 5 regular segments roundish, mucronate; and the 5 accessory ones jagged; calyx tubular, 5 cleft. ♃. H. Native of the mountains of Persia, near the Caspian Sea; and on the Cherson Alps, in Tauria, and throughout Siberia, in alpine places. Calyx angled, angles ending in lanceolate foliaceous segments. Corolla having the tube almost cylindrical, widening upwards, of a greenish brown colour outside, but dotted inside. Limb azure blue. Filaments dilated in the middle.

Var. α, *impunctàta;* limb of corolla without any dots. ♃. H. Gentiàna septémfida, Pall. fl. ross. 2. p. 101. t. 92. f. 13. Sims, bot. mag. 1229. Frœl. gent. p. 47. no. 16. Willd. spec. 1. p. 1333. Bieb. fl. cauc. 1. p. 195.

Var. β, *punctàta;* limb of corolla dotted. ♃. H. Sims, bot. mag. 1410. Pneumonánthe septémfida, Schmidt, l. c. Eurythàlia septémfida, Borkh.

Seven-cleft-flowered Calathian-violet. Fl. June, July. Clt. 1804. Pl. ½ to 1½ foot.

12 P. sapona'ria (Schmidt, in Rœm. arch. 1. p. 10. no. 12.) stem terete; leaves oblong-lanceolate, 3-nerved; flowers in axillary and terminal fascicles, sessile; corolla campanulately ventricose, with 5 obtuse, entire segments, and 5 smaller accessory fringed ones. ♃. H. Native from Canada to Carolina, in low meadows and woods. Gentiàna saponària, Lin. spec. 330. Frœl. gent. p. 32. no. 8. Sims, bot. mag. 1039. Willd. spec. 1. p. 1338. Michx. fl. bor. amer. 1. p. 176. Pursh. fl. sept. amer. 1. p. 185. Gent. fimbriàta, Vahl. symb. 3. p. 47.—Mor. hist. 3. p. 484. sect. 12. t. 5. f. 4.—Plukn. alm. 186. f. 1. Flowers crowded, fine blue. Segments of corolla broader than long. Capsule fusiform. There is said by Frœlich to be a variety of this species collected in Carolina, with a slenderer stem, and lanceolate, membranous, obtuse, 3-nerved leaves, with only one terminal flower to each stem, and having the accessory segments of corolla less toothed.

Soapwort-like Calathian violet. Fl. Aug. Sept. Clt. 1776. Pl. 1-2 feet.

13 P. Catesbæ'i; stem terete, minutely downy, and somewhat scabrous; leaves short, elliptic-ovate, acute, with scabrous edges; flowers terminal, fasciculate; corolla 10-cleft, campanulate, somewhat ventricose or barrel-shaped; the 5 regular segments acutish, and the 5 accessory ones jagged. ♃. H. Native of North and South Carolina, in open grassy places. Gentiàna Catesbæ'i, Walt. fl. car. 109. Nutt. gen. amer. 6. p. 172. Ait. hort. Kew. ed. 2. vol. 2. p. 112. Gent. saponària Andr. bot. rep. t. 418.—Catesb. car. t. 70. Nearly allied to *P. saponària.* Flowers pale blue. Leaves sessile, rounded at the base.

Catesby's Calathian violet. Fl. Aug. Sept. Clt. 1803. Pl. ½ to 1 foot.

14 P. ochroleu'ca; stem terete, smooth; leaves ovate-lanceolate, smooth, 3-nerved; flowers disposed in sessile, terminal fascicles; corolla campanulately-ventricose, with 5 acute segments, and as many small, simple, acute, accessory ones; calycine segments longer than the tube of the corolla. ♃. H. Native from Pennsylvania to Florida, in dry, sandy fields, or gravelly hills. Gentiàna ochroleùca, Frœl. gent. p. 35. no. 9. Willd. spec. 1. p. 1338. Sims, bot. mag. 1551. Pursh, fl. sept. amer. 1. p. 185. Gent. villòsa, Lin. spec. 330. Frœl. gent. p. 36. no. 10. Willd. spec. 1. p. 1338. Gentiàna saponària, Walt. fl. car. p. 109. Michx. fl. bor. amer. 1. p. 176. Pneumonánthe villòsa, Schmidt, in Rœm. arch. 1. p. 10. no. 13.—Plukn. alm. t. 186. f. 1.—Grov. vir. p. 145. Flowers yellowish-green outside, but blue and striped with purple inside. Capsule ovate.

Cream-coloured flowered Eurythalia. Fl. Aug. Sept. Clt. 1803. Pl. 1 foot.

15 P. interme'dia; stems erect; leaves obovate-oblong, 3-nerved; flowers terminal, aggregate; calyxes foliaceous, unequal; corolla ventricose, barrel-shaped, 10-cleft; the 5 accessory segments small and simple, as in *P. ochroleùca.* ♃. H. Native of Virginia. Gent. intermèdia, Sims, bot. mag. 2303. Corolla barrel-shaped, as in *P. ochroleùca, P. saponària, P. gélida, P. frígida,* &c. Accessory segments simple and bifid. Anthers distinct. Calyx and corolla now and then 6-cleft. Corolla more or less whitish green outside, changing more or less to violet, internally streaked with violet.

Intermediate Calathian violet. Fl. Oct. Clt. 1820. Pl. ½ foot.

16 P. incarna'ta; flowers aggregate, terminal, barrel-shaped, with an unequally jagged border; leaves oval; petioles decurrent. ♃. H. Native of North America. Gentiàna incarnàta, Sims, bot. mag. 1856. Corolla pale blue at the base, limb white, tinged with green. Nearly allied to *P. saponària* and *P. ochroleùca,* especially with the latter.

Flesh-coloured flowered Calathian violet. Fl. Oct. Clt. 1812. Pl. ½ foot.

Cult. The species of this genus are all handsome border flowers; and *P. acaúlis* is well fitted for edgings to borders. They all grow best in a peat border; and are increased by division of the root, and by seed. Some of the rarer species may be grown in pots, and placed among other alpine plants.

XV. GLYPHOSPE'RMUM (from γλυφω, *glypho,* to engrave, and σπερμα, *sperma,* a seed; seeds beset with excavated dots). D. Don, mss.—Gentiàna species, Ruiz et Pav. in herb. Lamb.

Lin. syst. *Polygàmia, Dioècia.* Flowers polygamous. Calyx 5-cleft. Corolla tubular, with a 5-cleft limb and a naked throat. Stamens inserted in the throat of the corolla; filaments altogether adnate to the tube; anthers incumbent; cells loose at the base, and diverging. Ovarium fusiform, compressed, 1-celled, 2-valved; style hardly any; stigma capitate, 2-lobed; lobes very short, revolute, pruinose. Capsule membranous, 1-celled, dehiscing at apex, many seeded; placentas 2, very narrow; seeds round, rust coloured, full of excavated dots, disposed in a simple order.—Small, much branched, shrubs. Branches terete, scabrous, from papillæ. Leaves opposite, decussate, petiolate, lanceolate, coriaceous, with serrulated margins. Flowers copious, racemosely panicled at the tops of the branches; corollas small, violaceous. Flowers sometimes smaller and female with the rudiments of stamina; sometimes larger and hermaphrodite, on distinct plants. This genus has the habit of *Mitrasácme,* with scabrous branches.

1 G. viola'ceum (D. Don, mss.) branches scabrous from papillæ; leaves lanceolate, mucronate. ♄. S. Native of Peru. Gentiàna violàcea, Ruiz et Pav. mss. ex herb. Lamb. Calycine segments lanceolate, mucronate, 3-nerved. Corolla twice longer than the calyx; lobes roundish, crenulated.

Violaceous-flowered Glyphospermum. Shrub 1½ foot.

2 G. orna'tum (D. Don, mss.) branches glabrous; leaves ovate-oblong, obtuse. ♄. S. Native of Peru, at Guayaquil, Tafalla. Branches subtetragonal. Flowers larger than those of the first species, violaceous? Calycine segments ovate-lanceolate. Corolla twice longer than the calyx: with flat, roundish, quite entire lobes.

Decked Glyphospermum. Shrub 1½ foot.

Cult. For culture and propagation see *Tàchia,* p. 197.

XVI. SELA'TIUM (from *σελας, selas,* glittering: deep colour of the flowers). D. Don, mss.—Gentiàna, Ruiz et Pav. in herb. Lamb.

Lin. syst. *Pentándria, Digýnia.* Calyx semi-5-parted, membranous, with linear, acute, flat, erect segments. Corolla tubular, 5-lobed. Stamens 5, adnate to the base of the corolla; filaments dilated, flat, attenuated at apex; anthers incumbent. Ovarium fusiform, stipitate. Style very short; stigma 2-lobed: lobes flat, cuneate, dilated. Placentas 2; one-half shorter than the ovaria.—Perennial plants. Leaves opposite, sessile, veinless, with scabrous edges. Flowers terminal, subracemose, drooping.

1 S. coccíneum (D. Don, mss.) stems terete, ascending, branched, leafy; leaves linear-lanceolate, acute, veinless; flowers subracemose, drooping; corolla twice longer than the calyx. ♃. F. Native of Peru. Gentiàna coccínea, Ruiz et Pav. Leaves hardly an inch long, with roughish edges. Calycine segments ovate-lanceolate, acute. Corollas scarlet. Filaments channelled; anthers oblong. Ovarium oblong. Style hardly any.

Scarlet-flowered Selàtium. Pl. ½ to 1 foot.

2 S. foliòsum (D. Don, mss.) stem terete, simple, erect, leafy; leaves linear, acute; calycine segments linear, acute, erect, length of corolla; flowers terminal, fascicled, erect; filaments flat, dilated. ♃. F. Native of Peru, on the Cordilleras. Stem the thickness of a writing-quill. Leaves crowded in an interrupted manner, glabrous, 2 inches long, with scabrous edges: radical ones aggregate. Lobes of corolla ovate, acute. Pedicels bractless. Ovarium fusiform.

Leafy Selatium. Pl. ½ foot.

3 S. assu'rgens (D. Don, mss.) stem assurgent, terete; leaves lanceolate, bluntish, 3-nerved, with scabrous edges; flowers terminal, in heaps; peduncles bibracteate; corolla twice the length of the calyx, with ovate-lanceolate segments. ♃. F. Native of Guayaquil. Stem thickness of a writing quill. Leaves 1½ to 2 inches long. Pedicels filiform. Corollas yellow.

Assurgent Selatium. Pl. ½ foot.

4 S. thyrsoídea; stem simple, strong; leaves long, linear, acute; flowers aggregate, axillary, forming altogether a dense raceme; corolla campanulate, hardly exceeding the calyx. ♃. H. F. Native of Peru, at Huay-Huay, near Pasco. Gentiàna thyrsoídea, Hook, bot. misc. 2. p. 227. Root fusiform. Stem naked at top. Leaves 3-4 inches long. Flowers numerous. Anthers oblong, a little longer than the filaments. The plant turns black on drying.

Thyrsoid-flowered Selatium. Pl. 1 foot.

5 S. incu'rvum; stem naked at bottom and leafy at top; leaves elliptic, acute, 3-nerved; flowers axillary, aggregate at the top of the stem; corolla obovate, twice as long as the calyx: with obtuse incurved segments. ♃. F. Native of Peru, along with the preceding. Gentiàna incúrva, Hook, bot. misc. 2. p. 228. Corollas an inch long, yellow.

Incurved-flowered Selatium. Pl. ½ foot.

6 S. attenua'tum (D. Don. mss.) stem erect, terete; leaves linear-lanceolate, acuminated, many-nerved; peduncles angular, elongated, umbellate, bractless; calycine segments ovate-lanceolate; corolla tubular: lobes roundish; seeds roundish. ♃. F. Native of Peru. Leaves 1½ to 2 inches long, with scabrous edges. Pedicels slender, 4 to 5 together, in an umbel. Filaments dilated, channelled. Ovarium oblong. Stigma capitate, 2-lobed, pruinose.

Attenuated Selatium. Pl. 1 foot.

7 S. diffu'sum (D. Don, mss.) stem filiform, branched, diffuse, terete; leaves lanceolate, acute, 3-nerved, attenuated at the base, petiolate; peduncles usually by threes, angular, terminal; calycine segments ovate-lanceolate, acute; corolla rotate: with oblong, obovate, mucronate segments. ♃. F. Native of Peru, at Talcahuano. Root fusiform. Leaves subpetiolate, with scabrous edges. Filaments subulate. Anthers and ovarium oblong. Stigma sessile, 2-lobed, pruinose.

Diffuse Selatium. Pl. ½ foot.

8 S. multicau'lis (D. Don, mss.) stems numerous, ascending, tufted, filiform; radical leaves petiolate, spatulate: cauline ones linear-lanceolate, acutish; peduncles usually solitary, terminal; calyx turbinate: with lanceolate, mucronate segments; corolla funnel-shaped, deeply 5-cleft: lobes elliptic, obtuse, connivent. ♃. F. Native of Peru, Ruiz et Pav. Root long. Plant tufted. Radical leaves crowded, all scabrous on the edges. Corolla pale lilac, twice longer than the calyx. Filaments dilated at bottom. Ovarium fusiform; stigma sessile, 2-lobed.

Many-stemmed Selatium. Pl. tufted.

Cult. For culture and propagation see *Eudoxia*, p. 202.

XVII. ULO'STOMA (meaning unknown to us) D. Don. mss.—Gentiàna species, Ruiz et Pav. in herb. Lamb.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-parted: with ovate-lanceolate, acute segments. Corolla funnel-shaped, twice longer than the calyx; limb 5-parted; tube bearded with long hairs inside. Stamens 5; filaments dilated, attenuated at the apex; anthers incumbent. Ovarium fusiform. Stigma sessile, 2-lobed.—A perennial, herbaceous, tufted plant. Stems leafy, terete, erect. Leaves opposite, decussate, sessile, linear-lanceolate, acute, obscurely 3-nerved, with scabrous margins; radical ones aggregate. Flowers umbellate, white. ?

1 U. filamentòsa (D. Don, mss.) ♃. F. Native of Peru.

Thready Ulostoma. Pl. tufted, ½ foot.

Cult. For culture and propagation see *Eudoxia*, p. 202.

XVIII. SCHULTE'SIA (named in honour of Joseph Augustus Schultes, M.D. Professor of Botany at Landshut; author of Systema Vegetabilium.) Mart. nov. gen. 2. p. 103.

Lin. syst. *Tetrándria, Monogýnia.* Calyx tubular, 4-cleft, 4-winged; wings running out into erect subulate segments. Corolla salver-shaped; with an equal tube, a quadrifid limb, and naked throat. Stamens 4; filaments filiform: anthers erect, unchangeable in the dried state. Stigma bilamellate. Capsule 1-celled, 2-valved, many-seeded; seeds small, angular.—Slender, glabrous herbs. Stems tetragonal, simple or forked. Leaves sessile, opposite, decussate, lanceolate or linear. Flowers terminal, or in the forks. Pedicels continuous with the calyx. Corollas fine rose-coloured or yellow.

1 S. crenuliflòra (Mart. l. c. p. 104. t. 180.) stem erect, branched; leaves ovate-lanceolate, acute; flowers nearly sessile; wings of calyx broad, half-ovate; segments of corolla nearly orbicular, finely crenulated. ⊙. S. Native of Brazil, in the province of Bahia, in alpine, schistous places, near Villa do Rio de Contas. Corolla fine yellow, an inch long. Branches 1-2-flowered.

Notch-flowered Schultesia. Pl. 1½ foot.

2 S. gra'cilis (Mart. l. c. p. 105. t. 181.) stem straight, simple, or simply branched; leaves thin, erectish, acute: lower ones ovate-lanceolate: upper ones narrow-lanceolate; flowers solitary, on long peduncles, erect or drooping; wings of calyx narrow; segments of corolla almost square, spreading. ⊙. S. Native of Brazil, in the mine provinces, in mountain fields. Corolla rose-coloured; tube yellowish at the base.

Slender Schultesia. Pl. ½ to 1 foot.

3 S. Auble'tii; stem straight, simple, or a little branched; leaves lanceolate, attenuated, the lower ones shorter and acute; flowers solitary, terminal or axillary, on short peduncles; wings of calyx broad; segments of corolla obtuse, undulated, crenulated. ⊙. S. Native of Guiana, Cayenne, Maranham, Trinidad, &c. E'xacum Guianénse, Vahl. symb. 3. p. 16. Aubl. guian. 1. p.

68. t. 26. f. 1. Sebæ'a Guianénsis, Spreng. syst. 1. p. 426. Flowers pale red. Capsule 2-celled, 2-valved. Seeds minute.

Aublet's Schultesia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

4 S. stenophy'lla (Mart. l. c. p. 106. t. 182.) stem straight, simple or dichotomous; leaves lanceolate or linear, spreading; flowers erect, bifoliate at the base; wings of calyx narrow; segments of corolla, short, broad-ovate. ⊙. S. Native of Brazil, in the province of Pianhia, in moist meadows; and in like places, in the island of Cuba; and of Mexico, on the burning mount Jorullo. Erythræ'a Jorullénsis, H. B. et Kunth, nov. gen. amer. 3. p. 177. E'xacum Cubénse, Poepp. enum. pl. cub. exsic. Sebæ'a Jorullénsis, Spreng. syst. 1. p. 426. Stem 1-3-flowered, when 3 the middle flower is sessile. Corolla rose-coloured; or of a rose-purple colour.

Narrow-leaved Schultesia. Pl. $\frac{1}{4}$ to $1\frac{1}{2}$ foot.

Cult. The seeds of this species should be sown in pots in a mixture of gravel and peat, placing the pots in pans of water, and the plants afterwards thinned if too numerous.

XIX. CALLOPI'SMA (from *καλλος, kallos,* beauty; in reference to the beauty of the species.) Mart. nov. gen. bras. 2. p. 107.—Deianìra Schlecht. in Linnæa, 1. p. 196.

Lin. syst. *Tetrándria, Monogýnia.* Calyx campanulate, 4-parted; segments keeled. Corolla salver-shaped: with an equal cylindrical tube; a 4-parted limb; and a naked throat. Stamens 4; filaments subulate; anthers straight, birimose, opening by a double pore at the apex. Stigma exserted, 2-lobed. Capsule 1-celled, 2-valved, many-seeded; seeds small, oblong, or angular.—Glabrous, glaucous, almost simple herbs. Stems straight, terete. Leaves sessile or perfoliate, opposite, decussate, with pellucid margins: lower and upper ones the smallest, those under the inflorescence very short; inflorescence paniculately corymbose. Peduncles furnished with opposite bracteas. Corollas rose-coloured or white.

1 C. perfolia'tum (Mart. l. c. p. 108. t. 183.) stems simple; leaves ovate, or ovate-oblong, perfoliate and connate. ♃. S. Native of Brazil, in the province of St. Paul, and Minas Geraes, in elevated fields, at the altitude of from 1400 to 3000 feet. Corollas sometimes rose-coloured, and sometimes white. Radical leaves 5-nerved.

Var. α. angustifòlia (Mart. l. c.) plant smaller, slenderer; leaves lanceolate, acuter. ♃. S. Deianìra erubéscens, Schlecht. in Linnæa, 1. p. 196.

Var. β, latifòlia (Mart. l. c.) larger, more robust; leaves ovate, often obtuse. ♃. S. Deianìra palléscens, Schlecht, l. c.

Perfoliate Callopisma. Pl. $\frac{1}{4}$ to $1\frac{1}{2}$ foot.

2 C. amplexifòlium (Mart. l. c. p. 109.) stem simple or branched; leaves oblong-lanceolate, or narrow-oblong, sessile or half stem-clasping at the base. ♃. S. Native of Brazil, in the provinces of Minas Geraes and St. Paul, along with the preceding species. Deianìra nervòsa, Schlecht, in Linnæa, 1. p. 197. Corollas rose-coloured, larger than those of the preceding. Leaves $2\frac{1}{2}$ inches long.

Clasping-leaved Callopisma. Pl. $\frac{1}{4}$ to 1 foot.

Cult. For culture and propagation see *Tàchia* below.

XX. TA'CHIA (*Tachi* is the Guiana name of the first species, which name is said to mean an ants' nest; the trunk and branches are usually full of ants.) Aubl. 1. p. 75. Juss. gen. 142. Mart. nov. gen. bras. 2. p. 118.—Myrmècia, Schreb. gen. no. 177. Lisiánthus, Sal. par. under no. 34.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, 5-angled, 5-toothed. Corolla funnel-shaped: with a 5-cleft limb, and a wide naked throat. Stamens 5, exserted, reclinate; anthers oblong-sagittate, unchanged by drying. Stigma exserted, small, roundish, bilamellate. Capsule 1-celled, 2-valved, tumid; margins of valves bent into the central placenta, many-seeded; seeds small, viscid.—Shrubs or trees. Leaves opposite; petioles combined at the base into a sheath. Flowers lateral, axillary and terminal, yellowish, large.

1 T. Guiane'nsis (Aubl. guian. 1. p. 75. t. 29. Mart. nov. gen. bras. 2. p. 119.) shrubby, glabrous; branches tetragonal; leaves oblong, acuminated, attenuated at the base; flowers axillary, solitary, sessile; segments of corolla acute, revolute. ♄. S. Native of Guiana; and of Brazil, in the province of Rio Negro, in moist woods, at the river Japura. Myrmècia Tàchia, Gmel. syst. 247. Rœm. et Schultes, syst. 3. p. 163. Leaves 8 inches long, and 2-3 broad. Corollas yellow. The natives use the root, which is bitter, as a febrifuge. There are drops of a yellow pellucid gum from the axils of the leaves, beneath the flowers.

Guiana Tachia. Shrub 5-6 feet.

2 T. longifòlia (Mart. nov. gen. bras. 2. p. 118. in a note.) shrubby, downy; branches fastigiate, tetragonal; leaves lanceolate or oblong-lanceolate, acute, downy; flowers on short, axillary, and terminal pedicels; segments of corolla ovate-lanceolate, acute. ♄. S. Native of Jamaica, in woods. Lisiánthus longifòlius, Lin. syst. 197. Lam. ill. t. 107. f. 1.—Browne, jam. p. 137. t. 9. f. 1.—Sloan, jam. p. 58. hist. 1. p. 157. t. 101. f. 1. Leaves tapering into short petioles. Corollas yellow.

Long-leaved Tachia. Fl. June, July. Clt. 1793. Shrub 1-2 feet.

3 T. cordifòlia (Mart. l. c.) leaves cordate; flowers terminal, solitary or twin; segments of corolla lanceolate, acute. ♄. S. Native of Jamaica. Lisiánthus cordifòlius, Lin. syst. 193. mant. 43.—Browne, jam. p. 157. 2. t. 9. f. 2. Flowers yellow. P. Browne remarks that this plant may be deemed a variation of *T. longifòlia*, they being so much alike in habit, the form of the leaves is almost the only difference; that they are always cordate, the upper ones only being ovate and sessile; the corollas are also rather larger.

Heart-leaved Tachia. Fl.? Clt. 1816. Shrub 2-3 feet.

4 T. Swa'rtzii; shrubby, glabrous; branches terete; leaves on long petioles, lanceolate, acute at the base, and acuminated at the apex; peduncles trichotomously corymbose, axillary; segments of corolla ovate, acute, erect; stamens much exserted. ♄. S. Native of Jamaica, on the blue mountains. Lisiánthus exsértus, Swartz. prod. p. 40. fl. prod. occ. 1. p. 346. Corollas yellow.

Swartz's Tachia. Fl. June, July. Clt. 1793. Shrub 10 feet.

Cult. These are elegant shrubs when in blossom. They will grow freely in a mixture of peat and sand, mixed with a little loam; and cuttings strike root readily in sand under a hand-glass, in heat. The species are difficult to keep through the winter in this country, being very apt to damp off; but to prevent this, as much as possible, they should be kept rather dry in damp weather.

XXI. PREPU'SA (from *πρεπουσα, prepousa,* conspicuous; beauty of plant.) Mart. nov. gen. bras. 2. p. 120.

Lin. syst. *Hexándria, Monogýnia.* Calyx large, campanulate, 6-winged, 6-cleft, coloured. Corolla campanulate, 6-cleft, with a swoln tube, and a naked throat. Stamens 6, and as if they were emerging from a duplicature of the corolla. Stigma bilamellate. Capsule 1-celled, 2-valved, many-seeded; margins of valves inflexed, placentiferous; seeds nearly globose, many sided—An erect shrub, with fastigiate branches. Leaves opposite, decussate, crowded at the tops of the branches. Racemes terminal, leafy. Flowers showy.

1 P. monta'na (Mart. nov. gen. bras. 2. p. 121. t. 190.) leaves obovate, emarginate; branches obsoletely tetragonal at

tops; corolla 4 times higher than the calyx. ♄. S. Native of Brazil. Calyx of a yellow straw colour.

Mountain Prepusa. Shrub 8-10 feet.

Cult. See *Tàchia*, p. 197, for culture and propagation.

XXII. ORTHOSTE'MON (from ορθος, *orthos*, straight; and στημων, *stemon*, a stamen; stamens equal.) R. Br. prod. p. 451.

Lin. syst. *Tetrándria, Digýnia.* Calyx tubular, 4-toothed. Corolla with a short, 4-parted limb, and a naked throat, marcescent. Stamens equal, exserted; anthers dehiscing lengthwise, mutic at top, straight in the aged state. Stigmas 2, roundish.—A flaccid herb; with broadish leaves, and terminal flowers. This is an intermediate genus between *Canscòra*, Lam. the *Centaúrium*, Borkh, and *Erythræ'a*, but differs from them, in the limb of the corolla, and equal stamens, and in the anthers being straight, and the flowers being tetramerous.

1 O. ere'ctum (R. Br. l. c) stem straight; leaves broad-ovate, 3-nerved; lower ones petiolate; peduncles sub-corymbose; teeth of calyx hardly exceeding the tube of the corolla. ⊙. ? S. Native of New Holland, within the tropic. E'xacum eréctum, Roth. ex Spreng. syst. 1. p. 425. Habit of *Pládera virgata*.

Erect Orthostemon. Pl.

Cult. For culture and propagation see *Canscòra*, p. 199.

XXIII. CHLO'RA (from χλωρος, *chloros*, pale; because the flowers are of a pale yellow colour.) Renealm, specim. p. 80. t. 76. Schreb. gen. p. 653. Juss. gen. 142. Adans. fam. p. 503. Lam. ill. t. 296. Rchb. icon. 3. t. 206-209. and 5. p. 412.—Blackstònia, Huds. angl. ed. 1st. p. 146.

Lin. syst. *Octándria, Monogýnia.* Calyx of 8 narrow, spreading segments, rarely of 6. Corolla salver-shaped: tube shorter than the calyx, inclosing the ovarium; limb of 8, rarely of 6 deep equal segments. Stamens 8, rarely 6, shorter from the mouth of the tube; anthers linear, erect. Style erect, filiform; stigmas 2, cloven, ovate-oblong. Capsule ovate, with a furrow along each side, invested with the large membranous tube of the corolla, 1-celled, 2-valved; with inflexed edges. Seeds numerous, angular, minutely granulated, inserted in many rows along the inflexed margins of the valves.—Herbaceous, annual, smooth, glaucous, very bitter plants. Leaves opposite, sessile, or perfoliate, entire. Flowers terminal, stalked, aggregate or solitary, yellow.

1 C. perfolia'ta (Lin. syst. 361.) glaucous; leaves perfoliate; stem dichotomous, cylindrical; flowers corymbose, with a flower in each fork. ⊙. H. Native of Europe, in many places; in Britain, in chalky pastures or banks, and limestone and clay soils. Smith, engl. bot. t. 60. Hook. fl. lond. t. 2. Gentiàna perfoliàta, Lin. spec. 335. Sabbat. hort. t. 100.—Mor. hist. 2. p. 565. sect. 5. t. 26. f. 1-2.—Bauh. hist. 3. p. 355, with a figure.—Park, theatr. 273. 7. f. 272. 7.—Column. ecphr. 2. p. 78.—Cam. epit. p. 427. Root leaves oval, sessile, rosulate, the lower stem ones oval-lanceolate, the rest perfoliate. Flowers in a corymb of 2 forks, with a pedicillate flower in each fork. Calycine segments 8-10. Corolla golden yellow; segments sometimes 9, slightly emarginate. Stamens 6-9-10. Stigmas 2, shaped like a horse-shoe. Haller affirms that this plant is more bitter than the *Erythræ'a Centaúrium*, and that it seems to possess the same qualities.

Perfoliate-leaved, or Common Yellow-Wort. Fl. July, Aug. Britain. Pl. ½ to 3 feet.

2 C. imperfolia'ta (Lin. syst. 362. suppl. 218.) green; stem simple, tetragonal; leaves sessile, somewhat stem-clasping, ovate, acute; flowers terminal; calyx bifid beyond the middle, bell-shaped, length of the tube of the corolla; limb of corolla 6-cleft. ⊙. H. Native of the extreme parts of Italy. Chl. dúbia, Lam. ill. t. 296. f. 2. Segments of corolla oval. Anthers roundish beyond the tube. Stigmas 2, obtuse. Corolla deep yellow.

Imperfoliate-leaved Yellow-wort. Fl. June, July. Clt. 1823. Pl. 1 foot.

3 C. quadrifòlia (Lin. syst. 362.) stem simple, slightly tetragonal, jointed; leaves linear, 4 in a whorl, a little broader towards the ends, bluntish, length of internodes; flowers 8-cleft. ⊙. H. Native of the south of Europe, where it was found by Alstrœmer. Peduncles terminal, 5 together, each having 2 small, opposite, bracteas in the middle, and at the top 3 pedicellate flowers. Corolla yellow. Segments of corolla narrower than in *Chlòra perfoliàta*. Said to be a hybrid between *Chlòra perfoliàta* and *Lìnum quadrifòlium*.

Four-leaved Yellow-wort. Pl. 1 foot.

Cult. All the species are beautiful, and may be easily propagated from seeds, and require only common care in the cultivation. They do not seem to thrive in the open border, although they succeed very well in pots.

XXIV. HI'PPION (ιππος, *hippos*, a horse; and ιον, *ion*, a violet; horse violet.) Spreng. syst. 1. p. 505. gen. 1. p. 143. (1824.) E'xacum species, Smith. Gentiàna species, Plum. icon. t. 24.

Lin. syst. *Pentándria, Monogy'nia.* Calyx campanulate, viscid, 5-cleft; segments blunt, with membranous edges. Corolla salver-shaped; tube twice as long as the calyx, swelling at the base, and becoming ovate, where it is filled with the increasing ovarium, contracted at the orifice; limb 5-cleft, spreading, length of tube; segments obovate. Stamens 5, exserted, half as long as the border; filaments inserted in the orifice of the tube, leaning to the upper side of the flower, incurved at the apex; anthers incumbent, bifid at the base, remaining unchanged. Style declinate, glabrous. Stigma capitate, slightly cloven.—An erect, shrubby, glabrous, branched plant. Stem terete; branches slightly quadrangular. Leaves opposite, decussate, 5-nerved, reticulated, with veins, green, sessile, dilated into a cordate base. Panicles terminal, erect, trichotomously divided, many-flowered; pedicels terete, 1-flowered. Bracteas 2, at each division of the panicle, as well as 2 under each flower, formed like the leaves, but smaller, nerved. Flowers of an elegant golden colour, slightly drooping, of the size of those of *Chlòra perfoliàta*. Calyx and corolla clammy.

1 H. viscòsum (Spreng. syst. 1. p. 589.) ♂. G. Native of the Canary Islands. E'xacum viscòsum, Smith, icon. rar. t. 18. Gentiàna viscòsa, Ait. hort. kew. 1. p. 321. Sims. bot. mag. 2135.

Clammy Hippion. Fl. June, July. Clt. 1781. Pl. 1-2 feet.

Cult. This plant grows well in a mixture of peat and sand, and a very little loam. It is only to be increased by seeds, which ripen plentifully in our gardens.

XXV. CANSCO'RA (Kansjan-cora is the Malabar name of *C. perfoliàta*.) Lam. dict. 1. p. 601. Pladèra, Solander, mss. Roxb. fl. ind. 1. p. 416. Hook. bot. misc. 3. p. 89. Spreng. gen. 1. p. 84.—Centaúrum, Borkh. in Rœm. arch. 1. p. 28.—Hóppea, Willd. Hayne, term. t. 30. f. 3.

Lin. syst. *Tetrándria, Monogy'nia.* Calyx tubular, cylindrical or quadrangular, 4-toothed, with a contracted mouth. Corolla funnel-shaped, with a 4-cleft, unequal limb; the 2 upper segments equal, 2 lower ones combined a greater distance. Stamens 4; the 3 longest inserted in the mouth of the tube, the fourth just below the recess which separates the 2 lower segments. Filaments capillary. Anthers remaining unchanged, oblong, linear, erect. Style filiform; stigma 2-lobed: lobes obovate, revolute, minutely papillose above. Capsule cylindri-

cal, 1-celled, 2-valved. Seeds numerous, small, angular, inserted on the inflexed margins of the valves.—Small, erect, simple or branched, annual plants, stems and branches tetragonal. Leaves opposite, decussate, sessile. Flowers terminal or axillary, the terminal ones trichotomous, and the axillary ones solitary.

1 C. sessiliflòra (Schultes, syst. 3. p. 301. Wall. cat. no. 4367.) erect; stem and branches 4-sided; angles winged; leaves ovate, sessile, 3-nerved; flowers solitary, sessile, in the forks of the branches; capsule sub-cylindrical, nearly as long as the calyx. ⊙. S. Native of Coromandel and Bengal; appearing in moist pastures, during the rains, and first part of the cool season. Pládera sessiliflòra, Roxb. fl. ind. 1. p. 416. E'xacum heteroclìtum, Willd. spec. 1. p. 639. Gentiàna heteroclìta, Lin. syst. p. 270. mant. 560. Centaúrium heteroclìtum, Borkh. in Rœm. arch. 1. p. 28. Chiròmia brachiàta, Willd. herb. Largest leaves an inch long. Flowers small, pale red. Teeth of calyx acute. The 2 upper segments of the corolla oblong. Lobes of stigma obovate, thin.

Sessile-flowered Canscora. Pl. ½ foot.

2 C. Schulte'sii (Wall. cat. no. 4368.) stem branched from the base, and are, as well as the branches, tetragonally winged; radical leaves obtuse, few, rosulate; cauline leaves small, subulate, opposite, scale-formed; bracteas large, imbricate, ovate, ending in a hair-like point; calyx large; flowers sessile, in axils of the bracteas, spicate. ⊙. S. Native of the Burmese Empire, at Prome. Pládera pulchélla, Wall. mss. Flowers beautiful red. This is a very remarkable species, with the habit of a species of *Elytrària*.

Schultes's Canscora. Pl. 1 foot.

3 C. diffu'sa (R. Br. prod. p. 451.) erect; stem and branches tetragonal, filiform; lower branches opposite; upper ones alternate; leaves ovate-lanceolate, sessile, 3-nerved, acute; lower ones petiolate; flowers terminal, somewhat panicled, pedicellate; calyx tubular, wingless. ⊙. S. Native of the East Indies, growing on the banks of water courses, and on low fallow lands. Pládera virgàta, Roxb. fl. ind. 1. p. 471. Cham. et Schlecht, in Linnæa, 1. p. 198. Hook. bot. misc. 3. p. 89. t. 25. E'xacum diffùsum, Willd. spec. 1. p. 637. Gentiàna diffùsa, Vahl. symb. 3. p. 47. Flemíngia virgàta, Roxb. herb. Pládera muràlis, herb. Hamilt. Canscòra tenélla, Wall. cat. no. 4361. E'xacum tenéllum, herb. Mad. Centhèra of the Tamuls. Flowers small, rose-coloured. The 2 upper segments of the limb of the corolla equal, orbicular; segments of stigma recurved.

Diffuse Canscora. Fl. July, Aug. Clt. 1820. Pl. 1 to 2 feet.

4 C. foliòsa (D. Don. mss.) stem tetragonal, but not winged; leaves lanceolate, sessile; calyx tubular: with elongated, setaceous teeth. ⊙. H. Native of Nipaul, Royle. Stem 3 inches high. Radical leaves large, spreading.

Leafy Canscora. Pl. ¼ foot.

5 C. decussa'ta (Wall. cat. no. 4364.) erect; stem and branches 4-winged, the latter cross-armed; leaves ovate-lanceolate, acute, 3-nerved, sessile; terminal peduncles, trichotomous; flowers pedicellate; axillary ones solitary. ⊙. S. Native along with *C. diffùsa*, which it very much resembles; but is a little more robust, and seldom so high. Pládera decussàta, Roxb. fl. ind. 1. p. 418. Flemíngia decussàta, Roxb. herb. E'xacum alàtum, Roth. nov. spec. It is called in Bengalese, *Dunkoni*. Flowers larger than those of *C. diffùsa*, white. Peduncles 4-sided, like the stem and branches. Calyx 4-sided, and 4-winged, inflated. Corolla and stamens exactly as in *C. diffùsa*.

Decussate Canscora. Fl. July, Aug. Clt. 1816. Pl. 1 foot.

6 C. perfolia'ta (Lam. dict. 1. p. 601. Wall. cat. no. 4365.) erect; stem and branches 4-winged; cauline leaves lanceolate, 3-nerved: floral ones, or bracteas, perfoliate; flowers terminal, pedicellate; calyx striated; capsule oblong. ⊙. S. Native of India, where it delights in low moist soils. Pládera perfoliàta, Roxb. fl. ind 1. p. 418. Kansjan-Cora, Rheed. mal. 10. p. 103. t. 52. Flowers rather large, pale rose-coloured. Corolla subbilabiate; limb of upper lip largest, and deeply 2-parted; the lower one also consisting of 2 lobes, but smaller.

Perfoliate Canscora. Pl. 1½ foot.

7 C. ala'ta (Roth, ex Wall. cat. no. 4363.) glabrous, erect; stem and branches tetragonally winged; leaves sessile, 3-5-nerved, ovate-lanceolate, acute; wings of calyx very broad; bracteas roundish, peltate, perfoliate under the peduncles and pedicels. ⊙. H. Native of the East Indies. E'xacum alàtum, Heyne, herb. Flowers solitary, or by threes.

Winged-calyxed Canscora. Pl. 1-2 feet.

8 C. pusi'lla (Schultes, syst. 3. p. 301. Wall. cat. no. 4366.) erect; stem and branches tetragonal, the latter cross-armed; leaves sessile, sub-cordate; flowers terminal, sessile, by threes, monandrous; corolla hid in the calyx; capsule globular. ⊙. S. Native of the coast of Coromandel. Pládera pusílla, Roxb. fl. ind. 1. p. 419. Hòpea dichótoma, Vahl. enum. 1. p. 3. E'xacum séssile, Willd. spec. 1. p. 635. Leaves minute. Flowers small, yellow. Calyx sub-cylindrical. Corolla with the tube a little gibbous, and the border 4-toothed. Stamens 4, 3 of which bear minute, abortive anthers, the fourth a large, fertile one.

Least Canscora. Pl. 1 to 2 inches.

Cult. For culture and propagation see *E'xacum*, p. 213.

XXVI. VOHI'RIA (Voyria is the Guiana name of one of the species.) Juss. gen. 141. Lam. ill. 109. Vòyria, Aubl. guian. 1. p. 209. t. 83.—Lìta, Schreb. gen. 1734.

Lin. syst. *Pentándria, Monogýnia.* Calyx short, turbinate, 5-cleft, furnished with 2-3 scales at the base. Corolla salver-shaped, with a long, cylindrical tube, which is tumid at the base and apex, and a 5-cleft limb. Anthers 5, almost sessile, in the throat of the tube of the corolla. Stigma capitate, simple. Capsule oblong, 2-valved, 1-celled; margins of valves seminiferous. Seeds scrobiculate.—Gregarious plants, parasitical on the decayed roots of trees. Roots composed of thickish, white, fleshy fibres. Stems erect, flexuous, almost leafless, terete, articulated or nodose; scaly at the base; with 2 small, opposite scales at each joint of the stem.

1 V. ròsea (Aubl. guian. 1. p. 209. t. 83. f. 1.) flowers twin; segments of corolla ovate, acute; tube ventricose at top. ♃. S. Native of Guiana, in woods, at the roots of trees. Lam. ill. t. 109. Lìta ròsea, Willd. spec. 1. p. 1017. Root tuberous. Stem 3-4-5-cleft, with 2 opposite, fleshy, elliptic, acuminated scales at each joint. Corolla rose-coloured. Stem twice bifid.

Rose-coloured-flowered Vohiria. Fl. July, Aug. Clt. 1822. Pl. ¼ foot.

2 V. cœru'lea (Aubl. guian. 1. p. 211. t. 83. f. 2.) flowers twin; segments of corolla roundish; tube dilated at top. ♃. S. Native of Guiana, in woods, at the roots of trees. Lam. ill. p. 491. Lìta cœrùlea, Willd. spec. 1. p. 1071. Scales at the joints of the stem more leaf-like, and more ovate, than in the preceding, and nearly imbricated; and the segments of the corolla narrower. Flowers purplish, blue. Stem multifid.

Blue-flowered Vohiria. Pl. ¼ foot.

3 V. spatha'cea (Lam. ill. no. 2249. dict. 8. p. 771.) stem many-flowered; bracteas sub-spathaceous; throat of tube funnel-shaped; segments oblong. ♃. S. Native of Guiana. Lìta spathàcea, Spreng. syst. 1. p. 581. Nearly allied to *V. cœrùlea*. Stems ascending, simple, a little furrowed; furnished with 2 opposite, ovate, acute, scale-formed leaves at each joint. Flowers terminal, approximate, probably blue.

Spathaceous-bractead Vohiria. Pl. $\frac{1}{4}$ foot.

4 V. BREVIFLÒRA (Lam. ill. no. 2550. dict. 8. p. 771.) stem usually 3-flowered; tube of corolla 3 times longer than the calyx; segments linear, acute, short. ♃. S. Native of Guiana. Lìta breviflòra, Spreng. syst. 1. p. 581. Stem simple. Scales or leaves ovate, acute, remote. Corolla yellow.

Short-flowered Vohiria. Pl. $\frac{1}{4}$ foot.

5 V. UNIFLÒRA (Lam. ill. no. 2251. Pers. syn. 1. p. 284.) stem 1-flowered; corolla with a very long tube, and ovate-acute segments. ♃. S. Native of Martinique, and St. Vincent, among moss, at the roots of decayed trees. V. aphy'lla, Hook. bot. misc. 1. p. 46. t. 25. f. A. Gentiàna aphýlla, Jacq. amer. p. 87. t. 60. f. 3. Pers. ench. 1. p. 284. Lam. dict. 2. p. 642. E'xacum aphy'llum, Willd. spec. 1. p. 638. Lìta aphýlla, Dietr. gart. lex. 5. p. 531. Spreng. syst. 1. p. 581.—Plum. spec. 9. Root white, fascicled. Stem straw-coloured. Leaves or scales small, remote. Flowers large, for the size of the plant, yellow.

One-flowered Vohiria. Pl. $\frac{1}{4}$ foot.

6 V. TENE'LLA (Guilding, mss. in Hook. bot. misc. 1. p. 47. t. 25. f. B.) stem 1-flowered; corolla with a short tube, and linear-lanceolate segments. ♃. S. Native of St. Vincent, on mount St. Andre, in humid places, at the roots of decayed trees. Seeds furnished with long aril, as in the seeds of Orchideous plants. Leaves or scales small, remote.

Slender Vohiria. Pl. $\frac{1}{4}$ foot.

Cult. Uncultivatable, epiphytical plants.

XXVII. LEIPHAI'MOS (from λειος, *leios*, smooth; and φαιος, *phaios*, brown; this plant is smooth and of a brown colour.) Schlecht, et Cham. in Linnæa, 6. p. 387.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, 5-parted to the middle; segments lanceolate, acute. Corolla tubularly-funnel-shaped, marcescent, 5-cleft; segments of the limb short, ovate-triangular, very acute. Anthers 5, sagittate, on very short filaments. Ovarium lanceolate, tapering into the style. Stigma somewhat peltate, sub-bilabiate. Capsule lanceolate-elliptic, shorter than the tube of the corolla, 1-celled, 2-valved; valves villous inside at the margins, dehiscing in the middle. Seeds scobiform, very slender, minute, numerous, straw-coloured, appearing like congeries of hairs, when the capsule is open.—A parasitical, leafless herb, of the colour of *Hipópitys* (in place of leaves there are triangular, acute, erect, adpressed, membranous scales), with the habit and inflorescence of *Erythræ'a*.

1 L. PARASÍTICA (Schlecht, et Cham. l. c.) ♃.? S. Native of Mexico, growing on rotten trees, in woods, at Papantla. Plant about 3 inches high when in flower, and when in fruit about 6 inches high. Stem simple, terminated by cymose inflorescence.

Parasitical Leiphaimos. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. Plant not cultivatable.

XXVIII. ENICOSTE'MA (from ενικος, *enikos*, singular; and στημον, *stemon*, a stamen; in reference to the arched filaments.) Blum. bijdr. p. 848.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, unequally 5-cleft. Corolla funnel-shaped, 5-cleft, equal. Stamens 5, inclosed; filaments dilately-fornicated. Style shorter than the stamens; stigma capitate, sub-emarginate. Capsule oblong, 1-celled, 2-valved; valves inflexed on both margins. Seeds numerous, scrobiculate.- A plant with opposite, linear-lanceolate, 3-nerved, stem-clasping leaves, and axillary heads of flowers.

1 E. LITTORA'LE (Blum. bijdr. p. 848.) ♃.? S. Native of Java, on the shore, near Pamanukan, in the province of Krawang.

Sea-shore Enicostema. Fl. Aug. Sept. Pl.

Cult. For culture and propagation see *Hippion*, p. 198.

XXIX. CRAWFU'RDIA (named by Dr. Wallich, in honour of John Crawfurd, formerly governor of the island of Singapore; author of a history of the Indian Archipelago.) Wall. tent. fl. nep. p. 63.—Tripterospérmum, Blum. bijdr. p. 849.

Lin. syst. *Pentándria, Monogy'nia.* Calyx tubular, 5-toothed. Corolla tubular or campanulate, 5-cleft, with or without accessory lobes or segments. Stamens 5; filaments dilated, from the base of the corolla; anthers erect. Hypogynous disk 5-lobed. Style erect; stigmas 2, recurved. Capsule clavate, compressed, pedunculate, covered by the decayed calyx and corolla, 1-celled, 2-valved, even to the base; valves seminiferous near the edges. Seeds vertical, imbricate, with membranous edges, 2-lobed at one end.—Glabrous, twining herbs; with elongated, slender branches. Leaves opposite, 3-nerved, acuminated. Flowers axillary, solitary, or in fascicles, large, showy, pale blue. This genus appears to be the connecting link between the present order and *Apocýneæ*, through tribe *Gelsemie'æ*, which again connects that order with *Bignoniàceæ*.

1 C. FASCICULA'TA (Wall. tent. p. 63. t. 47.) leaves lanceolate, acuminated, 3-nerved; peduncles short, fascicled, bibracteate; teeth of calyx elongated, subulate; corolla tubular; limb furnished with accessory segments; capsule obovate, 3 times longer than its stipe. ⊙. ◠. G. Native of Nipaul, on Sheopore, and of Silhet. Gentiàna volùbilis, D. Don, prod. fl. nep. p. 126. Crawf. affìnis, Wall. cat. no. 4370. Plant green.

Fascicled-flowered Crawfurdia. Pl. twining.

2 C. SPECIÒSA (Wall. tent. p. 64. t. 48.) leaves ovate, acuminated, 5-nerved; flowers on long, nearly naked pedicels, solitary; teeth of calyx short; corollas campanulate, without accessory lobes or segments; capsule elliptic, shorter than its stipe. ♃.? ⊙.? ◠. G. Native of Nipaul, on Sheopore. Plant glaucescent.

Showy Crawfurdia. Pl. twining.

3 C. BLU'MII; leaves ovate, acute, 3-nerved; pedicels axillary, 1-flowered, bibracteate in the middle; calyx 5-cleft. ♃.? ⊙.? ◠. S. Native of Java, in the higher woods, on mounts Gede and Salak, where it is called *Tjoppi tuhur* by the natives. Tripterospérmum trinérve, Blum. bijdr. p. 849. Corolla tubular. Anthers sagittate. Seeds crested, fixed to the three sides of the berry, ex Blume.

Blume's Crawfurdia. Pl. twining.

4 C.? LOURE'IRI; leaves ovate-lanceolate, 3-nerved?; flowers lateral, disposed in elongated, drooping panicles; corolla campanulate; calyx 5-toothed. ♄. ◠. G. Native of China, and Cochinchina. Gentiàna scándens, Lour. coch. p. 171. Stem large, woody; branches long, scandent. Corolla with a large tube, which is grey outside, with distinct white dots, and furnished with dense purple hairs inside; limb short, spreading, white, bluntly 5-cleft; segments for the most part laciniately plicate. Capsule roundish.

Loureiro's Crawfurdia. Shrub climbing.

Cult. Crawfúrdia is a genus of very showy, twining plants. They will grow very well in a mixture of loam, sand, and peat; and may either be increased by cuttings or seeds. Should the seeds of any of the species ever be introduced to our gardens, we would recommend their being reared on a hot bed in spring, and in the middle of May the plants so reared to be transplanted out in the open border, against a south wall, and otherwise treated as the hardy species of *Convólvulus*.

Sub-Tribe II. COUTOU'BEÆ (this sub-tribe agrees with

the genus Coutoúbea ; in the capsule being 2-celled.) Capsule 2-celled, in consequence of the edges of the valves being bent into the central placenta ; margins of valves placentiferous. Anthers remaining unchanged even in the old state.

XXX. COUTOU'BEA (the Caribbean name of one of the species.) Aubl. guian. 1. p. 72.—Cotùbea, Mart. nov. gen. bras. 2. p. 110.—E'xacum species, Vahl.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx campanulate, 4-parted. Corolla salver-shaped, with an equal cylindrical tube, a naked throat, and a 4-parted limb. Stamens 4, exserted ; filaments bidentate at the base ; anthers sagittate, unchanged in the dried state. Stigma bilammellate. Capsule 2-celled, 2-valved, many-seeded ; seeds very minute.—Glabrous herbs or subshrubs, erect, rarely twining. Stems obscurely tetragonal, usually branched ; branches opposite, and thickened at the nodi. Leaves opposite, decussate, sessile, 1-nerved, thinnish, veined. Flowers disposed in terminal and lateral spikes or racemes, dense or loose, tribracteate, white.

* *Flowers tetramerous.*

1 C. DENSIFLÒRA (Mart. nov. gen. bras. 2. p. 111. t. 185.) stem simple at bottom ; leaves sessile, rounded at the base, and half stem-clasping, lanceolate, long-acuminated ; spikes terminal and lateral, cylindrical, dense-flowered : throat of corolla irrorate. ⊙. S. Native of Brazil, in the province of Bahia, in dry fields, at Villa da Caxoeira, at the altitude of from 200 to 400 feet. Corolla with a green tube ; throat bedewed with black ; limb white.

Dense-flowered Coutoubea. Pl. 2-3 feet.

2 C. SPICA'TA (Aubl. guian. 1. p. 72. t. 27.) stem erect, branched ; leaves lanceolate, acuminated at both ends ; spikes terminal, elongated, loose ; flowers decussate, rather close together. ⊙. S. Native of Cayenne, Guiana ; in the northern part of Brazil, as of Maranham and Para, &c. Meyer, ess. p. 87. Cotùbea spicàta, Mart. nov. gen. bras. 2. p. 112. Coutoúbea álba, Lam. ill. 2. p. 319. t. 79. E'xacum spicàtum, Vahl. symb. 3. p. 17. Corollas white, reddish in the throat.

Spicate-flowered Coutoubea. Fl. July, August. Clt. 1823. Pl. 2-3 feet.

3 C. RAMÒSA (Aubl. guian. 1. p. 74. t. 28.) stem divaricately branched ; leaves oblong-lanceolate, acuminated at both ends ; spikes terminal and axillary, the lower part leafy ; flowers decussate, remote. ⊙. S. Native of Guiana and Brazil, in dry fields. Cotùbea ramòsa, Mart. nov. gen. bras. 2. p. 112.—E'xacum ramòsum, Vahl. symb. 3. p. 17. Corollas white.

Branched Coutoubea. Fl. June, July. Clt. 1824. Pl. 1-2 feet.

4 C. MÌNOR (H. B. et Kunth, nov. gen. amer, 3. p. 181.) stem dichotomous ; branches tetragonal ; leaves oblong, acute ; spikes terminal, flowers decussate. ⊙ S. Native in humid places, on the banks of the Orinoco, near the falls of Ature. Corolla white.

Smaller Coutoubea. Pl. ½ foot.

* * *Flowers pentamerous.*

5 C. VERTICILLA'TA (G. Don, in Loud. hort. brit. p. 48.) stem simple ; leaves lanceolate, acuminated at both ends, nerved ; flowers verticillate, axillary : calycine segments longer than the capsule. ⊙. S. Native of the West Indies. Gentiàna verticillàris, Lin. spec. 333. E'xacum verticillàtum, Willd. spec. 1. p. 640.—Plum. icon. 81. f. 2. Corollas white.

Whorled-flowered Coutoubea. Fl. June, July. Clt. 1818. Pl. 1½ foot.

6 C. VOLU'BILIS (Mart. nov. gen. bras. 2. p. 112.) stem twining, rather scandent, slender ; leaves lanceolate, long-acuminated, acute at the base ; spikes terminal, few-flowered ; flowers pentandrous, pentamerous, remote. ♃. ◡. S. Native of St. Domingo. Lisiánthus scándens, Spreng. syst. 1. p. 587. Corollas cream-coloured.

Twining Coutoubea. Shrub twining.

Cult. The species of *Coutoúbea* are of easy culture, requiring the same treatment as other tender annuals.

XXXI. ADENE'MA (from *αδην, aden*, a gland ; and *νημα, nema*, a filament ; filaments furnished with a swelled gland at the insertion of each). Gentiàna and E'xacum species of authors.

LIN. SYST. *Pentandria, Monogýnia.* Calyx 5-parted. Corolla funnel-shaped, 5-cleft. Stamens 5 ; filaments short, each furnished with a gland at its insertion ; anthers incumbent, inclosed. Style single, length of filaments ; stigma large, 2-lobed. Capsule 1-celled, 2-valved ; seeds scobiform, fixed to parietal, linear placentas, which adhere to the margins of the valves. An erect, perennial plant, with creeping roots ; sessile, lanceolate, opposite, decussate, 3-nerved leaves ; tetragonal, simple stems ; and axillary, sessile, small white flowers, generally 3 in the axils of each leaf, and therefore appearing as if they were verticillate.

1 A. HYSSOPIFÒLIUM ; ♃. S. Native of the East Indies, in moist uncultivated grounds, flowering during the wet season. Gentiàna verticillàta, Linn. suppl. 174. E'xacum hyssopifòlium, Willd. spec. 1. p. 640.—Burm. afr. t. 74. f. 3.

Hyssop-leaved Adenema. Pl. ½ to 1 foot.

Cult. This is a plant of easy culture. Any light rich soil will suit it ; and it will be readily increased by dividing the plant at the root. It should have plenty of water given to it when in a growing state.

XXXII. SCHUBLE'RIA (named after Gustavus Schubler, professor of botany at Tubingen). Mart. nov. gen. bras. 2. p. 113.—Cúrtia, Schlecht, in Linnæa, 1. p. 209.—Thurnhausèra, spec. Pohl. in litt.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla tubularly-subcampanulate, equal, with a 5-cleft limb, and a naked throat. Stamens 5, minute ; anthers oblong. Stigma simple, penicillately glandular. Capsule 2-valved, 2-celled, many-seeded. Seeds ovate or obovate, minute, angular.—Annual, erect, glabrous, slender herbs. Stems tetragonal, simple, or branched ; branches opposite, dichotomous. Leaves sessile, opposite, or verticillate, narrow. Inflorescence panicled, loose, or crowded, terminal and lateral ; peduncles bracteolate. Flowers small, rose-coloured, or yellow.

1. S. DIFFU'SA (Mart. l. c. p. 114. t. 186. f. 1.) stem slender, spreadingly panicled ; leaves subpetiolate, 3-4 in a whorl, ovate, acute ; corollas hardly twice longer than the calyx ; segments ovate-roundish. ⊙. S. Native of Brazil, on the ascent of high mountains, in marshy, grassy places, at the altitude of 4000 feet. E'xacum brachiàtum, Spix et Mart. reis. 1. p. 397. Corollas yellow ; throat constricted, downy inside.

Diffuse Schubleria. Pl. ¼ to ¾ foot.

2 S. CONFE'RTA (Mart. l. c. p. 115. t. 186. f. 2.) stem straight, terminated by a short, crowded, panicle ; leaves sessile ; 3-4 in a whorl, broad, ovate, acute ; corolla hardly twice as long as the calycine segments, which are setaceous ; segments of corolla ovate, obtuse. ⊙. S. Native of Brazil, in the mine provinces, in marshes, particularly on Serro Frio. Corollas yellow.

Crowded Schubleria. Pl. ½ foot.

3 S. STRÍCTA (Mart. l. c. p. 116. t. 187.) stem straight, simple at bottom ; leaves 4-6 in a whorl, ovate, acuminated, 3-nerved ; panicles corymbose, coarctate ; corolla more than twice as long as the calyx : with rounded segments. ⊙. S. Native of Brazil, in humid places, near Tejuco, and elsewhere in the diamond district ; also on Serra de St. Antonia. Sabbàtia verti-

cillàris, Spreng. syst. 1. p. 580. Cúrtia gentianoìdes, Schlecht. in Linnæa, 1. p. 210. Corolla rose-coloured.

Straight Schubleria. Fl. May, June. Pl. 1-2 feet.

4 S. pa'tula (Mart. l. c. p. 117. t. 188.) stem dichotomous, spreading; branches slender; leaves opposite, linear; panicles spreading; corolla 3 times higher than the calyxes, with acutish segments. ⊙. S. Native of Brazil, in the mine provinces, especially in marshy, grassy places, at the altitude of 2900 feet, on Serra do Itambe, and in the province of Goyaz, between Carretao and Crixas. Corolla having the tube white at the base, and a rose-coloured limb.

Spreading Schubleria. Fl. May. Pl. 1 to 1½ feet.

5 S. tene'lla (Mart. l. c. p. 117.) stem filiform, nearly simple; leaves opposite, narrow-linear, or subulate; panicles corymbose; corolla hardly twice the height of the calyx. ⊙. S. Native of Brazil, in the province of Goyaz. Corollas yellow.

Weak Schubleria. Pl. ¼ to ¾ foot.

6 S. tenuifòlia; stem simple; leaves linear-lanceolate, opposite; panicles dichotomous; calycine segments lanceolate-subulate; flowers small. ⊙. S. Native of Guiana. Exácum tenuifòlium, Aubl. guian. 1. p. 68. t. 26. f. 2. Flowers small, red.

Fine-leaved Schubleria. Pl. ½ foot.

Cult. For culture and propagation see *Schultèsia*, p. 196.

XXXIII. HE'LIA (from ἕλος, *helos*, a marsh; habitation of species). Mart. nov. gen. bras. 2. p. 122.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, 5-parted; segments erect, with membranous margins. Corolla salver-shaped, with a sub-oblique, 5-parted, marcescent limb; a cylindrical tube, which is inflated in the middle, or unequal; throat naked. Anthers oblong, emarginate at both ends. Stigma of 2 cylindrical legs, not bilamellate. Capsule 2-valved, 2-celled, many-seeded. Seeds small, nearly globose, or angular.—Glabrous herbs, with perpendicular roots. Stems terete, fistular, simple. Leaves opposite, decussate, sessile, confluent at the base, marginated, quite entire, having the middle nerve running out, and the lateral ones vanished. Flowers cream-coloured or green, disposed in coarctate, bracteate, few-flowered panicles.

1 H. oblongifòlia (Mart. nov. gen. bras. 2. p. 123. t. 191.) leaves oblong or oblong-lanceolate, obtuse; tube of corolla slender, 3 times longer than the limb, which is finely denticulated. ⊙. S. Native of Brazil, in the province of St. Paul, in marshes. Panicle dichotomous. Corollas pale cream-coloured. Stem quite simple.

Oblong-leaved Helia. Pl. 3 feet.

2 H. spatula'ta (Mart. l. c. p. 124.) leaves oblong-spatulate; tube of corolla twice as long as the limb, which is quite entire. ⊙. S. Native of the south of Brazil; and of the island of Pararuma, in the Orinoco, in hot humid places. Lisiánthus spatulàtus, H. B. et Kunth, nov. gen. 3. p. 181. Corollas green. Stem quite simple.

Spatulate-leaved Helia. Pl. 2-3 feet.

Cult. For culture and propagation see *Schultèsia*, p. 196.

XXXIV. EUDO'XIA (from εν, *eu*, well, and δοξα, *doxa*, glory, in reference to the beauty of the species). D. Don, mss. Gentiàna species, Ruiz et Pav. in herb. Lamb.

Lin. syst. *Pentándria, Digýnia.* Calyx campanulate, membranous, semiquinquifid; segments lanceolate, acute, 3-nerved. Corolla campanulate, 5-parted; segments elliptic, obtuse, nerved, convolutely imbricated in æstivation. Stamens 5, adnate to the tube of the corolla, at the base, inclosed; filaments channelled inside; anthers linear, incumbent. Ovarium fusiform, 2-celled, 2-valved, 2 inches long. Stigma 2-lobed, sessile; lobes dilated, roundish, revolute. Ovula disposed in one series in each cell, orbicular, peltate, concave on one side, with membranous edges.—Perennial, erect herbs. Leaves opposite or verticillate, nerved. Flowers large, drooping, showy, disposed in terminal, thyrsoid panicles.

1 E. formosíssima (D. Don, mss.) stems erect, angular, solid; lower leaves opposite; upper ones as if they were 5 in a whorl, sessile at intervals of 2 inches, all 5 nerved; flowers numerous, disposed in terminal, oblong, thyrsoid panicles. ♃. F. Native of Peru, Ruiz et Pav. Stem an inch thick. Leaves 2 inches long, lanceolate, acute, distant, glabrous, greyish green. Pedicels 1-flowered, 1½ to 2 inches long. Corollas large, scarlet. Ovarium fusiform.

Most showy Eudoxia. Pl. erect.

2 E. pe'ndula (D. Don. mss.) stems erect, terete; leaves opposite, ovate-lanceolate, acuminated, many-nerved; flowers numerous, disposed in thyrsoid, oblong panicles. ♃. F. Native of Peru. Very nearly allied to the preceding, but differing in the leaves and calycine segments being broader, long-acuminated, and many-nerved, and in the stamens and peduncles being terete. Corolla violaceous, barely longer than the calyx. Stem purplish, thickness of a writing quil.

Pendulous-flowered Eudoxia. Pl. erect.

Cult. Should either of the species of *Eudóxia* ever be introduced to our gardens, we would recommend their being grown in pots, in a mixture of peat and sand, with the addition of a little loam; and in winter to be placed on a shelf in a greenhouse or frame until their hardiness be ascertained.

Sub-tribe III.

CHIRO'NIÆ (this tribe agrees with the genus *Chirònia*, in the anthers being changed in the old state.) Capsule 1-celled, 2-valved; margins of valves inflexed, seminiferous. Anthers changed in the old state.

XXXV. CHIRO'NIA (from the centaur Chiron). Lin. gen. no. 255. Schreb. 349. Jus. gen. p. 142. Gærtn. fruct. 1. t. 114. Lam. ill. t. 108. Chirònia, sect. vèræ, Cham. in Linnæa, 6. p. 343.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla salver-shaped, with a narrow tube and a spreading limb, which is longer than the tube. Stamens 5; filaments broad, short, rising from the top of the tube; anthers oblong, erect, connivent, at length spirally twisted. Style declinate, a little longer than the stamens. Stigma capitate, assurgent. Capsule ovate, 1-celled, 2-valved. Seeds numerous.—Small shrubs. Stems simple, or branched. Leaves sessile, opposite, decussate. Flowers terminal, red, or white.

1 C. jasminoìdes (Lin. spec. 272. amœn. 4. p. 84. Cham. in Linnæa, 6. p. 344.) glabrous; stem tetragonal; leaves lanceolate, linear; panicles dichotomous, or flowers terminal, solitary on the tops of the branches; calycine segments acute, keeled, much shorter than the capsule, which is cylindrically oblong. ♄. G. Native of the Cape of Good Hope. Thunb. prod. 1. p. 35, and in Lin. trans. 7. p. 251. Ker. bot. reg. t. 197. Lodd. bot. cab. 27. Ch. uniflòra, Link. Lam. dict. 1. p. 737. ill. t. 108. f. 3. Segments of calyx lanceolate, acuminated, length of the tube of the corolla. Corolla red or purplish; segments ovate, acuminated, length of tube.

Jasmine-like Chironia. Fl. April, July. Clt. 1812. Shrub 1-2 feet.

2 C. lychnoìdes (Lin. syst. p. 229. mant. 207.) glabrous; stem simple, terete; leaves linear, lanceolate; peduncles terminal, elongated, usually by threes. ♄. G. Native of the Cape of Good Hope, on the summits of mountains. Thunb. prod. p. 35. and in Lin. trans. 7. p. 252. Berg. cap. p. 45. Lateral bracteas subulate. Calycine segments lanceolate-subu-

late keeled. Corolla purple; tube length of calyx; segments of the limb ovate, acute, longer than the tube.

Lychnis-like Chironia. Fl. May, July. Clt. 1816. Shrub 1-2 feet.

3 C. melampyrifòlia (Lam. ill. p. 479. no. 2175.) stem nearly simple, terete; leaves lanceolate, with decurrent sides, as in the preceding; flowers pedicellate, axillary, disposed in a terminal panicle. ♄. G. Native of the Cape of Good Hope. Calycine segments straight, acute, shorter than the tube of the corolla. Segments of corolla longer than the tube. Perhaps only a variety of *C. lychnoìdes*.

Melampyrum-leaved Chironia. Shrub 1-2 feet.

4 C. nudicau'lis (Lin. syst. p. 229. suppl. 151. Cham. in Linnæa, 6. p. 344.) herbaceous; glabrous; leaves of different forms, ovate-oblong, bluntish: radical ones often rosulate; stems many, simple, subtetragonal, bearing each 2 opposite lanceolate leaves, and 1 flower; superior internodes elongated; segments of calyx subulate, equal in length to the capsule, which is cylindrically oblong. ♃. G. Native of the Cape of Good Hope, on the top of the Table Mountain. Thunb. prod. 1. p. 35. and in Lin. trans. 7. p. 249. t. 12. f. 3. C. jasminoìdes, Lam. dict. 1. p. 736. ill. t. 108. f. 2. Corolla purple. Calycine segments length of the tube of the corolla.

Var. α, tabulàris (Cham. in Linnæa, 6. p. 344.) lower leaves elliptic, bluntish.

Var. β, elongàta (Eklon, mss. Cham. l. c.) lower leaves linear-lanceolate.

Naked-stemmed Chironia. Fl. July, Aug. Clt. 1816. Pl. 1 foot.

5 C. linoìdes (Lin. hort. cliff. 54. spec. 272.) glabrous; stem branched; branches terete, fastigiate; leaves linear, erect, fleshy, acute; peduncles terminal, elongated; calycine segments acute, 1-nerved; capsule elliptic. ♄. G. Native of the Cape of Good Hope, Thunb. prod. p. 35. and in Lin. trans. 7. p. 252. Curt. bot. mag. t. 511. Ch. vulgàris, Cham. in Linnæa, 6. p. 343.—Breyn. cent. p. 175. t. 90. Calycine segments lanceolate, shorter than the tube of the corolla. Corolla red, with ovate-oblong, obtuse segments. Anthers not spiral, but incurved. Stem nodulose.

Var. α, linoìdes (Cham. l. c.) shrub taller, looser; leaves broader, flat; calycine segments narrow, 1-nerved.

Var. β, intermèdia (Cham. l. c.) dwarfer; leaves narrower; calycine segments triangular, 1-3 nerved, sometimes short, and sometimes drawn out.

Var. γ, lychnoìdes (Cham. l. c.) calycine segments dilated, subauriculate, short. Ch. lychnoìdes, Cham. et Schlecht, in Linnæa, 1. p. 190. Var. β, and γ, α, probably of Lin. and Thunb. Ch. emarginàta, Jarouz, pl. nov. cap. 1821. p. 11.

Flax-like Chironia. Fl. July, Sept. Clt. 1787. Sh. 1 to 2 feet.

6 C. serpyllifòlia (Lehm. sem. hort. Hamb. 1828. p. 16. Linnæa, 5. p. 362.) stems weak, tetragonal, glabrous; leaves ovate, nearly sessile, thick, dotted beneath; peduncles terminal, solitary; calycine segments subulate. ♄. G. Native of the Cape of Good Hope. Stems many from the same root; corymbose at top. Corolla rose-coloured, about the size of those of *Ch. baccífera*. Perhaps a species of *Roslínia*.

Wild Thyme-leaved Chironia. Fl. July, Sept. Clt. 1829. Shrub 1 foot.

7 C. tetragòna (Lin. syst. 229. supp. 151.) glabrous; branches tetragonal; leaves ovate, 3-nerved, bluntish; flowers terminal, solitary; calycine segments bluntish, keeled, clammy, 3 times shorter than the corolla. ♄. G. Native of the Cape of Good Hope, Thunb. in Lin. trans. 7. p. 249. t. 12. f. 2. Corollas purple. Perhaps a species of *Roslínia*.

Tetragonal-branched Chironia. Fl. July, Aug. Clt. 1824. Shrub 1-2 feet.

Cult. Peat with a little loam is the best soil for the species of this genus; and young cuttings planted in the same kind of soil, with a hand-glass placed over them, strike root readily. Although said to be shrubs, none of the species are long lived; and therefore frequently require to be raised from seeds or cuttings. They are all pretty plants when in blossom.

XXXVI. ROSLI'NIA (meaning unknown to us). Mœnch, meth. supp. p. 211.—Chirònia species, Lin. and others.—Chirònia, sect. Spùriæ, Cham. in Linnæa, 6. p. 344.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, with short, subulate segments. Corolla salver-shaped, with ovate, acute, short segments. Stamens 5; filaments short; anthers oblong, spiral. Style declinate; stigma peltate. Berry fleshy, 1-celled, many-seeded. Seeds rather compressed, nearly globose, dark, wrinkled from dots. Small shrubs, with opposite, decussate leaves, and terminal, solitary, rose-coloured, or yellow flowers.

1 R. baccífera (Mœnch, l. c.) branches subtetragonal; leaves opposite, decussate, glabrous, linear-lanceolate, sessile, decurrent, with reflexed edges, longer than the internodes; flowers terminal, solitary; calycine segments 1-nerved, acute, propping the much larger globose berry. ♄. G. Native of the Cape of Good Hope. Chirònia baccífera, Lin. spec. 273. Thunb. prod. p. 33. and in Lin. trans. 7. p. 255. Curt. bot. mag. 233.—Commel. rar. t. 9. Flowers red.

Berry-bearing Roslinia. Fl. June, July. Clt. 1759. Shrub 1-2 feet.

2 R. angustifòlia; glabrous; branches terete?; leaves linear, spreading; calyx ovate; corollas clammy: segments cuneated, acuminated; calycine segments acute, conniving at the points; flowers solitary, terminal. ♄. G. Native of the Cape of Good Hope. Chirònia angustifòlia, Hort. Kew. ex. Sims, bot. mag. t. 818. Flowers red, large.

Narrow-leaved Roslinia. Fl. June, July. Clt. 1800. Shrub 1 foot.

3 R. frute'scens; downy; stem and branches terete; leaves lanceolate, obtuse, rather tomentose, as well as the branches and calyxes; flowers terminal, corymbose; calycine segments obtuse, almost nerveless, inclosing a lanceolate, elliptic berry. ♄. G. Native of the Cape of Good Hope, Chirònia frutéscens, Lin. spec. 270. amœn. 4. p. 308. Mill. fig. t. 97. Lam. ill. t. 108. f. 1. Curt. bot. mag. t. 37.—Commel. rar. t. 8. Corolla large, of an elegant red.

Var. β; leaves narrow-linear; flowers large, red. ♄. G. Chirònia frutéscens, β, Lam. dict. 1. p. 737.—Burm. afr. 205. t. 74. f. 1.

Var. γ, decussàta; plant more tomentose; leaves more crowded; branches very short; flowers rather larger. ♄. G. Chirònia decussàta, Vent. cels. t. 31. Curt. bot. mag. t. 707. Chirònia frutéscens β, latifòlia, Wendl. coll. t. 4.

Var. δ, glàbra (Cham. in Linnæa, 6. p. 344.) plant glabrous.

Var. ε, albiflòra; flowers pure white.

Frutescent Roslinia. Fl. July, Sept. Clt. 1756. Shrub, 1-2 feet.

Cult. See *Chirònia* above for culture and propagation.

XXXVII. ERYTHRÆ'A (from ερυθρος, *erythros*, red flowers). Renealm, spec. 77. t. 76. Borkh. in Rœm. arch. 1. p. 28. Richard in Pers. ench. 1. p. 283. R. Br. prod. p. 45. Schkuhr, handb. t. 59. Chirònia and Gentiàna species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx subpentagonal, 5-cleft. Corolla funnel-shaped, marcescent, with a short limb. Anthers spiral, in the old state; style erect. Stigmas 2, roundish. Capsule linear, 2-valved.—Small annual glabrous plants. Leaves

sessile, opposite, decussate; radical ones rosulate, 3-5 nerved. Flowers terminal, sessile, or pedicillate, red or yellow.

§ 1 *Flowers sessile, or on very short, hardly evident pedicels.*

1 E. Centau'rium (Pers. ench. 1. p. 283.) stem tetragonal, dichotomously panicled, corymbose; leaves ovate-lanceolate, 3-nerved; calyx shorter than the tube of the corolla. ⊙. H. Native throughout Europe, in dry gravelly pastures; in several parts of Britain, common. Willd. enum. 1. p. 247. Chirònia Centaúrium, With. p. 237. Curt. fl. lond. t. 247. Smith, fl. brit. p. 257. engl. bot. t. 417. Heyne, getr. darst. t. 29. Jaume St. Hil. fasc. 24. t. 1. Wood. med. bot. 435. t. 157. Mayerhoffer, fl. monac. t. 5. Gentiàna Centaúrium, Lin. spec. 332. Oed. fl. dan. 617. Bull. herb. t. 253. Plenck. off. t. 175. Centaúrium vulgàre, Rafin. sœl. p. 68. Hippocentaúrium Centaúrium, Schult. œstr. fl. ed. 2. vol. 1. p. 283. Centaúrium mìnus, Cam. epit. 428, &c. Calycine segments subulate. Corollas rose-coloured; segments elliptic. This is a pure bitter, and agrees, in this respect, with other Gentianeous plants.

Var. β, màjus (Schmidt, fl. boh. 2. p. 31.) radical leaves spatulate; stem 2 feet high, branched; branches all axillary, twiggy, trichotomous at the apex; branchlets dichotomous, 3-flowered; calyx 3 times shorter than the tube of corolla. ⊙. H. Bohemia.

Var. γ, mèdium (Schmidt, l. c.) radical leaves broader, obovate-roundish, 5-nerved: cauline ones half stem-clasping, ovate-obtuse; stem a foot high, branched at the base; branches erect, simple, trichotomous at the apex; branchlets trifid, 3-flowered; bracteas setaceous; calyx length of the tube of the corolla. ⊙. H. Bohemia.

Var. δ, mìnus (Schmidt, l. c.) radical leaves obovate; lower cauline ones oblong: superior ones linear, all obtuse; stem simple, erect, a finger in height, bi-trichotomous, 2-3-flowered, one of the flowers sessile, and the other pedicellate. ⊙. H. Bohemia.

Var. ε, palústre (Schmidt, l. c.) radical leaves as in var. γ; stem a hand high, and the branches dichotomous; cauline leaves oblong, acutish. ⊙. H. Bohemia.

Var. ϛ, collìnum (Schmidt, l. c.) radical leaves rather scabrous. ⊙. H. Bohemia.

Var. η, Brotèrii; leaves 3-nerved: lower ones oblong: upper ones lanceolate-linear; calyx much shorter than the tube of the corolla, which is filiform; segments of corolla bluntish. ⊙. H. Native of Portugal. Gentiàna Centaúrium, Brot. fl. lus. 1. p. 276. This differs from the species, in the superior leaves being narrower, and in the filiform tube of the corolla.

Var. θ, grandiflòra; larger than the species; limb of corolla larger, concave; segments broad. ⊙. H. Native of Europe, in moist places. E. Centaúrium *β*, Pers. ench. 1. p. 283. Centaúrium erythræ'a, Rafin and Schousboe.

Var. ι, albiflòra; flowers white.

N. B. See Wallr. ann. bot. p. 34. and Spreng. obs. bot. p. 10. in which Chirònia Centaúrium, Ch. pulchélla, and Ch. mapérta, are found under one specific name.

Centaury Gentian, or Lesser Centaury. Fl. July, Aug. Britain. Pl. $\frac{1}{4}$ to 1 foot.

2 E. Cachanlahu'an (Rœm. et Schultes, syst. 4. p. 167.) branches spreading; leaves ovate-lanceolate, veinless; calyx angular, quinquifid, length of the tube of the corolla; calycine segments connivent; segments of corolla suberose at the apex. ⊙. H. Native of Chili. Cachanlahùan, Molin. chil. ed. 2d. p. 124. Chirònia Chilénsis, Willd. spec. 1. p. 1667. Gentiàna Peruviàna, Lam. dict. 2. p. 642. Cahan Laguen, Feuill. per. 2. t. 35. Stem dichotomous, and corymbose at the top. This is the Cahan Laguen of Chili, a famous stomachic medicine of that country. Arnott does not think that the *E. Quiténsis* is specifically distinct from the present, although the flowers are said to follow the quaternary division. Though it is medicinally used in Peru, Humboldt never saw it while there; but it was cultivated in the plains of Chiloe, the inhabitants of which may have originally brought it with them from Chili, where it is a native.

Cachanlahuan Lesser Centaury. Fl. July, Aug. Clt. 1825. Pl. $\frac{1}{2}$ to 1 foot.

3 E. Quite'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 178.; much branched; branches dichotomous; leaves 3-nerved, lower ones oblong, upper ones lanceolate; flowers terminal, lateral, and axillary, on long pedicels; calyx equal in length to the tube of the corolla; parts of flower quaternary. ⊙. H. Native of Quito, in temperate places, where it is called Cachanlagua; and of Chiloe. E'xacum Quiténse, Spreng. syst. 1. p. 425. Stem and branches tetragonal. Calycine segments linear, acute, furnished with a narrow membraneous line on the back, and diaphanous margins. Corolla rose-coloured, with a cylindrical tube, and oblong, obtuse, equal segments. Capsule oblong, 2-celled, 2-valved. This differs from the preceding in the tetramerous flowers.

Quito Lesser Centaury. Pl. $\frac{1}{2}$ to 1 foot.

4 E. latifòlia (Smith, engl. fl. 1. p. 321.) stem 3-cleft at top; leaves roundish-elliptic, 5-7-nerved; flowers terminal, fasciculate; tube of corolla equal in length to the calyx; segments of the limb lanceolate. ⊙. H. Native of England, on the sea-shore of Lancashire, and to the north of Liverpool; and of the county of Down, Ireland. Chirònia Centáurium, var. 2. Smith. fl. brit. p. 1393. Corollas pink.

Broad-leaved Lesser Centaury. Fl. July, Aug. Britain. Pl. $\frac{1}{2}$ foot.

5 E. capita'ta (Willd. ex Rœm. et Schultes, syst. 4. p. 168.) leaves elliptic-lanceolate or obovate, 3-5-nerved; flowers capitate, bracteate. ⊙. H. Native, country unknown. This is said to be a very showy species.

Capitate-flowered Lesser Centaury. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

6 E. confe'rta (Pers. ench. 1. p. 283.) plant erect, dwarf, branched; leaves ovate, obtuse, 3-nerved; flowers sessile, fascicled, crowded; calyx about equal in length to the middle of the tube of the corolla. ♃. H. Native of Spain. Corollas red. Very nearly allied to *E. spicàta*.

Crowded-flowered Lesser Centaury. Fl. July, Aug. Clt. 1821. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

7 E. aggrega'ta (Sweet, fl. gard. t. 137.) stems tetragonal, much branched, decumbent; branches dichotomous, aggregate, few-flowered; flowers sessile; leaves spatulate, obtuse, 1-nerved, tapering into the petioles at the base; bracteas linear, obtuse, rather longer than the calyx; calyx twice shorter than the tube of the corolla. ♂. S. Native of the south of Europe. Flowers beautiful, rose-coloured. Segments of corolla oval, obtuse. Stem and branches tetragonal.

Aggregate Lesser Centaury. Fl. March, June. Clt. 1824. Pl. $\frac{1}{4}$ foot.

8 E. littora'lis (Fries. nov. fl. suec. p. 30.) stem simple or branched, dwarf, tetragonal; leaves ovate-oblong, obtuse; flowers crowded, sessile, fasciculate; calyx about equal in length to the tube of the corolla. ⊙. H. Native of Britain, on the sea coast; and of Sweden, near Gottenburg, and of Holland. Chirònia littoràlis, Turn. and Dillw. guide, p. 469. Smith, engl. bot. 2305. Chirònia pulchélla, Don, fl. brit. fasc. 1. no. 7. Corollas pink. This species differs from *E. conférta* in the shape of the leaves and length of the tube of the corolla.

Sea-shore Lesser Centaury. Fl. June, July. England. Pl. $\frac{1}{4}$ foot.

9 E. spica'ta (Pers. ench. 1. p. 283. Smith, fl. græc. t. 238.) branches dichotomous, tetragonal; leaves lanceolate-

oblong, obtuse, 3-nerved; flowers subsecund; calyxes and bracteas about equal in length to the tube of the corolla. ⊙. H. Native of Italy, Greece, and France, in humid places. Gentiàna spicàta, Lin. spec. p. 333. Chirònia spicàta, Willd. spec. 1. p. 1069.—Barrel. icon. t. 1242. Flowers alternate, spicate; segments of corolla ovate-lanceolate. Corollas red or pink.

Var. β, flòre-álbo; flowers white. Matth. comm. p. 488. f. 2. C. Bauh. prod. 130.

Spike-flowered Lesser Centaury. Fl. July, Aug. Clt. 1820. Pl. ½ to 1 foot.

10 E. alopecuroìdes; stems somewhat tetragonal, dichotomously branched; leaves oblong-lanceolate, 1-nerved; lower ones spatulate: upper ones narrower, acute; flowers sessile, secund, crowded, subspicate; corolla funnel-shaped, with an acute, spreading-limb. ⊙. H. Native country unknown. Gentiàna alopecuroìdes, Lam. dict. 2. p. 643. Calyx angular at the base, with linear-subulate, erect segments, length of tube of the corolla. Very like *E. spicàta*.

Fox-tail-like Lesser Centaury. Pl. ⅓ foot.

11 E. austra'lis (R. Br. prod. p. 451.) leaves oval-lanceolate, obtuse, 3-nerved; flowers subsecund, almost sessile; superior bracteas shorter than the calyx. ⊙. H. Native of Van Diemen's Land. Very nearly allied to *E. spicàta*.

Southern Lesser Centaury. Pl. ½ foot.

12 E. uliginòsa (Waldst. et Kit. pl. rar. hung. 3. t. 258.) stem simple, tetragonal, compressed, dichotomously corymbose at top, scabrous from pubescence, as well as the leaves and calyxes; leaves 3-nerved; radical ones obovate-spatulate: cauline ones linear, acute; calyx length of the tube of the corolla. ⊙. H. Native of Pannonia, and several other parts of the south of Europe, in humid meadows. E. paludòsa, Schrad. E. compressa, Hayne. E. angustifolia, Wallr. Hippocentaúria uliginòsa, Schultes, œstr. fl. 1. p. 389. Stem simple and branched. Calyx sometimes shorter than the tube of the corolla. The roughness all over the plant from short hairs is perfectly manifest under a microscope.

Bog Lesser Centaury. Fl. Ju. July. Pl. ½ to 1 foot.

§ 2. *Flowers pedicellate.*

13 E. emargina'ta (Waldst. et Kit. pl. rar. hung. 3. t. 275.) stem tetragonal, dichotomous at top; angles diaphanous; leaves oblong-ovate, obsoletely 5-nerved; flowers pedicellate; segments of corolla oblong, emarginate at the apex. ⊙. H. Native of Pannonia, about Pesth. Hippocentaúria emarginàta, Schultes, œstr. fl. ed. 2. vol. 1. p. 390. Leaves shorter than the internodes, with diaphanous edges. Calycine segments subulate. Corolla with a white or pale purple limb.

Emarginate-petalled Lesser Centaury. Fl. Pl. ½ foot.

14 E. pulche'lla (Fries, nov. fl. suec. p. 30.) dwarf, much branched; branches tetragonal; leaves short, ovate or oval, 3-nerved: cauline ones equal in length to the internodes; flowers in loose panicles, destitute of scales at the base; calyx nearly as long as the tube of the corolla; style simple. ⊙. H. Native throughout Europe, in the sand by the sea-side, and in moist meadows; as well as of Caucasus. In Britain, on the sandy sea-coast of England and Scotland. E. ramosíssima, Pers. ench. 1. p. 283. E. palústris, Schrad. new journ. 4. p. 78. E. pulchélla α and β inapérta, Link et Hoffmans. fl. port. 1. p. 253. Chirònia pulchélla, Smith, fl. brit. 258. engl. bot. t. 458. Chirònia pulchélla β, D. C. fl. fr. no. 2781. Gentiàna ramosíssima, Vill. delph. 2. p. 530. Chirònia Gerárdi, Schmidt, fl. bohem. 2. no. 131. Chirònium centaúrium of many authors. Gentiàna Centaúrium β, Lin. spec. p. 333. Chirònia Centaúrium β, Willd. spec. 1. p. 1068. Chirònia inapérta of many authors. Hippocentaúria pulchélla, Schultes, œstr. fl. ed. 2d. 1. p. 389.—Vaill. bot. par. 32. t. 6. f. 1. Corollas slender, rose-coloured. From the flowers closing at 11 o'clock in the evening, it has been confused with *Chirònia inapérta*, or *E'xacum pusíllum*.

Var. β; stem simple, few-flowered. ⊙. H. Native along with the species. Chirònia pulchélla, Willd. spec. 1. p. 1067. Gentiàna pulchélla, Swartz, act. holm. 1783. p. 84. t. 3. f. 8-9. Willd. spec. 1. p. 1067. Erythræ'a pùmila, Dietr. gart. lex. suppl. 2. p. 249.? Gentiàna palústris, Lam. ill. no. 2221. Chirònia pulchélla γ, D. C. l. c. Flowers rose coloured.

Neat Lesser Centaury. Fl. Aug. Sept. Britain. Pl. ⅛ to ½ foot.

15 E. tenuiflòra (Link et Hoffmans. fl. port. 1. p. 354.) stem erect, dichotomously branched at top, tetragonal; leaves oblong and lanceolate, 3-nerved, acute; tube of corolla much longer than the calyx; segments of corolla very narrow, acute. ⊙. H. Native of Portugal, on the sea-shore, near Acosta. Gentiàna ramosíssima, Brot. fl. lus. 1. p. 279. Flowers in the forks hardly pedicellate. Calycine segments linear, unequal. Corolla with a red limb, and whitish, filiform tube.

Slender-flowered Lesser Centaury. Pl. ½ foot.

16 E. pyrena'ica (Pers. ench. 1. p. 285.) leaves ovate-lanceolate, erect; segments of corolla lanceolate. ⊙. H. Native of the Pyrenees. Said by D. C. fl. fr. suppl. no. 2781, to be a variety of *E. pulchélla*.

Pyrenean Lesser Centaury. Pl. ⅛ to ¼ foot.

17 E. linariæfòlia (Pers. ench. 1. p. 283.) stem simple or branched; leaves linear, obtuse, usually sub-one-nerved; corolla funnel-shaped; calyx shorter than the tube; style very long, simple; flowers sub-corymbose. ♂. H. Native of the south of Europe, on the banks of the Durance, near Avignon. D. C. fl. fr. suppl. no. 2781, a. Lois, not. 155. E. linearifòlia, Dietr. gart. lex. suppl. 2. p. 248. Gentiàna linariæfòlia, Lam. dict. 2. p. 641.—Bocc. mus. 2. t. 43.—Barrel. icon. 423. Nearly allied to *E. pulchélla*. Corolla purplish or rose-coloured. Calycine segments linear.

Toad-flax-leaved Lesser Centaury. Pl. ¼ foot.

18 E. occidenta'lis (Rœm. et Schultes, syst. 4. p. 171.) stem branched from the base: branches short; leaves ovate or oblong; flowers longer than the branches; segments of calyx acute. ⊙. H. Native on the sea-shore, about Bayonne. Chirònia occidentàlis, D. C. fl. fr. suppl. no. 2782. Gentiàna marítima, Thore, chlor. land. p. 94. Habit of *E. pulchélla*, but dwarfer. Corollas yellow.

Western Lesser Centaury. Pl. ⅛ to ¼ foot.

19 E. marítima (Pers. ench. 1. p. 283.) stem branched at top, dichotomous, corymbose, tetragonal; leaves oblong-lanceolate, 3-nerved; flowers pedicellate; segments of corolla ovate-bluntish; calyx length of the tube of the corolla; style bipartite. ⊙. H. Native of Italy, France, Greece, and Spain, by the sea-side. Chirònia marítima, Willd. spec. 1. p. 1069, exclusive of the syn. Barrel. icon. t. 468. Smith, fl. græc. t. 237. Chirònia marítima angustifòlia, D. C. fl. fr. no. 2782. suppl. p. 428. Gentiàna marítima, Lin. mant. p. 55. Lam. dict. 2. p. 642. Cav. icon. 3. p. 49. t. 296. f. 1.—Bocc. mus. 2. p. 83. t. 76.—Barrel. icon. t. 467, not 469. —Column. ecphr. 78. t. 77. Calycine segments linear. Very like *E. Centáurium*, but differs in the flowers being pedicellate and yellow. It differs from *E. lùtea*, in the flowers being twice the size, in the segments being lanceolate-linear, acuminated.

Var. β; Tingitàna (Schousb. mar. p. 85.) stem a little compressed; leaves 3-nerved. ⊙. H. Native of Tangiers, by the sea-side.

Sea-side Lesser Centaury. Fl. July, Aug. Clt. 1777. Pl. ¼ to ½ foot.

20 E. Meye'ri (Bunge, in Led. fl. alt. ill. t. 159. fl. alt. 1. p. 220.) stems erect, 2-edged, dichotomous at top; leaves ovate-oblong, somewhat 3-nerved; flowers bractless; peduncles about

equal in length to the flowers; tube of corolla exceeding the calyx, which is 5-parted: with subulate segments; corolline segments obtuse, crenulated at the apex. ⊙. H. Native of Altaia, in humid meadows, at the river Irtysch, near Ablaikit, and elsewhere. Stem obsoletely tetragonal, 2-10 inches high. Lower leaves obovate-obtuse. Flowers solitary, pedicellate, in the forks. Peduncles tetragonal. Tube of corolla slender. Anthers hardly twisted.

Meyer's Lesser Centaury. Pl. $\frac{1}{4}$ to $\frac{3}{4}$ foot.

21 E. Roxbu'rghii; stems dichotomously branched, terete; lower leaves rosulate, spatulate, obtuse, 3-nerved: cauline leaves lanceolate, obtuse, 3-nerved; calycine segments linear, much shorter than the tube, which is terete and slender; segments of corolla ovate-lanceolate, acute.? ⊙. H. Native of the East Indies. Chirònia centaurioìdes, Roxb. Chirònia jasminoìdes, and E'xacum diffùsum, Heyne, herb. Plant much branched from the base. Flowers rose-coloured, pedicellate.

Roxburgh's Lesser Centaury. Pl. $\frac{1}{3}$ foot.

22 E. lu'tea (Rœm. et Schultes, syst. 4. p. 171.) stem tetragonal, dichotomously-panicled; leaves many-nerved; lower ones ovate, superior ones oblong-lanceolate; segments of corolla elliptic; calyx length of the tube of the corolla; style bifid. ⊙. H. Native of Italy and France, on the mountains. Chirònia lùtea, Bertol. rar. pl. dec. 2. p. 32. Chirònia marítima, var. a, D. C. fl. fr. no. 2782. suppl. p. 32. Gentiàna marítima, Savi, pis. 1. p. 274.—Barrel. icon. t. 468. Gentiàna pùmila, Gouan, fl. monsp. p. 33. Leaves acute, ? shining. Pedicels thick, angular, sometimes the length of calyx. Calyx tubular; with acutely keeled linear-subulate segments. Corolla salver-shaped; with bluntish segments. Capsule cylindrical.

Yellow-flowered Lesser Centaury. Fl. July, Aug. Clt. 1824. Pl. $\frac{1}{2}$ to 1 foot.

23 E. elòdes (Rœm. et Schultes, syst. 4. p. 172.) stem nearly simple, tetragonal: angles winged, pellucid; leaves roundish, 5-nerved, downy, stem-clasping; calycine segments obtuse, addressed, glandular; limb of corolla connivent. ⊙. H. Native of the lower Pyrenees, in the valley d'Ossau, in boggy meadows. Chirònia uliginòsa, Lapeyr. abr. suppl. p. 39. Very nearly allied to *E. marítima*. Root of many capillary fibres. Peduncles axillary, sub-divided, 6-10-flowered. Tube of corolla inclosed in the calyx. Limb of corolla golden yellow.

Marsh Lesser Centaury. Pl. $\frac{1}{2}$ to 1 foot.

24 E. Porte'nsis (Link. et Hoffmans. fl. port. 1. p. 351. t. 66. a.) stems prostrate, tetragonal; branches assurgent; leaves ovate-roundish, obtuse, generally 3-nerved; tube of corolla longer than the calyx; segments of corolla acutish. ⊙. H. Native of Portugal, in humid places, about Oporto, and elsewhere. Gentiàna Portènsis, Brot. fl. lus. 1. p. 278. Habit of *Verónica serpyllifòlia*. Flowers terminal, usually 3, rarely 7, those in the forks sessile. Calycine segments scarious on the edges. Corolla yellow (reddish or whitish, ex Link. fl. port. l. c.), with long, narrow segments. Style bifid. Stems filiform, creeping, ex Brot.

Oporto Lesser Centaury. Pl. prostrate.

25 E. cæspitòsa (Link. et Hoffmans. fl. port. 1. p. 352. t. 66. b.) stem branched, tufted, prostrate; leaves 1-nerved, lanceolate-spatulate, fleshy; flowers terminal, 3 together, nearly sessile, capitate; tube of corolla hardly exceeding the calyx; segments of corolla acutish. ♂.? H. Native of Portugal, in marshes and bogs, near Figueira. Gentiàna chloòdes, Brot. fl. lus. 1. p. 276. Tops of branches tetragonal. Flowers colour of those of *E. Centáurium*. This is easily distinguished from the other species in the fleshy leaves.

Tufted Erythræa. Pl. prostrate.

26 E. grandiflòra (Bivon. sic. cent. 3.) stem tall, straight, rather tetragonal; leaves oblong, obtuse, 3-nerved; flowers corymbose, bracteate; calyx much shorter than the tube of the corolla, with subulate segments; segments of corolla bluntish. ⊙. H. Native of Sicily, on the mountains.

Great-flowered Lesser Centaury. Pl. 1 foot.

27 E.? Cochinchine'nsis (Spreng. syst. 1. p. 580.) stem quite simple; leaves ovate-oblong; flowers axillary, solitary, pedicellate; calyx tubular, slightly 5-cleft; stigma turbinate-roundish. ⊙. F. Native of Cochinchina. Hottònia littoràlis, Lour. coch. p. 105. Anthers twisted.

Cochinchina Lesser Centaury. Pl. $\frac{1}{2}$ foot.

28 E. cómpar (R. Br. in. append. to Salt. abyss. p. 476.) this species has not yet been described. ⊙.? H. Native of Abyssinia.

Equal Lesser Centaury. Pl.

Cult. All the species of this genus are elegant, delicate little plants. The seeds should be sown in small pots, well drained with sherds, in a mixture of gravel and peat, or sand, loam, and peat; and those species, natives of the sea-shore, may be watered occasionally with salted water.

XXXVIII. SABBA'TIA (in honour of L. Sabbati, a celebrated Italian botanist.) Adans. fam. p. 503. Sal. par. lond. t. 32. Pursh, fl. amer. sept. 1. p. 123. Rchb. hort. bot. 2. t. 118. Chirònia species, Lin. Michx. and others. Swértia species, Mill. dict. no. 2.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla with an urceolate tube; and a 5-12-parted limb. Stigma 2-parted; segments spiral. Stamens 5; anthers at length revolute. Capsule 1-celled, 2-valved; margins of valves seminiferous.—Biennial herbs, with angular stems and branches. Leaves opposite, sessile, decussate. Flowers terminal, solitary or corymbose. Corollas rose-coloured or white.

1 S. gra'cilis (Sal. par. lond. t. 32.) weak; branches loose, elongated, 1-flowered; leaves linear-elliptic, or lanceolate; calycine segments linear, equal in length to the tube of the corolla; segments of corolla obovate; stem angular. ♂. F. Native from Pennsylvania to Carolina, and of Canada, in wet pastures, on the banks of rivers. Chirònia grácilis, Michx. fl. bor. amer. 1. p. 146. Chirònia campanulàta, Lin. spec. p. 272. Flowers rose-coloured.

Slender Sabbatia. Fl. July, Aug. Clt.? Pl. 1 foot.

2 S. stella'ris (Pursh, fl. amer. sept. 1. p. 137.) erect; branches dichotomous, elongated, 1-flowered; leaves lanceolate, acute; segments of calyx subulate, shorter than the tube of the corolla; segments of corolla obovate; stem terete. ♂. H. Native of New York, New Jersey, &c. in salt marshes. Bartram, icon. ined. t. 13, in the Banksian Library. The flowers are large, and of a beautiful rose-colour, with an elegant yellow star in the centre, which is surrounded by a deep red border. This plant is extremely shy of cultivation, though very desirable for that purpose. It varies with white flowers.

Starry-flowered Sabbatia. Fl. Aug. Pl. 1 foot.

3 S. angula'ris (Pursh, l. c.) erect; leaves ovate, stem-clasping; peduncles elongated, corymbose; calyx half shorter than the corolla: with lanceolate segments; stem marginately quadrangular. ♂. H. Native from Canada to Carolina, in shady woods, on grassy hills; and of the Arkansas. Chirònia angulàris, Michx. fl. bor. amer. 1. p. 146. Lin. spec. 272. Willd. spec. 1. p. 1067. Habit of *Erythræ'a Centaúrium*. Flowers crowned as in *Hypéricum;* purplish red. It varies with longer and shorter, broader and narrower leaves. It is used by the inhabitants of North America, for the same purposes, and in the same way, as *Erythræ'a Centaúrium* is in this country.

Angular-stemmed Sabbatia. Fl. July, Aug. Clt. 1826. Pl. 1 foot.

4 S. campe'stris (Nutt. in amer. phil. trans. vol. 5. n. s. p. 197.) erect; branches dichotomous; leaves ovate, stem-clasp-

ing; peduncles elongated, sub-fastigiate: calyxes winged, with linear segments, which exceed the 5-parted corolla. ⊙. H. Native of North America, in the open prairies of the Arkansas, and red river. Plant bitter. Stem and branches angular. Peduncles forming a loose corymb. Leaves acute, 3-5-nerved. Corollas rose-coloured, size of those of *S. angulàris;* the segments obovate, and the base marked by a 5-rayed, greenish star.

Field Sabbatia. Fl. June, July. Pl. 1 foot.

5 S. calycòsa (Pursh, l. c. p. 138.) erect, leafy; leaves oblong-oboval; flowers solitary, with usually a 5-7-parted limb; calyx foliaceous, exceeding the corolla: with broad oblanceolate segments. ♂. H. Native from New York to Carolina, in wet meadows, Sims, bot. mag. 1600. Chirònia dichótoma, Walt. fl. car. 95.? Bartram, icon. ined. t. 10. in the Banksian Library. Chirònia calycòsa, Michx. fl. bor. amer. 1. p. 147. Corolla large, rose-coloured, with obovate segments. Calyx involucra-formed.

Calycose Sabbatia. Fl. Ju. Aug. Clt. 1812. Pl. 1 foot.

6 S. chloroìdes (Pursh, l. c.) weak; leaves lanceolate, erect; branches few, 1-flowered; corollas 7-13-parted, large; calycine segments linear, shorter than the corolla. ♂. H. Native from New York to Carolina, in bogs. Chirònia chloroìdes, Michx. fl. bor. amer. 1. p. 147. Chirònia dodecándra, Walt. fl. car. p. 95. Chlòra dodecándra, Lin. syst. p. 299. Willd. spec. 2. p. 341. Stem decumbent or weak. Corollas large, rose-coloured, with oblong segments.

Chlora-like Sabbatia. Fl. Aug. Sept. Clt. 1817. Pl. decumbent.

7 S. panicula'ta (Pursh. l. c.) erect; leaves lanceolate-linear; panicle many-flowered, bracteate, sub-fastigiate; calycine segments subulate, thrice shorter than the corolla; stem tetragonal. ♃. F. Native of New Jersey and Carolina, in bogs and cedar swamps. Chirònia paniculàta, Michx. fl. bor. amer. 1. p. 146 Swértia diffórmis, Lin. spec. p. 328. Mill. dict. no. 2. Willd. spec. 1. p. 1330. Flowers white, with oblong segments. Lower leaves sometimes ovate-lanceolate: superior ones subulately setaceous.

Var. α, latifòlia (Pursh, l. c.) leaves short-ovate; panicles few-flowered. ♃. H. Chirònia lanceolàta, Walt. fl. car. p. 95.

Var. β, angustifòlia (Pursh, l. c.) leaves linear; panicle corymbose, many-flowered. ♃. H.

Panicled-flowered Sabbatia. Fl. July, Aug. Clt. 1817. Pl. $1\frac{1}{2}$ foot.

8 S. Austra'lis (Cham. et Schlecht. in Linnæa, 1. p. 194.) erect; stem quadrangular; angles winged; leaves linear-lanceolate, 3-nerved; peduncles elongated, 1-flowered; calycine segments 3-nerved, acute, the middle nerve keeled, equal in length to the tube of the corolla; segments of corolla lanceolate, acuminated. ♂. F. Native of Brazil, in the province of Cisplatine. Plant glabrous. Lower leaves obovate, obtuse, the rest linear-lanceolate, with revolute edges. Plant often 1 or 2 flowered; or terminated by a few-flowered panicle. Corolla white, salver-shaped, with a 5-cleft limb. Anthers twisted. Stigmas bipartite, flat, at length elongated, and more or less twisted. Capsule half 2-celled. Seeds wrinkled.

Southern Sabbatia. Pl $\frac{1}{2}$ to 2 feet.

† *Species not sufficiently known.*

9 S. amœ'na; erect; leaves linear-lanceolate, acute; flowers terminal; calyx length of corolla, which is rotate; stem terete, dichotomous. ♂. H. Native of Maryland, Delaware, New Jersey. Chirònia amœ'na, Rafn. in Desv. journ. bot. 1. p. 224. Perhaps the same as *S. grácilis.*

Pleasant Sabbatia. Pl. 1. foot.

10 S. cymòsa; erect; leaves lanceolate, obtuse; cymes terminal; corolla longer than the calyx; stem tetragonal: angles membranous; calycine segments linear-obtuse. ♂. F. Native of Carolina. Chirònia cymòsa, Lam. ill. 1. p. 479. no. 2178. Poir. suppl. 2. p. 234. Leaves as if they were truncate at the base; upper ones almost linear; radical ones ovate-roundish, petiolate; and the bracteas linear, ex Poir. Perhaps the same as *S. angulàris*, or *S. paniculàta*, var. *α, latifòlia.*

Cymose-flowered Sabbatia. Pl. 1 foot.?

Cult. The species of *Sabbàtia* are very elegant plants, when in blossom, and are therefore worth cultivating in every collection. The seeds should be sown thinly in pots, in the same way as recommended for the species of *Erythræ'a;* but the pots require to be placed in shallow pans of water, the species being natives of marshes and bogs.

Sub-tribe IV.

LISIA'NTHEÆ (this sub-tribe agrees with the genus *Lisiánthus*, in the capsule being 2-celled, and in the anthers being changed in the old state.) Capsule 2-celled, in consequence of the margins of the valves being bent into the central column; margins of valves placentiferous. Anthers changed in the old state.

XXXIX. LISIA'NTHUS (from λυσις, *lysis*, dissolution; and ανθος, *anthos*, a flower; a name given to the plant, on account of medical virtues possessed by it, of dissolving humours, being a powerful cathartic.) Browne, jam. p. 157. t. 9. f. 1. Schreb. gen. no. 274. Lin. suppl. 135. mant. p. 6. Juss. gen. 142. Aubl. guian. 1. p. 204. Gærtn. fruct. suppl. 1. p. 23. t. 183. H. B. et Kunth, nov. gen. amer. 3. p. 180. Mart. nov. gen. bras. 2. p. 92. Ruiz. et Pav. fl. per. 2. p. 114. Cullùmia, Sal. par. lond. under no. 34.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, 5-cleft; segments erect, with membranous, diaphanous, and incumbent edges. Corolla funnel-shaped, marcescent; tube unequal, on one side, or ventricose above; limb equal, 5-cleft; throat beardless or naked. Stamens 5, rather unequal, ascending; anthers sagittate, fixed by the base, for the most part revolute, especially in the dried state. Style elongated; stigma bilamellate. Capsule 2-celled, 2-valved, many-seeded; margins of valves inflexed, placentiferous. Seeds angular.—Herbaceous or suffruticose, erect, glabrous plants. Roots perpendicular. Stems subtetragonal, simple or divided at top. Leaves decussately opposite, sessile, or on short petioles; petioles usually more or less combined into a short sheath, quite entire, usually marginated, 3-5-nerved. Flowers axillary, among the superior leaves, or terminal, racemose; racemes bifid, with a flower in the fork, or dichotomous or panicled. Corollas of various beautiful colours. Pedicels continuous with the calyx, bracteolate, sub-opposite.—Inhabitants of tropical America, in fields and alpine pastures.

§ 1. *Flowers blue or purple.*

1 L. alpe'stris (Mart. nov. gen. bras. 2. p. 93. t. 171.) stem finely 4-winged; leaves ovate-orbicular, obtuse, marginate; flowers solitary, axillary, drooping; calycine segments ovate, acutish; corolla campanulately tubular, with ovate, orbicular, acutish segments. ⊙. S. Native of Brazil, in the mine provinces, in pastures, on the mountains, particularly between Villa da Campanha and Villa Rica. Corolla pale violet, above an inch long. Leaves 1 or $1\frac{1}{2}$ inch in diameter.

Alp Lisianthus. Fl. Jan. Feb. Pl. 1 to $1\frac{1}{2}$ foot.

2 L. pe'ndulus (Mart. l. c. 2. p. 94. t. 172.) leaves oblong, acute, sessile at the bottom of the stem, and running down it; stem tetragonal, submarginate; racemes terminal, on long peduncles; calycine segments acuminated; corolla campanulately funnel-shaped: with deep, oblong, acute, erectish segments. ⊙. S. Native of Brazil, on mountains, near Villa Rica, and St. Joao del Rey. Leaves 1 to $1\frac{1}{2}$ inch long. Corollas $1\frac{1}{2}$ inch long, of a beautiful, pale violet. The roots are very bitter, and are used in decoction by the natives as a febrifuge.

Pendulous Lisianthus. Pl. 1-2 feet.

3 L. ala'tus (Mart. l. c. p. 95. t. 174.) stem tetragonal; with the angles a little winged; leaves sessile, ovate, obtuse, marginate; flowers racemose; calycine segments ovate-roundish; corolla from a slender tube to ventricose: with ovate segments. ♃. S. Native of Brazil, in alpine pastures, near Villa Rica, Sabara, and on the range of mountains called Serra de St. Antonio, in the mine provinces. L. speciòsus, Schlecht, in Linnæa, 1. p. 198. Racemes sometimes simple, and sometimes crowded, coarctate. Flowers drooping. Corolla 1½ to 2 inches long, pale violet.

Winged-stemmed Lisianthus. Pl. 1½ to 2 feet.

4 L. amplíssimus (Mart. l. c. p. 96. t. 175.) stem tetragonal; having the angles a little winged; leaves sessile, ovate, acute, a little margined; flowers racemose; calycine segments ovate; corollas very large, campanulate, with ovate-orbicular segments. ♃. S. Native of Brazil, in alpine pastures, near Villa Rica, Villa do Principe, and elsewhere, in the mine provinces. Racemes twin, 2-flowered, with a flower in the fork. Corolla large, purple or blue. The roots are very bitter, and are used in decoction as a febrifuge, like those of *L. péndulus*, by the inhabitants of the mine provinces of Brazil.

Very large-flowered Lisianthus. Pl. 2 feet.

5 L. cœrule'scens (Aubl. guian. 1. p. 207. t. 82. Mart. l. c. p. 100. t. 178. f. 2.) stem tetragonal, leafless a long way at the top: leaves narrow-lanceolate: lower ones ovate, acute, few; flowers bifidly racemose or solitary, drooping; calycine segments ovate, acute; corolla funnel-shaped; with a short, gibbous tube: and ovate, acute, erectish segments. ⊙. S. Native of Brazil, in the province of St. Paul, in moist fields; and of Guiana, in humid meadows. Leaves small. Corolla small, blue, a nail in length.

Bluish-flowered Lisianthus. Pl. ½ to 1 foot.

6 L. prate'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 180.) stem simple, tetragonal; angles a little winged; leaves linear, obtuse, sessile, remote; flowers few, terminal; calycine segments ovate, obtuse; corolla funnel-shaped, with ovate, acute segments. ⊙. S. Native of grassy places, near Esmeraldo, on the Orinoco. Flowers unequally pedicellate. Corolla blue. Nearly allied to *L. cœruléscens*, Aubl.

Meadow Lisianthus. Fl. May. Pl. 1 to 1½ foot.

7 L. purpura'scens (Aubl. guian. 1. p. 205. t. 81.) stem branched, obsoletely tetragonal; leaves sessile, ovate, acuminated; racemes terminal, dichotomous, on long peduncles; calycine segments roundish, obtuse; corolla campanulately funnel-shaped: with roundish-ovate, acutish segments. ⊙. S. Native of the Missions of the Orinoco, in inundated places, between St. Fernando de Atabapo, and the falls of Maypure; and of Guiana. Lam. ill. t. 107. f. 2. H. B. et Kunth, nov. gen. amer. 3. p. 182. Flowers solitary, remote, secund, at length drooping. Corolla purplish, 9 lines long. Stamens equal to the corolla in length, or a little exserted. Leaves reticulately veined.

Purplish-flowered Lisianthus. Fl. May. Pl. 1 foot.

§ 2. *Flowers scarlet.*

8 L. pulche'rrimus (Mart. l. c. p. 97. t. 176.) stem sub-tetragonal, finely winged; leaves sessile, ovate, acuminated; or broad-elliptic, revolute, with membranous margins; panicles terminal, dichotomous; calycine segments ovate, acute; corollas large, campanulately funnel-shaped, from a slender tube. ♃. G. Native of Brazil, in the mine provinces, especially near Villa Rica, Sabura, Tepanhoa, Villa do Principe, Tejuco, &c. Corolla large, nearly 3 inches long, scarlet. Peduncles twin, dichotomous; with a flower in each fork.

Very fair Lisianthus. Pl. 3 feet.

9 L. e'legans (Mart. l. c. p. 98. t. 177.) stem sub-tetragonal; leaves sessile, ovate, short-acuminated, with sub-revolute edges; racemes on long peduncles; flowers drooping; calycine segments ovate, acute; corolla funnel-shaped, from an elongated tube: with ovate-acute segments. ♃. G. Native of Brazil, in the mine provinces, in alpine pastures, especially near Villa Rica, Pires, Villa do Principe, and on mount Itambe, &c. Peduncles 2-3-flowered. Corolla 1½ inch long, fine scarlet.

Var. α, *robústa* (Mart. l. c.) stem 2-3-feet, branched, leafy; flowers large, red, more remote.

Var. β, *símplex* (Mart. l. c.) stem almost simple, leafy at bottom, and elongated at top into an almost 1-flowered pedicel; flowers smaller.—Lis. pedunculàtus, Schlecht, in Linnæa, 1. p. 199.

Elegant Lisianthus. Pl. 1 to 2 feet.

10 L. angustifòlius (Mart. l. c. p. 99. t. 178. f. 1.) stem tetragonal; angles slightly winged; leaves sessile, narrow-linear-lanceolate, acute, with revolute edges; flowers drooping, usually solitary; calycine segments ovate, short-acuminated; corolla funnel-shaped, with a slender tube, and narrow, ovate, acute, erectish segments. ⊙. S. Native of Brazil, in the mine provinces, in elevated fields, near St. Domingo, &c. Corolla fine scarlet, an inch and more long.

Narrow-leaved Lisianthus. Pl. 1 to 1½ foot.

§ 3. *Flowers yellow, or greenish yellow, or altogether green.*

11 L. infla'tus (Mart. l. c. p. 94. t. 173.) leaves ovate-oblong, acute, on short petioles; stems terete; racemes terminal, few-flowered, sub-secund, drooping; calycine segments ovate, obtuse, apiculated; corolla with a narrow base, and a ventricosely campanulate top: with ovate, obtuse, spreading segments. ⊙. S. Native of Brazil, in subalpine fields, near Villa Rica, Sabura, and elsewhere, in the mine provinces. Racemes twin, 2-4-flowered, with or without a flower in the fork. Flowers pendulous. Corolla more than an inch long, pale greenish.

Inflated-flowered Lisianthus. Fl. Feb. March. Pl. 2 to 2½ feet.

12 L. Ku'nthii; stem branched, terete; leaves lanceolate-linear, nearly sessile; racemes terminal, simple; calycine segments roundish, obtuse, concave; corolla funnel-shaped: with ovate, acute segments. ⊙. S. Native of grassy places, at the foot of mount Duida, near Esmeralda, in the missions of the Orinoco. L. angustifòlius, H. B. et Kunth, nov. gen. amer. 3. p. 181. Leaves 1-nerved, obsoletely veined. Flowers solitary, or twin, secund, lower ones remote. Calyx quadrifid.? Corolla green.

Kunth's Lisianthus. Fl. May. Pl. 1 to 2 feet.

13 L. bífidus (H. B. et Kunth, nov. gen. amer. 3. p. 181.) stem simple, obsoletely tetragonal; leaves nearly sessile, lanceolate, acute; racemes terminal, bifid; calycine segments roundish-elliptic, obtuse; corolla funnel-shaped: with ovate-obtuse segments. ⊙. S. Native of New Granada, near the mine of Santanna. L. racemòsus, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 788. Leaves remote. Flowers solitary, secund. Corollas green. Stamens exserted.

Bifid-racemed Lisianthus. Fl. June. Pl. 1 to 2 feet.

14 L. macrophy'lla (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 788. H. B. et Kunth, nov. gen. 3. p. 183.) shrubby; branches tetragonal; leaves ovate, acute, on short petioles; corymbs terminal, paniculately disposed; calycine segments roundish; corolla funnel-shaped: with ovate, obtuse segments. ♄. S. Native of New Granada, on the declivity of Panama de Almaguer, between Pansitara and the river Ruiz. Stem articulated, rather hairy, having 2 of the sides convex, and the other 2 furrowed. Floriferous branches sub-fastigiate. Leaves reticulately veined; having the nerves and veins hairy on the under side. Corollas yellow. Leaves 7-8 inches long.

Long-leaved Lisianthus. Fl. Nov. Shrub 6 feet.

15 L. trífidus (H. B. et Kunth, nov. gen. amer. 3. p. 182.)

stem branched, tetragonal: having the angles winged; leaves on short petioles, ovate, acute; racemes terminal, trifid; calycine segments oblong, obtuse; corolla funnel-shaped: with roundish obtuse segments. ⊙. S. Native of New Granada, between Mariquita and the mine of Santanna. Leaves quintuple-nerved, and reticulately veined, 3 inches long. Petioles connate at the base. Flowers secund, solitary, hardly an inch long. Corolla greenish. Branches of racemes fastigiate.

Trifid-racemed Lisianthus. Fl. June. Pl. 1 foot.

16 L. GLA'BER (Mutis, in Lin. suppl. 134. Smith, icon. 1. p. 29. t. 29.) shrubby; branches tetragonal; leaves elliptic or ovate-lanceolate, acute; corymbs terminal and axillary, few-flowered, involucrated by 2 or 3 leaves. ♄. S. Native of Peru; and New Granada, at Santa Fe de Bogota. H. B. et Kunth, nov. gen. amer. 3. p. 183. L. corymbòsus, Ruiz. et Pav. fl. per. 2. p. 14. t. 124. Corolla campanulately funnel-shaped, yellow.

Glabrous Lisianthus. Shrub.

17 L. ALA'TUS (Aubl. guian. 1. p. 204. t. 80.) stem tetragonal; angles winged; leaves oblong, acuminated, nearly sessile; cymes terminal, racemose, dichotomous, loose; calycine segments yellowish; genitals exserted. ⊙. S. Native of Cayenne and Guiana, in waste places. Lam. dict. 3. p. 661, exclusive of *L. chelonoìdes*, Lin. Stem articulated. Leaves obliquely nerved. Pedicels each furnished with a gland-like body and a scale-like bractea. Corolla white, with a furrowed tube; segments of the limb marked with a green spot on both sides at apex. Plant bitter like the rest.

Wing-stemmed Lisianthus. Fl. July, Aug. Clt. 1824. Pl. 2-3 feet.

18 L. CHELONOÌDES (Lin. suppl. 134, exclusive of the syn. of Aubl. syst. 197.) stem terete; leaves oval-oblong, rather connate at the base, bluntish; panicle terminal, dichotomously branched, racemose; racemes long; calyx globose. ⊙.? S. Native of Surinam and Cayenne. Flowers alternate, remote, secund. Corolla greenish yellow, with a sub-recurved tube. Plant bitter, and purgative. Stem sub-tetragonal at the base, becoming gradually terete to the top. Lower leaves connate; upper ones only sessile.

Chelone-like Lisianthus. Pl. 2 to 3 feet.

19 L. GRANDIFLÒRUS (Aubl. guian. 1. p. 201. t. 79.) stem simple, tetragonal at the base, and terete at apex; leaves ovate, acuminated, connate at the base, beset with short hairs on both surfaces, but especially on the margins and middle nerve; panicle dichotomous; corolla with an undulated limb, and reflexed, roundish, sinuated segments. ⊙. G. Native of Guiana, and Cayenne, in humid places. Desf. in Lam. dict. 3. p. 661. Leaves rather large. Flowers large, solitary, greenish-yellow. Three of the stamens are exserted.

Great-flowered Lisianthus. Fl. July, Aug. Clt. 1818. Pl. 2 to 3 feet.

20 L. LONGIFLÒRUS (Willd. herb. ex Rœm. et Schultes, syst. 4. p. 787.) leaves lanceolate, rugosely nerved beneath, scabrous on both surfaces. ⊙.? S. Native of South America, Humb. et Bonp. Kunth knows nothing of this plant.

Long-flowered Lisianthus. Pl.

21 L. FRÍGIDUS (Swartz. prod. p. 40. fl. ind. occ. 1. p. 352.) stem tetragonal; leaves petiolate, ovate, acuminated; panicles terminal, trichotomous; corollas ventricose: with roundish obcordate segments. ♃. S. Native of St. Dominica, on mount Soufriere; and of Guadaloupe. L. acuminàtus, Desf. in Lam. dict. 3. p. 660.? Flowers yellow, erect. Segments of calyx obtuse.

Frigid Lisianthus. Pl. 2 to 3 feet.

22 L. FISTULÒSUS (Poir. suppl. 3. p. 564.) stem terete, striated, fistular; leaves sessile, ovate, acute, 3-nerved; corymbs dichotomous, many-flowered; calycine segments very blunt; segments of corolla short, obtuse; stamens length of corolla. ⊙. S. Native of Cayenne. Leaves 2-3 inches long. Flowers on short pedicels. Corolla yellow, an inch long, with a sub-inflated throat. Capsule ovate.

Fistular-stemmed Lisianthus. Pl. 1 to 2 feet.

23 L. LATIFÒLIUS (Swartz, prod. p. 40. fl. ind. occ. 1. p. 348.) branches obsoletely tetragonal; leaves petiolate, lanceolate-ovate, acuminated; peduncles simple, trichotomous; calycine segments acute, unequal; segments of corolla erect, lanceolate, acute. ♄. S. Native of Jamaica, on high mountains. Corolla yellow, an inch long. Very like *L. exsértus*, but differs in the stamens being inclosed. Corymbs hardly longer than the leaves.

Broad-leaved Lisianthus. Fl. July, Sept. Clt. 1821. Shrub 5 to 6 feet.

24 L. UMBELLA'TUS (Swartz. prod. p. 40. fl. ind. occ. 1. p. 350.) branches tetragonal; leaves petiolate, long, obovate, sub-acuminated; peduncles terminal and axillary, a little compressed, bearing each an umbel of 20-30 pedicellate flowers; calycine segments lanceolate; segments of corolla short, obtuse, erect; stamens sub-exserted. ♄. S. Native of the west of Jamaica, on hills. Leaves a foot long. Corolla ½ an inch long, yellow.? Capsule ovate.

Umbellate-flowered Lisianthus. Fl. July, Aug. Clt. 1822. Shrub 6 to 7 feet.

25 L. VISCÒSUS (Ruiz, et Pav. fl. per. 2. p. 14. t. 125.) stem obsoletely tetragonal, furrowed, branched at top; leaves oblong, on short petioles, very veiny; corymbs ample, terminal, clammy; calycine segments concave; segments of corolla roundish, cordate, spreading. ♄. S. Native of Peru, in high places, at Munna. Leaves entire, and sub-sinuated, obtuse, shining. Bracteas ovate, recurved. Corolla greenish yellow. Capsule 3 inches long.

Clammy Lisianthus. Shrub.

26 L. REVOLU'TUS (Ruiz, et Pav. fl. per. 2. p. 14. t. 127.) stem branched, tetragonal, striated; leaves lanceolate, petiolate, with revolute margins, beset with recurved pili on the nerves beneath; corymbs terminal and axillary, bearing each 4-6 1-flowered pedicels. ♄. S. Native of Peru, on cold mountains of Munna. Lower leaves approximate; superior ones remote, ovate-oblong, 4-5 inches long. Bracteas lanceolate. Corolla yellowish-red.

Revolute-leaved Lisianthus. Shrub 6 feet.

27 L. PARVIFÒLIUS (Desf. in Lam. dict. 3. p. 660. ill. 476.) stem filiform, tetragonal; leaves linear, sessile, mucronate, adpressed to the stem; corymbs terminal, few-flowered; calyx cleft even to the middle, with sub-carinated segments; corolla 3 times longer than the calyx. ⊙.? S. Native of South America.? Root fibry. Stem yellowish.

Small-leaved Lisianthus. Pl. 1 foot.

28 L. ACUTA'NGULUS (Ruiz, et Pav. 2. p. 14. t. 122. f. a.) stem fistular, tetragonal; angles acute; leaves distant, connivent at the base; lower ones cordate, upper ones ovate; peduncles dichotomous, panicled; calycine segments ovate; corolla subringent: with an incurved tube, and roundish, revolute segments. ♃.? S. Native of Peru, in the mountains of Panatahua. Pedicles short, thick, 1-flowered. Calyx short. Stem dichotomous. Corollas yellow. Capsules pendulous.

Acute-angled-stemmed Lisianthus. Fl. July. Aug. Clt. 1820. Pl. 6 feet.

29 L. OVA'LIS (Ruiz, et Pav. fl. per. 2. p. 13.) stem twiggy, terete, fistular, branched at top; peduncles axillary and terminal, corymbose, dichotomous; pedicles secund; leaves òvate, veinless, on short petioles. ♄. S. Native of Peru, in groves. Corollas greenish yellow. Capsule pendulous.

Oval-leaved Lisianthus. Shrub 10 to 12 feet.

30 L. CAMPANULA'CEUS (Lam. dict. 3. p. 660. ill. p. 476. no. 2161.) stem slender, simple, obsoletely tetragonal; leaves ovate,

acute, petiolate, with 2 oblique nerves; peduncles solitary or twin, long, bracteolate under the flower; calyx turbinate; corolla with a short tube, a ventricose sub-campanulate, inflexed limb; and ovate, obtuse, rather irregular segments. ⊙. S. Native of South America. Leaves 12-20 lines long, and 5-6 broad. Bracteas minute. Corolla yellow.?

Campanulate-flowered Lisianthus. Pl. 1 to 1½ foot.

31 L. nigre'scens (Cham. et Schlecht, in Linnæa, 6. p. 388.) stem and branches terete; leaves of the sterile branches half stem-clasping, ovate, with rounded, stem-clasping auricles, which are lanceolate at the base, acuminated, pale green above, but paler beneath; panicle large, loose-flowered; calycine segments narrow-lanceolate, acuminated; corolla almost funnel-shaped; with elliptic-acuminated segments. ⊙. G. Native of Mexico, in woods, at Papantla. Leaves 6 inches long, and 2 inches broad. Corolla blackish in the dried state, but probably greenish yellow in the recent state. Capsule elliptic.

Blackish-flowered Lisianthus. Pl. 1 to 2 feet.

32 L. saponarioìdes (Cham. et Schlecht. l. c. p. 389.) stem branched, nearly terete at bottom, but obsoletely tetragonal at top; leaves nearly sessile, ovate-lanceolate, acuminated, with rather scabrous edges; inflorescence a compound cyme. ♃ G. Native of Mexico, at Papantla, on the edges of woods. Leaves 5 inches long. Calycine segments lanceolate, acuminated. Corolla white, salver-shaped; with ovate, acuminated segments. Capsule elliptic or ovate.

Saponaria-like Lisianthus. Pl. 1 to 2 feet.?

† *Species not sufficiently known; and probably not belonging to the genus.*

33 L. carina'tus (Desr. in Lam. dict. 3. p. 659. ill. t. 107. f. 3.) glabrous; stem branched; branches tetragonal; leaves roundish-ovate, sessile, 3-nerved; calyx prismatic, having the segments keeled upwards; corolla with a slender tube, and ovate, spreading segments. ♄. S. Native of Madagascar. Leaves sub-connate. Flowers erect, pedicellate, terminal and axillary. Corolla 3 times longer than the calyx. Capsule ovate-oblong.

Keeled-calyxed Lisianthus. Shrub.

34 L. trine'rvis (Desr. in Lam. dict. 3. p. 659. ill. p. 476.) downy; stem sub-tetragonal; leaves ovate, mucronate, on short petioles; flowers in loose terminal, trichotomous panicles, pedicellate; calyx deeply divided, with keeled segments; limb of corolla parted nearly to the base into narrow segments. ♃. S. Native of Madagascar. Leaves beset with short hairs on both surfaces; bracteas short, lanceolate, acute. Capsule ovate.

Three-nerved-leaved Lisianthus. Pl. 1½ foot.

35 L. tubiflòrus (Pet. Th. in Willd. mss. ex Rœm. et Schultes, syst. 4. p. 788.) glabrous; stem terete; leaves ovate, acuminated, petiolate, 3-nerved; umbels terminal, few-flowered; calyx ventricose, contracted at top; tube of corolla 6 inches long; limb wide: with ovate, acuminated segments. ♄.? S. Native of Madagascar. Superior leaves lanceolate, 4 inches long, longer than the internodes.

Tube-flowered Lisianthus. Shrub.?

Cult. Most of the species of *Lisiánthus* are very handsome when in blossom. A mixture of loam, sand, and peat is a good soil for them; and cuttings of the shrubby and perennial species strike root readily in sand, under a hand-glass. The annual kinds require the same as that recommended for *E'xacum*, p. 213.

XL. IRLBA'CHIA (named by Martius, in honour of Gabriel, Count de Bray, of the dynasty of Irlbach, ambassador from the King of Bavaria to the Court of Spain.) Mart. nov. gen. bras. 2. p. 101.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, 5-cleft; segments erect, with membranous margins. Corolla funnel-shaped, equal, deciduous; limb 5-cleft; throat naked. Anthers revolute when dry. Stigma bifid; segments cylindrical, not bi-lamellate. Capsule 2-celled, 2-valved, many-seeded; margins of valves placentiferous. bent inwards.—An erect, glabrous herb. Stems tetragonal, fistular. Leaves opposite, decussate, petiolate, triple or quintuple-nerved. Flowers alternate, disposed in dichotomous panicles. This genus differs from *Lisiánthus* in the regular corolla, and structure of the stigma.

1 I. e'legans (Mart. l. c. p. 102. t. 179.) leaves lanceolate, acuminated; rachis of panicle geniculately bent. ⊙. S. Native of Brazil, in the province of Rio Negro, near Ega, in moist, sylvan meadows. Corolla blue, a nail in length. Racemes long, twin, with a flower in the fork between them.

Elegant Irlbachia. Pl. 1½ to 2 feet.

Cult. For culture and propagation see *E'xacum*, p. 213.

XLI. SYMBOLA'NTHUS (from *συμβολον, symbolon*, a ring; in reference to the ring at the base of the filaments.) Lisiánthus species, Ruiz. et Pav. and H. B. et Kunth.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, pentagonal; segments with membranous margins. Corolla salver-shaped, with a cylindrical tube, 3 times longer than the calyx; and a 5-parted limb; segments with crenulately fringed edges. Stamens inserted in the tube, hardly exserted; anthers sagittate, at length convolute, having a short, ring-formed, crenulated, membrane at the base of the filaments. Ovarium ovate, compressed, 1-celled, 2-valved; placentas 2, parietal, bilamellate, bearing seeds on the back. Stigma 2-lobed; lobes linear-oblong, flat, blunt. Capsule ovate.—Glabrous, branched shrubs; branches tetragonal. Leaves opposite, decussate, on short petioles, with a prominent middle nerve, obsoletely veined; petioles round at the base. Flowers axillary, solitary, or 2-3 terminal, rose-coloured.

1 S. Ku'nthii; leaves oblong, acute; flowers pedicellate, axillary ones solitary, and terminal ones 2-3 together; corolla salver-shaped, with fringed segments. ♄. S. Native of New Granada, on mountains between Honda and Mariquita. Lisiánthus anómalus, H. B. et Kunth, nov. gen. amer. 3. p. 184. Branches sub-dichotomous. Leaves 2½ inches long. Flowers size of the following species. Bracteas oblong, sub-spathaceous.

Kunth's Symbolanthus. Shrub 5 to 6 feet.

2 S. Pavònii; leaves ovate-lanceolate; flowers pedicellate, axillary, solitary; calyx pentagonal; corolla sub-ringent. ♄. S. Native of Peru, on the mountains. Lisiánthus calygònus, Ruiz, et Pav. fl. per. 2. t. 126. Leaves 2-3 inches long. Pedicels curved, furnished with 3 ovate, concave, acuminated, bracteas each. The 3 outer segments of the calyx are lanceolate, and 2 inner, sub-sagittate, all with membranous, fringed edges. Corolla rùb-ringent, rose-coloured, large, with acuminated, reflexed segments.

Pavon's Symbolanthus. Shrub 5 to 6 feet.

Cult. For culture and propagation see *Tàchia*, p. 197.

XLII. EU'STOMA (from *ευστομος*, a beautiful mouth; in reference to the fair corollas). Sal. par. lond. t. 34.—Lisiánthus species of authors.

Lin. syst, *Pentándria, Monogýnia.* Calyx deeply 5-cleft, having the backs of the segments more or less winged. Corolla with a funnel-shaped tube, which is contracted a little at the apex; and a deeply 5-cleft limb, which is longer than the tube, and is variegated below the middle above. Stamens 5, inserted near the middle of the tube, and a little longer than it; filaments erect, linear-lanceolate; anthers rather sagittate. Ovarium

oblong, 1-celled, ex Sal. and 2-celled, ex Nutt. succulent; with short, stipitate placentas. Style short, erect; stigma large, deeply 2-lobed. Seeds scrobiculate.—Annual herbs, with the habit of *Pneumonánthe*. Leaves glaucous, oblong, opposite, decussate, perfoliate. Corymbs few-flowered, dichotomous, terminal. Flowers blue. The plants have glaucous, perfoliate leaves, not unlike those of Lobel's Catchfly, the *Silène Armèria*.

1 E. SILENIFOLIA (Sal. par. t. 34.) stems terete; leaves obovate-lanceolate; segments of calyx winged on the back. ⊙. H. Native of Providence, and of North America, on the sandy banks of the great salt river of the Arkansas; and at sources of the Canadian river. Lisiánthus glaucifòlius, Lam. dict. 660. Jacq. col. 1. p. 64. icon. rar. 1. t. 33. Nutt. in amer. phil. trans. vol. 5. n. s. p. 177. Corolla purple: anthers yellow.

Catchfly-leaved Eustoma. Fl. July. Clt. 1804. Pl. 1-2 foot.

2 E. EXALTA'TA (Sal. l. c.) stem slightly tetragonal; leaves spatulate or oblong-lanceolate; calycine segments winged on the back. ⊙. S. Native of St. Domingo and Vera Cruz. Lisiánthus exaltàtus, Lam. 3. p. 662. ill. p. 478. Gentiàna exaltàta, Lin. spec. 231. Lam. dict. 2. p. 636. Erythræ'a Plumièri, H. B. et Kunth. nov. gen. amer. 3. p. 176.—Plum. spec. 3. Burm. amer. icon. t. 81. f. 1. Leaves 3-nerved. Segments of corolla crenated. Fruit full of clammy seeds. This species differs from the preceding, in having a more angular stem, and a greater number of flowers; in the wings of the calyx being broader, and in the filaments being inserted a little higher up.

Var. β, albiflòra; herb more glaucous than the species: and the flowers white and more expanded. ⊙. F. Native of Mexico, at Papantla, on the banks of rivulets. Cham. et Schlecht, in Linnæa, 6. p. 387.

Tall Eustoma. Pl. 2 to 3 feet.

Cult. The seeds of the species of *Eústoma* require to be reared on a hot-bed, and otherwise treated like other tender annuals.

Tribe II.

EXACIE'Æ (the plants contained in this section agree with *E'xacum*, in having a 2-celled capsule.) Capsule 2-celled; margins of valves bent into the central placenta, which is at length free, and bears the seeds.

XLIII. SEBÆ'A (named in memory of Alb. Seba, an apothecary of Amsterdam, author of Locupletissimi rerum naturalium thesauri descriptio, 4 vol. fol. Amsterdam, 1734—1765.) Solander mss. R. Br. prod. p. 451. E'xacum species of Lin. and others.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx 4-5-parted; segments keeled or winged on the back. Corolla 4-5-cleft, salver-shaped, marcescent. Stamens 4-5, exserted; anthers dehiscing lengthwise: when old, recurved, with a callous apex. Stigmas 2. Capsule 2-celled, 2-valved; valves with inflexed edges inserted into the central placenta, which is at length free.—Erect annual glabrous herbs, with tetragonal stems and branches; opposite, decussate, sessile leaves; and usually terminal, corymbose panicles of flowers.

1 S. CORDA'TA (R. Br. prod. p. 452.) stem dichotomous, tetragonal; leaves sessile, cordate; flowers 5-cleft in the forks, on short pedicels, or in corymbs; stamens inclosed; segments of calyx cordate, furnished each with a keel on the back. ⊙. G. Native of the Cape of Good Hope. E'xacum cordàtum, Lin. syst. 155. suppl. 124. Cham. et Schlecht in Linnæa, 194. Gentiàna exacoìdes, Lin. spec. p. E'xacum grandiflòrum, Gærtn. fruct. 2. p. 158. t. 114.—Burm. afr. t. 74. f. 5. Corolla yellow, with a cylindrical tube and obovate segments. Habit of *Erythræ'a Centaúrium*. In all the varieties the stamens are said to be inclosed in the throat of the corolla.

Var. α, macrántha (Cham. et Schlecht in Linnæa, 1. p. 191.) keels of the calyx, which is large, broadly winged, smooth, or scabrous; corollas large, an inch long: more than twice longer than the calyx.

Var. β, intermèdia (Cham. et Schlecht, l. c.) keels of calyx with narrow, smooth, almost evanescent wings; corolla smaller, half an inch long, twice as long as the calyx.

Var. γ, micrántha (Cham. et Schlecht. l. c. p. 192.) keels of calyx winged, nerved, having the nerves ending in teeth; corolla minute, 4 lines long, not quite twice the length of the calyx.—Plukn. alm. p. 94. t. 275. f. 4.

Cordate-leaved Sebæa. Fl. July, Aug. Clt. 1815. Pl. $\frac{1}{4}$ to $\frac{3}{4}$ foot.

2 S. SULPHU'REA (Cham. et Schlecht. in Linnæa, 1. p. 192.) stem dichotomously and corymbosely branched, sub-tetragonal; leaves sessile, broad, ovate, acute, 1-nerved; calyx nearly globose, with acute segments, which are winged by a narrow keel on the back; flowers 5-cleft; stamens exserted. ⊙. G. Native of the Cape of Good Hope, on the top of the Table Mountain. S. tabulàris, Ecklon, mss. Leaves 3 lines long and two broad. Corolla sulphur coloured, with elliptic, acute segments. Calyx much shorter than the tube of the corolla.

Sulphur-coloured flowered Sebæa. Pl. $\frac{1}{3}$ foot.

3 S. CRASSULÆFÒLIA (Cham. et Schlecht, l. c. p. 193.) stem corymbosely branched; angles winged; branches straight; leaves cordate, roundish, acute, sessile, 3-5-nerved; flowers quinquefid; calyx ovoid, with acute, sharply keeled segments; stamens exserted. ⊙. G. Native of the Cape of Good Hope, at Plettenbergsbay Poort. Stem naked at the base. Branches floriferous at top. Leaves 4-5-lines broad, and 3 lines long, with the margins and apexes inflexed. Flowers crowded, yellow.

Crassula-leaved Sebæa. Pl. 1 to $1\frac{1}{2}$ foot.

4 S. CAPITA'TA (Cham. et Schlecht, l. c.) stem crowded with leaves at bottom, the rest naked and simple, terminated by a coarctate panicle; leaves sessile, ovate, attenuated at the base, 3-nerved; flowers quadrifid; calyx ovate, with keeled segments; stamens exserted. ⊙. G. Native of the Cape of Good Hope, on the top of the Table Mountain. Leaves with revolute edges. The superior part of the stem often furnished with one or two pairs of minute, stem-clasping leaves. Corolla yellow, much longer than the calyx, with obtuse segments.

Capitate-flowered Sebæa. Pl. $\frac{1}{2}$ foot.

5 S. AU'REA (R. Br. prod. p. 452.) stem dichotomous, slightly tetragonal; leaves sessile, cordate, ovate, 3-nerved; panicle corymbose, terminal; flowers quadrifid: calycine segments with winged keels; stamens inclosed. ⊙. H. Native of the Cape of Good Hope. Gentiàna aúrea, Thunb. E'xacum aúreum, Lin. syst. 155. suppl. 123. Lam. ill. t. 80. f. 2. E'xacum séssile, Lin.—Plukn. phyt. t. 275. f. 3. Corolla golden yellow, with lanceolate, acute segments. Habit of *Erythræ'a Centaúrium*.

Var. β; flowers pale yellow. Cham. in Linnæa, 6. p. 646.

Golden-flowered Sebæa. Fl. Ju. Aug. Clt. 1824. Pl. $\frac{1}{4}$ foot.

6 S. A'LBENS (R. Br. l. c.) stem tetragonal, dichotomously branched, fastigiate; leaves cordate, decurrent, 3-nerved; flowers 5-cleft, terminal; calycine segments keeled on the back; stamens exserted. ⊙. G. Native of the Cape of Good Hope. E'xacum álbens, Lin. syst. 155. suppl. 123. E'xacum pedunculàtum, Lin. Gentiàna álbens, Thunb. Corolla whitish; tube longer than the calyx; and the limb length of the tube.—Burm. afr. p. 207. t. 74. f. 4.

White-flowered Sebæa. Fl. Aug. Clt. 1820. Pl. $\frac{1}{3}$ foot.

7 S. OVATA (R. Br. prod. p. 452.) stem branched, dichoto-

mous; leaves sessile, ovate, 3-nerved; flowers quinquefid; segments of calyx acuminated, with simple keels on the back, about equal to the segments of corolla in length. ⊙. G. Native of Van Diemen's Land, and of New South Wales. E'xacum ovàtum, Labill. nov. holl. 1. p. 38. t. 52. Corolla red.?

Ovate-leaved Sebæa. Fl. Aug. Clt. 1820. Pl. ½ foot.

8 S. ambígua (Cham. in Linnæa, 6. p. 346.) stem fastigiately cymose, dichotomous; leaves broad-ovate, rather fleshy; flowers quadrifid; stamens exserted; calyx obconical, with diaphanous, obtuse, rounded, toothed segments. ⊙. G. Native of the Cape of Good Hope.

Var. α, grácilis (Cham. l. c.) outer branches of cyme evolute.

Var. β, crássa (Cham. l. c.) outer branches of cyme contracted; flowers glomerate.

Ambiguous Sebæa. Pl. ½ foot.

9 S. pusílla (Ecklon, mss. Cham. in Linnæa, 6. p. 346.) flowers quinquefid; stamens inclosed; calyx cylindrical, with narrow-lanceolate, keeled, acute segments, which are shorter than the tube of the corolla. ⊙. G. Native of the Cape of Good Hope. This species comes nearest to *S. ovàta;* but differs from it in the tube of the corolla, being longer in the inclosed stamens, and whole habit.

Small Sebæa. Pl. small.

Cult. These are elegant plants while in blossom. They should be treated like other tender annuals, by being reared on a hot bed, and afterwards planted out into a warm, sheltered border, about the end of May.

XLIV. E'XACUM (from *ex*, out; and *ago*, to drive; expels poison.) Spreng. gen. 1. p. 8.—E'xacum species, Lin. gen. 141. Juss. gen. 142.—Centaúrium, Plukn. mant. t. 343. f. 3.

Lin. syst. *Tetrándria, Monogýnia.* Calyx campanulate, 4-cleft; segments winged on the back. Corolla salver-shaped, or sub-rotate, with a globose or ventricose tube, and a 4-cleft limb. Stamens 4, declinate; filaments terete; anthers long, somewhat tetragonal, emarginate at the base, erect, dehiscing by 2 pores at the apex. Style filiform, declinate, flexuous; stigma undivided, clavate, furnished with minutely papillose furrows on all sides. Capsule globose, crustaceous, 2-celled, with a septicidal dehiscence; placentas 2, adnate to a double dissepiment, thick. Seeds very minute, scrobiculate.—Erect, branched, annual herbs. Leaves opposite, decussate, sessile, 3-5-nerved. Flowers terminal and axillary.

1 E. se'ssile (Lin. spec. 163.) stem erect, tetragonal, simple, dichotomous at top; flowers solitary, from the forks of the stem, and tops of the branches; leaves sessile, ovate-cordate, obtuse, fleshy; capsule drooping. ⊙. S. Native of the East Indies. Flowers larger than the leaves.

Sessile-flowered Exacum. Pl. ½ foot.?

2 E. puncta'tum (Lin. syst. 155. suppl. 124.) leaves nearly sessile, oblong, 3-nerved, dotted like *Hypéricum;* stamens exserted. ⊙. S. Native of the East Indies. Corolla bluish. Stamens yellow.

Dotted-leaved Exacum. Pl. ½ to 1 foot.

3 E. bi'color (Roxb. fl. ind. 1. p. 413.) erect; stem and branches tetragonal: angles a little winged; leaves sessile, ovate, 5-nerved; flowers axillary, solitary, on short pedicels; anthers erect. ⊙. S. Native of Cuttack, in the East Indies. Root almost simple. Leaves variable in size; floral ones small and narrow. Corollas large, white, having the segments tipped with blue.

Two-coloured-flowered Exacum. Pl. 1 to 2 feet.

4 E. teragònum (Roxb. l. c. Wall. pl. rar. asiat. 3. p. 47. t. 276.) stem simple, erect, tetragonal; leaves sessile, ovate-lanceolate, 5-nerved; flowers numerous, terminal; stamens and style declinate. ⊙. S. Native of Bengal, where it is called Koochuri; Silhet, Nipaul, Kamaon, &c. E. Chulèsium, Ham. herb. Leaves 2-4 inches long. Flowers large, of a most beautiful blue colour. Calycine segments dagger-shaped. Segments of corolla acute. Anthers linear. This is a most elegant, robust plant.

Tetragonal-stemmed Exacum. Fl. July, Sept. Clt. 1820. Pl. 3 to 4 feet.

5 E. stylòsum (Wall. cat. no. 4355.) glabrous; stem tetragonal; leaves ovate-lanceolate, acute, 3-nerved; peduncles axillary and terminal, corymbose; style longer than the stamens; segments of corolla obtuse. ⊙. S. Native of the East Indies, about Prome.

Long-styled Exacum. Pl. 2 to 3 feet.

6 E. te'res (Wall. in Roxb. fl. ind. 1. p. 414.) stem and branches terete; leaves lanceolate, acuminated, tapering at the base, nearly sessile, 3-nerved; peduncles opposite, 3-flowered, forming a terminal corymb; segments of corolla lanceolate, acuminated. ⊙. S. Native of Silhet, and Lower Nipaul. Leaves 3-4 inches long, and ½ an inch broad in the middle. Flowers dark blue, large. Habit of the preceding.

Terete-stemmed Exacum. Pl. 2 feet.

7 E. Zeyla'nicum (Roxb. fl. ind. 1. p. 414.) erect; stem and branches tetragonal: angles slightly winged: leaves nearly sessile, ovate-lanceolate, acuminated, 3-nerved; racemes terminal and axillary, forming an expanded, terminal, corymb-formed panicle; flowers pentamerous; calyx with 5 broad, membranous wings, with subulate points. ⊙. H. Native of Ceylon, and the Neelgherries. Chirònia trinérva, Lin. fl. zeyl. p. 90. Willd. spec. 1. p. 1065.—Burm. zeyl. p. 145. t. 67. Leaves 1-3 inches long. Peduncles and pedicels tetragonal. Segments of calyx furnished with a broad, membranous wing on the back of each. Tube of corolla gibbous. Limb of corolla of 5 obovate, mucronate, beautiful, violet-coloured divisions. Anthers linear, straight, and hard, with 2 pores at the apex, and also opening on the sides.

Ceylon Exacum. Pl. 1 to 2 feet.

8 E. grandiflòrum (Wall. cat. no. 4358.) stem tetragonal; leaves ovate-lanceolate to lanceolate, acute, 3-5-nerved; peduncles axillary and terminal, trichotomous, or 3-flowered, corymbose. ⊙. S. Native of the East Indies, at Courtallum. Flowers large; segments of corolla ovate-oblong, acute.

Great-flowered Exacum. Pl. 1 to 2 feet.

9 E. pedunculà'tum (Lin. spec. 163. Vahl, symb. 1. p. 15.) erect; stem with 1-2 pairs of opposite branches, then dichotomous, slightly tetragonal; leaves nearly sessile, oblong-lanceolate, obtuse, 3-nerved; segments of calyx membranously winged on the back; stamens exserted; style declinate. ⊙. S. Native of Ceylon. E. carinàtum, Roxb. fl. ind. 1. p. 415. Sebæ'a carinàta, Spreng. syst. 1. p. 426. Root branched. Flowers terminal, numerous, pretty large, yellow, collected in dichotomous corymbs, with a single, long, pedicellate flower in each fork. Filaments inserted on a membranous rim, round the inside of the mouth of the tube. Anthers erect, opening at the sides, yellow. Perhaps a species of *Sebæ'a*.

Peduncled Exacum. Pl. ½ foot.

10 E. ptera'nthum (Wall. cat. no. 4360.) stem and branches tetragonal; leaves elliptic-oblong, tapering to both ends, 3-5-nerved; flowers pedicellate, dichotomously cymose: with a flower in each fork; alternate wings of calyx the largest. ⊙. H. Nàtive of Tavoy.

Wing-flowered Exacum. Pl. 1 foot.

11 E. Hamiltònii; stem 4-winged; leaves elliptic-oblong, acute, 5-nerved; flowers terminal, corymbose; segments of calyx ovate, acuminated, each furnished with a membranous wing on the back. ⊙. G. Native of Nipaul, where it is called

Kashwa-swa. E. tetragònum, D. Don, prod. fl. nep. p. 128, but not of Roxb. Stamens exserted. Flowers large, yellow.

Hamilton's Exacum. Pl. 1 to 2 feet.

12 E. sulca'tum (Roxb. fl. ind. 1. p. 415.) erect, branched, furrowed on the opposite sides of the stem and branches; leaves nearly sessile, lanceolate, fleshy, 3-nerved; flowers terminal, numerous, trichotomously corymbose; segments furnished each with a keel on the back; stamens erect; stigma bifid; capsule globular. ♂. S. Native of Bengal. Sebæ'a sulcàta, Spreng. syst. 1. p. 426. E. dichótomum, Herb. madr. E. stellàtum, Hamilt. herb. Root fibrous. Leaves from 1 to 2 inches long. Flowers bright blue, those on the forks solitary, and on long pedicels. Peduncles 4-sided. Bracteas ovate, recurved. Anthers ovate-oblong, connivent. This appears to be intermediate between *Sebæ'a* and *E'xacum*, from the bifid stigma.

Furrowed-stemmed Exacum. Pl. ½ to 1 foot.

Cult. All the species of this genus are very showy when in blossom. The seeds should be reared on a hot bed, like those of other tender annuals; and about the end of May the plants may be planted out in the open border, in a warm, sheltered situation; and some of the larger, showy kinds may be planted in pots, and otherwise treated like Balsams.

XLV. MICROCA'LE (from μικρος, *micros*, small, and καλος, *kalos*, pretty; plants small and very pretty). Link.—E'xacum species, Smith.—Gentiàna species, Lin.

Lin. syst. *Tetrándria Monogýnia.* Calyx divided about half way into 4 equal acute segments, permanent. Corolla with a swelling tube, length of calyx; and a 4-parted, spreading limb; segments equal, imbricate in the bud. Stamens 4, inclosed, filiform, erect; anthers roundish-oblong. Ovarium oval. Style filiform, inclining a little, as long as the limb. Stigma capitate, undivided. Capsule filling the tube of the corolla, which gradually enlarges with it; elliptic, compressed, imperfectly 2-celled. Seeds small, rough, attached to a fixed or finally separated double placenta. — Herbaceous, glabrous, intensely bitter plants. Leaves simple, entire, and are, as well as the branches or flower-stalks, opposite. Flowers terminal, yellow, or rose coloured.

1 M. filifórme (Link. l. c.) stem dichotomous from the bottom, filiform; leaves chiefly radical, lanceolate, or spatulate, 1-nerved, sessile; flowers terminal, on long pedicels. ⊙. H. Native of Europe, in sandy, turfy bogs; in England, in Hampshire, Devonshire, Cornwall, Dorsetshire, and Sussex, in rotten, marshy, sandy, turfy ground; in Ireland, in Dursey Island, Cork; in Chili, about Conception. Gentiàna filifórmis, Lin. spec. 335. With. 263. Oed. fl. dan. 324. Ehrh. phyt. 43. E'xacum filifórme, Smith, fl. brit. 182. engl. bot. t. 235. Hook. fl. lond. fasc. 2. p. 91. t. 8.—Vaill par. p. 32. t. 6. f. 3. Root fibrous. Leaves an inch long. Corollas small, yellow.

Filiform Microcale. Fl. Ju. July. England. Pl. ¼ foot.

2 M. pulche'llum; leaves lanceolate?; sessile; panicle corymbose; pedicels filiform; calycine segments subulate. ⊙. H. Native of New Jersey, on the sea coast. E'xacum pulchéllum, Pursh, fl. amer. sept. 1. p. 100. Sabbàtia pulchella, Spreng. syst. 1. p. 581. Flowers rose coloured. Plant resembling very much the preceding.

Neat Microcale. Fl. May. Cult. 1826. Pl. ½ foot.

3 M. pusíllum; stem much branched, dichotomous; leaves oblong, 3-nerved; peduncles short, crowded; segments of corolla connivent. ⊙. H. Native of Europe, in inundated places. Gentiàna pusílla, Lam. dict. 2. p. 645. Chirònia inapérta, Willd. E'xacum pusíllum, D. C. fl. franc. no. Spreng. syst. 1. p. 425.—Vaill. par. t. 6. f. 2.

Small Microcale. Pl. ¼ foot.

Cult. Sow the seed in a moist situation, in peat earth, or in pots, which should be kept moist, by being placed in pans of water.

Tribe III.

DESFONTAINIE'Æ. Calyx 4-5-parted; segments nearly equal, obtuse, cartilaginous, nerved, imbricate in æstivation. Corolla tubular, cartilaginous, 5-nerved; nerves running through the axis of the segments; limb 4-5-lobed: lobes very veiny, roundish, retuse, with ciliated edges, imbricate in æstivation. Stamens 4-5, inclosed, glabrous, combined with the tube of the corolla nearly their whole length, free at apex, thick convex on one side and flat on the other; anthers erect, innate 2-celled: cells linear, parallel, separated by narrow intervals, inserted in a large fleshy connective (continuation of the filaments), which is shorter than them, dehiscing longitudinally. Ovarium globose, 1-celled; ovula very numerous, horizontal, without order, adnate to septiform placentas. Style filiform, glabrous; stigma capitate. Berry globose, 1-celled, many-seeded. Placentas 4-5, parietal, hence the berry appears many-celled; free from the inner margin; thickened, trigonal, having reflexed, seminiferous sides. Column none. Seeds numerous, disposed without order, erect, obovate, ventricose, angular; furnished with an umbilicus at the base, a dark brown dilated chalaza at apex, and a prominent, calious raphe on the inner side. Outer testa coriaceous, fulvous, full of pellucid dots: inner one membranous, paler, adhering to the nucleus. Albumen copious, fleshy, white. Embryo very minute, roundish, milk coloured, erect in the umbilical end of the seed, with very short cotyledons, and a thick, very blunt radical.— Evergreen shrubs, natives of South America, having a very bitter taste. Leaves opposite, petiolate, spinosely toothed: petioles articulated with the branches. Flowers terminal, solitary, pedunculate; peduncles bibracteate. Corollas scarlet, with a yellow limb. Berries white.

Some groups of plants exist in whose external features there is nothing that can lead to a knowledge of their affinities; and among these may be ranked the remarkable genus under consideration. From observing the similarity in the disposition of the veins of the calyx and corolla, and the consistence of these organs, as well as the nervation and dentation of the leaves, I was led to conclude that it might be allied to *Theophrásta;* but a closer examination did not confirm that conjecture; although from remarking the nature of the albumen, and the structure and position of the embryo, I was afterwards induced to compare it with the *Gentiàneæ*, to which family I am now fully persuaded it must be referred, notwithstanding its toothed leaves, and the greater number of its placentæ.—D. Don, in edinb. phil. journ. July, Sept. 1831.

XLVI. DESFONTA'INIA (for derivation see Fontanèsia, p. 51. of the present volume.) Ruiz, et Pav. fl. per. syst. 1. p. 59. fl. per. 2. p. 47. t. 186. gen. t. 5. Humb. et Bonpl. pl. æquin. 1. p. 157. t. 45. H. B. et Kunth. nov. gen. amer. 7. p. 274. syn. 4. p. 267. D. Don, in edin. phil. journ. July, Sept. 1831.—Línkia Pers. ench. 1. p. 219.

Lin. syst. *Tetra-Pentándria Monogýnia.* Character the same as that of the tribe.

1 D. spinòsa (Ruiz, et Pav. l. c.) calycine segments lingulate, and are, as well as the leaves, glabrous. ♄. G. Native of Peru, in forests, at Churupallana, Tarma, and betwixt Munna and Pozuzo, Ruiz, et Pav.; and on the Andes of Quindiu, and in Parama de Almaguer, Humb. et Bonpl. D. spléndens, Humb. et Bonpl. pl. æquin. amer. 1. p. 157. t. 45. H. B. et Kunth. nov. gen. 7. p. 274. Línkia Peruviàna, Pers. ench. 1. p. 219. An erect, much branched, evergreen, glabrous shrub. Leaves elliptic-oblong, coriaceous, glabrous, shining above, cuneated,

and quite entire at the base, with spiny-toothed margins; teeth large, 7-14 in number. Calyx glabrous, hardly shorter than the peduncles. Corolla 4 times longer than the calyx. Berries white, size of cherries.

Spiny-toothed leaved Desfontainia. Shrub 10 feet.

2 D. parvifòlia (D. Don, in edinb. phil. journ. July, Sept. 1831.) ribs of leaves pilose beneath; calycine segments oval, ciliated. ♄. G. Native of Peru, on the mountains at Munna, Ruiz. D. spinòsa, Ruiz, herb. but not of fl. per. A much branched, compact, evergreen shrub, with quadrangular branches; angles prominent. Leaves cuneated, 5-7-toothed, rarely tricuspidate, shining above; teeth spiny. Bracteas connate at the base, having the edges and ribs pilose. Lobes of corolla ciliated. Stigma furnished with 4 tubercles, pruinose.

Small-leaved Desfontainia. Shrub 5-10 feet.

Cult. The species of *Desfontàinia* are shrubs worth cultivating in every collection, for the elegance of their foliage, as well as the brilliancy of their flowers. We would recommend them to be grown in pots filled with a mixture of peat, loam, and sand, if they ever should be introduced to our gardens. Young cuttings will probably strike root in sand under a bell-glass.

XLVII. PALLA'DIA (meaning unknown to us.) Lam. ill. t. 285.—Blackwéllia, Gærtn. fruct. 2. t. 117.

Lin. syst. *Octándria, Monogýnia.* Calyx funnel-shaped, coloured; with a short tube, and 4 obovate segments. Corolla funnel-shaped; tube long, with 8 plaits; limb in 8 oblong segments. Stamens 8, united to the tube of the corolla for more than half its length, permanent; anthers unknown. Ovaria 2; style simple, compressed, situated between the ovaria, and parallel to them, and connected with their base; its edges finely-toothed; stigmas 2, spreading. Capsules 2, club-shaped, prismatic, erect, parallel, close together, membranous, stiff, obscurely angular at one side, and marked with a deep furrow on the other, each of 1-cell, and 2 finally spiral valves. Seeds numerous, minute, roundish, rather angular; placentas spongy, as long as the capsule, to the edges of whose valves, at the furrowed side, it is attached, being marked there by a similar furrow; while its other side is convex, and its whole surface rough with minute tubercles.

1 P. Anta'rctica (Lam. l. c. Smith, in Rees' cycl.) Native at Cape Horn.?

Antarctic Palladia. Pl. small.

Cult. For culture and propagation see *Gentiàna*, p. 183.

Order CLVIII. BIGNONIA'CEÆ. R. Br. prod. p. 470. H. B. et Kunth. nov. gen. amer. 3. p. 132. D. Don, in edinb. phil. journ. july, sept. 1823.—Bignòniæ, sect. II. Juss. gen. 139. edit. Usteri, p. 154.

Calyx divided or entire, sometimes spathaceous. Corolla monopetalous, hypogynous, usually irregular, with a 4-5-lobed limb. Stamens 5; filaments unequal, 4 of which usually bear anthers, and sometimes only 2 of them, seldom all fertile, therefore there are either 1 or 3 of them sterile; anthers 2-celled; cells equal in insertion, usually divaricate. Ovarium girded by a glandular disk, 2-celled, or falsely 4-celled, many-seeded. Style 1; stigma bilamellate. Capsule 2-valved, 2-celled, sometimes falsely 4-celled; dissepiment parallel or contrary, at length free, bearing the seeds at the commissures with the valves. Seeds transversely foliaceous, compressed. Albumen none. Embryo straight, foliaceous; with a centrifugal radicle.—Trees or shrubs often twining or climbing. Leaves opposite, rarely alternate, usually compound, rarely simple, exstipulate. Inflorescence terminal and axillary, somewhat panicled.

This is readily distinguished from the allied orders, in the fruit, structure, and placentation of the seeds. The showy, trumpet-shaped flowers of all the species render them objects of admiration. The greater number of them are tropical. *Técoma* is a hardy, climbing shrub, of great beauty when in blossom; and the species of *Jacaránda* are resplendent with blue or purple flowers, and elegant supra-decomposed leaves, which emulate those of *Acacia*. The wood is said to resist the attack of worms. Nothing is known of their qualities.

Among the numerous tribes of vegetables which people the regions of equinoxial America, the *Bignoniàceæ* hold a distinguished rank, whether as regarded for the beauty of their flowers, and the diversity of their forms, which give to the vegetation peculiar features, or as objects highly deserving the attention and investigation of the botanist. Perhaps in no tribe of plants, does the form of vegetation assume such variety as in this family. In the beautiful genus *Jacaránda* are contained the loftiest trees to be met with either in this or any of the neighbouring orders. These splendid trees, which are entirely wanting in the ancient continents, form one of the brightest ornaments of the forests of tropical America. The genus *Bignònia*, as constituted by Linnæus, contained an assemblage of plants, which, generically considered, were widely different from each other. To Jussieu we are indebted for having set us an example worthy of imitation, by his judicious division of this overgrown genus. It is the great advantage which a natural system possesses over all artificial methods in the studying of vegetables, that it teaches us to examine and group them according to their respective affinities; and to give to the different parts their relative importance, in characterizing genera. Willdenow, and almost all those botanists who have followed the Linnæan artificial method of classification, have left the genus *Bignònia* untouched, without even adopting the important divisions proposed by M. de Jussieu.

Synopsis of the genera.

Tribe I.

Bignonie'æ. Capsule 2-valved, 2-celled, sometimes falsely 4-celled. Dissepiment parallel or contrary to the valves, at length free, bearing the seeds at the commissures with the valves. Seeds transverse, compressed, winged on the margins.

§ 1. *Stamens 4, didymous, with the rudiment of a sterile one.*

1 Bignònia. Calyx 5-toothed. Corolla with a short tube, a campanulate throat, and a 5-lobed limb. Stamens 4, didynamous, with a fifth sterile one. Lobes of anthers divaricate. Capsule silique-formed; dissepiment parallel.

2 Spathòdea. Calyx spathaceous, cleft on one side, and toothed or entire on the other. Corolla funnel-shaped, with a 5-lobed, somewhat bilabiate limb. Stamens 4, didynamous, with a fifth sterile one. Lobes of anthers divaricate. Capsule

silique-formed, falcate, falsely 4-celled; dissepiment contrary, corky.

3 Te'coma. Calyx 5-toothed. Corolla with a short tube, a campanulate throat, and a 5-lobed sub-bilabiate limb. Stamens 4, didynamous, with a fifth sterile filament. Lobes of anthers divaricate. Capsule silique-formed; dissepiment contrary.

4 Jacara'nda. Calyx 5-toothed, rarely entire. Corolla with a short tube, a campanulate throat, and a 5-lobed, bilabiate limb. Stamens 4, didynamous, with the rudiment of a fifth; anthers usually 1-lobed, rarely 2-lobed. Capsule broad, compressed; dissepiment contrary; valves woody.

5 Amphilòphium. Calyx with a double limb; inner one bilabiate; outer one undulately curled. Corolla sub-coriaceous; with a short tube, a large ventricose throat, and a bilabiate limb; upper lip galeate, bidentate; lower one tridentate. Stamens 4, didynamous; with the rudiment of a fifth. Lobes of anthers divaricate. Capsule ovate, rather ligneous; dissepiment parallel. ?

6 Zeyhe'ria. Calyx spathaceous, closed, at length bipartite. Corolla with a short tube, and a 5-lobed, somewhat bilabiate limb.? Stamens 4, didynamous, with the rudiment of a fifth. Capsule echinated, orbicular, compressed; dissepiment contrary.

7 Frederícia. Calyx coloured, pentagonal, 5-toothed. Corolla salver-shaped, with a cylindrical tube, and a spreading, 5-6-cleft, equal border. Stamens 4, didynamous, with the rudiment of a fifth. Capsule oblong, compressed, acutish; dissepiment contrary.

8 Ferdinandu'sia. Calyx 4-toothed. Corolla funnel-shaped, 4-parted; segments bifid, bearded.? Stamens 4, didynamous, with the rudiment of a fifth. Capsule compressed, elliptic, 2-celled, 4-valved; dissepiment contrary. ?

9 Stenolòbium. Calyx 5-toothed, small. Corolla with a narrow tube, a dilated, campanulate throat, and a 5-lobed, bilabiate limb. Stamens 4, didynamous, with the rudiment of a fifth; lobes of anthers linear, divaricate. Capsule linear, silique-formed; dissepiment parallel.

10 Delóstoma. Calyx 3-lobed, coriaceous. Corolla funnel-shaped, with a dilated throat, and a spreading, bilabiate limb. Stamens 4, didynamous, with the rudiment of a fifth. Lobes of anthers parallel. Capsule lanceolate, compressed; valves coriaceous; dissepiment parallel.

11 Astia'nthus. Calyx tubular, 5-toothed. Corolla with a short tube, a campanulate throat, and a 5-lobed, bilabiate limb. Stamens 4, didynamous, with the rudiment of a fifth. Lobes of anthers confluent. Capsule silique-formed; dissepiment parallel. Seeds winged, and pappose.

12 Chilópsis. Calyx ventricose, membranous, cleft even to the base on the lower side; limb oblique, tridentate. Corolla with a short tube, a campanulate throat, and a 5-lobed, bilabiate limb. Stamens 4, didynamous, with the rudiment of a fifth. Lobes of anthers equal, divaricate. Capsule short, silique-formed; dissepiment contrary.

13 Oxe'ra. Calyx 4-parted. Corolla with a short tube, a dilated throat, and a 4-cleft, nearly equal limb. Stamens 4, didynamous, 2 of which are sessile. Ovarium 4-lobed, seated on a glandular disk. Fruit unknown. Probably a genus of *Cyrtandràceæ*.

§ 2. *Stamens 5, all fertile.*

14 Platyca'rpum. Calyx 5-parted. Corolla with a short tube, a funnel-shaped throat, and a 5-lobed, nearly equal limb. Stamens 5, equal, fertile. Capsule didymous, ligneous, compressed; dissepiment contrary; cells 2-seeded.

15 Calosa'nthes. Calyx entire. Corolla with a short tube, a campanulate throat, and a 5-cleft, curled, bilabiate limb. Stamens 5, all fertile, the exterior pair the longest. Capsule silique-formed, compressed; dissepiment contrary.

§ 3. *Stamens 4, didynamous, without the rudiment of the sterile one.*

16 Millingtònia. Calyx slightly 5-parted. Corolla with a long, slender tube; a funnel-shaped, 4-parted limb; the upper segment broadest, and nearly half 2-cleft. Stamens 4, didynamous, without any rudiment of a fifth. Capsule silique-formed, slender; dissepiment parallel.

17 Argy'lia. Calyx 5-cleft. Corolla with a short tube, a campanulate throat, and a 5-lobed, somewhat bilabiate limb. Stamens 4, didynamous, without any rudiment of a fifth. Anthers bearded; lobes equal, divaricate. Capsule silique-formed, compressed; dissepiment parallel.

18 Incarvíllea. Calyx tri-bracteate, 10-cleft; the 5 outer segments subulate; the 5 inner shorter and bifid. Corolla with a short tube, a ventricose throat, and a 5-lobed, bilabiate limb. Capsule silique-formed, 6-ribbed; dissepiment bilamellate, contrary.

19 Wíghtia. Calyx 4-toothed. Corolla funnel-shaped; limb 4-cleft, upper segment 2-lobed. Stamens 4, didynamous, without any rudiment of a fifth. Hypogynous disk wanting. Stigma clavate, undivided. Capsule silique-formed; dissepiment parallel. Seeds imbricated lengthwise.

§ 4. *Stamens 5, 2 of which fertile, and 3 sterile.*

20 Cata'lpa. Calyx 2-parted. Corolla with a short tube, a ventricose, campanulate throat, and an unequal, 4-lobed limb. Stamens 5, 2 fertile, and 3 sterile. Capsule silique-formed; dissepiment parallel.

21 Schrebe'ra. Calyx tubular, bilabiate; lips nearly equal, emarginate. Corolla salver-shaped, with a cylindrical tube, and a spreading, 5-6-7-cleft border. Stamens, 2 fertile, and 3 sterile. Capsule pear-shaped, woody; dissepiment parallel.

Tribe II.

Tourretie'æ. Capsule 1-celled, 2-valved; valves placentiferous in the middle. Placentas 2, large and fleshy. Seeds imbricated, horizontal, flattened, girded by a membranous margin.

22 Tourre'ttia. Calyx bilabiate; upper lip acuminated; lower one 4-notched. Corolla with the tube equal in length to the calyx, and a unilabiate limb; upper lip drawn out into a

hollow; lower lip wanting. Stamens 4, didynamous. Capsule ovate, or oblong, echinated, 2-celled; dissepiment prismatic, central, seminiferous.

23 Eccremoca'rpus. Calyx membranous, 5-cleft, coloured. Corolla tubular, with an equal throat, and a 5-lobed, equal limb. Stamens 4, didynamous, with the rudiment of a fifth; anthers versatile; cells parallel, combined; wings of seeds repandly sinuated, nerved.

24 Cala'mpelis. Calyx semi-5-cleft. Corolla with a tubular base, a ventricose throat, and a contracted, 5-lobed limb. Stamens 4, didynamous, without any rudiment of a sterile one. Lobes of anthers obtuse, divaricate, distinct at apex. Wings of seeds repandly sinuated, emarginate at the base.

Tribe III.

Crescentie'æ. Fruit a large, melon-shaped, 1-celled berry; with a solid rind, pulpy inside. Seeds nestling in the pulp.

25 Cresce'ntia. Calyx bipartite or bilabiate. Corolla large, campanulate, with a short tube, a ventricose throat, and an erect, 5-lobed, cleft, unequal limb. Stamens 4, didynamous, with the rudiment of a fifth. Berry large, many-seeded.

26 Tanæ'cium. Calyx cylindrical, truncate. Corolla with a very short tube, a large, ventricose throat, and a nearly equal, 5-lobed limb. Stamens 4, didynamous; with the rudiment of a fifth. Berry large, corticate.

27 Tripinna'ria. Calyx cup-shaped, 5-crenate. Corolla sub-campanulate; tube longer than the calyx; throat widened; limb 5-cleft, spreading; upper segment the largest. Stigma bifid, acute. Berry large, fleshy. Seeds compressed.

Tribe I.

BIGNONIE'Æ (this tribe contains genera agreeing with the genus *Bignònia* in important characters.) Capsule 2-celled, 2-valved, sometimes falsely 4-celled. Dissepiment parallel or contrary to the valves. Seeds transverse, compressed, winged on the edges.

§ 1. *Stamens 4, didynamous, with the rudiment of a sterile one.*

I. BIGNO'NIA (so named by Tournefort, in compliment to the Abbé Bignon, Librarian to Louis IV.) Tourn. inst. 72. Juss. 139. Gærtn. fruct. t. 52. H. B. et Kunth, nov. gen. amer. 3. p. 132. D. Don, in edinb. phil. journ.—Bignònia species of Lin. and others.

Lin. syst. *Didynàmia, Angiospérma.* Calyx campanulate, 5-toothed, rarely entire. Corolla with a short tube, a campanulate throat, and a 5-lobed, bilabiate limb. Stamens 4, didynamous, that is, 2 long, and 2 short, with the rudiment of a fifth. Lobes of anthers divaricate. Stigma bilamellate. Capsule silique-formed, 2-celled; having the dissepiment parallel with the valves; seeds disposed in 2 rows, imbricate, transverse, with membranous wings.—Usually scandent shrubs, furnished with tendrils; rarely erect trees or shrubs. Leaves opposite, simple, conjugate, ternate, digitate or pinnate. Flowers axillary and terminal, usually panicled. Corollas trumpet-shaped, white, yellow, orange-coloured, purple, violaceous, or rose-coloured.

§ 2. *Leaves simple.*

1 B. vimina'lis (H. B. et Kunth, nov. gen. 3. p. 132.) arboreous; leaves simple, usually by threes, linear, narrowed at both ends, glabrous; panicles terminal, sessile; corollas glabrous. ♄. S. Native of Mexico, on the western declivities of mountains, betwixt Mescala and Estola, at the altitude of 360 hexapods. A tall tree, with a dense, pyramidal head. Leaves 8-10 inches long, and 5 lines broad. Calyx 5-toothed; teeth acute. Corolla yellow, campanulately funnel-shaped; limb downy outside, with undulated margins.

Twiggy Trumpet-flower. Tree tall.

2 B.? tomentòsa (Thunb. jap. 252.) arboreous; leaves simple, cordate, tomentose, opposite; flowers in axillary panicles. ♄. H. Native of Japan. Too-vulgo Kiri, Kæmpf. amœn. 859. t. 860. Incarvíllea tomentòsa, Spreng. syst. 2. p. 836. Lower leaves cordate; upper ones ovate-acute, 5-nerved, downy above, and tomentose beneath, as well as the peduncles and pedicels. Panicles at first trichotomous, then dichotomous. Perhaps a species of *Catálpa*.

Tomentose Trumpet-flower. Fl.? Clt. 1820. Tree.

3 B.? tenuisíliqua (Vahl. eclog. 2. p. 43.) climbing; leaves simple, lanceolate, acuminated, glabrous, opposite; panicles terminal; corolla glabrous. ♄. ⏑. S. Native of South America. Branches beset with white dots. Leaves 2-3 inches long, and 1 broad. Capsule or follicle $1\frac{1}{2}$ foot long.

Slender-podded Trumpet-flower. Shrub cl.

4 B. floribu'nda; leaves opposite, simple, ovate-roundish, acuminated, sub-cordate, 3-nerved, petiolate; flowers crowded, panicled. ♄. S. Native of Maranham, in low, bushy places. Flowers very showy, flesh-coloured, in great profusion.

Bundle-flowered Trumpet-flower. Shrub straggling.

5 B. pa'llida (Lindl. bot. reg. 965.) erect, glabrous; leaves simple, opposite, oblong, obtuse, rather cordate at the base; flowers axillary, usually solitary; pedicels and calyxes lepidoted; calyx turbinate, irregularly 5-toothed. ♄. S. Native of St. Vincent. Branches terete. Corolla 2 inches long, funnel-shaped: with a yellow tube, and a pale lilac limb; lobes crenately ciliated.

Pale-flowered Trumpet-flower. Fl. July. Clt. 1823. Shrub 6 feet.

6 B.? obtusifòlia (Lam. dict. 1. p. 418.) leaves alternate, simple, ovate-oblong, obtuse; corymbs small, terminal; calyx 4-lobed, unequal; corolla tubular: with a 4-lobed, unequal, reflexed limb. ♄. S. Native of Brazil. Leaves tapering into the petioles. Flowers large. This differs from all the rest, in the leaves being alternate, and in the corolla and calyx being 4-lobed.

Blunt-leaved Trumpet-flower. Shrub.

7 B.? illicifòlia (Pers. ench. 2. p. 170.) leaves nearly opposite, ovate, mucronate, coriaceous, glabrous: with revolute margins. ♄. S. Native of Madagascar, Commers. There is also a variety of this, with emarginate leaves.

Holly-leaved Trumpet-flower. Shrub.

§ 3. *Leaves conjugate, that is, one pair of leaflets at the top of each petiole, which is extended into a tendril.*

8 B. u'nguis (Lin. spec. 869.) scandent, glabrous; branches terete?; leaves conjugate; leaflets ovate, acuminated; tendrils bent, tripartite; peduncles axillary, 1-flowered. ♄. ⏑. S. Native of Barbadoes, St. Domingo, &c. Mill. dict. no. 5.—Tourn. inst. 164.—Sloane, jam. 90. hist. 1. p. 208.—Plum. amer. 80. p. 94.—Plukn. alm. 109. t. 163. f. 2. Flowers yellow. Follicles long.

Claw Trumpet-flower. Fl.? Clt. 1759. Shrub cl.

9 B. uncina'ta (Meyer, prim. esseq. p. 210.) scandent, glabrous; leaves conjugate; leaflets oval, drawn out into a cuspidate point; tendrils trifid; peduncles axillary. 1-flowered; calyx bilabiate. ♄. ⏑. S. Native of about the Essequibo. Spathòdea uncinàta, Spreng. syst. 2. p. 835. Leaflets $2\frac{1}{2}$ inches long, and $1\frac{1}{2}$ broad, glabrous, shining above, having the veins red beneath. Peduncles short, rising from 2 ovate-acute brac-

teas. Corolla an inch long, yellow. Capsule a span long, Seeds 2-lobed, acute, acuminated at both ends by a wing. Very nearly allied to *Bignònia únguis-càti.*

Hooked Trumpet-flower. Shrub cl.

10 B. stamínea (Lam. dict. 1. p. 416. Willd. spec. 3. p. 293.) scandent; leaves conjugate; leaflets ovate-oblong; tendrils simple, convolute; peduncles axillary, 1-flowered; stamens and style exserted. ♄. ◡. S. Native of St. Domingo.—Plum. spec. 5. icon. t. 56. f. 2. Flowers yellowish purple, scentless. Fruit hard, ovate. It differs from the rest, in the stamens being longer than the corolla, in the style being very long, and clavate.

Long-stamened Trumpet-flower. Fl.? Clt. 1825. Shrub cl.

11 B. capreola'ta (Lin. spec. 870. hort. cliff. 317.) scandent; leaves conjugate; leaflets cordate-oblong: lower ones simple; tendrils small, trifid: lobes bifurcate; peduncles axillary, 1-flowered, crowded. ♄. ◡. H. Native of North America, in the more southern parts. Sims, bot. mag. 864.—Breyn. icon. 33. t. 25.—Duham. arb. 1. p. 104. t. 40.—Bocc. sic. 31. t. 15. f. 31.—Zan. hist. 74. f. 2. ed. 2d 49. t. 33. Calyx entire. Corollas reddish yellow. Follicles flattened, a foot long.

Tendrilled Trumpet-flower. Fl. June, July. Clt. 1710. Shrub cl.

12 B. longiflòra (Cav. icon. 6. p. 58. t. 581.) scandent; branches terete; leaves conjugate; leaflets lanceolate, glabrous, shining; tendrils simple; peduncles terminal, twice trifid; corolla funnel-shaped: upper lip erect, deeply emarginate; lower lip tripartite. ♄. ◡. S. Native of Guayaquil. Corolla 3 inches long, scarlet, copper-coloured inside.

Long-flowered Trumpet-flower. Shrub cl.

13 B. Chamberla'ynii (Sims, bot. mag. 2148.) branches terete, glabrous; leaves conjugate; leaflets ovate, acuminated, glabrous, shining above; tendrils strong, simple; racemes axillary, 6-8-flowered. ♄. ◡. S. Native of Brazil. B. æquinoxiàlis, *β*, Chamberlàynii, Ker. bot. reg. t. 741. Calyx cupulate, entire, or obsoletely 5-toothed. Corolla funnel-shaped, yellow; segments obtuse.

Chamberlayne's Trumpet-flower. Fl. April, Oct. Clt. 1820. Shrub cl.

14 B. æquinoxia'lis (Lin. spec. 869. Meyer, esseq. p. 210.) scandent; branches terete, glabrous; leaves glabrous, conjugate; leaflets oblong-lanceolate; tendrils simple, axillary; peduncles 2-flowered: terminal ones racemose; follicles linear. ♄. ◡. S. Native of Cayenne, and the island of Arrowabisch. —Plum. spec. 5. icon. 55. f. 1.—Sabb. hort. 2. t. 85. Mill. dict. no. 6. Flowers yellow. Calyx 5-toothed. Anthers hairy, and peduncles 5. Vahl, l. c.

Equinoxial Trumpet-flower. Fl. April, Oct. Clt. 1768. Shrub cl.

15 B. allia'cea (Swartz, prod. p. 91. fl. ind. occ. 2. p. 1039. Lam. dict. 1. p. 421.) branches tetragonal; leaves conjugate; leaflets elliptic, coriaceous; tendrils simple; peduncles axillary, 2-flowered; calyx 5-toothed. ♄. ◡. S. Native of Guiana & Cayenne, and the West Indies. Barrel, æquin. 23. Aubl. guian. 2. p. 659. Leaflets large, acute at both ends, smelling of garlic. Flowers large, white. The garlic scent of this species is sufficient to distinguish it from all others, hence its trivial name, and its name in French, *liane a l'ail.*

Garlic-scented Trumpet-flower. Fl.? Clt. 1790. Shrub cl.

16 B. rige'scens (Jacq. schœnbr. 2. p. 44. t. 210.) scandent; leaves conjugate; leaflets elliptic, retuse; flowers racemose; peduncles 3-flowered; tendrils simple, short; calyx 5-toothed. ♄. ◡. S. Native of the Spanish Main, at Caraccas, Willd. spec. 3. p. 294. Leaflets ovate, stiffish, ex Jacq. Corollas white, with a tinge of red, yellow inside; tube incurved; segments of the limb obcordate. Branches terete.

Stiffish-leaved Trumpet-flower. Fl. Ju. July. Clt. 1823. Shrub cl.

17 B. salicifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 133.) scandent; branches terete, sulcate, glabrous; branchlets hairy; leaves conjugate; leaflets lanceolate, acute at both ends, quite glabrous, shining; tendrils simple; peduncles axillary, 3-6-flowered, downy. ♄. ◡. S. Native on the banks of the Orinoco, near Carichana, and of Trinidad. Leaflets membranous, 3 inches long. Calyx quite entire. Corollas funnel-shaped, 1½ inch long, copper-coloured; with a white limb.

Willow-leaved Trumpet-flower. Clt. 1824. Shrub cl.

18 B. chrysoleu'ca (H. B. et Kunth, nov. gen. amer. 3. p. 134.) scandent; branches tetragonal, sulcately striated, glabrous; leaves conjugate; leaflets oblong, acuminated, glabrous, rounded at the base, shining; tendrils undivided; peduncles 3-5-flowered. ♄. ◡. S. Native on the banks of the river Magdalena, betwixt Rio Viego, and Bogorgne. Leaflets 5-6-inches long, and 2 broad. Common petioles puberulous. Calyx quite entire. Corolla glabrous, yellow, with a white limb, 1½ inch long.

Yellow and White-flowered Trumpet-flower. Fl. Ju. July. Clt. 1824. Shrub cl.

19 B. lactiflòra (Vahl, symb. 3. p. 80. t. 66.) scandent, glabrous; leaves conjugate; leaflets cordate, ovate, glabrous; tendrils trifid; racemes leafy at bottom; limb of calyx quite entire. ♄. ◡. S. Native of the Island of Santa Cruz. Branches striated. Leaflets 2 inches long. Racemes twin; with a petiolate bractea at the base of each pedicel. Corolla 1½ inch long, milk white, villously tomentose on the outside. Follicles lanceolate, 2 inches long, acute at both ends.

Milk-flowered Trumpet-flower. Fl. Ju. July. Clt. 1823. Shrub cl.

20 B. crucígera (Lin. spec. 869.) scandent, glabrous; leaves conjugate, lower ones ternate; leaflets ovate-cordate, acuminated; racemes axillary; stem muricated; tendrils simple. ♄. ◡. G. Native of Virginia, Mexico, &c. Lin. hort. cliff. 317. Mill. dict. no. 12.—Grov. virg. p. 73.—Plum. icon. 48. t. 58.—Morr. hist. 3. p. 672. sect. 15. t. 3. f. 16. Leaflets large. Flowers yellow, whitish beneath. A transverse section of the stem represents a cross, hence the trivial name. Follicles a foot long.

Cross-bearing Trumpet-flower. Fl.? Clt. 1759. Shrub cl.

21 B. grandifòlia (Jacq. schœnbr. 3. p. 19. t. 287.) scandent; petioles and branches scabrous; leaves conjugate; leaflets oblong or ovate, acute at both ends; tendrils simple; corymb terminal, trifid; peduncles 3-flowered, scabrous. ♄. ◡. S. Native of the Spanish Main, about Caraccas, Willd. spec. 3. p. 296. Ker. bot. reg. 418. Hook. bot. mag. 3011. Leaflets large, a foot long. Calyx bluntly 4-toothed. Corollas yellow, 2 inches long.

Great-leaved Trumpet-flower. Fl. April, July. Clt. 1816. Shrub cl.

22 B. latifòlia (Rich. in act. soc. hist. nat. par. 1. p. 11.) scandent, glabrous; leaves conjugate; leaflets ovate, nerved, membranous; tendrils? spikes or racemes lateral; calyx inflated. ♄. ◡. S. Native of Cayenne. Flowers crowded. large, yellow.

Broad-leaved Trumpet-flower. Fl.? Clt. 1823. Shrub cl.

23 B. pube'scens (Lin. spec. p. 870.) leaves conjugate, cirrhose; leaflets cordate-ovate, downy beneath. ♄. ◡. S. Native of Campeche. Flowers yellow.

Downy Trumpet-flower. Fl. June, July. Clt. 1759. Shrub cl.

24 B. affìne; leaves binate, cirrhose?; leaflets ovate-lanceolate, cordate at the base, downy beneath; racemes terminal, compound. ♄. ◡. S. Native of Maranham. Flowers middle-sized, yellow. Nearly allied to *B. pubéscens.*

Allied Trumpet-flower. Shrub cl.

25 B. pícta (H. B. et Kunth, nov. gen. amer. 3. p. 136.)

erect; branches compressed, striated, glabrous; leaves conjugate; leaflets ovate, obtuse, roundish at the base, rather coriaceous, glabrous, shining; panicles terminal, few-flowered; corollas glabrous. ♄. S. Native of the province of Guayana, between the town of Angostura and Farrera. Leaflets about 4 inches long, and $2\frac{1}{2}$ broad. Calyx quite entire. Corolla funnel-shaped, white, striped with red; throat yellow.

Painted-flowered Trumpet-flower. Clt. 1823. Shrub 4 feet.

26 B. MAGNOLIÆFÒLIA (H. B. et Kunth, nov. gen. amer. 3. p. 136.) creeping; leaves conjugate; leaflets elliptic, short-acuminated, rounded at the base, glabrous, shining; panicles terminal, simple; corollas glabrous. ♄. S. Native of the Missions of Orinoco, in woods near Javita, on the banks of the rivers Tuamini and Temi. Leaflets coriaceous, reticulately veined. Panicles spike-formed, nearly a foot long. Corolla white, with a yellow throat.

Magnolia-leaved Trumpet-flower. Shrub creeping.

27 B. SPECTA'BILIS (Vahl, symb. 3. p. 80.) scandent, glabrous; leaves conjugate; leaflets ovate-oblong, acuminated, obtuse; tendrils simple; flowers racemose, glabrous; calyx quite entire. ♄. ◡. S. Native of the Island of Santa Cruz. Willd. spec. 3. p. 294. Racemes terminal, short, having the 2 lower pedicels 3-flowered, and the rest 1-flowered. Bracteas setaceous. Corolla 3 inches long, rather coriaceous, glabrous, purple; segments obovate. Anthers glabrous. Stigma oblong.

Showy Trumpet-flower. Clt. 1820. Shrub cl.

28 B. ELONGA'TA (Vahl, ecl. 2. p. 45. t. 16.) scandent; leaves conjugate; leaflets oval, tomentose beneath; racemes very long, terminal; peduncles dichotomous; tendrils strong, simple? ♄. ◡. S. Native of South America. Leaflets membranous, 3 inches long, ending in a blunt acumen, clothed with yellowish tomentum beneath. Calyx truncate, entire. Corolla purple?, $1\frac{1}{2}$ inch long, clothed with fine tomentum, as well as the calyxes.

Elongated-racemed Trumpet-flower. Fl.? Clt. 1820. Shrub climbing.

29 B. CORYMBÍFERA (Vahl, eclog. 2. p. 45. t. 17.) leaves conjugate, without tendrils; leaflets sub-cordate, ovate, acuminated, glabrous; corymbs axillary and terminal; calyx quite entire. ♄. S. Native of South America. Corymbs trichotomous. Corollas an inch long, downy.

Corymb-bearing Trumpet-flower. Shrub.

30 B. LAURIFÒLIA (Vahl, eclog. 2. p. 44.) leaves conjugate; leaflets oblong, glabrous; racemes terminal; branches dichotomous; corollas clothed with soft tomentum outside. ♄. S. Native of Cayenne. Tendrils none.

Laurel-leaved Trumpet-flower. Fl.? Clt. 1804. Shrub.

31 B. MOLLÍSSIMA (H. B. et Kunth, nov. gen. amer. 3. p. 133.) scandent; branches terete, striated, downy; leaves conjugate; leaflets ovate, acute, cordate, clothed with soft hairs above, and fuscescent tomentum beneath; tendrils undivided; panicles axillary; corollas downy ouside. ♄. ◡. S. Native of the province of Caraccas, in the valleys of Aragua, where it is called *Vejuco* by the natives. Leaflets 2-3 inches long, and $1\frac{1}{2}$ to 2 broad. Branches of panicle dichotomous, downy. Calyx 5-toothed. Corollas somewhat funnel-shaped. Follicles 7 inches long, downy.

Very soft Trumpet-flower. Clt. 1820. Shrub cl.

32 B. DIVERSIFÒLIA (H. B. et Kunth, nov. gen. amer. 3. p. 133.) scandent; branches quadrangular, striated, glabrous; leaves conjugate and simple; leaflets roundish-ovate, acuminated, sub-cordate, glabrous, shining; tendrils undivided; panicles terminal; corollas glabrous. ♄. ◡. S. Native of Mexico, near Campeche. Leaflets reticulately veined, and somewhat 5-nerved, membranous, $2\frac{1}{2}$ inches long, and $1\frac{1}{2}$ broad. Partial petioles downy inside. Calyx 5-toothed. Corollas campanulately funnel-shaped.

Diverse-leaved Trumpet-flower. Clt. 1825. Shrub cl.

33 B. FLORIBU'NDA (H. B. et Kunth, nov. gen. amer. 3. p. 134.) scandent; branches tetragonal, striated, warted; leaves conjugate; leaflets oblong-elliptic, acuminated, acute at the base, glabrous, shining; tendrils undivided; panicles axillary; corollas downy outside. ♄. ◡. S. Native of Mexico, near Campeche. Branches beset with white warts and fine powder. Leaflets $2\frac{1}{2}$ inches long, and 15-16 lines broad. Panicle powdery, with opposite branches, and dichotomous branchlets. Calyx obsoletely 5-toothed. Corolla funnel-shaped, 8 lines long.

Bundle-flowered Trumpet-flower. Clt. 1824. Shrub cl.

34 B. OBLÌQUA (H. B. et Kunth, nov. gen. amer. 3. p. 135.) scandent; branches terete, striated, powdery; leaves conjugate; leaflets ovate-oblong, obtuse, retuse, obliquely cordate at the base, coriaceous, glabrous, shining; tendrils undivided; peduncles axillary, dichotomous; corollas glabrous. ♄. ◡. S. Native of the province of Caraccas, in Isle de las Aves, situated in the lake Tacarigua. Leaflets 3 inches long, and from 18 to 20 lines broad. Calyx quite entire, or irregularly 5-toothed. Corollas funnel-shaped, red.

Oblique-leaved Trumpet-flower. Shrub cl.

35 B. GLABRA'TA (H. B. et Kunth, nov. gen. amer. 3. p. 135.) scandent; branches terete, warted, glabrous; leaves conjugate; leaflets ovate, obtuse, retuse, rounded at the base, rather coriaceous, glabrous, shining; tendrils undivided; inflorescence unknown. ♄. ◡. S. Native of the Spanish Main, near Cumana, where it is called *Vejuco blanco* by the natives. Capsule 7 inches long. It only differs from the preceding, in the form of the leaves.

Glabrous Trumpet-flower. Shrub cl.

36 B. HONDE'NSIS (H. B. et Kunth, nov. gen. amer. 3. p. 135.) scandent; branches terete, furrowed, glabrous; leaves conjugate; leaflets elliptic-ovate, acuminated, rounded at the base, rather coriaceous, glabrous, shining; tendrils and inflorescence unknown. ♄. ◡. S. Native of New Granada, near Honda, at the altitude of 130 hexapods. Branches whitish. Leaflets 5-6 inches long, and 3 inches broad. Follicles 12-16 inches long.

Honda Trumpet-flower. Shrub cl.

37 B. TILIÆFÒLIA (H. B. et Kunth, l. c. p. 136.) branches terete, striated, downy; leaves conjugate; leaflets roundish, acuminated, cordate, membranous, glabrous, downy on the veins beneath; tendrils unknown; spikes terminal; corollas tomentose outside. ♄. ◡. S. Native on the banks of the Orinoco. Leaflets 3 inches long. Spikes 5-6-flowered, tomentose. Calyx obsoletely 5-toothed. Corolla funnel-shaped, with a curved tube, widened upwards. Ovarium oblong, clothed with silky tomentum.

Lime-tree-leaved Trumpet-flower. Shrub cl.

38 B. VILLÒSA (Vahl, eclog. 2. p. 44.) leaves conjugate; leaflets ovate, clothed with very soft villi; tendrils filiform. ♄. ◡. S. Native of the Island of St. Martha. Leaflets glabrous above, except the midrib, 2 inches long, acuminated. Calyx truncate, quite entire. Corolla 3 inches long, glabrous, purple. Perhaps the same as *B. pubéscens*, Lin.; but the leaflets in that plant are cordate, and the flowers yellow.

Villous Trumpet-flower. Shrub cl.

39 B. PYRAMIDA'TA (Rich. in soc. hist. nat. par. no 1. Pers. ench. 2. p. 171.) scandent, glabrous; leaves conjugate; leaflets rather coriaceous; panicles terminal, rather pyramidal, many-flowered, composed of cymose corymbs. ♄. ◡. S. Native of Cayenne.

Pyramidal-panicled Trumpet-flower. Shrub cl.

40 B. CA'NDICANS (Rich. l. c.) scandent; leaves conjugate; leaflets roundish-ovate, clothed with white tomentum beneath;

panicles very loose, small-flowered. ♄. ◡. S. Native of Cayenne.

Whitish-leaved Trumpet-flower. Shrub cl.

41 B. longisíliqua (Bert. ex Spreng. syst. 2. p. 330.) scandent, cirrhiferous; leaves conjugate; leaflets deeply cordate, acuminated, membranous, glabrous; racemes terminal, simple; calyx 5-toothed, and are, as well as the corollas, glabrous. ♄. ◠. S. Native of New Granada, on the banks of the river Magdalena.

Long-podded Trumpet-flower. Shrub tw.

42 B. Sellòi (Spreng. syst. 2. p. 831.) scandent, cirrhiferous; leaves conjugate; leaflets oblong, sub-cordate, acute, glabrous, shining; panicles opposite, horizontal, many-flowered; calyxes and corollas glabrous. ♄. ◠. S. Native of Brazil.

Sello's Trumpet-flower. Shrub tw.

§ 2. *Lower leaves ternate; upper ones conjugate, furnished with tendrils.*

43 B. echina'ta (Jacq. amer. 183. t. 176. f. 52. Gærtn. fruct. 1. p. 240. t. 52.) branches nodose, angular; petioles of lower leaves dichotomous: branches trifoliate; upper leaves ternate and conjugate; leaflets ovate, acuminated; tendrils simple; corymbs axillary. ♄. ◡. S. Native of Carthagena and Guiana, in sandy places. Aubl. guian. 2. p. 648. t. 264. Lam. dict. 1. p. 415. Jacarànda echinàta, Spreng. syst. 2. p. 834. Corolla flesh-coloured, an inch long. Follicles 5 inches long, elliptic, muricated.

Echinated-podded Trumpet-flower. Clt. 1804. Shrub cl.

44 B. microca'lyx (Meyer, prim. esseq. p. 211.) lower leaves ternate: superior ones conjugate; leaflets oval, obtuse; flowers racemose; calyx 5-toothed, very short. ♄. ◡. S. Native about Essequibo, climbing on the highest trees. Branches nodose at the insertion of the leaves; nodi compressed. Tendrils none. Racemes axillary, few-flowered. Corollas 3 inches long, purple, elegantly striped inside; segments obtuse. Lobes of stigma obtuse, crenulated. This species is closely allied to *Bign. echinàta*, and *Bign. heterophýlla*.

Small-calyxed Trumpet-flower. Shrub cl.

45 B. Cherè're (Aubl. guian. 2. p. 644. t. 260.) lower leaves ternate; upper ones conjugate, cirrhose; leaflets ovate, acuminated, sometimes sub-cordate, glabrous; cymes axillary. ♄. ◡. S. Native of Guiana, in woods, on the banks of rivers. B. heterophýlla, Willd. spec. 3. p. 298. B. Kerère, Lam. dict. 1. p. 420. Branches angular. Corollas 2 inches long, yellow. Follicles ovate, hard, compressed.

Cherere Trumpet-flower. Fl.? Clt. 1824. Shrub cl.

46 B. venu'sta (Ker, bot. reg. t. 249.) scandent; branches angular, glabrous; lower leaves ternate; superior ones conjugate; leaflets oblong-ovate, acuminated, oblique at the base; petioles villous inside; corymbs terminal, many-flowered. ♄. ◡. S. Native of Brazil. Calyx villous, short, 5-toothed. Corolla clavately funnel-shaped, with a spreading border, villous inside, crimson.

Lovely Trumpet-flower. Fl. Sept. Dec. Clt. 1816. Shrub climbing.

47 B. incarna'ta (Aubl. guian. 2. p. 645. t. 261.) scandent; leaves large; lower ones ternate; upper ones binate; tendrils simple; leaflets ovate, acuminated; corymbs axillary. ♄. ◡. S. Native of Guiana, in woods, on the banks of the river Sinemari. Shrub sarmentose. Flowers numerous, rose-coloured. Fruit long, flat.

Flesh-coloured-flowered Trumpet-flower. Shrub cl.

§ 3. *Leaves ternate or trifoliate, destitute of tendrils.*

48 B. triphy'lla (Lin. spec. 870. Mill. dict. no. 14.) leaves ternate, glabrous; leaflets ovate, acuminated; stem shrubby, erect. ♄. S. Native of the Island of Vera Cruz. Flowers white, in terminal panicles.

Three-leaved Trumpet-flower. Clt. 1733. Shrub erect.

49 B. móllis (Vahl, eclog. 2. p. 46. icon. pl. amer. t. 10.) scandent; leaves trifoliate; leaflets ovate, sub-cordate, downy on both surfaces; panicles terminal, many-flowered; flowers small. ♄. ◡. S. Native of Cayenne. B. tomentòsa, Rich. in act. soc. hist. nat. par. 1. p. 11. Branches beset with rufous hairs. Leaflets 5 inches long, obtuse, with a short acumen. Calyx clothed with brownish down, obsoletely 5-toothed. Corolla downy.

Soft Trumpet-flower. Clt. 1818. Shrub cl.

50 B. pilulífera (Rich. in act. soc. hist. nat. par. 1. p. 11.) scandent; leaves trifoliate; leaflets obovate, with a short acumen; panicles brachiate, composed of compound piluliferous racemes. ♄. ◡. S. Native of Cayenne. Flowers small.

Pill-bearing Trumpet-flower. Shrub cl.

51 B. Carichane'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 137.) erect; branches terete, striated, glabrous; leaves simple and ternate; leaflets oblong, obtuse, glabrous, shining, white beneath; panicles terminal, sessile; flowers pentandrous; corollas glabrous. ♃. S. Native on the banks of the Orinoco, betwixt Encaramada and Carichana. Branchlets rather downy. Branches of panicle dichotomous, hairy. Calyx obsoletely 5-toothed, smoothish. Corolla having the tube widened above, oblique, much longer than the calyx; segments roundish ovate, the 2 upper ones rather the largest. The 2 longer stamens exserted; filaments all pilose at the base. Anthers sagittately bifid, with diverging lobes. Perhaps a new genus.

Carichana Trumpet-flower. Shrub erect.

52 B. verrucòsa (H. B. et Kunth, l. c. p. 137.) erect?; branches terete, striated, warted, glabrous; leaves ternate; leaflets oblong, narrowed at top, obtuse, acutish at the base, glabrous, shining; panicles terminal, sessile; corollas glabrous. ♄. S. Native on the banks of the Orinoco, near the town of Caicaro. Leaflets $2\frac{1}{2}$ inches long, and 5 lines broad. Petioles downy. Branches of panicle dichotomous, downy. Calyx downy, 5-toothed. Corolla funnel-shaped, red. Follicles 3 inches long, glabrous.

Warted-branched Trumpet-flower. Shrub erect.

53 B. Apure'nsis (H. B. et Kunth, l. c. p. 138.) scandent; branches terete, a little striated, glabrous; leaves ternate; leaflets elliptic-oblong, short-acuminated, acutish at the base, glabrous, downy on the veins beneath; spikes terminal, sessile; corollas glabrous. ♄. ◡. S. Native on the shady banks of the river Apures, near El Diamante. Branches white. Flowers pedicellate, 2 inches long. Calyx irregularly 3-4 or 5-toothed. Corolla funnel-shaped, yellow, with roundish, spreading, nearly equal lobes. Filaments hairy at the base; the sterile one not seen.

Apures Trumpet-flower. Clt. 1824. Shrub cl.

54 B. umbròsa (H. B. et Kunth, l. c. p. 138.) scandent?; branches compressed, striated, clothed with fine, downy hairs; leaves ternate; leaflets ovate-oblong, acuminated, cordate, glabrous, shining; flowers panicled; corollas downy outside. ♄. ◡.? S. Native of New Andalusia, in valleys, about Caripe. Leaflets 5 inches long, and $2\frac{1}{2}$ broad. Petioles downy. Branches of panicle dichotomous, downy. Calyx almost quite entire. Flowers sweet-scented. Stamens with glabrous filaments, and ciliately fringed anthers.

Shaded Trumpet-flower. Shrub cl.?

55 B. ripa'ria (H. B. et Kunth, l. c. p. 138.) scandent; branches terete, striated, clothed with fine downy tomentum; leaves ternate; leaflets obovate-roundish, acuminated, cordate, beset with soft hairs on the veins beneath; panicles axillary, pedunculate; corollas downy outside. ♄. ◡.? S. Native of New Granada, near Mompox, on the banks of the river Magda-

lena. Petioles downy. Bracteas linear, tomentose. Calyx tomentose, almost quite entire. Corolla funnel-shaped, white. The sterile filament has not been seen.

River-side Trumpet-flower. Shrub cl.?

56 B. littora'lis (H. B. et Kunth, l. c. p. 139.) scandent, cirrhose; branches terete, glabrous; branchlets hairy; leaves ternate; leaflets roundish-ovate, acuminated, clothed with soft hairs on both surfaces; panicles axillary; corollas downy outside. ♄. ◡.? S. Native of Mexico, about Acapulco. Petioles tomentose. Branches of panicle dichotomous, tomentose. Calyx downy, obsoletely 5-toothed. Corolla funnel-shaped, red. The sterile filament has not been seen.

Sea-shore Trumpet-flower. Clt. 1824. Shrub cl.?

57 B. hæma'ntha (Bert. ex Spreng. syst. 2. p. 832.) erect; leaves ternate; leaflets elliptic, retuse, coriaceous, quite glabrous; peduncles short, axillary, few-flowered. ♄. S. Native of Porto Rico.

Blood-flowered Trumpet-flower. Shrub erect.

§ 4. *Leaves digitate, destitute of tendrils.*

58 B. lepidòta (H. B. et Kunth, nov. gen. amer. 3. p. 139.) arboreous; leaves quinate; leaflets lanceolate-oblong, obtuse; with revolute edges, coriaceous, glabrous, covered with small, scale-like dots beneath; peduncles axillary, usually 3-flowered; corollas glabrous. ♄. S. Native of Cuba, between Havannah and Regla. Branches angular, dichotomous. Peduncles clothed with rusty powder. Calyx irregularly 5-6-toothed, lepidoted outside. Corolla 2 inches long, funnel-shaped, rose-coloured; with a curved tube, and roundish, undulated lobes.

Scaly-dotted Trumpet-flower. Tree.

59 B. fluvia'tilis (Aubl. guian. 2. p. 655. t. 267. H. B. et Kunth, l. c. p. 139. Meyer, esseq. 211.) arboreous; leaves quinate; leaflets ovate-oblong, acuminated, coriaceous, glabrous, shining; corymbs axillary, somewhat dichotomous; corollas downy outside. ♄. S. Native of Guiana, on the banks of rivers, but always so near their mouths that the water is salt, Aublet; in humid places, on the banks of the Orinoco, near Carichana. Branches terete, warted. Petioles puberulous. Calyx irregularly 3-5-cleft, clothed with white tomentum, ex Kunth, 4-5-toothed, ex Aubl. Corolla funnel-shaped, white. Follicles oblong, compressed, obtuse. Meyer's plant differs from that of Aublet, in the peduncles being few-flowered and terminal, in the calyxes being sub-quinquefid, and in the flowers being fasciculately racemose. Corolla 2 inches long. Lobes of stigma roundish, white.

River Trumpet-flower. Clt. 1824. Tree tall.

60 B. æsculifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 140.) arboreous; leaflets 7, obovate-oblong, short-acuminated, narrowed at the base, membranous, downy above, clothed with canescent tomentum beneath; panicles terminal, sub-corymbose; corollas downy outside. ♄. S. Native of Mexico, in hot valleys, between Acapulco and Mescalo. A very tall tree. Calyx 5-toothed. Corolla sub-campanulate, orange-coloured; with a very short tube; a ventricose throat, which is plicate, longitudinally inside; the 2 upper segments of the limb erect, smaller; the 3 lower ones reflexed, bearded, marked by a yellow spot.

Horse-chestnut-leaved Trumpet-flower. Tree tall.

61 B. leucóxylon (Lin. spec. p. 870.) arboreous; leaves quinate; leaflets ovate-lanceolate, acuminated, glabrous; flowers terminal, solitary or twin. ♄. S. Native of Jamaica, on the banks of rivers. Andr. bot. rep. p. 43. t. 43. Swartz, obs. p. 233.—Brown, jam. 263.—Pluk. alm. 215. t. 200. f. 4.—Sloane, jam. p. 154. hist. 2. p. 62. Leaves with 5-7-8 leaflets. Calyx bilabiate; upper lip rounded; lower lip bifid; with ovate, sharp teeth. Corolla rose-coloured; with a long, narrow tube, swelling a little at top; limb bilabiate; upper lip the shortest; all the segments rounded and waved, and somewhat villous. Follicles long, Swartz, pendulous. The wood is very hard and white. The flowers are white, not unlike those of *Stramònium*, rising before the leaves, several together, from the ends of the shoots. Pods square, Sloane.

White-wooded Trumpet-flower. Fl. June, July. Clt. 1759. Tree.

62 B. chrysa'ntha (Jacq. schœnbr. 2. p. 45. t. 211.) arboreous; leaflets 5, ovate, acuminated, tomentose; flowers terminal, crowded. ♄. S. Native at Caraccas. Leaflets on long pedicels, 5 inches long. Calyx tubularly-campanulate, 5-toothed. Corollas 2 inches long, yellow. Flowers copious at the tops of the branches; peduncles 1-2-flowered.

Yellow-flowered Trumpet-flower. Fl. May. Clt. 1823. Tree 12-26 feet.

63 B. hirsu'ta (Lam. dict. 1. p. 222. Willd. spec. 3. p. 299.) arboreous; leaves quinate; leaflets obovate, emarginate, downy beneath; panicles terminal; corollas curved, clothed with rufescent, yellowish hairs outside. ♄. S. Native of the East Indies. Leaflets nearly 3 inches long. Flowers small, yellow-red. Calyx nearly truncate, furnished with 4 very short teeth. Stamens exserted.

Hairy Trumpet-flower. Tree.

64 B. antisyphilítica (Mart. reise. bras. ex Linnæa, 5. p. 38.) arboreous; lower leaves bipinnate; superior ones digitately quinate; leaflets ovate, long-acuminated, glabrous; panicles dichotomous; capsule linear, flat. ♄. S. Native of Brazil, in the province of Rio Negro. Flowers green. Calyx inflated.

Antisiphylitic Trumpet-flower. Tree.

65 B. Megapota'mica (Spreng. syst. add. p. 237.) leaves quinate, glabrous; leaflets petiolate, obovate-oblong, quite entire; peduncles bifid, axillary, cymose; calyx 5-toothed; corolla downy. ♄. S. Native of Brazil, about Rio Grande.

Rio Grande Trumpet-flower. Shrub or tree.

66 B. orbicula'ta (Jacq. amer. 184. t. 180. f. 79.) scandent; leaves quinate; leaflets oblong, acuminated, glabrous; racemes axillary. ♄. ◡. S. Native of Carthagena, in woods. Jacarànda orbiculàta, Spreng. syst. 2. p. 834. Leaflets on long petioles. There is a tendril on the upper leaves, in place of a terminal leaflet. Flowers middle-sized, sweet-scented, yellowish, with a paler limb. Follicles large, orbicular, compressed, flat, shining, nearly like those of *Jacaranda Bahaménsis*. This is perhaps a species of *Jacáranda*.

Orbicular-podded Trumpet-flower. Shrub cl.

§ 5. *Leaves abruptly pinnate, or bipinnate, furnished with tendrils.*

67 B. Chìca (Humb. et Bonpl. pl. æquin. 1. p. 107. t. 31. H. B. et Kunth, nov. gen. 3. p. 142.) scandent; leaves abruptly bi-pinnate; leaflets conjugate, elliptic-ovate, acuminated, deeply cordate, glabrous; panicles axillary, pendulous. ♄. ◡. S. Native on the banks of the Orinoco, and Cassiquiares, near Maypures; Esmeralda; and Mandavaca. Bark chinky. Branches terete, green, dotted with brown. Leaves 8-10 inches long, abruptly bi-pinnate; pinnæ 2 pair; leaflets conjugate. Tendrils simple, from the tops of the general and partial petioles. Branches of panicle dichotomous. Calyx almost quite entire, fleshy. Corolla funnel-shaped, violaceous; limb with nearly equal, rounded segments. Follicles 2 inches long, compressed, ½ an inch broad.

Chica Trumpet-flower. Clt. 1819. Shrub cl.

68 B. cle'matis (H. B. et Kunth, nov. gen. amer. 3. p. 141.) scandent; leaves conjugately pinnate, with an odd one; leaflets 2 pairs, ovate, narrowed at top, acute, cordate at the base, glabrous; flowers panicled. ♄. ◡. S. Native of Llanos de

Caraccas, betwixt the town of Calabozo, and the river Guarico. Habit of *Clématis vitálba*. Branches quadrangular, glabrous. Leaves 7-8 inches long; leaflets 2 inches long, and 1 broad. Tendrils petiolar, trifid at apex. Panicles axillary, downy. Calyx obsoletely 5-toothed, cleft lengthwise, tomentose. Corollas white, yellowish inside; lobes nearly equal, roundish, red.

Virgin-bower-like Trumpet-flower. Clt. 1820. Shrub cl.

69 B. JASMINIFÒLIA (H. B. et Kunth, nov. gen. amer. 3. p. 141.) scandent; leaves conjugately bipinnate, with 2-3 pair of pinnæ, and an odd one; leaflets 3-4 pair, with an odd one, ovate, obtuse, rounded at the base, the terminal one twice as long as the lateral ones, ovate-lanceolate. ♄. ◡. S. Native on the banks of the rivers Orinoco and Atabapo, near San Fernando. Branches quadrangular. Leaflets rather coriaceous, 5-8 lines long, lower ones sometimes ternate. Stipulas? twin, dimidiate, roundish-ovate. Follicles compressed, 7 inches long. This is a very elegant species.

Jasmine-leaved Trumpet-flower. Clt. 1826. Shrub cl.

70 B. TERNA'TA; scandent; leaves ternate; divisions pinnate; leaflets oblong, acute, coriaceous; panicles terminal. ♄. ◡. S. Native of Maranham, among bushes, but rare. Flowers pale red.

Ternate-leaved Trumpet-flower. Shrub cl.

71 B. BÍJUGA (Vahl. symb. 2. p. 68.) glabrous; scandent?; leaves abruptly pinnate; with only 2 pair of elliptic, acuminated, obtuse, shining leaflets; petioles margined; racemes terminal; peduncles articulated, compressed; pedicels filiform; calyx with an almost entire border. ♄. S. Native of Madagascar. Branches alternate, compressed. Leaves rarely conjugate. Leaflets petiolate.

Two-paired-leaved Trumpet-flower. Clt. 1822. Shrub cl.?

§ 6. *Leaves impari-pinnate, destitute of tendrils.*

72 B. RACEMÒSA (Lam. dict. 1. p. 424.) glabrous, scandent; leaves impari-pinnate; leaflets 5-7, ovate, acute; common petioles winged; racemes simple, loose, longer than the leaves; calyx short, almost truncate; corolla tubular, with a very short, nearly equal limb. ♄. ◡. S. Native of Madagascar. Leaflets shining, almost an inch long. Calyx truncate.

Var. β; leaflets more numerous, ovate-lanceolate. ♄. S. Native of Madagascar. Leaflets 9-11. Flowers smaller, disposed in racemes, which are hardly the length of the leaves.

Racemose-flowered Trumpet-flower. Shrub cl.?

73 B. COMPRE'SSA (Lam. dict. 1. p. 424.) glabrous, scandent?; branches alternately nodose and compressed; leaves impari-pinnate; leaflets 3 to 7, oval-oblong, obtuse, coriaceous; common petioles margined; ultimate branches compressed; calyx almost truncate, with 5 very minute teeth. ♄. ◡. S. Native of the East Indies. Leaves on the compressed branches very minute, and simple. Flowers small, few, nearly sessile, at the tops of the branches.

Compressed-branched Trumpet-flower. Shrub cl.?

74 B. MACROSTA'CHYA (Wall. cat. no. 6505.) young branches and rachi of leaves downy; leaves impari-pinnate; leaflets 9, coriaceous, obovate-oblong, acuminated, the lower ones smaller and rounder: having small, subulate stipels at the base of the petiolules; racemes long, terminal, simple; corolla downy outside; bracteas long, linear, one to each pedicel. ♄. S. Native of the East Indies, on the banks of the Saluen river, and on rocks at Kogun.

Long-spiked Trumpet-flower. Tree.

75 B. FIMBRIA'TA (Wall. cat. no. 6500.) erect?; leaves impari-pinnate; leaflets hairy, ovate-lanceolate, long-acuminated; panicles terminal, trichotomous, beset with glandular hairs, as well as the calyxes, which are 5-lobed; corolla funnel-shaped, with lacerately-fringed segments; capsule long. ♄. S. Native of the Burmese Empire, at Moalmeyne.

Fringed-flowered Trumpet-flower. Shrub or tree.

76 B. MULTÍJUGA (Wall. pl. rar. asiat. 1. p. 81. t. 95. t. 96.) arboreous; leaves impari-pinnate, with many pairs of leaflets; leaflets dimidiately ovate-cordate, acuminated, quite entire; panicles large, terminal; capsule flat, lanceolate, membranaceously winged. ♄. S. Native of Silhet and Penang. A large tree, with thick, dotted branches, long leaves, and large leaflets. Flowers large, 3 inches long, by threes, dirty yellow, purplish inside, of a saponaceous odour. Panicle 4 feet long, erect. Calyx pentagonal, divided into 5, acute, cuspidate teeth. Corolla campanulate, densely villous outside. Wings of seed drawn out at both ends.

Many-paired-leaved Trumpet-flower. Clt. 1827. Tree.

77 B. ADENOPHY'LLA (Wall. cat. no. 6503.) branches downy; leaves impari-pinnate, downy beneath, as well as the rachi; leaflets obovate-oblong, mucronate, sessile; the terminal one the largest, becoming gradually smaller to the base; the lowest pair close to the stem, and rounder, distant from the others; panicles terminal, clothed with rusty down; calyx large, campanulate, thickly clothed with rusty down; lobes triangular, acute; corolla large, thickly clothed with woolly tomentum outside, but glabrous inside, with rounded lobes. ♄. S. Native of the Burmese Empire, on mount Taong-Dong, banks of the Irrawaddi; Prome; Segaen. Peduncles and pedicels thick. Bracteas ovate-acuminated, deciduous. Pods long, terete, ribbed, and curved, tomentose.

Gland-leaved Trumpet-flower. Tree.

78 B. TELFAÌRIÆ (Bojer, mss. ex Hook. bot. mag. 2976.) arboreous; leaves impari-pinnate, with 6-9 pair of ovate-oblong, acuminated, shining leaflets; panicles terminal, loose; capsules terete, acuminated, fleshy; seeds broadly winged. ♄. S. Native of Madagascar, in the temperate regions of the mountains of Angove. Flowers horizontal, drooping, large, of a most delicate rose-colour. Calyx campanulate, with acute, green teeth, edged with red. Lobes of corolla rounded, crenately fringed.

Telfair's Trumpet-flower. Tree 20 feet.

79 B. COLE'I (Bojer, mss. ex Hook. bot. mag. 2817.) leaves 3 in a whorl, impari-pinnate; leaflets 5, elliptic, quite entire; flowers rising from the main stem, in clusters, on short pedicels; capsules oblong, acuminated, warted. ♄. S. Native of the Mauritius, and Timor. B. ramiflòra, Nov. ann. mus. 3. p. 381. Calyx angular, 5-toothed, coloured; teeth obtuse. Corolla with a cylindrical tube, swollen upwards, thrice as long as the calyx, reddish, veined with yellow; segments of the limb roundish, waved, reddish purple. Anthers 1-celled, the other cell being abortive.

Lady Cole's Trumpet-flower. Tree.

§ 7. *Leaves decompound.*

80 B. VARIA'BILIS (Jacq. hort. schœnbr. 2. p. 45. t. 212.) scandent, glabrous; branches tetragonal; lower leaves biternate; superior ones conjugate, divisions ternate; tendrils trifid, terminating the common petioles, as in the rest of the species; racemes simple, short, many-flowered, terminal; calyx 5-toothed. ♄. ◡. S. Native of Caraccas. Leaflets oblong, acuminated, glabrous. Corollas 3 inches long, with a greenish yellow tube, having the limb at first of the same colour; but this afterwards becomes white.

Variable Trumpet-flower. Clt. 1819. Shrub cl.

81 B. A'LBA (Aubl. guian. 2. p. 653. t. 266.) scandent; glabrous: leaves composed of 3 pinnate divisions, each division composed of 5 ovate-acuminated, petiolate leaflets; corymbs axillary, dichotomous, many-flowered. ♄. ◡. S. Native of Guiana, on the banks of the river Sinemari, Lam. dict. 1. p. 420. Willd. spec. 3. p. 505. Jacaránda álba, Spreng. syst. 2. p. 834. Petioles and branchlets nodose. Flowers white. Fruit ovate-oblong, rugged.

White-flowered Trumpet-flower. Clt. 1823. Shrub cl.

82 B. amœ'na (Wall. pl. asiat. rar. 2. p. 78. t. 183.) leaves tripinnate: each pinnæ furnished with 3 to 9 lanceolate, acuminated, quite entire, smooth leaflets; panicle terminal, trichotomous; calyx bluntly 3-lobed; limb of corolla puberulous outside. ♄. S. Native of the Mauritius. Bign. amàra, Loud. hort. brit. p. 483. Branches cylindrical, dotted. Flowers very fragrant, pale yellow, orange-coloured inside, drooping, subcorymbose. Capsule cylindrical, slender, spiral. Leaves and leaflets on long, angular stalks.

Pleasing Trumpet-flower. Clt. 1828. Tree.

83 B. Ghórta (Hamilt. herb. ex Wall. cat. no. 6510.) glabrous: leaves impari-bipinnate; common rachi jointed: partial ones winged, as also jointed; leaflets ovate, acuminated, attenuated at the base, sessile, the odd one the largest; panicles terminating the branches; lobes of calyx slight, mucronate; corolla glabrous. ♄. S. Native of the East Indies. Flowers middle-sized. Leaves puberulous in the young state. Leaves with 3 pair of pinnæ, the pinnæ furnished with 2-3 pairs of leaflets.

Ghorta Trumpet-flower. Tree or shrub.

Cult. All the species of this genus are truly splendid while in blossom, and the greater number of them climbers; they are therefore desirable plants to train up rafters and pillars, in stoves, as they grow and flower freely. A mixture of loam and peat suits them best: and cuttings taken from young shoots strike root readily, under a hand-glass, in heat, either in mould or sand.

II. SPATHO'DEA (from σπαθη, *spathe*, a spathe, in reference to the form of the calyx.) Beauv. fl. d'ow. 1. t. 29. R. Br. prod. p. 471. H. B. et Kunth, nov. gen. amer. 3. p. 146.—Bignònia species, Lin. Roxb. and others.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx spathaceous, cleft on one side, and toothed or entire on the other side. Corolla funnel-shaped, with a 5-lobed, rather unequal, subbilabiate limb. Stamens 4, didynamous, that is, 2 long, and 2 short, with the addition of a fifth sterile filament. Cells of anthers divaricate, hanging by their connective. Stigma bilamellate. Capsule silique-formed, falcate, falsely 4-celled; dissepiment contrary, corky. Seeds furnished with membranous wings, transverse. — Erect shrubs or trees, rarely climbing shrubs. Leaves opposite, rarely alternate, simple, conjugate, but usually impari-pinnate. Leaflets entire. Flowers somewhat panicled, orange-coloured, yellow, or purple.

§ 1. *Leaves simple.*

1 S.? alternifòlia (R. Br. prod. p. 472.) leaves alternate, simple, somewhat ovate, entire, coriaceous, glabrous; stem arborescent. ♄. S. Native of New Holland, within the tropic, Bauer.

Alternate-leaved Spathodea. Tree.

2 S.? comòsa; tender parts very downy; leaves opposite, simple, cordate; corymbs terminal, short, leafy; calyx 5-cleft; corolla with a long, slender tube, and bilabiate border. ♄. S. Native of Moluccas. Bignònia comòsa, Roxb. fl. ind. 3. p. 103.

Tufted Spathodea. Tree.

§ 2. *Leaves conjugate, tendrilled.*

3 S. laurifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 146.) scandent; branches compressed, a little striated, glabrous; leaves conjugate; tendrils simple; leaflets ovate, obtuse, coriaceous, glabrous; peduncles terminal, few-flowered; calyx cleft on one side, and entire on the other. ♄. ◡. S. Native of New Andalusia, in woods, near Bordones and Cumana. Leaves 3½ inches long, and 2 broad. Peduncles dichotomous, 3-7-flowered. Corollas orange-coloured.

Laurel-leaved Spathodea. Shrub cl.

4 S. Orinoce'nsis (H. B. et Kunth, l. c. p. 147.) scandent; branches terete, furrowed, glabrous; leaves conjugate; tendrils simple?; leaflets oblong, acute, coriaceous, glabrous; calyx cleft on one side, and entire on the other. ♄. ◡. S. Native on the banks of the Orinoco, near Carichana. Leaflets 4 inches long. Inflorescence and colour of flowers unknown.

Orinoco Spathodea. Shrub cl.

5 S. obova'ta (H. B. et Kunth, l. c.) scandent; branches terete, striated, downy; leaves conjugate; tendrils simple?; leaflets obovate, acuminated, glabrous; axillary peduncles 1-flowered, and the terminal ones 3-flowered; calyx irregularly 3-5-cleft. ♄. ◡. S. Native of New Granada, near Turbaco. Bign. obovàta, Spreng. syst. 2. p. 330. Petioles puberulous. Leaflets 4 inches long, and 2½ broad. Corollas about 2 inches long, violaceous. This plant, from the form of the calyx, probably does not belong to the genus.

Obovate-leaved Spathodea. Shrub cl.

6 S. unca'ta (Spreng. syst. 2. p. 835.) scandent, glabrous; branches terete; leaves conjugate, undulated; tendrils longer than the petioles, trifid at apex, hooked; calyx spathaceous, bilabiate; flowers lateral, umbellate, aggregate. ♄. ◡. S. Native of Guiana, and the West Indies. Bignònia uncàta, Andr. bot. rep. t. 530. Sims, bot. mag. t. 1511.—Pluk. alm. p. 109. t. 163. f. 2.? Flowers yellow. Perhaps a species of *Bignònia*.

Hooked Spathodea. Fl. Sept. Clt. 1804. Shrub cl.

§ 3. *Leaves impari-pinnate.*

7 S. heterophy'lla (R. Br. prod. p. 472.) arboreous; leaves glabrous, pinnate and ternate, or simple; leaflets lanceolate-linear, entire; flowers racemose. ♄. S. Native of New Holland, within the tropic.

Various-leaved Spathodea. Tree.

8 S. glandulòsa (Blum. bijdr. p. 762.) arboreous; leaves impari-pinnate and ternate; leaflets ovate-oblong, acuminated, glabrous, furnished with many glands beneath at the base; panicles axillary and terminal, straight. ♄. S. Native of **Java**, on the mountains of Parang, and at the foot of Mount Tjerimai.

Glandular-leafletted Spathodea. Fl. year. Tree 15 to 25 feet.

9 S. adena'ntha; leaves ternate, verticillate, or impari-pinnate; leaflets ovate-oblong, acuminated, serrated; racemes terminal. ♄. S. Native of Guinea. Bignònia glandulòsa, Schum. pl. guin. p. 274. Limb of calyx obsoletely 4-toothed. Corolla pale purple; segments roundish, scattered with glands outside.

Gland-flowered Spathodea. Tree 30 feet.

10 S. Rhee'dii (Spreng. syst. 2. p. 835.) arboreous; leaves downy, impari-pinnate; leaflets 3-7 pairs, roundish, downy; racemes terminal, erect; calyx spathaceous; corolla much curved, slender. ♄. S. Native on the coast of Coromandel and Malabar. Bignònia spathàcea, Lin. suppl. 283. Retz. obs. 5. p. 5. Roxb. cor. 2. t. 144. fl. ind. 3. p. 103. Bign. falcàta, Kon. mss.—Rheed. 6. p. 53. t. 29. Shoots covered with whitish down. Racemes length of leaves. Flowers white, pretty large. Limb spreading. Fruit about a foot long, pendulous, twisted in various forms. This tree is called *Woody* by the Telingas; *Will-padri* by the Tamuls.

Rheede's Spathodea. Clt. 1794. Tree.

11 S. crìspa (Wall. cat. no. 6515.) arboreous; leaves villous, while young, pinnate; leaflets 5-7, oblong; racemes solitary, terminal, bearing a few flowers on long pedicels; calyx spathaceous; corolla salver-shaped, having the segments of the border nearly equal, and much curled. ♄. S. Native of Mysore, where it was collected by Dr. Buchanan. Bign. atrovìrens, Roth. herb. madr. S. atrovìrens, Spreng. syst. 2. p. 835. Leaves 6-10 inches long. Leaflets simple, very rarely ternate.

Flowers large, white. Tube of corolla cylindrical, as in the last species. Follicles pendulous, 12-14 inches long.

Curled-flowered Spathodea. Tree 25 feet.

12 S. ROXBU'RGHII (Spreng. syst. 2. p. 835.) arboreous; leaves 3 in a whorl, or scattered, impari-pinnate; leaflets from 4 to 5 pairs, serrated, smooth; panicles erect, terminal, dense, downy, many-flowered; fruit narrow, 4-celled; calyx generally 2-parted, with the upper lip 2-cleft, very downy. ♄. S. Native of the Circars. Bignònia quadriloculàris, Roxb. cor. 2. t. 145. fl. ind. 3. p. 107. Bark grey, with a few scabrous spots. Branches forming a dense, spreading head. Flowers large, rose-coloured, delightfully fragrant. Limb of corolla nearly equal, having the edges elegantly waved. Fruit a foot long, 2 inches broad, ½ an inch thick, straight, 2-valved, 4-celled: dissepiment enlarged in the middle, on each side, into a sharp ridge, which touches the valves, and divides each of the usual cells into 2 compartments; and in these ridges the seeds are fixed. This species is also remarkable on account of the serrated leaves. The wood is employed for many purposes by the natives.

Roxburgh's Spathodea. Clt. 1820. Tree large.

13 S. STIPULA'TA (Wall. cat. no. 6518.) arboreous; tender parts villous; leaves impari-pinnate; leaflets 4-6 pairs from ovate to oblong-elliptic; common petioles channelled; stipulas a tuft of sessile, orbicular ones in the axils of the leaves. ♄. S. Native of Pegu. Bignònia stipulàta, Roxb. fl. ind. 3. p. 108. Branches 4-cornered. Calyx and peduncles very woolly. Follicles cylindrical.

Stipulate Spathodea. Tree 10 to 20 feet.

14 S. LONGIFLÒRA (Vent. ex Pers. ench. 2. p. 173.) arboreous; leaves impari-pinnate; leaflets about 4 pairs, ovate to oblong, entire, cuspidate, downy while young; lower pair the smallest; panicles large, spreading, terminal; corolla bilabiate; follicles pendulous, long, slender, sub-cylindrical, with sharp edges, and variously curved. ♄. S. Native about Coromandel and Malabar, in the more mountainous parts, as well as of Ceylon and Java. Bignònia chelonoìdes, Lin. suppl. 283. Roxb. fl. ind. 3. p. 106. Bignònia longiflòra, Willd. spec. 3. p. 304. Padri, Rheed, mal. 6. p. 53. t. 29. *Pori-padyra-marum* of the Tamuls, and *Tagada* of the Telingas. Bark scabrous, brown. Leaves a foot long, glabrous in the adult state. Leaflets 4 inches long, and 2 broad. Ramifications of panicles decussate, the smaller or terminal ones dichotomous, with a sessile flower in the fork. Flowers pretty large, yellow, very fragrant. Follicles very long. The wood of this tree is high-coloured, hard, durable, and of much use amongst the inhabitants of the hills, where it is plentiful.

Long-flowered Spathodea. Clt. 1816. Tree large.

15 S. CORYMBÒSA (Vent. ex Pers. ench. 2. p. 173.? Spreng. syst. 2. p. 835.) erect; leaves conjugate, glabrous; leaflets sub-cordate, acute, quite entire; petioles glandular at the base; flowers corymbose. ♄. S. Native of Trinidad. Flowers yellow.

Corymbose-flowered Spathodea. Clt. 1824. Tree.

16 S. CAMPANULA'TA (Beauv. fl. d'ow. 1. p. 47. t. 27-28.) arboreous, glabrous; leaves alternate, impari-pinnate; leaflets 9, oblong-lanceolate, tapering to both ends; flowers racemose, terminal; calyx thick, arcuately reflexed, rather villous. ♄. S. Native of the west coast of Africa, in the kingdom of Waree. Corolla large, campanulate, of a reddish orange-colour, having the segments bordered with yellow. Genitals declinate. This species is remarkable, in having alternate leaves; the leaflets are, however, opposite.

Campanulate-flowered Spathodea. Tree or shrub.

17 S. LÆ'VIS (Beauv. fl. d'ow. 1. p. 48. t. 29.) erect; leaves impari-pinnate; leaflets 9, ovate, acuminated, toothed from the middle to the apex; flowers terminal. ♄. S. Native of Guinea, as at Sierra Leone and Waree. Leaves alternate. Racemes composed of 1-3-flowered peduncles. Flowers purple. Limb of corolla unequal; segments roundish. Calyx erect, smooth, 5-toothed. This species is remarkable, in having the leaflets toothed.

Smooth Spathodea. Clt. 1825. Shrub 5 to 10 feet.

18 S. TULIPÍFERA; leaves impari-pinnate; leaflets oblong, entire, hairy beneath; racemes corymbose, tomentose. ♄. S. Native of Guinea, at Aquapim. Bignònia tulipífera, Thonn. ex Schum. pl. guin. p. 273. Pedicels solitary. Corolla large, scarlet; segments ovate, with curled yellow edges. Tube of corolla short.

Tulip-bearing Spathodea. Tree large.

19 S.? FRAXINIFÒLIA (H. B. et Kunth, nov. gen. amer. 3. p. 147.) scandent; branches compressedly quadrangular, furrowed, glabrous; leaves impari-pinnate; leaflets ovate-elliptic, obtuse, glabrous, shining; panicles terminal, with opposite, compressed, dichotomous branches; calyx cleft on one side, and nearly entire on the other. ♄. ◡. S. Native of Llanos de Caracas, near Calabozo, in humid places, on the banks of the river Guarico. Bignònia fraxinifòlia, Spreng. syst. 2. p. 833. Branches warted. Leaves 8-9 inches long, with 3 pair of leaflets. Axils of petioles glandular. Corolla yellow, 5- rarely 4-cleft.

Ash-leaved Spathodea. Clt. 1822. Shrub cl.

20 S. GIGA'NTEA (Blum. bijd. p. 761.) arboreous; leaves pinnately decompound; leaflets oblong-lanceolate, acuminated, quite glabrous; panicles terminal, straight. ♄. S. Native of Java, in mountain woods, where it is called *Kipadali*.

Gigantic Spathodea. Fl. year. Tree 80 feet.

Cult. See *Bignònia*, p. 222, for culture and propagation. Like the species of *Bignònia*, they are splendid plants when in blossom.

III. TE'COMA (from Tecomaxochitl, the Mexican name of one of the species.) Juss. gen. p. 139. R. Br. prod. 471. H. B. et Kunth, nov. gen. amer. 3. p. 142.—Bignònia species, Lin. and others.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx campanulate, 5-toothed. Corolla with a short tube, and a campanulate throat; limb 5-lobed, bilabiate. Stamens 4, didynamous, that is, 2 long, and 2 short, with the rudiment of a fifth sterile filament. Stigma bilamellate. Capsule silique-formed, 2-celled, having the dissepiment contrary to the valves. Seeds disposed in 2 rows, imbricate, winged, transverse.—Erect trees or shrubs, rarely scandent shrubs. Leaves opposite, simple, impari-pinnate or digitate. Flowers terminal, panicled, yellow or flesh-coloured.

§ 1. *Leaves simple.*

1 T. UNDULA'TA; arboreous; leaves opposite, simple, linear-lanceolate, undulated; racemes lateral; limb of calyx cut into 5 emarginate segments; follicles linear, a little compressed. ♄. S. Native of Hindostan. Bignònia undulàta, Roxb. fl. ind. 3. p. 101. Bignònia salicifòlia, Hamilt, herb. Bark scabrous. Branches drooping like the *Weeping Willow*. Leaves clothed with minute, micaceous scales. Racemes 2-3 inches long, 5-6-flowered. Flowers very large, erect, orange-coloured. Segments or teeth of calyx often emarginate. Corolla with an obliquely campanulate tube, and a 4-parted limb; the upper division large, and divided into 2 rounded lobes; the under 3 equal, with rounded, curled edges. Pods curved. Seed with a very thin membranous margin all round; dissepiment contrary.

Undulated-flowered Tecoma. Tree 20 to 30 feet.

2 T. SPLE'NDIDA (Spreng. syst. 2. p. 834.) shrub erect; leaves crowded, linear, acute, fleshy, glabrous; flowers subracemose, terminal; anthers exserted, woolly. ♄. S. Native of Brazil. Esterhàzia splèndida, Mikan.

Splendid Tecoma. Fl.? Clt. 1820. Shrub erect.

§ 2. *Leaves digitate.*

3 T. DIGITA'TA (H. B. et Kunth, nov. gen. amer. 3. p. 142. arboreous; branches terete, glabrous; leaves digitate; leaflets obovate-oblong, quite entire, acute, glabrous. ♄. S. Native of New Andalusia, near Santa Cruz. Bark white. Leaflets 7 on each leaf, middle leaflet the largest. Capsule terete. Perhaps belonging to a distinct genus.

Digitate-leaved Tecoma. Clt. 1818. Tree 30 to 40 feet.

4 T. PENTAPHY'LLA (Juss. gen. 139.) arboreous; leaves digitate, quinate; leaflets obovate-lanceolate, quite entire, acute. ♄. S. Native of the West Indies and Brazil, if Guari-pariba, Marcgr. bras. 108. t. 118. Bignònia pentaphy'lla, Lin. spec. p. 870. hort. cliff. 497. Schlecht, in Linnæa, 6. p. 734. Swartz, obs. 233. Flowers 4-5 together, at the ends of the branches, pale blue, sweet scented. Corolla 2 inches long. Leaves pale green, whitish beneath, beset with minute glabrous dots, as well as the calyxes and pedicels. Leaflets on longish petioles. Calyx bilabiate: upper lip subtridentate, a little longer than the lower one, which is entire or bifid. Capsule 4-5 lines long, and 3 lines broad.

Five-leaved Tecoma. Tree 25 feet.

5 T. SERRATIFÒLIA; arboreous; leaves digitate; leaflets 4-5, ovate, attenuated, serrated, glabrous; pedicels terminal, crowded, 1-flowered; calyx bilabiate. ♄. S. Native of Trinidad, where it is called *Pony* by the Spaniards. Bignònia serrátifòlia, Vahl. eclog. 2. p. 46. Lateral leaflets smaller than the middle ones, all unequally serrated from the middle. Peduncles clothed with farinaceous tomentum, sometimes 2-flowered. Corolla yellow, 3 inches long.

Serrated-leaved Tecoma. Clt. 1822. Tree.

§ 3. *Erect trees and shrubs, with impari-pinnate leaves.*

6 T. AZALEÆFÒLIA (H. B. et Kunth, nov. gen. amer. 3. p. 142.) arboreous; branches quadrangular, glabrous; leaflets 3-4 pair, oblong, obtuse, serrated, glabrous; panicles simple, terminal. ♄. S. Native of the eastern declivities of the Andes of Peru, near Sondorilla, on the banks of the river Guancabamba, where it is called *Fresno* by the natives. Branches brown. Leaves 3 inches long; leaflets small. Panicles composed of simple racemes. Flowers flesh-coloured. Capsule compressed, 4 inches long.

Azalea-leaved Tecoma. Tree 10 to 15 feet.

7 T. ROSÆFÒLIA (H. B. et Kunth, l. c. p. 143.) arboreous?; branches terete, striated a little, glabrous; leaflets usually 2 pair, oblong, obtuse, serrated, glabrous; racemes terminal, simple. ♄. S. Native of Quito, near Chillo. Leaves usually impari-pinnate, rarely ternate or simple. Leaflets 1 inch long. Corollas yellow. Capsule as in the preceding species.

Rose-leaved Tecoma. Tree.?

8 T. SAMBUCIFÒLIA (H. B. et Kunth, l. c. p. 143.) arboreous; branches a little compressed, glabrous; leaves usually 2-3 pair, oblong, acuminated, serrated, glabrous; panicles terminal, simple. ♄. S. Native of the Andes of Peru, near Montan. Leaves usually impari-pinnate, intermixed also with ternate and simple ones. Leaflets 1½ inch long. Panicle composed of simple racemes. Flowers yellow. Capsule 4 inches long, warted.

Elder-leaved Tecoma. Clt. 1824. Tree 10 feet.

9 T. STA'NS (Juss. gen. 139.) arboreous; branches somewhat tetragonal, glabrous; leaflets ovate-lanceolate, acuminated, serrated, glabrous; racemes terminal, simple. ♄. S. Native of various parts of South America, and the West Indies, Mexico, &c. Hook. bot. mag. 3191. Bignònia stáns, Lin. spec. 871.—Plum. spec. 5. icon. 54.—Sloan, hist. 2. p. 63. Leaflets 4-5 pair. Terminal leaflets 3 inches long, the rest shorter. Flowers yellow.

Var. β, incìsa; leaflets more deeply cut. ♄. S. Native of South America. Bignònia incìsa, Colv. cat. Técoma incìsa, Sweet, hort. brit. p. 182.

Standing Tecoma. Fl. Aug. Clt. 1730. Tree 10 to 12 feet.

10 T. SORBIFÒLIA (H. B. et Kunth, l. c. p. 144.) arboreous?; branches tetragonal, glabrous; leaflets usually 2 pair, oblong, acuminated, serrated, clothed with white tomentum; panicles terminal, simple. ♄. S. Native near the town of Quito. Terminal leaflets about 4 inches long, lateral ones 3 inches long. Branches of panicle simple, downy. Flowers unknown, but probably yellow. Capsule narrowed, 7-8 inches long, warted.

Service-leaved Tecoma. Clt.? Tree or shrub.

11 T. MÓLLIS (H. B. et Kunth. l. c.) arboreous?; branches compressedly tetragonal, downy; leaflets 4 pairs, oblong, acuminated, almost quite entire, clothed with soft down-like hairs, on both surfaces; panicles terminal, simple. ♄. S. Native of Mexico, near Guanaxuato. Terminal leaflets 3 inches long; lateral ones 2½. Branches of panicle simple, downy. Corollas yellow.

Soft Tecoma. Clt. 1824. Tree or shrub.

12 T.? AFRICA'NA; arboreous; leaflets 2 pair, obovate, coarsely toothed, wrinkled; racemes terminal, simple, 6-7-flowered. ♄. S. Native of Senegal. Bignònia Africàna, Lam. dict. 1. p. 424. Leaves scabrous above. Terminal leaflet petiolate, lateral ones sessile. Calyx cup-shaped, unequally 4-cleft. Corollas 2 inches long, 4-cleft. Perhaps a distinct genus.

African Tecoma. Tree tall.

13 T. FU'LVA; arboreous; branches tetragonal; leaflets many pairs, cuneate, serrated, small, villous; racemes axillary. ♄. S. Native of South America. Bignònia fúlva, Cav. icon. 6. p. 58. t. 580. Stem of a fuscous-violaceous colour. Common petioles winged. Corollas yellowish.

Fulvous-flowered Tecoma. Shrub 5 to 6 feet.

14 T. SUAVE'OLENS; arboreous; leaflets 3 pair, oval, serrulated, glabrous; panicles terminal, thin; first divisions brachiate; corolla woolly; calyx villous, with a 4-cleft limb: upper division furnished with 2 minute points. ♄. S. Native of Bengal, and of the southern parts of the Coromandel coast. Bignònia suavèolens, Roxb. fl. ind. 3. p. 104. Bign. noctiflòra, Ham. herb. Bign. gratíssima, Kon. Bign. chelonoìdes, Kon. *Patali* is the Sanscrit name of the tree, see Asiat. res. p. 291. *Parul* is the Bengalese name; and *Paral* is the Hindostanee name. Bark ash-coloured, rather scabrous. Leaflets ending in narrow, bluntish points; the outer ones the largest, 6 inches long, and 3-4 broad. Panicle composed of a few spreading branches; the first and second series thereof opposite; the upper ones dichotomous, with a solitary, pedicellate flower in each fork; all are thickly beset with glandular, viscid hairs. Flowers large, of a dark, dull crimson colour, exquisitely fragrant. Corolla with an ample woolly throat, convex beneath, flat, and plaited above; the upper division of the border shortest; having the margins of all curled. Ovarium oblong-clavate, on a glandular receptacle.

Sweet-scented-flowered Tecoma. Tree.

§ 4. *Climbing shrubs; with impari-pinnate leaves.*

15 T. AUSTRA'LIS (R. Br. prod. p. 471.) scandent, glabrous; leaflets 5, elliptic, glabrous in the adult state, entire; panicle terminal; capsule oblong. ♄. ◡. G. Native of New Holland, within the tropic, and of New South Wales. Bignònia Pandòrea, Vent. malm. t. 43. Andr. bot. rep. t. 86. Sims. bot. mag. 865. Panicle composed of simple racemes; also the racemes are often axillary. Flowers pale red, with a dark purple, bearded throat.

Southern Tecoma. Fl. April, July. Clt. 1793.

16 T. MEONA'NTHA; scandent, glabrous; branches angular; leaflets 9, lanceolate, subserrated, bluntish, mucronate, dotted beneath; panicles terminal; corolla with a bearded throat. ♄. ◡. G. Native of New Holland. Bignònia meonántha, Link. enum. 2. p. 130. Bign. pandòrea mìnor, hort. angl. Serratures of leaves few, bluntish. Corolla subventricose, 8 lines long, of

reddish white colour. Leaves and flowers smaller than in *Técoma austràlis*. Upper lip of corolla emarginate.

Smaller-flowered Tecoma. Fl. April, July. Clt.? Shrub cl.

17 T. JASMINOÌDES; leaves impari-pinnate, glabrous, shining; leaflets 5, oblong-lanceolate, bluntly acuminated, entire, paler beneath; panicles terminal, trichotomous. ♄. ◡. G. Native of New Holland, in Moreton Bay. Bignònia jasminoìdes, Cunningh. in Loud. hort. brit. p. 582. Branches terete, glabrous, green. Calyx crenately 5-toothed. Corolla funnel-shaped, downy inside and outside, and a little bearded in the throat, of a pale blush colour, almost white, with a dark purple throat. Segments of corolla rounded, rather unequal. The fifth or sterile filament very short, bearded at top; all the rest bearded at the base.

Jasmine-like Tecoma. Fl. July, Aug. Clt. 1830. Shrub cl.

18 T. DIVERSIFÒLIA; leaves impari-pinnate, very variable; lower ones smallest, with 11 sessile, ovate-roundish, unequal-sided, deeply crenated leaflets: the terminal leaflets the largest, ovate-oblong, and bluntly acuminated, having the common petiole winged, and articulated at the pairs of leaflets; the leaves become as they ascend the stems gradually larger, the leaflets more entire; the ultimate ones are therefore the largest, with only 5 leaflets, which are ovate-oblong, bluntish and repandly crenate, having the terminal leaflet twice the size of the lateral ones. ♄. ◡. F. Native of New Holland. The petioles have always narrow wings, and the leaves are dark green, glabrous, and shining.

Diverse-leaved Tecoma. Fl.? Clt. 1830.? Shrub cl.

19 T. CAPE'NSIS (Lindl. bot. reg. 1117.) scandent, glabrous; branches terete; leaflets 9, ovate, serrated, bearded in the axils of the veins beneath; racemes terminal on long peduncles; calyx 5-toothed; limb of corolla 4-parted; segments nearly equal, obtuse; the upper one emarginate. ♄. ◡. G. Native of the Cape of Good Hope. Bignònia Capénsis, Thunb. prod. p. 105. Ait. hort. kew. 4. p. 50. Flowers middle-sized, of an orange scarlet colour, 2 inches long.

Cape Tecoma. Fl. July, Sept. Clt. 1783. Shrub cl.

20 T. GRANDIFLÒRA (Sweet, hort. brit. p. 184.) slightly scandent, glabrous; leaflets 7-9, ovate, acuminated, coarsely serrated, attenuated at the base; panicles terminal, pendulous; calycine segments lanceolate, length of the tube of the corolla. ♄. ◡. G. Native of China and Japan. Bignònia grandiflòra, Thunb. jap. 253. Blum. bijdr. 778. Bign. Chinénsis, Lam. dict. 1. p. 424. Rjotsjo, Kæmpf. amœn. p. 856. Banks, icon. Kæmpf. t. 21. Incarvíllea grandiflòra, Spreng. syst. 2. p. 836. *Tung-vong-fa* of the Chinese. Branches rooting. Young shoots spotted with dark purple. Leaves 6-10 inches long; petioles marginate. Flowers pendulous, forming terminal, cross-armed panicles, large, of a tawny orange colour on the outside, and of a tolerably bright reddish orange inside, with brighter streaks. Nectary a glandular, crenated ring. Anterior lobe of stigma recurved.

Great-flowered Tecoma. Fl. July, Aug. Clt. 1800. Shrub climbing.

21 T. RADÌCANS (Juss. gen. p. 139.) scandent, glabrous; branches rough, radicant; leaflets 9, ovate, acuminated, coarsely serrated; racemes terminal, corymbose, on long peduncles; tube of corolla 5 times longer than the calyx. ♄. ◡. H. Native of Carolina, Florida, and Virginia. Bignònia radìcans, Lin. spec. 871. hort. cliff. 317. ups. 178. Grov. virg. 73. Mill. icon. t. 65. Duham, arb. 1. p. 103. t. 1. Sabb. hort. 2. t. 84. Du Roi, hardb. 1. p. 116. Wangenh. amer. 68. t. 26. f. 53. Willd. arb. 47. Curt. bot. mag. 485.—Riv. mon. p. 101.—Mor. hist. 3. p. 612. f. 15. t. 3. f. 1.—Corn. can. 102. t. 103. This is a beautiful hardy climber, fixing itself to trees or walls, by roots, like ivy. The flowers are produced at the ends of the shoots, in large bunches; and have long swelling tubes, shaped somewhat like a trumpet, whence this species, as well as all the species of *Bignònia*, have the name of Trumpet-flower. The corolla is large, scarlet orange-coloured.

Var. β, minor; flowers smaller, scarlet. ♄. ◡. H. Native of Carolina. There is a remarkable difference between this and the species, in the shape and size of the leaves, as well as in the colour and size of the flowers.

Rooting Tecoma. Fl. Aug. Clt. 1640, *β*, 1724. Shrub cl.

§ 5. *Leaves decompound.*

22 T. XYLOCA'RPA; arboreous; leaves bi-tripinnate; leaflets from obliquely oblong to semicordate; panicles terminal; segments of the limb of the corolla round, and curled; capsules long, linear, crooked, ligneous, tubercled. ♄. S. Native of Soonda, in the East Indies. Bignònia xylocárpa, Roxb. fl. ind. 3. p. 108. Bark ash-coloured, rather spongy, and considerably cracked. Leaves 1-4 feet long. Common petioles scabrous. Branches of panicle opposite or tern, 2-3 or more times dichotomous, slightly downy, with a single flower in each fork. Bracteas ovate-oblong. Flowers large, white, with a tinge of yellow, delightfully fragrant. Capsule 2 feet long; dissepiment contrary.

Woody-fruited Tecoma. Tree 20 to 40 feet.

Cult. All the species of this genus are elegant plants, well worth the cultivator's care. *T. radìcans* is a hardy climbing shrub, well fitted for decorating a wall, or front of a house. The other species require the same treatment as that recommended for the species of *Bignònia*, see p. 222.

IV. JACARA'NDA (the name of *J. Braziliàna* in Brazil.)

Juss. gen. p. 138. ed. Usteri, p. 154. H. B. et Kunth, nov. gen. amer. 3. p. 145. Humb. et Bonpl. pl. æquin. 1. p. 59. D. Don, in edinb. phil. journ. 1823.—Bignònia species of some authors.

LIN. SYST. *Didynàmia, Angiospérma.* Calyx campanulate, 5-toothed; rarely tubular, truncate, entire. Corolla tubular at the base, very much dilated above, campanulate, ventricose beneath; limb bilabiate, 5-lobed. Stamens 4, didynamous; with a fifth longer, sterile filament, which is villously bearded at top. Anthers 1-lobed in most of the species, with an obsolete rudiment of another lobe; rarely 2-lobed (as in *Jacaránda tomentòsa*), with the lobes equal and diverging. Stigma bilamellate. Capsule broad, compressed, 2-celled; valves thick, ligneous; dissepiment contrary to the valves, placentiferous on both sides. Seeds flat, transverse, with foliaceously-winged edges; outer testa coriaceous, rugosely plicate.—Trees natives of South America, with the habit of the fine-leaved species of *Acàcia*. Leaves opposite, bipinnate. Flowers showy, panicled, terminal, rarely lateral, blue, violaceous, or yellow.

§ 1. *Anthers* 1-*lobed. Leaves abruptly bi-pinnate.*

1 J. ACUTIFÒLIA (Humb. et Bonpl. pl. æquin. 1. p. 59. t. 17. nov. gen. 3. p. 145.) leaves bipinnate, usually with 5-6 pair of alternate pinnæ; leaflets 9-12 pairs, linear-lanceolate, acuminated, glabrous; corolla silky, with a straight tube. ♄. S. Native of Peru, near San Felipe: and on the banks of the river Guancabamba. Bark grey, chinky. Leaflets opposite or alternate. Panicle terminal, large, pyramidal, many-flowered. Calyx campanulate, 5-toothed; teeth ovate, acute. Corolla large, violaceous; with a campanulate throat, ventricose beneath. Capsule oval, acutish.

Acute-leaved Jacaranda. Tree 10 feet.

2 J. OBTUSIFÒLIA (Humb. et Bonp. pl. æquin. 1. p. 62. t. 18. Kunth, nov. gen. 3. p. 145.) leaves bipinnate; with many pairs

of alternate or opposite pinnæ (about 15 pairs); leaflets many-pairs alternate or opposite, oval-oblong, obtuse, downy; corollas glabrous, having an arched tube, which is three times shorter than the throat. ♄. S. Native on the banks of the Orinoco, in shady places, near Carichana, where it is called *Arbol del roseto.* Bark grey, wrinkled. Leaves a foot long. Leaflets contiguous. Panicle large, many-flowered, diffuse, usually lateral. Calyx small, campanulate, 5-toothed; teeth acute. Corolla violaceous, glabrous, larger than those of *J. mimosifòlia;* throat much dilated. Ovarium ovate, 2-edged.

Obtuse-leaved Jacaranda. Tree 30 feet.

3 J. MIMOSIFÒLIA (D. Don, in bot. reg. t. 631.) leaves bipinnate, with many pairs of opposite pinnæ (14-24 pair), each pinnæ bearing 10-28 pair of trapezoid-oval oblong, mucronate, downy leaflets, the odd or terminal leaflet lanceolate, and longer than the lateral ones; corollas silky, having the tube a little arched, and 3 times shorter than the throat. ♄. S. Native of Brazil. J. ovalifòlia, R. Br. in bot. mag. t. 2327. Bark grey, nodose from cicatrices at bottom. Leaves beset with scattered, shining dots. Leaves $1\frac{1}{2}$ foot long. Panicles large, terminal, naked, erectly pyramidal. Flowers showy, drooping, blue. Calyx villous, 5-toothed. Ovarium ovate-oblong, acuminated.

Mimosa-leaved Jacaranda. Fl. April, May. Clt. 1818. Tree 6 to 10 feet.

4 J. FILICIFÒLIA (D. Don. in edinb. phil. journ. 1823.) leaves bipinnate, with many pairs of opposite pinnæ (9-18 pair), each pinnæ bearing from 6 to 15 pair of contiguous trapezoid-oval, mucronate, glabrous, coriaceous leaflets: the odd or terminal one elliptic-rhomboid, acute, large; corolla glabrous, with an arched tube about equal in length to the throat. ♄. S. Native in woods, at the river Essequibo. J. rhombifòlia, Meyer, prim. esseq. p. 213. Bignònia filicifòlia, Anderson, cat. hort. St. Vincent, in trans. soc. arts, &c. vol. 25. p. 200. Branches elongated, with broad cicatrices occasioned by the falling of the leaves. Leaves 1 to $1\frac{1}{2}$ foot, shining above, and glaucous beneath. Panicles lateral and terminal. Calyx campanulate, 5-toothed. Corollas large, violaceous, with a narrow cylindrical tube, and a wide, campanulate throat. Ovarium elliptic.

Fern-leaved Jacaranda. Fl.? Clt. 1800. Tree 25 to 40 feet.

5 J. COPA'IA (D. Don, in edinb. phil. journ. 1823.) leaves bipinnate, with 4-5 pairs of opposite pinnæ, each pinna bearing 3-6 pair of elliptic or cuneated, obtuse, coriaceous, glabrous leaflets; calyx tubular, truncate; corollas velvety. ♄. S. Native of Guiana, in woods. Bignònia, Capàia, Aubl. guian. 2. p. 650. t. 265. and 262. J. procèra, Spreng. syst. 2. p. 834. Bignònia procèra, Willd. spec. 3. p. 307. Pers. ench. 2. p. 173. Bark thick, grey, wrinkled. Leaves $1\frac{1}{2}$ to 2 feet long. Panicle large, terminal. Calyx truncate, entire, with a short cleft on both sides of the mouth. Corolla blue, size of those of *Digitàlis ambígua,* with a dilated, ventricose, bearded throat. Capsule oval, obtuse.

Copaia Jacaranda. Clt. 1793. Tree 60 to 80 feet.

6 J. BAHAME'NSIS (Sims. bot. mag. under no. 2327.) leaves bipinnate; pinnæ alternate; leaflets opposite or alternate, acute at both ends; calyx truncate; corollas glabrous. ♄. S. Native of the Bahama Islands, particularly of the Island of Providence, near the town of Nassau, Catesby. Bignònia cœrùlea, Lin. spec. 872. Mill. dict. no. 11. Willd. spec. 3. p. 307.—Catesb. car. 1. p. 42. t. 42. Panicle terminal. Flowers blue. Fruit emarginate.

Bahama-island Jacaranda. Fl. July, Aug. Clt. 1724. Tree.

7 J. BRASILIA'NA (Lam. dict. 1. p. 420.) leaves bipinnate; leaflets oblong, acute; panicles lateral; fruit short, with sinuated edges. ♄. S. Native of Brazil. Bignònia Braziliàna, Willd. spec. 3. p. 307. Jacarànda II. Pis, bras. p. 165. Flowers yellow. This species will be easily distinguished from the rest, by its yellow flowers. We know nothing of the anthers.

Brazilian Jacaranda. Clt. 1820. Tree 20 to 30 feet.

§ 2. *Anthers 2-lobed: lobes equal. Leaves impari-bipinnate.*

8 J. TOMENTÒSA (R. Br. in bot. mag. under no. 2327. in bot. reg. 1103.) leaves bipinnate, with 3-5 pairs of pinnæ, and an odd one; leaflets ovate or elliptic, acute or acuminated, unequal, tomentose in the young state, and beneath in the adult state; corollas silky; branches downy. ♄. S. Native of Brazil, Sir George Staunton, and Sello. J. pubéscens, Lodd. cat.? Bark grey. Leaves a span long. Panicles small, terminal, tomentose; peduncles 1-3-flowered. Calyx campanulate, 5-toothed; teeth ovate, acute. Corolla violaceous or blue; with a widened throat. Capsule oval-orbicular.

Tomentose Jacaranda. Fl.? Clt. 1824. Tree 20 to 30 feet.

Cult. Jacarànda is a genus composed of elegant trees, having much the habit of the fine-leaved *Acacias;* bearing large, usually terminal panicles of showy blue, or violaceous flowers, and on that account are worth cultivating in every collection of stove plants. They grow freely in a mixture of loam, peat, and sand, or any light rich soil; and cuttings, half ripened, strike root readily, if planted in sand, with a hand-glass placed over them; but the leaves of these cuttings should not be shortened, or cut in any way. If the trees are kept dry in winter, it will check their growth, and throw them into flower.

V. AMPHILO'PHIUM (from *αμφιλοφος, amphilophos,* crested on all sides; limb of corolla much curled.) H. B. et Kunth, nov. gen. amer. 3. p. 148.—Bignònia species, Lin.

LIN. SYST. *Didynàmia, Angiospérma.* Calyx campanulate, with a double limb; inner one bilabiate; outer one spreading, undulately curled. Corolla somewhat coriaceous, with a short tube, a large ventricose throat, which is sulcately compressed in front: limb bilabiate; upper lip large, helmet-shaped, bidentate; lower one straight, tridentate, about equal in length to the superior one. Stamens 4, didynamous, that is, 2 long, and 2 short, with the rudiment of a fifth. Lobes of anthers cohering at top, divaricate. Stigma bilamellate. Capsule ovate, rather ligneous, 2-celled, 2-valved. Seeds imbricate, membranaceously-winged, transverse.—Climbing, cirrhose shrubs; with opposite, conjugate leaves, and terminal panicles of rose-coloured or red flowers.

1 A. PANICULA'TUM (H. B. et Kunth, l. c. p. 149.) leaves conjugate; leaflets ovate-roundish, acuminated, subcordate, finely lepidoted on both surfaces, clothed with down-like hairs on the middle nerve beneath, and on the inside of the petioles; tendrils trifid. ♄. ◡. S. Native of New Andalusia, near the monastery of Caripe, and on mount Cocollar. Bignònia paniculàta, Lin. spec. 869. Jacq. amer. 183. t. 116. Vahl. symb. 3. p. 80.—Plum. spec. 5. icon. 56. f. 11. Panicle composed of 3-flowered peduncles. Corollas rather fleshy, rose-coloured. Jacquin's plant has the lower leaves ternate.

Var. β, mólle; leaflets orbicular, acuminated, cordate, clothed with adpressed, rufescent, stellate, branched tomentum beneath. ♄. ◡. S. Native near Vera Cruz. A. mólle, Cham. et Schlecht. in Linnæa. 5. p. 120. Branches tetragonal, tomentose.

Panicled Amphilophium. Fl.? Clt. 1738. Shrub cl.

2 A. MUTÌSII (H. B. et Kunth, nov. gen. amer. 3. p. 149. t. 219.) leaves conjugate; leaflets ovate-roundish, acuminated, cordate, finely lepidoted on both surfaces; petioles glabrous; tendrils angular, trifid at top. ♄. ◡. S. Native of New Granada, near Mariquita, in temperate places. Branches somewhat 6-angled, glabrous, white; branchlets green, beset with powdery atoms. Branches of panicle few-flowered. Corollas

fleshy, rose-coloured. Very nearly allied to the preceding species.

Mutis's Amphilophium. Shrub cl.

3 A. MACROPHY'LLUM (H. B. et Kunth, l. c. p. 150.) leaves conjugate; leaflets ovate-roundish, acuminated, cordate, hairy and shining above, and clothed with fuscescent tomentum beneath, as well as the petioles; tendrils? ♄. ◡. S. Native of New Granada, near Turbaco. Hairs and tomentum stellate. Branches sulcately angular. Panicles axillary and terminal, clothed with fuscescent tomentum. Branches dichotomous. Corollas red.

Large-leaved Amphilophium. Shrub cl.

4 A.? PUBE'SCENS (Spreng. syst. 2. p. 836.) leaves ternately bi-pinnate, downy; leaflets oblong, obtuse, sessile, almost quite entire; flowers axillary, opposite, pedunculate. ♄. ◡. S. Native of Brazil.

Downy Amphilophium. Shrub tw.

Cult. For culture and propagation see the climbing species of *Bignònia*, p. 222.

VI. ZEYHE'RIA (named in honour of M. Zeyher, director of the Botanic Garden at Baden; and author of several botanical papers.) Mart. nov. gen. bras. 2. p. 65. t. 159.

LIN. SYST. *Didynàmia*, *Angiospérma*. Calyx spathaceous, closed, at length bipartite. Corolla tubular; tube nearly equal; limb 5-lobed, hardly bilabiate. Stamens 4, didynamous, with the rudiment of a fifth sterile one. Stigma bilamellate. Capsule echinated, orbicular, compressed, having the dissepiment contrary to the valves. Seeds with membranous wings, imbricated.—A small tree, or large shrub; branches opposite. Leaves opposite, digitate. Flowers terminal, paniculately corymbose; bracteas twin, naked, axillary.

1 Z. MONTA'NA (Mart. nov. gen. bras. 2. p. 66. t. 159.) leaves digitate; leaflets 5, lanceolate, clothed with fulvous, farinaceous, stellate tomentum beneath, as well as outer branches and inflorescence. ♄. S. Native of Brazil, in the province of St. Paul. Spathòdea montàna, Spreng. syst. add. p. 237. Corolla 1 to 1½ inch long, clothed with golden, lepidoted tomentum outside; segments ciliated, the 3 superior ones narrower and shorter.

Mountain Zeyheria. Shrub 7 feet.

Cult. For culture and propagation, see *Jacarànda*, p. 226.

VII. FREDERI'CIA (named in compliment to Frederick William III. King of Bavaria, a great promoter of the sciences.) Mart. in nov. act. bonn. 13. p. 7. t. A. and B.

LIN. SYST. *Didynàmia*, *Angiospérma*. Calyx tubularly campanulate, pentagonal, coloured; with 5 short teeth. Corolla salver-shaped; with a cylindrical tube, and a spreading border; limb 5-6-cleft; segments spreading, roundish. Stamens 4, didynamous, with the rudiment of a fifth sterile one; filaments bearded at the base; lobes of anthers divaricate. Stigma bilamellate. Capsule compressed, oblong, acutish, almost as broad as long; dissepiment contrary to the valves. Seeds transverse, with membranous margins.—Branched, rambling shrubs. Leaves ternate; leaflets quite entire. Flowers terminal, panicled, bracteate. Inflorescence scarlet.

1. F. SPECIÒSA (Mart. l. c. p. 9. t. A.) leaflets oblong, acuminated, flattish, bearded in the axils of the veins beneath; panicle pyramidal, spreading; calyx and corolla 5-cleft. ♄. ◡. S. Native of Brazil, in the provinces of St. Paul and Rio Janeiro, in woods. Branches terete, striated, glabrous. Panicle large, having the rachis and peduncles tetragonal, purplish scarlet, and clothed with fine villi. Corollas scarlet, or reddish yellow. There are varieties of this species, having the corolla more or less red or yellow, with a glabrous or downy throat.

Showy Fredericia. Shrub cl.

2 F. GULIE'LMI (Mart. l. c. p. 11. t. B.) leaflets ovate-oblong, acute at the base, and short-acuminated at the apex, usually complicate, quite glabrous on both surfaces; panicle compact; calyx, but particularly the corolla, for the most part 6-cleft. ♄. ◡. S. Native of Brazil, in the interior parts of the province of Bahia, in woods. Branches terete, glabrous, often rough from warts. Rachis, peduncles, and pedicels tetragonal, scarlet, and downy. Corolla yellow, downy outside, as in the first species.

William's Fredericia. Shrub cl.

Cult. For culture and propagation see *Bignònia*, p. 222.

VIII. FERDINANDU'SA (named in honour of Ferdinand, hereditary prince of Austria.) Pohl, bot. zeit. 1827. no. 10. p. 153. pl. bras. 2. p. 8.

LIN. SYST. *Didynàmia*, *Angiospérma*. Calyx 4-toothed. Corolla funnel-shaped, 4-parted; segments unequal, bifid, bearded at apex. Stamens 4, didynamous; rudiment of a fifth not seen. Anthers involute at the base and apex; cells parallel or combined; pollen spherical, yellow. Ovarium gibbous at apex, 4-cleft. Style elongated. Stigma bipartite. Capsule large, elliptic, ovate, 2-celled, 4-valved. Seeds unknown.—Erect, middle-sized trees. Leaves large, opposite, coriaceous, blackish or yellowish green, shining, quite entire, ovate, on short petioles; bracteas small. Flowers terminal and axillary, corymbose, scarlet or whitish-green. Stamens and stigmas exserted. Throat of corolla naked. This genus is nearly allied to *Fredericia* and *Zeyhèria*, Mart.

1 F. ELLÍPTICA (Pohl, bras. 2. p. 9. t. 106.) leaves oval-elliptic, obtuse at the apex; bracteas roundish, trifid. ♄. S. Native of Brazil, in the province of Goyaz, in boggy places. Leaves dark green above, and yellowish green beneath. Corollas whitish green.

Elliptic-leaved Ferdinandusa. Tree 12 feet.

2 F. OVA'LIS (Pohl, pl. bras. 2. p. 10. t. 107.) leaves oval, marginated, acutish at the apex; bracteas roundish, quite entire, acute, half stem-clasping, ciliated at their confluence. ♄. S. Native of Brazil, in the province of Goyaz, near to the town of the same name, at Serra de Manoel Gomez. Corollas dark red or scarlet. Leaves dark green above, and yellowish beneath.

Oval-leaved Ferdinandusa. Tree 10 to 12 feet.

3 F. SPECIÒSA (Pohl, pl. bras. 2. p. 12. t. 108.) leaves oval-elliptic, emarginate, acute; bracteas lanceolate, quite entire, scarious. ♄. S. Native of Brazil, in the province of Minas Geraes, on Serra de Spilons; and of the province of Goyaz, at Caza de Telha, and St. Cruz. Corollas scarlet, 2 inches long. Leaves greenish yellow.

Showy Ferdinandusa. Tree 9 feet.

Cult. For culture and propagation see *Jacarànda*, p. 226. The species are extremely elegant when in blossom.

IX. STENOLO'BIUM (from στενος, *stenos*, narrow; and λοβος, *lobos*, a pod; in reference to the narrow, linear, siliquose capsule.) D. Don, in edinb. phil. journ. 1823.

LIN. SYST. *Didynàmia*, *Angiospérma*. Calyx small, campanulate, 5-toothed, equal. Corolla with a narrow tube; a dilated, inflated, campanulate throat; and a 5-lobed, equal, bilabiate limb. Stamens 4, didynamous, that is, 2 long, and 2 short, with a very short rudiment of a fifth; lobes of anthers linear, spreadingly divaricate. Stigma bilamellate. Capsule narrow-linear, siliquose, compressed, 2-celled; dissepiment parallel with the

valves. Seeds flat, transverse, with membranous margins.—A frondose, erect tree. Leaves opposite, simple, very like those of the sweet chestnut, elliptic, coriaceous, acute, feather-nerved, petiolate, with serrated edges, clothed with copious stellate tomentum beneath, 5-7 inches long, and 2-3 broad, glabrous above. Flowers terminal, numerous, spicately panicled, reddish purple, size of those of *Jacaránda*. Style slender, shorter than the stamens. Capsule 5 inches long.

1 S. castanifòlium (D. Don, l. c.) ♄. G. Native of Peru, in woods, at Huayaquil. Bignònia serràta, Pav. mss. in herb. Lamb.

Chestnut-leaved Stenolobium. Tree erect.

Cult. For culture and propagation see *Jacaránda*, p. 226.

X. DELO'STOMA (from δηλος, *delos*, manifest; and στομα, *stoma*, a mouth; in allusion to the wide mouth of the flower.) D. Don, in edinb. phil. journ. 1823.—Bignònia species of Pav.

Lin. syst. *Didynàmia, Angiospérma.* Calyx campanulate, 3-lobed, coriaceous. Corolla funnel-shaped, with a dilated throat, and a spreading, bilabiate limb; lower lip 3-lobed; upper lip shorter, and 2-lobed; lobes broad, roundish, flat. Stamens 4, didynamous, that is, 2 long and 2 short; with the addition of a short fifth sterile, glabrous one. Lobes of anthers parallel, equal. Stigma broad, bilamellate. Capsule lanceolate, compressed, 2-celled; valves coriaceous, rather fleshy: dissepiment parallel with the valves. Seeds flat, transverse, with broad, membranous edges.—Frondose trees, natives of Peru. Leaves simple, opposite, elliptic, petiolate, bluntly acuminated. Flowers terminal, spicately racemose, large, rose-coloured. The campanulate, 3-lobed calyx, the figure of a corolla; the parallel lobes of the anthers; and the structure and form of the capsule; are the marks which particularly characterize this genus.

1 D. denta'tum (D. Don, l. c.) leaves elliptic-oblong, toothed, downy beneath. ♄. S. Native of Peru. Bignònia ròsea, Pav. mss. in herb. Lamb. Flowers rose-coloured.

Toothed-leaved Delostoma. Tree.

2 D. integrifòlium (D. Don, l. c.) leaves elliptic, quite entire, tomentose beneath. ♄. S. Native of Peru. Bignònia simplicifòlia, Pav. mss. in herb. Lamb.

Entire-leaved Delostoma. Tree.

Cult. For culture and propagation see *Jacaránda*, p. 226.

XI. ASTIA'NTHUS (from αστειος, *asteios*, beautiful; and ανθος, *anthos*, a flower; in allusion to the brilliant flowers.) D. Don, in edinb. phil. journ. 1823.

Lin. syst. *Didynàmia, Angiospérma.* Calyx tubular; limb equal, 5-toothed. Corolla tubular at the base, but with a dilated, campanulate, ventricose throat; limb 5-lobed, bilabiate; lower lip 3-lobed, the middle lobe large; the superior lip 2-lobed, and reflexed. Stamens 4, didynamous; with a shorter, glabrous rudiment of a fifth sterile one. Stigma bilamellate. Anthers naked; lobes equal, confluent. Capsule very long, siliquose, 2-celled. Dissepiment parallel with the valves, thick, placentiferous on both sides. Seeds transverse, compressed; with winged margins, and pappose from numerous villi.—An erect, branched, frondose shrub, native of Mexico. Branches terete, glabrous. Leaves simple, tern, elongated, broad-linear, coriaceous, quite entire, glabrous, 6-10 inches long, 1-nerved, attenuated at both ends. Flowers terminal, numerous, panicled. Corolla larger than that of *Digitàlis purpùrea*, reddish purple. Lobes of the limb of the corolla broad, round, with curled and erose edges. This genus is distinguished from *Bignònia*, in the confluent lobes of the anthers, by its seeds being furnished with a villous pappous, and by its habit. It differs from *Técoma*, besides the characters above enumerated, in having a parallel, and not a transverse dissepiment; and from *Spathòdea*, with some species of which it agrees in habit; but is readily distinguished by the structure of its capsule, in having seeds furnished with a villous pappous, and lastly, in the lobes of the anthers being confluent.

1 A. longifòlius (D. Don, l. c.) ♄. S. Native of Mexico. *Long-leaved* Astianthus. Shrub.

Cult. For culture and propagation see *Jacaránda*, p. 226.

XII. CHILO'PSIS (from χειλος, *cheilos*, a lip; and οψ, *ops*, resemblance; on account of the calyx being furnished with a distinct lip.) D. Don, in edinb. phil. journ. 1823.—Bignònia species, Cav.

Lin. syst. *Didynàmia, Angiospérma.* Calyx membranous, oblong, ventricose, cleft on the lower side, even to the base; limb oblique, tridentate on the upper side. Corolla with a tubular base, and a dilated campanulate throat; limb 5-lobed, bilabiate; lobes oval-roundish, with curled, crenated edges; lower lobe large, oblong. Stamens 4, didynamous; besides the rudiment of a fifth sterile, glabrous one. Stigma bilamellate. Anthers naked; lobes equal, divaricate. Capsule short, siliquose, 2-celled: dissepiment contrary, placentiferous. Seeds transverse, with membranous margins.—An erect, branched shrub, native of Mexico; with terete, downy branches. Leaves alternate, linear, flat, elongated, 3-5 inches long, glabrous, coriaceous, attenuated at both ends. Racemes terminal, short, dense, tomentose; pedicels short, furnished with 2 linear-lanceolate bracteoles each. Lobes of stigma replicate. Corolla dark purple, size of those of *Chelòne*. This is a well-marked genus, readily distinguished from *Spathòdea*, in the structure of its capsule, and by having simple, alternate leaves.

1 C. salígna (D. Don, l. c.) ♄. S. Native of Mexico. Bignònia lineàris, Cav. icon. 3. t. 269.

Willow-leaved Chilopsis. Fl. ? Clt. 1825. Shrub 10 feet.

Cult. For culture and propagation see *Jacaránda*, p. 226.

XIII. OXE'RA (from ογκηρος, *onkeros*, tumid; in allusion to the swollen throat of the corolla.) Labill. sert. cal. p. 23. t. 28.—Oncòma, Spreng. gen. 1. p. 24.

Lin. syst. *Diándria, Monogy'nia.* Calyx 4-parted, scarious. Corolla tubular at the base, and dilated at the throat; limb 4-cleft, nearly equal. Stamens 4, 2 of which are fertile. Anthers 2-celled, exserted. Ovarium 4-lobed, seated on a glandular disk. Ovula numerous, fixed to fleshy, central placentas. Style central, incurved; stigma bifid. Fruit probably baccate.—A shrub, about 6 feet high; with pale, sulphur-coloured, warted branches. Leaves opposite, ovate-oblong, exstipulate. Racemes axillary. Flowers pendulous, sub-umbellate. Fertile stamens, and style exserted. Peduncles twice trichotomous, bracteate. Flowers large.

1 O. pulche'lla? (Labill. l. c.) ♄. G. Native of New Caledonia.

Neat-leaved Oxera. Shrub 6 feet.

Cult. For culture and propagation see *Jacaránda*, p. 226.

XIV. PLATYCA'RPUM (from πλατυς, *platys*, broad; and καρπος, *carpos*, a fruit; in reference to the broad compressed fruit.) Humb. et Bonpl. pl. æquin. 2. p. 81. H. B. et Kunth, nov. gen. amer. 1. p. 151.

Lin. syst. *Pentándria, Monogy'nia.* Calyx 5-parted, equal. Corolla with a short tube, a funnel-shaped throat, and a 5-cleft, equal limb. Stamens 5, equal. Stigma bilamellate. Capsule didymous, ligneous, compressed, 2-celled, 2-valved; dissepiment contrary to the valves, and adnate to them; cells 2-seeded. Seeds membranaceously winged.—A large tree; with opposite, simple entire leaves; and terminal panicles of pale red flowers.

1 P. Orinoce'nse (Humb. et Bonpl. pl. æquin. 2. p. 81. t. 104.) ♄. S. Native on the banks of the Orinoco, near Atures. Sickíngia Orinocénsis, Spreng. syst. 1. p. 622. A tree, with a dense head. Bark thin, smoothish; wood white. Branchlets clothed with rusty tomentum at top. Leaves petiolate, obovate-oblong, obtuse, 5-6 inches long, white beneath, and clothed with rusty down on the nerves and veins. Petioles pilose. Branches of panicle dichotomous.

Orinoco Platycarpum. Tree 25 to 40 feet.

Cult. For culture and propagation see *Jacaránda*, p. 226.

XV. CALOSA'NTHES (from καλος, *calos*, beautiful; and ανθος, *anthos*, a flower; in reference to the beauty of the flowers.) Bignònia species of Roxb. Blum. bijdr. 760.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx entire, coriaceous, tubular, campanulate. Corolla with a short tube, a campanulate throat, and a bilabiate border; upper lip 2-cleft; under lip 3-cleft; segments wrinkled. Stamens 5, all antheriferous; the exterior pair the longest, bending in under the upper lip, very woolly at the base; anthers double, each part oblong, bursting on the under side. Hypogynous disk, a somewhat pentagonal, fleshy body. Style length of stamens, hollow its whole length, having a funnel-shaped mouth, opening between the membranous, orbicular lobes of the stigma. Capsule silique-formed, large, compressed transversely, a little curved, having the convexity upwards; dissepiment contrary to the valves?. Seeds numerous, surrounded by a delicate, semi-circular, membranous wing.—A large tree, with opposite, supra-decompound leaves; and terminal, secund racemes of flowers.

1 C. I'ndica (Blum. bijdr. 761.) ♄. S. Native of the coast of Coromandel and Malabar, in forests, among the mountains; and of Java, where it is called *Pompuran*. Bignònia I'ndica, Lin. Willd. spec. 3. p. 306. Roxb. fl. ind. 3. p. 110. Bignònia pentándra, Lour. coch. 460. Spathòdea Indica, Pers. ench. 1. p. 173. Palego-Pajoneli, Rheed. mal. 1. t. 43 and 44. *Shyonaka* and *Mundooka-puna*, are two of its Sanscrit names; *Shyona* is its Hindostanee name; *Vanga marum* is the Tamul name; and *Pampena*, the Telinga name. Tree large. Leaves opposite, decussate, 4-5 feet long. Leaflets obliquely cordate, smooth, pointed. Peduncles and pedicels scabrous. Racemes terminal, secund, erect, stiff; lower two thirds naked and scabrous, somewhat quadrangular; upper third part imbricated on one side by very large, fleshy, dark red flowers; with scarcely any bracteas. Capsule long, linear.

Indian Calosanthes. Fl.? Clt. 1775. Tree 40 to 50 feet.

Cult. For culture and propagation see *Jacaránda*, p. 226.

XVI. MILLINGTO'NIA (named in honour of Thomas Millington, an English botanist, who has written on vegetable physiology.) Lin. suppl. 291. Juss. gen. 138. Willd. spec. 3. p. 382. Bignònia suberòsa, Roxb.

Lin. syst. *Didynàmia*, *Angiospérma*. Calyx small, slightly 5-parted; with nearly equal divisions. Corolla funnel-shaped; tube from 2 to 3 inches long, slender and cylindrical; limb 4-parted; the upper division broadest, and nearly half 2-cleft. Stamens 4, didynamous, exserted, without any rudiment of a sterile filament; anthers spurred. Ovarium oblong. Style as long as the corolla; stigma bilamellate. Capsule slender, linear, pretty smooth, 2-celled, thin, pointed, about a foot long, and 3 inches broad, and one line thick; dissepiment parallel with the valves. Seeds numerous, round, surrounded by a remarkably fine pellucid membrane. Embryo with 2 emarginate, reniform cotyledons.—A large tree. Bark deeply cracked, and spongy. Leaves opposite, supra-decompound; leaflets subcordate, entire. Panicles terminal. Wood white, firm, and close-grained.

1 M. horte'nsis (Lin. suppl. 291. Willd. spec. 3. p. 382.) ♄. S. Native of the East Indies, but in what particular place is unknown. Bignònia suberósa, Roxb. fl. ind. 3. p. 111. Leaves about 2 feet long. Leaflets acuminated, 1-3 inches long. Panicle cross-armed; ramifications horizontal, the first trichotomous, then dichotomous, with generally a simple flower in the fork. Bracteas minute. Flowers numerous, large, pure white, delightfully fragrant.

Garden Millingtonia. Fl.? Clt. 1820. Tree 50 to 60 feet.

Cult. For culture and propagation see *Jacaránda*, p. 226.

XVII. ARGY'LIA (this beautiful genus is dedicated to the memory of Archibald, Duke of Argyle, a nobleman distinguished for his patriotic virtues, and love of science, and more especially of botany. His fine garden at Whitton Park, in Middlesex, was justly celebrated towards the middle of the last century. It contained a very extensive collection of plants, particularly of ornamental and useful American trees, many of which he himself first introduced to this country.) D. Don, in edinb. phil. journ. 1823, and 1829, July.

Lin. syst. *Didynàmia*, *Angiospérma*. Calyx 5-parted. Corolla with a tubular base, and a ventricose throat; limb nearly equal, 5-lobed, imbricate in æstivation. Stamens 4, didynamous, that is, 2 long, and 2 short, without any rudiment of a sterile one. Anthers beardless, 2-parted; lobes obtuse, divaricate, distinct at apex, dehiscing by a longitudinal chink. Stigma bilamellate, pruinose. Capsule silique-formed, 2-celled, 2-valved, many-seeded, torulose; valves crustaceous, navicular. Seeds transverse, wingless, reniform, 2-lobed at apex, with an obtuse margin, concave and striated on one side, and convex and tubercled on the other; outer testa coriaceous. Embryo conforming to the cavity of the seed.—Perennial, green herbs. Roots thick, divided, fleshy, fusiform. Stems erect, terete, branched, viscid, downy, fleshy. Leaves alternate, remote, peltately digitate, petiolate; leaflets deeply bi-tripinnatifid, unequal, disposed in a circle, minutely downy and viscid. Peduncle a continuation of the stem, fleshy. Flowers terminal, racemose, numerous; pedicels short, alternate, each furnished with a bractea at the base. Corollas large, yellow, size of those of *Catálpa syringæfòlia*, showy, marked with numerous red dots in the throat.

1 A. cane'scens (D. Don, in edinb. phil. journ. 1829. July.) clothed with hoary down; segments of the leaves linear, channelled; tube of corolla exceeding the calyx. ♃. G. Native of Chili, about Coquimbo, Caldcleugh. The herb is more slender, the down more copious, short, and canescent, than in *A. radiàta;* and the flowers are smaller, but also yellow.

Canescent Argylia. Pl. 1 foot.

2 A. radia'ta (D. Don, in edinb. phil. journ. no. 8. p. 260. 1823. and July 1829.) glabrous; segments of the leaves flat, dilated at apex; tube of corolla twice longer than the calyx. ♃. G. Native of Peru. Bignònia radiàta, Lin. spec. 871. Willd. spec. 3. p. 301.—Feuill. per. 1. p. 731. t. 22. Corolla large, yellow, dotted with red in the throat. The plant, in the general description, is said to be clothed with minute viscid down.

Ray-leaved Argylia. Pl. 1 foot.

Cult. The species of *Argylia* are extremely splendid while in blossom. They will thrive best in a light rich soil, such as a mixture of loam, peat, and sand. Cuttings will strike root in sand, under a hand-glass, if kept free from damp.

XVIII. INCARVI'LLEA (named after P. Incarville, a Chinese Jesuit, who first sent specimens of it to Bernard de Jussieu, in the year 1743; and seeds of many other plants, as, for instance, the Chinese Aster, so common in our gardens.) Juss. gen. 138. ed. Usteri, p. 154. Lam. dict. 3. p. 233. ill. t. 527. Bunge, in mem. acad. petersb. 2. p. 120.

Lin. syst. *Didynàmia, Angiospérma.* Calyx tribracteate, pentagonal, 10-cleft; the 5 outer segments subulate, elongated, and glabrous, thickened; the inner ones shorter and bifid. Corolla bilabiate; segments nearly equal. Stamens 4, didynamous; filaments glandularly thickened at apex; anthers bisetose, 2-celled; cells horizontal, opposite, dehiscing at bottom. Stigma bilamellate. Capsule silique-formed, 6-ribbed, falcate, dehiscing laterally; dissepiment bilamellate, contrary to the fissures. Seeds numerous, winged, Bunge, l. c. Calyx 5-cleft, tribracteate. Corolla with a tubular base, a ventricose throat, and an unequal, 5-lobed limb. Stamens didynamous; anthers 2-lobed. Stigma bilamellate. Capsule silique-formed, compressed, long, narrow, 2-celled, 2-valved; dissepiment opposite the valves, many-seeded. Seeds winged.—A Chinese herb; with alternate, striated branches; alternate, pinnately jagged leaves; and loose, spicate racemes of flowers. Corolla like that of *Digitàlis;* and the capsule like that of *Catálpa,* or *Fæ'num Græ'cum.* The rudiment of a sterile filament not seen, ex Juss. l. c.

1 I. Sine'nsis (Lam. dict. 3. p. 233.) 2. G. Native of China, on way sides, near Pekin, and from that to the north. even to the limits of the empire. J. Chinénsis, Bunge, mem. acad. petersb. 2. p. 120. Cámpsis adrèpens, Lour. coch. 378. Stem 1-2 feet high, herbaceous, erect. Leaves bipinnatifid; leaflets cut; lobes linear. Racemes terminal, loose. Flowers nearly sessile. Corollas large, scarlet, deciduous. Capsule 2 inches long and more. The figure of Lam. expresses the upper part of the plant well, ex Bunge, l. c. Stem branched, striated, a foot high. Leaves like those of *Chelidònium hy'bridum,* pinnately jagged, petiolate, glabrous. Flowers like those of *Digitàlis,* loosely spiked, terminal, purple, ex Willd. spec. 3. p. 289. The plant of Jussieu is probably distinct from that of Bunge.

China Incarvillea. Pl. 1 to 2 feet.

Cult. This is a most elegant plant when in blossom. Should it ever be introduced to our gardens, we would recommend its being treated as a greenhouse plant. A mixture of loam, peat, and sand, or any light rich soil, will suit it; and cuttings will probably be easily rooted.

XIX. WI'GHTIA (named after Richard Wight, F.L.S. of the East India Company's Medical Service; lately in charge of the botanical establishment at Madras.) Wall. pl. rar. asiat. 1. p. 71. t. 81.

Lin. syst. *Didynàmia, Angiospérma.* Calyx 4-toothed. Corolla funnel-shaped; limb 4-cleft; upper segment 2-lobed. Stamens 4, didynamous, without any hypogynous disk, or sterile filament. Stigma clavate, undivided. Capsule follicular, 2-valved; dissepiment parallel with the valves, placentiferous on both sides, at length free. Seeds imbricated lengthwise, winged at both ends. Radicle inferior.—A large, twining shrub. Leaves opposite, simple, and are, as well as the peduncles, covered with minute, stellate, deciduous down. Racemes large, axillary; peduncles dichotomous. This genus differs from all other Bignoniaceous plants, in the complete absence of a hypogynous disk, and sterile filament; and in the margins of the valves being bent inwards, so much so as to form the dissepiment; in the seeds being erect; and in the radicle being inferior.

1 W. gigante'a (Wall. l. c.) ♄. ⏑. S. Native of Nipaul, on Sheopore and Sumbunah. Flowers rose-coloured, scentless, an inch long.

Giant Wightia. Shrub cl.

Cult. For culture and propagation see *Bignònia,* p. 222.

XX. CATA'LPA (the Indian name of the first species.) Juss. gen. 138. ed. Usteri, p. 155. Spreng. gen. 1. p. 24. Sims, bot. mag. 1094. Schkuhr. handb. t. 175.—Bignonia species, Lin. and others.

Lin. syst. *Diándria, Monogy'nia.* Calyx 2-parted. Corolla campanulate, with a ventricose tube, and an unequal, 4-lobed limb. Stamens 5, 2 of which are fertile, and the other 3 sterile. Stigma bilamellate. Capsule silique-formed, long, cylindrical, 2-valved; dissepiment opposite the valves. Seeds membranously margined, and pappose at base and apex.—Trees with simple leaves, opposite, or disposed 3 in a whorl. Flowers terminal, panicled.

1 C. syringæfòlia (Sims, bot. mag. 1094.) leaves cordate, flat, 3 in a whorl. ♄. H. Native of North America, on the banks of the Ohio, Mississippi, and Delaware, &c. in gravelly soil; it is found in considerable quantities in the forests of Wabash, Illinois territory, where the wood is even split for palings. Schkuhr, handb. t. 175. Bignònia Catálpa, Lin. spec. 868. Willd. spec. 3. p. 289. Wangh. amer. p. 58. t. 20. f. 45. Catálpa bignonioìdes, Walt. fl. car. p. 64. Catálpa cordifòlia, Nutt. gen. amer. 1. p. 10.—Duham. arb. 1. p. 104. t. 41.—Catesb. car. 1. p. 49. t. 29.—Schmidt, arb. 1. t. 14. Lin. hort. cliff. 317. Branches strong. Leaves large, deciduous. Panicles large, branchy, terminal. Corollas white, speckled with purple and yellow. This tree has a good effect when it stands in the middle of large openings, where it can freely send forth its side branches, and show itself to advantage; but it always requires a sheltered situation. The leaves, however, come out very late. The branches dye wool a kind of cinnamon colour. This tree appears to have been introduced by the aborigines, hence its name of Catawba, derived from the Indians residing on Catawba river.

Syringa-leaved Catalpa. Fl. July, Aug. Clt. 1726. Tree 20 to 40 feet.

2 C. ova'ta; leaves ovate-cordate, 3 in a whorl. ♄. H. Native of Japan and China. Bignònia Catálpa, Thunb. fl. jap. 251. Kawara Fisagi Kæmpf. amœn. 841. t. 842. *Kakusju* is the Japanese name of the tree. Thunberg remarks, that the Japanese lay the leaves on parts of the body affected with pain, supposing them to be beneficial to the nerves; and that a decoction of the pods is esteemed serviceable in asthma.

Ovate-leaved Catalpa. Tree.

3 C. longíssima (Juss. gen. ed. Usteri, p. 155.) leaves oblong, or ovate-lanceolate, acuminated, 3 in a whorl, undulated. ♄. S. Native of the West Indies. Bignònia longíssima, Swartz. prod. 91. fl. ind. occ. 2. p. 1037. Ait. hort. kew. 2. p. 347. B. longisíliqua, Jacq. amer. 182. t. 176. f. 78. Bignònia Quércus, Lam. dict. 1. p. 412.—Plum. spec. 5. icon. 57. Corolla whitish, undulately crenulated; upper segment emarginate. Capsule very long and slender. Seeds woolly.

Very-long-capsuled Catalpa. Clt. 1777. Tree 30 to 40 feet.

4 C. cassinoìdes (Spreng. syst. 1. p. 70.) leaves opposite, ovate or elliptic, coriaceous, glabrous; racemes terminal, few-flowered. ♄. S. Native of Brazil, near Rio Janeiro. Bignònia cassinoìdes, Vahl. symb. 2. p. 68. Lam. dict. 1. p. 418. Leaves 2 inches long, many-nerved, terminated by a small acumen. Corollas large, 2 inches long, glabrous.

Cassine-like Catalpa. Shrub or tree.

5 C. HIRSU'TA (Spreng. syst. 1. p. 70.) leaves opposite; oblong, attenuated at both ends, hairy; flowers axillary, almost sessile; segments of corolla entire. ♄. S. Native of Brazil.

Hairy Catalpa. Shrub or tree.

6 C. MICROPHY'LLA (Spreng. syst. 1. p. 70.) leaves opposite, obovate, obtuse; peduncles terminal, usually 3-flowered. ♄. S. Native of St. Domingo. Bignònia microphy'lla, Lam. dict. 1. p. 418.—Plum. spec. 5. icon. 55. f. 2. Shrub size of *Prùnus spinòsa*. Leaves sessile. Flowers large, white; limb undulated.

Small-leaved Catalpa. Clt. 1820. Tree 10 to 20 feet.

Cult. The *C. syringæfòlia* is an elegant flowering tree, very proper for large shrubberies. It thrives well in common garden soil; and is generally increased by seed, or slips of the root. For the culture and propagation of the rest of the species, see *Jacarànda*, p. 226.

XXI. SCHREBE'RA (named in honour of J. C. D. Von Schreber, Author of an edition of Linnæus's Genera plantarum, 2 vols. 8vo. 1788, and several other botanical works.) Roxb. cor. 2. t. 101. fl. ind. 1. p. 109.

Lin. syst. *Diándria, Monogýnia.* Calyx tubular, bilabiate; lips nearly equal, emarginate, and sometimes there is a tooth in each fissure, which separates the lips. Corolla salver-shaped, with a cylindrical tube, and a spreading, 5-6-7-cleft border; segments cuneate, and truncate. Stamens 2; anthers oblong, hid within the tube of the corolla. Stigma bifid, acute. Capsule large, pear-shaped, woody, 2-celled, 2-valved, scabrous, opening from the apex; dissepiment parallel with the valves. ? Seeds 4 in each cell, oval, compressed, with a long, membranous wing.—A large timber tree. Leaves opposite, impari-pinnate. Leaflets 7-9 in number, oblique, ovate or cordate, entire, 3-4 inches long. Panicles terminal, thin, trichotomous. Flowers rather small, white and brown, variegated, very fragrant during the night.

1 S. SWEITENIOÌDES (Roxb. l. c.) ♄. S. Native of the East Indies, on the Raja-mundri, Circar, Balaghata mountains, &c. *Mucaadi* is the Telinga name of the tree, and *Mogalinga-marum* of the Tamuls. Trunk erect. Bark scabrous. Branches narrow, spreading in every direction, so as to form a large, beautiful shady head. The wood of this tree is of a grey colour, very close-grained, heavy and durable. It is used for a great variety of purposes, for which it is suitable, being less liable to warp than most other woods.

Mahogany-like Schrebera. Tree large.

Cult. For culture and propagation see *Jacarànda*, p. 226.

Tribe II.

TOURRETIE'Æ (this tribe contains plants agreeing with Tourrètia in important characters.) D. Don, in edinb. phil. journ. 1829. July. Bignoniàceæ, sect. 2. R. Br.

Capsule 1-celled, 2-valved; valves bearing placentas in the middle. Placentas 2, large, fleshy. Seeds horizontal, obovate, imbricate, flattened, surrounded by a wing, which is emarginate at the base.

XXII. TOURRE'TIA (so named by Dombey, after Marc Antoine-Louis Claret la Tourrette, a friend of Rousseau, author of Chloris Lugdunensis, and Botanicæ Scholæ Veterinariæ, Ludg. prælectiones.) Domb. ex Juss. gen. ed. Usteri, p. 155. Juss. gen. 139. Schreb. gen. no. 1009. Lam. ill. 527. —Dombèya, Lher. t. 17.

Lin. syst. *Didynàmia, Angiospérma.* Calyx bilabiate; upper lip, acuminated; lower one broader, four notched. Corolla tubular, contracted in the middle; tube length of calyx; limb unilabiate; upper lip drawn out into a hollow; lower lip wanting, but in place of it there are 2 teeth. Stamens 4, didynamous, lying in the hollow of the upper lip of the corolla. Anthers 2-lobed. Hypogynous disk urceolate. Stigma bifid. Capsule ovate or oblong, ligneo-coriaceous, echinated with hooked spines, 2-celled, 2-valved at apex; dissepiment prismatic, central, seminiferous, continuous with the middle of the valves, rising into a wing on both sides, which divides each cell into 2 parts, hence the capsule appears to be 4-celled. Seeds few, girded by a membranous margin, emarginate, and crenulated at the base.—A climbing herb; with tetragonal, dichotomous branches. Leaves opposite, conjugately ternate; furnished with a branched tendril from the top of the common petiole; and also having a ciliary crown surrounding the stem in the axils of the leaves. Flowers disposed in terminal racemes, each flower furnished with a narrow bractea. Corollas of a dusky violet colour.

1 T. LAPPA'CEA (Willd. spec. 3. p. 263.) ⊙. ◡. H. Native of Peru. Dombèya lappàcea, Lherb. stirp. nov. 1. p. 33 t. 17. Stem fistular. First leaves ternate, having the lateral leaflets bipartite; the rest of the leaves conjugate; ternate or biternate.

Burdock Tourretia. Fl. June, Aug. Clt. 1788. Shrub cl.

Cult. For culture and propagation see *Calámpelis*, p. 232.

XXIII. ECCREMOCA'RPUS (from εκκρεμης, *ekkremes*, pendant; and καρπος, *karpos*, a fruit; fruit pendulous.) Ruiz. et Pav. gen. fl. per. p. 90. t. 18. syst. 157. Humb. et Bonpl. pl. æquin. 1. p. 229. t. 65. H. B. et Kunth, nov. gen. 3. p. 150.

Lin. syst. *Didynàmia, Angiospérma.* Calyx large, membranous, 5-cleft, coloured. Corolla tubular; throat equal; limb 5-lobed, equal. Stamens 4, didynamous, with the rudiment of a fifth sterile one; anthers linear, inserted by the middle, versatile; cells parallel, almost connate. Stigma 2-lobed. Capsule ovate, somewhat tetragonal, 1-celled, 2-valved; placentas 2, large, fleshy, adnate to the middle of the valves. Seeds imbricate, horizontal, surrounded by a membranous wing.—Scandent sub-shrubs. Leaves opposite, abruptly bi-tripinnate, terminated by a branched tendril. Peduncles opposite the leaves, many-flowered. Corollas green or yellow.

1 E. LONGIFLÒRUS (Humb. et Bonpl. pl. æquin. 1. p. 229. t. 65. Kunth. nov. gen. 3. p. 150.) leaves abruptly tripinnate; leaflets oval, entire, rarely bifid or trifid. ♄. ◡. G. Native of Peru, in forests, near the mount Saraguru. Stem furrowed, glabrous at bottom, but clothed with rusty tomentum at the nodi above. Leaflets sessile. Peduncles pendulous, 3-4-flowered. Calyx campanulate, 5-cleft, loose, red. Corolla a little arched, 3-4 times longer than the calyx, yellow, with a green limb. Capsule slightly tetragonal.

Long-flowered Eccremocarpus. Fl. July, Aug. Clt. 1825. Shrub cl.

2 E. VÍRIDIS (Ruiz. et Pav. fl. per. syst. p. 157.) leaves bipinnate, with 2 pairs of pinnæ; leaflets ovate, quite entire. ♄. ◡. G. Native of Peru, in forests. Calyx tubular, membranous, 5-cleft. Capsule pedicellate. Corolla green.

Green-flowered Eccremocarpus. Shrub cl.

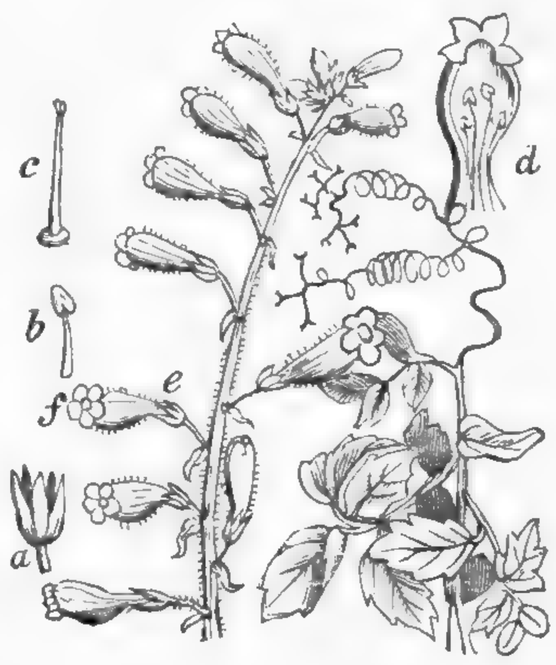
Cult. The species of this genus are extremely handsome when in blossom. They should be treated in the same manner as recommended for the species of *Calámpelis*.

XXIV. CALA'MPELIS (from καλος, *kalos*, beautiful; and αμπελις, *ampelis*, a vine.) D. Don, in edinb. phil. journ. July 1829. Sweet, fl. gard. n. s. t. 13.—Eccremocarpus species, Ruiz, et Pav.

Lin. syst. *Didynàmia, Angiospérma.* Calyx campanulate, half 5-cleft (f. 22. *a.*). Corolla with a ventricose throat, a tubular base (f. 22. *e.*), and a contracted, 5-lobed mouth (f. 22. *f.*). Stamens 4, didynamous (f. 22. *d.*), without any rudiment of a sterile one; anthers bipartite (f. 22. *b.*); lobes obtuse, divari-

cate, distinct at apex. Stigma bipartite (f. 22. *c.*), hispid at top. Capsule 1-celled, 2-valved; valves placentiferous in the middle. Placentas 2, large, fleshy. Seeds obovate, horizontal, imbricate, flattened, surrounded by a broad, repandly sinuated wing, which is emarginate at the base; outer testa black, crustaceous, wrinkled, and a little scrobiculate.—A suffruticose, scandent plant. Leaves opposite, petiolate, abruptly bipinnate, terminated by a spiral, compound tendril. Leaflets coarsely serrated. Flowers racemose, secund. Racemes opposite the leaves, pedunculate, secund, many-flowered. Calyx short, green. Corolla scarlet, or deep orange red. Capsule large, muricated.

FIG. 22.



1 C. sca'ber (Sweet, fl. gard. n. s. t. 30.) ♄. ◡. G. Native of Chili. Eccremocárpus scàber, Ruiz. et Pav. syst. fl. per. 157. Lindl. bot. reg. 939. Leaves with 2 pairs of pinnæ; leaflets alternate, obliquely cordate, ovate, serrated or entire. Stems angular, thickly clothed with short, stiff, pellucid hairs, when young, but afterwards smooth. Leaves, racemes, and corollas clothed with glandular hairs.

Scabrous Calampelis. Fl. July, Aug. Clt. 1824. Shrub climbing.

Cult. This beautiful, climbing plant is generally raised from seeds in spring, in a hot bed; and when the plants are of sufficient size, they are planted singly in separate pots. They answer well to be trained in a conservatory; or to be planted out in the open ground, against a wall or house, with a south exposure, along with *Cobæ'a scándens*, where, if the summer prove warm, it will make a showy appearance.

Tribe III.

CRESCENTIE'Æ (the plants contained in this section agree with *Crescéntia*, in having a large, baccate fruit.) Fruit a large melon or gourd-shaped, 1-celled berry; with a corticate, solid rind; filled with pulp and seeds inside.

XXV. CRESCE'NTIA (named by Linnæus after Pietro Crescentio, an Italian writer on agriculture, in the thirteenth century.) Lin. gen. 762. Schreb. gen. no. 1021. Juss. gen. 127. edit. Uster. p. 142. Gærtn. fruct. suppl. 1. p. 229. t. 223. H. B. et Kunth, nov. gen. 3. p. 157.—Cujète, Plum. gen. p. 23. t. 16. icon. 109.

Lin. syst. *Didynàmia*, *Angiospérma*. Calyx bipartite, equal, deciduous. Corolla large, sub-campanulate; tube very short; throat large, ventricose, incurved; limb erect, 5-cleft, unequal; lobes toothed or curled. Stamens 4, didynamous; with the rudiment of a fifth; anthers 2-lobed. Stigma bilamellate. Berry large, form of a gourd, 1-celled, pulpy inside; rind solid. Seeds nestling in the pulp.—Large, spreading trees. Leaves alternate, solitary or in fascicles, simple, ternate or pinnate. Flowers solitary, rising from the trunk or branches.

1 C. Cuje'te (Lin. spec. 873. Jacq. amer. 175. t. 111. ed pict. p. 86. t. 167.) leaves oblong, acute or obtuse, cuneate at the base, in fascicles. ♄. S. Native throughout equinoxial America.—Plum. gen. 23. t. 109.—Comm. hort. 1. p. 137. t. 71. Branches horizontal. Flowers scattered over the older branches, and even in the trunk itself, solitary, pedicellate, sometimes all green, but most often variegated with green, purple, red, and yellow; they do not wither, but become putrid, and in that state exhale a nauseous and intolerable smell. The form and size of the fruit are variable; from spherical to bottle-shaped, and from 2 inches to a foot in diameter. These, however, if they are no more than varieties, are very constant. The fruit is covered with a thin skin, of a greenish yellow colour when ripe; under this is a hard, thin, woody shell, inclosing a pale yellowish soft pulp, of a tart, unsavoury flavour, surrounding a great number of flat seeds. These shells, cleansed of their pulp, and deprived of their outer skin, and dried, are used by the inhabitants of tropical America, for drinking cups; those of the long, small-fruited kind, are formed into spoons and ladles; those which are round are cut through the middle, and used as cups for chocolate and cacao: in short, these shells are converted into a variety of domestic furniture. They are frequently large enough to hold a gallon of fluid; they serve to boil water in, as they bear the fire well. The thicker parts are frequently used as button moulds in the West Indies. The Caribs engrave the outside with a number of grotesque figures, which they sometimes colour black or red. The pulp is sometimes eaten by the negroes, but is not looked upon as being either agreeable or wholesome; it is, however, much used by way of poultice; and a syrup made of it is in much request among the natives, in disorders of the breast, in contusions and inward bruises. The wood being very tough and flexible, is very fit for the coach-maker, and is frequently used for making saddles, stools, and other furniture. The leaves and branches are eaten by cattle, in times of scarcity, as is also the pulp of the fruit. The tree is called *Tutuma* in some parts of America.

Var. β; leaves narrow; fruit smaller, globose or ovate. Plum. gen. 23.

Var. γ, *Cujete mînima*, *fructu duro*. Plum. gen. 23. The smallest Calabash tree, with a hard fruit.

Cujete or Common Calabash Tree. Fl. ? Clt. 1690. Tree 20 to 30 feet.

2 C. cucurbitìna (Lin. syst. p. 565. mant. 250. Swartz, obs. 234.) leaves ovate, rather coriaceous, solitary; fruit ovate, acuminated. ♄. S. Native of Jamaica, in dry rocky places; and about Campeachy. C. latifòlia, Mill. dict. no. 2. C. Cujète, var. δ, Lin. spec. 873.—Plum. gen. 23. icon. 109.—Brown, jam. 266.—Pluk. alm. 124. t. 171. f. 2.—Sloan, jam. 206. hist. 2. p. 172. Branches erect. Pedicels 2-5, terminating, one-flowered, shorter than the leaves. Corollas size of those of the preceding, dusky; the base of the tube and throat is white. The fruit varies in size; the shell is so thin as to be unfit for any purpose; the seeds are also much thinner; and the pulp is deeper yellow than that of the preceding.

Gourd-like Calabash-tree. Fl. ? Clt. 1733. Tree 20 feet.

3 C. acumina'ta (H. B. et Kunth, nov. gen. amer. 3. p. 157.) leaves oblong-lanceolate, acuminated, cuneately narrowed at the base, in fascicles. ♄. S. Native of the Island of Cuba, near Havannah and Los Guines. Branches elongated, white. Flowers size of those of the two preceding. Fruit globose, 3-4 inches in diameter. It differs from *C. Cujète* in the leaves being narrower, acuminated, and less firm.

Acuminated-leaved Calabash tree. Clt. 1822. Tree.

4 C. aculea'ta (H. B. et Kunth, l. c. p. 158.) branches prickly; leaves ternate or simple, twin; common petiole furnished with a narrow wing above. ♄. S. Native of Mexico, near Campeachy.—Hern. mex. 290. Branches terete, warted. Leaves ovate-oblong, obtuse, running into the petioles at the base. Prickles nearly opposite, subulate at top, and thickened at the base. Flowers solitary or twin on the tops of the branches. Corolla as in the genus, greenish. Fruit oblong, ribbed.

Prickly Calabash tree. Tree.

5 C. ala'ta (H. B. et Kunth, l. c. p. 158.) unarmed; leaves 3 together, all ternate; or the middle one of the three is ternate, and the lateral ones simple; common petioles broadly winged. ♄. S. Native of Mexico, in very hot places, near Acapulco. There are prickle-formed tubercles, which rise from the same point as the leaves. Leaves 3, from the axil of each tubercle; middle leaf ternate, on a long petiole; lateral ones simple, smaller, and sessile. Simple leaves obovate-oblong, obtuse; leaflets of the ternate ones oblong, obtuse, acutish at the base. Flowers scattered, size of those of *Cobæ'a scándens*, on short pedicels, pale red, reticulately veined. Fruit globose, 4-6 inches in diameter, ex Bonpl.

Winged-petioled Calabash tree. Tree 20 to 30 feet.

Cult. The species of *Crescéntia* grow well in a mixture of loam, peat, and sand; and ripened cuttings will strike root in sand, under a hand-glass, in heat. The trees require to be so large before they come to a flowering state, that it is not likely they will ever be brought to blossom in this country.

XXVI. TANÆ'CIUM (from ταναηκης, *tanaekes*, long; stems elongated.) Schreb. gen. no. 1022, and p. 834. Swartz. prod. p. 91. fl. ind. occ. 2. p. 1049. Crescéntia species of authors. Tripinnària species, Spreng. gen. 2. p. 506.

Lin. syst. *Didynàmia, Angiospérma.* Calyx tubular, truncate, entire. Corolla with a long, cylindrical tube, a wide throat, and an erectly spreading, 5-cleft, nearly equal limb; the 2 upper segments approximating, less divided, nearly upright; the 3 lower spreading, a little reflexed. Stamens 4, nearly equal in length, with the rudiment of a fifth; anthers 2-lobed. Stigma 2-lobed. Berry large, pedicellate, globular or oblong, 2-celled. Seeds oblong, angular, nestling in the pulp.—Climbing shrubs, natives of Brazil. Leaves alternate, simple, or binate, ternate, glabrous.

1 T. parisíticum (Swartz, prod. 92. fl. ind. occ. 2. p. 1053.) leaves ovate, coriaceous; stem climbing, shrubby, radicant. ♄. ◡. S. Native of Jamaica and Caraccas. Jacq. hort. schœnbr. 1. p. 61. t. 115.—Brown, jam. 262. Leaves shining. This plant sustains itself by the help of the neighbouring trees, or is found spreading on the ground, if it does not meet with support.

Parasitical Tanæcium. Fl.? Clt.? Shrub climbing.

2 T. Jaròba (Swartz, prod. 92. fl. ind. occ. 2. p. 1050.) lower leaves ternate: superior ones twin; tendrils from the tops of the petioles, between the leaflets; stem scandent. ♄. ◡. S. Native of Jamaica, most common between St. Elizabeth's and Westmoreland.—Brown, jam. 267.—Sloan. jam. 207. hist. 2. p. 173.—Jaròba Marcg. bras. 25. Pis. bras. 173. Flowers white. This species climbs to the tops of the loftiest trees, and along their tops.

Jaroba Tanæcium. Shrub cl.

Cult. For culture and propagation see *Bignònia*, p. 222.

XXVII. TRIPINNA'RIA (so named, from the leaves of one of the species being tripinnate.) Spreng. gen. 2. p. 506. Tripínnia, Lour. coch. 391.

Lin. syst. *Didynàmia, Angiospérma.* Calyx unequally 5-cleft, or 5 crenate, campanulate, or cup-shaped. Corolla funnel-shaped, or sub-campanulate, with a widened throat, and a 5-cleft spreading limb; segments ovate, undulated, villous, upper ones the largest. Stamens 4, didynamous, about equal in length to the corolla, with the rudiment of a fifth. Stigma bifid, acute or bilamellate. Berry large, fleshy, 1-celled, filled with pulp. Seeds oblong, compressed, nestling in the pulp.—Large trees, with pinnate or tripinnate, alternate leaves. Flowers racemose, terminal.

1 T. Asia'tica (Spreng. syst. 2. p. 842.) leaves tripinnate, acuminated; racemes terminal. ♄. G. Native of Cochinchina, in woods on the mountains. Tripínna tripinnària, Lour. coch. p. 391. A large tree, with spreading branches. Leaves glabrous. Flowers yellowish, disposed in terminal, corymbose racemes.

Asiatic Tripinnaria. Tree large.

2 T.? Africa'na (Spreng. syst. 2. p. 842.) leaves pinnate; leaflets oblong, serrated; flowers lateral from the trunk. ♄. S. Native of Mozambique. Crescéntia pinnàta, Jacq. coll. 3. p. 203. t. 18. Tanæ'cium pinnàtum, Willd. spec. 3. p. 312. A large tree. Calyx unequally 5-cleft. Corolla funnel-shaped, purple inside; having the tube dilated above; segments of the limb ovate, acute. Stamens 4, didynamous, with the rudiment of a fifth. Berry size of a man's head.

African Tripinnaria. Clt. 1824. Tree large.

Cult. For culture and propagation see *Crescéntia*, above.

Order CLIX. PEDALI'NEÆ (this order contains plants agreeing with the genus *Pedàlium* in important characters.) R. Br. prod. p. 519.—Sesàmeæ, Kunth, syn. 2. p. 251. Martyniàceæ, Link. handb. 1. p. 504.

Calyx divided into 5 nearly equal parts (f. 23. *a.*). Corolla monopetalous, hypogynous, irregular, having the throat ventricose, and the limb bilabiate. Stamens 4, didynamous, inclosed; with the rudiment of a fifth (f. 23. *b.*). Ovarium girded by a glandular disk at bottom, of many spurious, 1-2-seeded cells. Style simple; stigma undivided. Fruit drupaceous, dry, usually muricated (f. 23. *c.*), with several cells formed by the splitting of 2 placentas, and the divergence of their lobes as in the ovarium. Seeds pendulous, erect or horizontal, with a papery testa. Albumen none. Embryo straight.—Herbaceous plants; with opposite leaves; and axillary, bibracteate flowers.

This order differs from *Bignoniàcea*, in the seeds being usually definite and wingless; in the woody, parietal-lobed placentas, which spread and divide variously inside the pericarpum, so as to produce a 4-8-celled fruit, out of a 1-celled ovarium.

The leaves of *Sésamum* are emollient; its seeds contain an abundance of fixed oil, as tasteless as that of olive oil, for which it might be substituted, and which is expressed in Ægypt in great quantities. The fresh leaf of *Pedàlium mùrex*, when agitated in water, renders it mucilaginous, in which state it is prescribed by the Indian doctors, in cases of dysuria, &c.

Synopsis of the genera.

1 Se'samum. Capsule oblong, compressed, tetragonal, 4-celled, 2-valved; dissepiment contrary to the valves, bipartite. Seeds numerous, imbricated in one row in each cell.

2 Marty'nia. Drupe oblong, bicornute at apex, the anterior horn sulcately-toothed, containing a 4-celled nut; cells few-seeded.

3 Craniola'ria. Drupe ovate, containing a 4-celled, woody nut, which is furnished with 2 short horns at apex. Seeds 4 in each cell, but often solitary.

4 Josephínia. Lobes of stigma bifid. Drupes prickly, containing a 4-8-celled nut; cells 1-seeded. Seeds erect.

5 Peda'lium. Drupe ovate, 4-cornered (f. 23. *c.*), the corners furnished each with a thorn towards the base (f. 23. *d. c.*), containing a 2-celled, 4-winged, corky nut. Seeds pendulous, 2 in each cell.

I. SE'SAMUM (from Σησαμον, *Sesamon*, of Theophrastus and Dioscorides; from Sempsen, the Ægyptian name of one of the species.) Lin. gen. no. 782. Schreb. gen. no. 1048. Gærtn. fruct. 2. p. 132. t. 110. Juss. gen. 138. Lam. ill. t. 528. —Digitàlis species, Tourn.

LIN. SYST. *Didynàmia, Angiospérma.* Calyx 5-parted; the upper segment the smallest. Corolla with a short tube, and a campanulate throat; limb quinquefid, somewhat bilabiate; the lower segment the longest. Stamens 4, didynamous, inclosed, with the rudiment of a fifth sterile one. Stigma bilamellate. Capsule oblong, compressedly tetragonal, 4-celled, 2-valved; dissepiment contrary to the valves, bipartible. Seeds numerous, disposed in one series, somewhat imbricated, ovate, a little compressed, wingless, erect.—Annual herbs, with opposite and alternate leaves. Flowers axillary, solitary. Peduncles biglandular; glands bracteate. Corollas white, pale red or yellow.

1 S. I'NDICUM (Lin. spec. 884.) downy; lower leaves ovate, 3-lobed: superior ones lanceolate, undivided; stem erect, branched. ⊙. S. Native of the East Indies, common. Sims, bot. mag. 1788. S. trifoliàtum, Mill. dict. no. 3.—Rumph. amb. 5. t. 204. t. 76. f. 1.—Pluk. phyt. t. 109. f. 4. Stem scabrous. Leaves on long petioles, downy on both surfaces, glaucous beneath. Flowers white, tinged with red. In the plant found by Martius in Brazil, the rudiment of a fifth filament is wanting. This species was first introduced to Jamaica by the Jews, and is now cultivated in the West Indies. It is called *Vanglo*, or oil plant. The seeds are frequently used in broth, by many of the Europeans; but the Jews make them chiefly into cakes. Many of the Oriental nations look upon the seeds as a very wholesome food, and express an oil from them, not unlike, or inferior to, the oil of almonds. A decoction of the leaves and buds, is looked upon as a good resolutive, and frequently ordered in inflammations of the eyes, where warm fomentations become requisite.

Var. β, ròsea (Blum. bijdr. 778.) flowers rose-coloured. ⊙. H. Native of Java, on the mountains.

Indian Oily-grain, or Oil-seed. Fl. July. Clt. 1731. Pl. 1½ to 2 feet.

2 S. ORIENTA'LE (Lin. spec. 883.) leaves ovate-oblong, entire. ⊙. S. Native of the East Indies, and is now cultivated in South America. Lin. hort. cliff. 318. fl. zeyl. 318. Willd. spec. 3. p. 358. Gærtn. fruct. 2. p. 132. t. 110. Thunb. jap. 254. Lour. coch. 382. S. véterum, Bauh. pin. 27. Riv. mon. t. 114.—Burm. zeyl. 87. t. 38. f. 1. Schit-elu, Rheed. mal. 9. p. 105. t. 54. Corolla dirty white, or pale red. Plant rather hairy. This species is frequently cultivated in the Levant, and also in Africa, as a pulse; the seeds have been introduced into Carolina, by the African negroes. An oil is expressed from them, which will keep many years, without acquiring any rancid smell or taste, but in two years becomes quite mild, so that, when the warm taste of the seed which is in the oil when first drawn is worn off, it is used as a salad oil, and for all the purposes of sweet oil. They are also used by the negroes for food; they parch them over the fire, then mix them with water, and stew other ingredients with them. A pudding is made from them in the same manner as from millet or rice, called *Benny*, or *Bonny*, in Carolina. In Japan, where they have no butter, they use the oil for frying fish, and in dressing other dishes; as a varnish; and medicinally, as a resolvent and emollient. In China and Cochinchina, they are used for the same purposes.

Eastern Oily-grain, or Oil-seed. Fl. July. Clt. 1731. Pl. 1½ to 2 feet.

3 S. LU'TEUM (Retz. obs. 6. p. 31. no. 56.) leaves lanceolate, on long petioles; corollas hispid on the outside. ⊙. S. Native of the East Indies, in forests, at Nidrapur. Stem a little branched. Leaves alternate, having the margins and nerves beneath scattered with short hairs. Calyx and capsule hispid. Corolla deep yellow.

Yellow-flowered Oil-seed. Pl. 1 to 2 feet.

4 S. RADIA'TUM (Schum. pl. guin. p. 274.) hairy; leaves usually 3 in a whorl, on short petioles: lower ones roundish-ovate, deeply toothed: upper ones ovate-oblong, quite entire; bracteas setaceous, solitary. ⊙. S. Native of Guinea. Stem slightly tetragonal. Flowers purple.

Radiate Oil-seed. Pl. 4 feet.

5 S. LACINIA'TUM (Klein, Willd. spec. 2. p. 359.) leaves all bipartite and jagged; stem prostrate, hispid. ⊙. S. Native of the East Indies, near Hydrabad. Branches ascending at top. Leaves on short petioles, scabrous on both surfaces. Margins of the teeth of the calyx hispid. Capsule obtuse at both ends. Sésamum prostràtum, Retz. obs. 4. p. 28, is a very doubtful plant, or probably a synonyme of *Torènia Asiática.*

Jagged-leaved Indian Oil-seed. Pl. prostrate.

Cult. The species of *Sésamum* are grown in our gardens only as botanical curiosities. The seeds of them require to be reared on a hot-bed frame in early spring, and otherwise treated like other tender annuals, by planting them out in the open border, in a warm, sheltered situation, about the end of May.

II. MARTY'NIA (so named by Houston, in honour of John Martyn, F.R.S., professor of botany at Cambridge; author of Historia Plantarum variarum, and several other works; editor of Virgil's Georgics and Eclogues, born Sept. 1699, died 1768.) Houston, rel. t. 10. Lin. gen. no. 753. Schreb. gen. no. 1010. Mart. t. 42. Juss. gen. 140. ed. Usteri, 156. Gærtn. fruct. 2. p. 131. t. 110. Glox. obs. t. 1-2.—Proboscídea, Juss. Schmidel. icon. t. 12.

LIN. SYST. *Didynàmia, Angiospérma.* Calyx 5-cleft, nearly equal, bracteate at the base. Corolla sub-campanulate; limb 5-lobed, unequal. Stamens 4, didynamous, 2 of them sometimes sterile, with always the rudiment of a fifth. Stigma bilamellate. Drupe or capsule oblong, bicornute at apex; the anterior horn sulcately toothed, containing a 4-celled, woody nut; cells few-seeded. Seeds ovate, a little compressed, wingless, pendulous.? Radicle superior.—Herbs with opposite, rarely alternate leaves. Flowers spicate, axillary and terminal.

1 M. A'NNUA (Lin. syst. 559. spec. 862. Swartz, obs. 230.) stem branched; leaves alternate, lobed, cordate at the base; stamens 4, all fertile. ⊙. H. Native of Mexico, in high plains; and on the banks of the Mississippi. Sabb. hort. t. 91. Gærtn. fruct. 2. p. 131. t. 110. M. proboscídea, Glox. in obs. p. 14. Ait. hort. kew. 2. p. 339. Mill. dict. t. 286. Sims, bot. mag. 1056. M. alternifòlia, Lam. dict. 2. p. 112. Proboscídea Jussièuii, Schmidt, icon. 49. t. 12-13. Med. boh. beob. 1783. p. 20. M. Louisiàna, Mill. dict. no. 3. This is a large annual, villous, viscid plant. Corollas with a yellowish white tube, variegated with green, yellow, and violet spots and lines; limb wide, pale violet, marked with saffron-coloured and violet dots and lines. The lobes of stigma close when touched, according to Turra.

Var. β, tríloba; leaves oblong-deltoid, irregularly cordate at the base, 3-lobed: middle lobe long, sinuated, undulated, and finely denticulated. ⊙. H. Native near Vera Cruz. M. tríloba, Cham. et Schlecht. in Linnæa, 5. p. 121. Smaller than the species.

Annual Martynia. Fl. July, Aug. Clt. 1738. Pl. 1 to 2 feet.

2 M. LONGIFLÒRA (Lin. syst. p. 559.) stem simple; leaves opposite, roundish, repand; flowers axillary, solitary, on short pedicels; tube of corolla gibbously flattened at the base; stamens 4, all fertile. ⊙. G. Native of the Cape of Good Hope. Ait. hort. kew. 2. p. 339. Meerb. icon. 7. Willd. spec. 3. p.

265. Martýnia Capénsis, Glox. obs. p. 13. Stem erect, scabrous. Leaves 3-nerved. In place of bracteas at the base of the peduncles, there is a pedicellate gland. Tube of corolla very long. Corollas purplish.

Long-flowered Martynia. Fl. July, Aug. Clt. 1781. Pl. 2 feet.

3 M. dia'ndra (Glox. obs. p. 14. t. 1. Jacq. schœnbr. 3. p. 21. t. 289.) stem branched; leaves opposite, lobed, cordate at the base; stamens 4, 2 of them sterile. ⊙. G. Native of Mexico, at Vera Cruz; and near Campeche. Andr. bot. rep. 575. M. angulòsa, Lam. dict. 2. p. 112. Martýnia reliq. Houst. p. 5. t. 10. M. ánnua, Lin. spec. ed. 1. syst. ed. 10.—Martyn. cent. 42. t. 42. Erhert. pict. t. 1. f. 5. phil. trans. 38. no. 427. p. 3. Stem reddish. Leaves villous and viscid. Flowers thyrsoid, in the forks of the stem, drooping. Corolla with a white tube, tinged with purple, and spotted with red and yellow; limb pale red, with a shining purple spot at each segment: upper lip reflexed.

Diandrous Martynia. Fl. July, Aug. Clt. 1731. Pl. 2 feet.

4 M. lu'tea (Lindl. bot. reg. t. 934.) stem branched, clothed with glandular down; leaves opposite, cordate-orbicular, toothed, clothed with glandular down; beaks much longer than the pericarp. ⊙. H. Native of Brazil. Calyx involucrated by 2 bracteas. Corolla large, funnel-shaped, orange-yellow, clothed with blood-colour inside.

Yellow-flowered Martynia. Fl. Aug. Clt. 1825. Pl. 1 to 2 feet.

5 M. Zanqueba'rica (Lour. coch. 386.) stem procumbent; leaves pinnatifid, pilose; flowers axillary, solitary; beaks of capsule secund. ♄. S. Native of Zanzibar. Leaves petiolate, pilose. Flowers pale purple. Calyx pilose, with lanceolate, nearly equal, deciduous, expanded segments. Corolla ringent, with a large, roundish, gibbous tube, and a short limb; upper lip trifid, obtuse, the middle segment emarginate; the lower lip ovate, longer, entire. Fruit bisulcate on both sides, 4-beaked, 4-celled, 1-seeded, 2-valved.

Zanzibar Martynia. Shrub procumbent.

Cult. The seeds of the species should be reared on a hot-bed, as other tender annuals; and when transplanted into other pots, they should be kept in the hot-house or green-house until the seed is ripened. A light rich soil suits them best.

III. CRANIOLA'RIA (from *κρανιον, kranion*, a skull; some resemblance in capsule.) Lin. gen. no. 868. Juss. gen. ed. Usteri, p. 156. H. B. et Kunth, nov. gen. amer. 3. p. 153.—Martýnia species of authors.

Lin. syst. *Didynàmia, Angiospérma.* Calyx campanulate, spath-formed, 5-toothed, cleft on one side, bracteate at the base. Corolla funnel-shaped, with a very long tube, a campanulate throat, and a bilabiate limb; upper lip bifid; lower one trifid: the middle lobe the broadest. Stamens 4, didynamous, with the rudiment of a fifth. Stigma bilamellate. Drupe ovate, acute, containing a 4-celled, woody nut, which is furnished with 2 short horns at apex. Seeds 4 in each cell, or often solitary, ovate, a little compressed, wingless.—Villous, clammy herbs. Leaves opposite, 5-lobed. Flowers racemose from the forks of the branches, or axils of the leaves, or tops of the branches. Corollas white, with a painted throat.

1 C. a'nnua (Lin. mant. 417. syst. 417. Jacq. amer. 173. t. 110. Nees, et Mart. in act. bonn. 11. p. 68.) stems annual, branched; leaves cordate, palmate, toothed; tube of corolla longer than the calyx, which is bibracteate. ⊙. G. Native of the tropical parts of America. Martýnia craniolària, Swartz, obs. 230. Glox. obs. p. 14. Willd. spec. 3. p. 262. Martýnia spathàcea, Lam. dict. 2. p. 212.—Erhr. pict. t. 1. f. 2. Corolla white. The natives of Venezuela prepare from the dried roots of this plant a bitter and cooling drink.

Annual Craniolaria. Fl. July, Aug. Clt. 1733. Pl. 1 to 2 feet.

2 C. unibractea'ta (Nees, in Mart. nov. act. bonn. 11. p. 67.) stem perennial, branched; leaves cordate, rather angular, toothed; tube of corolla length of calyx, which is unibracteate. ♃. S. Native of Brazil, about Cachuera, and at Rio das Contas. Holorégmia víscida, Mart. in bot. zeit. 1821. 1. p. 300. bras. reise. 2. band. p. 239 and 344. Martýnia spathàcea, Spreng. syst. add. p. 338. Leaves a hand broad. Flowers disposed in long, simple racemes from the tops of the branches. Corolla pale sulphur-coloured, having the bottom painted with purple dots. Plant canescent.

Unibracteate Craniolaria. Pl. 4 to 5 feet.

Cult. The seeds and plants of *C. ánnua* should be treated in the same manner as those of the species of *Martýnia. Cran. unibracteàta* should be treated like other common perennial stove plants; and it may either be increased by seeds or cuttings.

IV. JOSEPHI'NIA (named in honour of the Empress Josephine, a great patron of botany and gardening.) Vent. malm. p. 67. t. 67. R. Br. prod. p. 520. Blum. bijdr. 779.

Lin. syst. *Didynàmia, Angiospérma.* Calyx 5-parted, equal. Corolla with a short tube, a large campanulate throat, and a 5-lobed, spreading, bilabiate limb; upper lip semi-bifid; lower one trifid: the middle segment the longest. Stamens 4, didynamous, with the rudiment of a fifth; anthers free. Stigma bifid; the segments emarginate, or semi-bifid; therefore the stigma is commonly called 4-cleft. Drupe dry, prickly, falsely 4-8-celled, opening at top, by 2-4 holes; cells 1-seeded; seeds erect. Radicle anterior.—Diffuse herbs. Leaves opposite, entire. Peduncles axillary. Flowers purplish.

1 J. Imperatrìcis (Vent. malm. p. 67. t. 67. mem. de l'inst. sc. phys. 1806. 1. sem. p. 71.) ovarium 4-5-celled; leaves lanceolate-elliptic, acute, downy beneath, as well as the stem; calyx equal. ♂. G. Native of New Holland, on the west coast. Baudin. Leaves ovate-cordate, ex Vent. Flowers pale pink, dotted, like those of *Catálpa syringæfòlia*, ex Vent.

Empress's Josephinia. Fl.? Clt.? Pl. 2 to 3 feet.

2 J. grandiflòra (R. Br. prod. p. 520.) ovarium 8-celled; leaves lanceolate, acuminated, downy beneath; stem glabrous; upper segment of calyx one half shorter than the rest; lower segment of corolla more than twice the length of the rest. ♂. S. Native of New Holland, within the tropic. Flowers purplish.

Great-flowered Josephinia. Shrub?

3 J. Cele'bica (Blum. bijdr. 779.) ovarium 8-celled; leaves oblong-lanceolate, downy; peduncles shorter than the petioles; drupes tomentose; calyx equal. ♄. S. Native of the Celebes, in woods.

Celebes Josephinia. Fl. Aug. Sept. Shrub.

Cult. For culture and propagation, see *Martýnia*, above.

V. PEDA'LIUM (from *πηδαλιον, pedalion*, the rudder of a ship; in reference to the dilated angles of the fruit.) Lin. gen. no. 794. Schreb. gen. no. 1065. Rottb. in coll. hafn. 2. p. 255. Gærtn. fruct. 1. p. 276. t. 58. Juss. gen. 140. ed. Usteri. 156.—Mùrex. Lin. fl. zeyl. 440.

Lin. syst. *Didynàmia, Angiospérma.* Calyx 5-parted (f. 23. *a.*); the upper segment very short; and the lowest longest. Corolla with a 3-cornered tube, a widened campanulate throat, flat beneath, and a 5-lobed, sub-bilabiate limb. Stamens 4, didynamous, with the rudiment of a fifth (f. 23. *b.*); filaments pilose at the base. Anthers twin, cruciate, terminated by a gland. Stigma bifid, revolute. Drupe dry, ovate-conical (f. 23. *c.*), 4-cornered, the corners thorny on the angles (f. 23. *c. d.*), containing a 2-celled, 4-winged, corky nut; cells 2-seeded; seeds pendulous, arillate, one above the other: there is an empty cell

below the fertile ones.—A trichotomous herb, with the habit of *Martýnia*. Leaves opposite. Flowers axillary, solitary. Fruit like those of *Tràpa*.

1 P. mu'rex (Lin. spec. 892.) ⊙. S. Native of the East Indies, Ceylon, Malabar, Coromandel, &c. near the sea. Lam. ill. t. 538. Mùrex, Lin. fl. zeyl. 440. Burm. ind. 139. t. 45. f. 2.—Herm. zeyl. p. 42. Cucu-Mullu, or Kakii-tali, Rheed. mal. 10. p. 143. t. 72. A pretty large, succulent, branched plant. Root deep orange-coloured, branched. Stem hardly any. Branches 1-2 feet. Leaves obovate, obtuse, regularly toothed, truncate, pretty smooth, 3-nerved, 2-3 inches long, and 1½ to 2 inches broad; petioles glandular. Flowers pretty large, yellow, on short pedicels, erect; on each side of their insertion is a small, roundish, brown gland.

FIG. 23.

Drupe nutant, armed with 4 sharp spines, one on each corner, at the base. The whole plant has an odour of musk. Of the same genus is the *Planta Euphrasiæ affinis*, Pluk. t. 373. f. 2. The sterile filament is terminated by an orange-coloured head. This plant, when fresh, has the singular property of rendering water or milk mucilaginous, without altering the taste, or colour, or smell of the liquid. This effect goes off in the course of 8 or 12 hours, leaving the liquid in its former state. Butter-milk is often sold in the markets of India; and in order to make a greater profit on their merchandize, they dilute it with water, and then thicken the whole by turning it round a few times with a few fresh leafy branches, which makes the adulterated butter-milk seem rich, and of the best sort.

Caltrop-fruited Pedalium. Fl. Aug. Sept. Clt. 1778. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Martýnia*, p. 235.

Order CLX. COBEA'CEÆ (this order only contains the genus *Cobæ'a*.) D. Don, in edinb. phil. journ. 1824. vol. 10. p. 3.

Calyx leafy, 5-cleft, equal (f. 24. *a*.) Corolla inferior, campanulate, regular, 5-lobed (f. 24. *b*.), imbricate in æstivation. Stamens 5, unequal (f. 24. *b*.), rising from the base of the corolla; anthers 2-celled, compressed. Ovarium superior, 3-celled, surrounded by a fleshy, annular, hypogynous disk; ovula several, ascending. Style simple; stigma trifid (f. 24. *b*.). Fruit capsular, 3-celled, 3-valved; with a septicidal dehiscence; placenta very large, 3-cornered in the axis, its angles touching the line of dehiscence of the pericarpium. Seeds flat, winged, imbricated in a double row; their integument mucilaginous. Albumen fleshy. Embryo straight. Cotyledons foliaceous; radicle inferior. — Climbing shrubs. Leaves alternate, abruptly pinnate; the common petiole lengthened into a tendril. Flowers axillary, solitary. This order is readily distinguished from *Bignoniàceæ* and *Pedalineæ*, the two foregoing orders, in the flowers being regular and pentandrous, in the presence of albumen to the seeds, &c.; and from *Polemoniàceæ* it is readily distinguished, by habit alone, and by the winged seeds.

I. COBÆ'A (named in honour of B. Cobo, a Spanish botanist.) Cav. icon. 1. p. 11. t. 16-17. and vol. 5. p. 69. t. 500. Pers. syn. 1. p. 185. H. B. et Kunth, nov. gen. amer. 3. p. 151.

Lin. syst. *Pentándria, Monogýnia*. Character the same as that of the order. Calyx permanent, covering the capsule; segments large, orbicular.

1 C. sca'ndens (Cav. l. c.) leaflets 3 pairs, elliptic, mucronate, marginate, and slightly ciliated: lower pair close to the stem, and sub-auriculate on one side at the base; tendrils branched; calycine segments broad, roundish, mucronulate; stamens about equal in length, hardly longer than the corolla. ♄. ᴗ. G. Native of Mexico, in various parts. Sims, bot. mag. 851. Calyx glaucous, 5-winged, before expansion. Flowers large, campanulate, with a short tube of a dark, dirty purple colour. (fig. 24. Lobes of corolla rather spreading, broad, short, roundish, imbricate, ciliated.

FIG. 24.

Climbing Cobæa. Fl. May, Oct. Clt. 1792. Shrub cl.

2 C. lu'tea (D. Don, in edinb. phil. jour. vol. 10. p. 4.) leaflets 3 pairs, oblong-lanceolate, acute; lower pair close to the stem; tendrils branched at top; calycine segments lanceolate, tapering to the apex; stamens twice the length of the corolla. ♄. ᴗ. G. Native of Guayaquil. Flowers yellowish, about half the size of those of *C. scándens*.

Yellow-flowered Cobæa. Shrub cl.

Cult. The *C. scándens* is a great favourite with most gardeners; it is a quick-growing, and profuse-flowering climber. It is well adapted for a large conservatory or greenhouse. It grows also well in the open air, in summer, trained against a south wall, or against a house, where it will flower in abundance. The plant is best raised from seeds, which ripen in abundance; but it may also be raised from cuttings, which latter mode is almost needless.

Order CLXI. ARAGOA'CEÆ (this order only contains the genus *Aragòa*.) Genera Bignoniaceis affinis. H. B. et Kunth, nov. gen. amer. 3. p. 154.

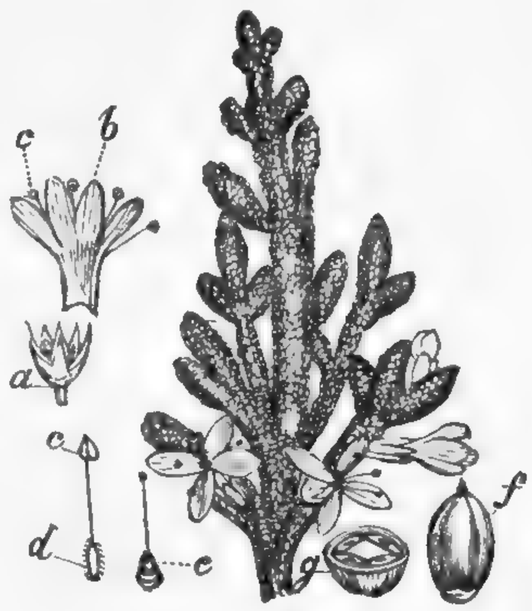
Calyx deeply 5-parted (f. 25. *a*.) Corolla tubular, salver-shaped (f. 25. *b*.); limb 4-parted; the lobes convolutely imbricate in æstivation; at length spreading. Stamens 4 (f. 25. *c*.), inserted in the sinuses between the lobes of the corolla, exserted; anthers cordate (f. 25. *c*.), the cells confluent, opening by a continuous line. Style filiform (f. 25. *c*.); stigma capitate, minutely papillose. Capsule 2-celled, 2-valved (f. 25. *g*.); valves cloven; dissepiment parallel with the valves. Seeds 4-5 in each cell, compressed, with a membranous border. Albumen copious, fleshy. Embryo erect; with plano-convex, obtuse, fleshy, cotyledons, furnished with 3 nerves; and a blunt radicle, much shorter than the cotyledons.—Much branched shrubs, natives of the mountains, near the city of Santa Fe de Bogota, in New Granada; with opposite branches. Leaves small, coriaceous, imbricated in 8 rows. Flowers axillary, solitary, nearly sessile, small, white.

This order is nearly related to the *Polemoniàceæ*; but differs from it, in its undivided stigma, in the confluent cells of the anthers and bilocular ovarium; and from *Scrophularíneæ*, in its regular flowers, foliaceous embryo, and convolute æstivation of the corolla.

I. ARAGO'A (named in honour of Francisco Arago, member of Academy of Paris; the celebrated astronomer.) H. B. et Kunth, nov. gen. amer. 1. p. 154. t. 216-217.

Lin. syst. *Tetrándria, Monogýnia.* Character the same as that of the order.

FIG. 25.



1 A. cupre'ssina (H. B. et Kunth, nov. gen. amer. 3. p. 156. t. 216.) branches downy; leaves scale-formed, ovate-deltoid, glabrous, closely adpressed, with rather woolly edges; throat of corolla villous. ♄. G. Native of Santa Fe de Bogota. A. junipérina, H. B. et Kunth, l. c. t. 216. *b.* Segments of corolla obovate, ciliated. Margins of the segments of the calyx ciliated. Anthers cordate, reniform. Filaments villous at the base.

Cypress-like Aragoa. Shrub.

2 A. abietìna (H. B. et Kunth, nov. gen. amer. 3. p. 156.) branches glabrous; leaves linear, spreading, ciliated a little; corolla glabrous. ♄. G. Native along with the preceding. Branches 3-4 in a whorl.

Fir-like Arogoa. Shrub.

Cult. Aragòa is a genus of beautiful and singular shrubs. Should either of them ever be introduced to our gardens, we would recommend their being treated as greenhouse plants; to be planted in pots, well drained with sherds, in a mixture of peat and sand.

Order CLXII. POLEMONIA'CEÆ (the plants contained in this order agree in important characters with the genus *Polemònium.*) Juss. gen. p. 136. ed. Usteri, p. 152. D. Don, in edinb. phil. journ. H. B. et Kunth, nov. gen. amer. 3. p. 160.

Calyx tubular (f. 26. *a.*, f. 27. *a.*), 5-cleft (f. 27. *a.*), or 5-toothed (f. 26. *a.*). Corolla rotate (f. 26. *b.*), or salver-shaped (f. 26. *d.*), or often funnel-shaped (f. 29. *b.*); limb 5-lobed (f. 27. *d.*, f. 29. *b.*), imbricate or twisted in æstivation. Stamens 5 (f. 26. *c.*, f. 27. *b.*, f. 29. *c.*), inserted sometimes beneath, and sometimes above the middle of the tube; anthers sagittate (f. 29. *c.*), incumbent, 2-celled. Ovarium simple, 3-celled (f. 28. *f.*), entire; ovula numerous, rarely definite. Style very long (f. 29. *d.*); stigma 3-lobed (f. 27. *c.*, f. 29. *e.*): lobes linear, obtuse. Capsule 3-celled (f. 28. *f.*), 3-valved, oblong, trigonal, rarely globose; valves opposite to the margins, septiferous inside in the middle, usually membranous, rarely thickish, and crustaceous, as in the genus *Cántua;* placenta trigonal, central, applied to the angles of the dissepiments. Seeds convex, angular, naked; or compressed and girded by a membrane; testa simple, membranous, the surface mucilaginous. Albumen fleshy, conforming to the seed. Embryo straight, large; with flat, orbicular or oval, somewhat foliaceous cotyledons; and a thickish, obtuse, straight, inferior radicle, which is generally shorter than the cotyledons.—Beautiful herbs or shrubs, usually branched. Leaves usually alternate, more rarely opposite, exstipulate, undivided, pinnatifid, or pinnate. Flowers terminal, numerous; or axillary, and nearly solitary, in most of the species bracteate. Corollas showy, blue, red, or white.

This order is characterized by a regular, 5-lobed corolla; a triple stigma; a 3-celled, 3-valved capsule, with septiferous valves; seeds numerous, or definite, attached to a 3-sided, central placenta, covered by a thin, mucilaginous integument, and furnished with a fleshy albumen; and, lastly, by a straight embryo, with somewhat foliaceous cotyledons. The most nearly allied order to it is *Convolvulàceæ*, which, however, is readily distinguished from it, by having a simple or double stigma; by the septa instead of proceeding from the centre of the valves, being directed to their margins; and the seeds having no central placenta, being attached to the bottom of the cells. The seeds are very different, being covered by a thin, very fragrant, mucilaginous albumen; with a curved embryo, having large, foliaceous, plaited, and wrinkled, emarginate cotyledons. The *Polemoniàceæ*, through the genus *Cántua*, has some affinity likewise with *Bignoniàceæ;* but that order has an irregular corolla; a bilamellate stigma; a very different capsule; transverse seeds, destitute of albumen; and lastly, a foliaceous embryo, with a curved radicle. Externally the *Plumbagíneæ*, have some resemblance to the *Polemoniàceæ*, through *Phlóx* and *Plumbàgo;* but the former order has 4 or 5 stigmas, and a simple ovarium attached to the bottom of the calyx.

Synópsis of the genera.

1 Polemònium. Calyx campanulate, 5-cleft (f. 26. *a.*) Corolla rotate (f. 26. *b.*); limb erect. Stamens inserted in the throat (f. 26. *c.*), bearded at the base; cells of capsule many-seeded.

2 Diape'nsia. Calyx 5-parted, coriaceous, tri-bracteate at the base. Corolla salver-shaped; tube short. Stamens inserted in the recesses of the corolla, nearly sessile. Stigma obsoletely 3-lobed. Cells of capsule many-seeded.

3 Phlóx. Calyx deeply 5-cleft (f. 27. *a.*), connivent. Corolla salver-shaped (f. 27. *d.*); tube elongated; limb twisted in æstivation; with cuneated segments. Stamens inserted above the middle of the tube. Cells of capsule 1-seeded.

4 Huge'lia. Calyx tubularly campanulate; segments somewhat spinose, linear. Corolla funnel-shaped; tube short, exserted; segments of the limb oblong. Stamens inserted at the throat. Cells of capsule many-seeded.

5 Lina'nthus. Calyx tubular; with 5 strong green nerves, which are drawn out into subulate, recurved teeth at the apex. Corolla funnel-shaped; tube short; segments of limb obovate, crenulated at apex. Stamens inclosed. Cells of capsule many-seeded.

6 Leptosìphon. Calyx tubularly-campanulate; lobes linear, subulate. Corolla funnel-shaped; tube very long, slender; limb campanulate; with oval, obtuse lobes. Stamens inserted at the throat. Cells of capsule many-seeded.

7 Fe'nzlia. Calyx tubularly campanulate, deeply 5-cleft; segments linear. Corolla somewhat funnel-shaped; tube short; segments of the limb obovate, toothed; anthers exserted from the tube. Cells of capsule many-seeded.

8 Gília. Calyx campanulate, 5-cleft (f. 28. *a.*). Corolla funnel-shaped (f. 28. *b.*), or sub-campanulate; segments of the limb obovate. Stamens inserted in the throat. Cells of capsule many-seeded.

9 Ægochlòa. Calyx tubularly campanulate, 5-cleft; segments unequal, spiny, entire to multifid. Corolla somewhat salver-shaped; segments oblong, entire; tube equal in length to the calyx. Stamens inserted in the upper part of the tube. Cells of capsule many-seeded.

10 Collòmia. Calyx campanulate, 5-cleft. Corolla salver-shaped; tube slender; segments of the limb oblong, entire. Stamens inserted towards the middle of the tube. Cells of capsule 1-2-seeded.

11 Calda'sia. Calyx tubular, 5-toothed, equal to the tube of the corolla in length. Corolla funnel-shaped; lobes of limb cuneated, emarginate. Stamens inserted in the middle of the tube. Cells of capsule 1-seeded.

12 Lœse'lia. Calyx tubular, involucrated by pungent bracteas (f. 29. *a. f.*); segments pungent. Corolla funnel-shaped (f. 29. *b.*); tube long; (f. 29. *g.*) lobes of limb broadly obovate, entire. Cells of capsule few-seeded. Seeds flat, orbicular, girded by a narrow membrane.

13 Ca'ntua. Calyx tubular, 5-toothed, often cleft to the middle on both sides. Corolla funnel-shaped; tube long; lobes of limb obcordate, convolute in æstivation. Stamens inserted near the base of the tube. Cells of capsule many-seeded. Seeds compressed, girded by an oblong, membranous wing.

I. POLEMONIUM (*πολεμωνιον, polemonion*, of Dioscorides, from *πολεμος, polemos*, war.) Tourn. inst. 146. t. 61. Lin. gen. no. 217. Schreb. gen. no. 289. Juss. gen. 136. ed. Usteri, p. 152. Gærtn. fruct. 1. p. 299. t. 62. Lam. ill. t. 106. Schkuhr. handb. t. 38. ed. H. B. et Kunth, nov. gen. amer. 3. p. 160. Led. fl. alt. 1. p. 232.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, 5-cleft (f. 26. *a.*). Corolla rotate (f. 26. *b.*), with a short tube, and a 5-lobed, equal, erect limb. Stamens 5 (f. 26. *c.*), equal, inserted in the throat of the corolla; filaments dilated at the base, bearded, in a continuous ring, and nearly closing the throat; anthers incumbent. Capsule roundish, with membranaceously crustaceous valves, covered by the permanent calyx; cells many-seeded. Seeds oblong, trigonal, filled with large albumen. Radicle twice longer than the cotyledons.—Erect, herbaceous plants, with alternate, usually impari-pinnate, seldom impari-bipinnate leaves; leaflets entire; terminal, panicled corymbs of bracteate flowers, and blue or white corollas.

1 P. cœrù'leum (Lin. spec. 230.) stem glabrous; leaves pinnate; leaflets ovate-lanceolate, acuminated, glabrous; segments of calyx ovate or elliptic lanceolate, acuminated; flowers erect, corymbose; calyxes hairy; segments of corolla roundish-oval, obtuse; anthers elliptic. ♃. H. Native of Siberia, and the north of Europe; as of Germany, Switzerland, Lapland, Denmark, in shady places. It is sometimes found apparently wild, in some parts of Britain; as at Malham Cove, in Yorkshire; at Matlock, in Derbyshire; as well as near Bakewell, and at Lover's Leap, Buxton, Smith, engl. bot. t. 17. Fl. dan. t. 255. Sabb. hort. 2. t. 82. Valeriàna cœrùlea, Bauh. pin. 164. Valeriàna Græ'ca, Dod. pempt. 352. f. 1.—Besl. eyst. 9. t. 11. f. 2.—Gmel. sib. 4. p. 103. t. 69. Capsule ovate-globular, obsoletely 3-grooved. Flowers blue. This plant is called *Greek Valerian, Jacob's Ladder*, or *Ladder of Heaven*. It is a common border flower; with erect, stiff stems.

Var. β, *flòre álbo;* flowers white. The white-flowering common Greek-Valerian. Berl. eyst. 9. t. 11. f. 3.

Var. γ; stem and calyxes woolly. ♃. H. Native of Siberia. P. cœrùleum, β, Lin. ups. p. 40.—Gmel. sib. 4. p. 103. t. 50.

Var. δ, *variegàta;* leaves variegated.

Var. ε, *pícta;* flowers variegated with white and blue.

Var. ι, *pilíferum* (Lindl. bot. reg. t. 1303.) stem erectish, hardly longer than the radical leaves; calyxes villous. ♃. H. Native of North America, Richardson. Stem and leaves pilose. Flowers blue.

Blue-flowered or Common Greek-Valerian. Fl. June.

2 P. gra'cile (Willd. enum. suppl. p. 10.) stems simple, elongated; leaves pinnate: calyx full of glandular down; segments of corolla ovate, obtuse; anthers sagittate. ♃. H. Native of Dahuria. P. cœrùleum, γ gràcile. Horn. hort. hafn. 2. p. 957. Rœm. et Schultes, syst. 4. p. 364. Flowers pale blue.

Slender Greek-Valerian. Fl. June, July. Clt. 1808. Pl. $1\frac{1}{2}$ feet.

3 P. Sibíricum (G. Don, mss. Sweet, fl. gard. t. 182.) erect, glabrous; leaves pinnate; leaflets petiolate, pinnatifid; segments lanceolate; petioles and calyxes pilose; calycine segments ovate, acute; segments of corolla elliptic; stamens sagittate; stem fistular, angular, glabrous, but downy at top. ♃. H. Native of Siberia. P. lácteum, Lehm. hort. sem. hamb. 1825. p. 17. pug. 1. p. 27. act. bonn. 14. p. 815. Pol. disséctum, Rchb. icon. t. 463. Lower leaflets ciliated. Flowers white, crowded, sub-corymbose. Filaments pilose at bottom. This species differs from all others, in the bipinnate leaves. Perhaps only a variety of *P. cœrùleum.*

Siberian Greek-Valerian. Fl. June, July. Clt. 1800. Pl. 2 feet.

4 P. pulche'llum (Bunge, in Led. fl. alt. ill. t. 20. fl. alt. 1. p. 233.) stems downy, nearly naked; radical leaves pinnate; leaflets oblong, acute: upper ones confluent, all glandularly ciliated; calycine segments linear-oblong, acutish; flowers erect, corymbose. ♃. H. Native of Siberia, in stony places, in the Kuraic Islands, and at the river Tschuja. Nearly allied to *P. hùmilis*, Willd.; but differs, in the stem being suffruticose, in the calyxes being hairy, in the stamens being sagittate. Flowers smaller than those of *P. cœrùleum*, from white to blue. Calyx glandularly ciliated; segments of corolla roundish; stigma and anthers white.

Neat Greek-Valerian. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

5 P. acutiflòrum (Willd. mss. in herb. ex Rœm. et Schultes, syst. 4. p. 792.) stem nearly leafless; leaves nearly all radical, pinnate; leaflets oblong; calyx hairy at the base; segments of corolla ovate, acute, ciliated. ♃. H. Native of the north-west coast of America, Pallas. P. boreàle, Adams. Flowers blue, few in a corymb.

Acute-flowered Greek-Valerian. Pl. $\frac{1}{2}$ foot.

6 P. pulche'rrimum (Hook, bot. mag. 2979.) stems many, ascending, leafy, and are, as well as the calyxes, downy; leaflets ovate, obtuse, glabrous: panicles sub-corymbose; calycine segments ovate, acute; segments of corolla ovate, acutish. ♃. H. Native of the rocky mountains. Flowers pale blue, varying to white. Leaves with a faint smell of musk, mostly radical; rachi of leaves downy. Corymbs drooping. Corolla rotately campanulate. Nearly allied to *P. Richardsònii.*

Prettiest Greek-Valerian. Fl. July, Aug. Clt. 1827. Pl. ½ foot.

7 P. Richardsònii (Graham, in edinb. phil. journ. dec. 1827. bot. mag. 2800.) stems pilose, angular, branched at the base, leafy; leaves pinnate; leaflets ovate-roundish, mucronulate, downy beneath; flowers nutant; calyx villous, viscid, with ovate, pointed segments; segments of corolla obtuse, crenulated; root very long, somewhat fusiform. ♃. H. Native of North America, in deep sandy soil, about the Great Bear Lake, Richardson; and of Siberia. P. speciòsum, Fisch. mss. P. cœrùleum, var. nàna, Hook, in Lin. trans. 14. p. 377. Root yellow. Stem purplish at the base. Flowers in terminal corymbs; but drooping. Corolla with a yellow tube, and a pale purple limb, marked with deeper veins. P. speciòsum, Fisch. mss. from the islands of St. Lawrence and St. Paul; and P. lanàtum, Fisch. mss. from Kamtschatka, is a variety of the same, with more downy stems.

Richardson's Greek-Valerian. Fl. July, Oct. Clt. 1826. Pl. ½ foot.

8 P. moscha'tum (Wormkiold, mss. ex Graham, edinb. phil. journ. June 1820.) stems diffuse, branched; leaves pinnate, slightly downy, rather fleshy; leaflets roundish-cordate; calyx hairy, with obtuse segments; segments of corolla obtuse. ♃. H. Native of North America, Drummond. Root fibrous. Stems angular, reddish. Leaflets about 10 pairs; those of the cauline leaves oblong-ovate, the terminal one obovate in both. Flowers paniculately corymbose, somewhat drooping, nearly inodorous; peduncles generally 2-flowered, sometimes drooping. Peduncles, pedicels, calyxes, and stem clothed with glandular down. Corolla with blue limb, having deeper veins, indistinctly crenated. Hooker considers this plant the same as *P. Richardsónii*.

Musky-scented Greek-Valerian. Fl. May, June. Clt. 1827. Pl. 3 to 4 inches.

9 P. villòsum (Rudolf, Georgi, besch. des. russ. reichs. 3. p. 771. Sweet, fl. gard. t. 266.) stem pilose, angular, erect; leaves with many pairs of leaflets, which are ovate-bluntish, pilose on both surfaces; flowers a little panicled, drooping; segments of corolla roundish, crenulated. ♃. H. Native of Siberia, Kamtschatka, &c. P. lanàtum, Fisch. mss. P. hùmile, Rœm. et Schultes, syst. 4. p. 792. Lindl. bot. reg. 1304. Pol. cœrùleum, β, Gmel. sib. 4. p. 103. no. 69. Stem leafy. Calyxes villous and viscid; with ovate-bluntish segments. Corollas blue. Perhaps only a variety of *P. Richardsònii*.

Villous Greek-Valerian. Fl. July, Oct. Clt. 1826. Pl. ½ foot.

10 P. Mexica'num (Cerv. in Lagasc. gen. et spec. nov. diagn. p. 10. no. 140. Ker. bot. reg. 242.) plant viscid, and clothed with glandular down on every part; leaves pinnate, downy; leaflets lanceolate; outer ones combined, usually forming a 3-lobed, terminal leaflet; flowers drooping; calyx clothed with clammy villi. ♃. H. Native of Mexico. P. ciliàtum, P. bursifòlium, P. pimpinelloìdes, Willd. mss. ex Rœm. et Schultes, syst. 4. p. 793. Flowers corymbose, pale blue. Plant very pale green. Mr. Nuttall found this, or a nearly allied species at Flat-Head river, in which the leaflets are somewhat rhomboid-ovate, acutish; and the calycine segments oblong, acute. Mr. James also found it on the banks of the Canadian river; but the flowers in his plant are said to be smaller.

FIG. 26.

Mexican Greek Valerian. Fl. April, May. Clt. 1817. Pl. 1 foot.

11 P.? cilia'tum (Willd. mss. ex Rœm. et Schultes, syst. 4. p. 792.) leaves pinnatifid, hairy, ciliated; segments of corolla ciliately toothed. ♃. H. Native of Pennsylvania, Muhlenburgh. Leaves sessile, with acute segments. Flowers terminal, racemose. Calycine segments linear, ciliated, acute, length of corolla. Perhaps a species of *Eutòca*.

Ciliated-leaved Greek-Valerian. Pl.

12 P. re'ptans (Lin. spec. 230.) root creeping; stems leafy, glabrous; leaves pinnate; leaflets 7, ovate, acute, glabrous; flowers nutant; segments of corolla cuneate. ♃. H. Native of North America, from Pennsylvania to Carolina, on the sides of rich hills. Mill. fig. t. 209. Sims, bot. mag. 1887. Leaflets 7 to 11 in number. Flowers in a loose, panicled corymb. Flowers blue, and sometimes white.

Creeping Greek-Valerian. Fl. April, May. Clt. 1758. Pl. ½ foot.

Cult. The species of Greek-Valerian are all handsome, hardy, border flowers, of easy culture. They grow in any common garden soil; and are readily increased by dividing at the root, or by seed.

II. DIAPE'NSIA (the ancient Greek name for the Sanicle.) Lin. gen. no. 194. fl. lapp. 1. Juss. gen. 135. edit. Usteri, p. 151. D. Don, in Sweet, fl. gard. n. s. t. 251.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, coriaceous, tribracteate at the base. Corolla salver-shaped; tube short, wide; limb flat, 5-cleft. Stamens 5, inserted in the sinuses of the corolla nearly sessile: anthers linear, obtuse, inserted by their bases, dehiscing lengthwise. Stigma obsoletely 3-lobed. Cells of capsule many-seeded. Seeds roundish.—Small, tufted, North American herbs. Leaves alternate, crowded at the roots, coriaceous, quite entire. Peduncles scape-formed, 1-flowered. This genus is said to be nearly allied to *Phlóx*, but is easily distinguished from that genus, in the shorter corolla, in the concrete lobes of the stigma, in the many-seeded cells of the capsule, in the alternate leaves and inflorescence.

1 D. Lappónica (Lin. fl. lap. no. 88. t. 1. f. 1. spec. p. 202.) leaves linear-spatulate, coriaceous, glabrous, with callous, subrevolute edges; peduncles usually 1-flowered, erect; anthers oblique, mutic. ♃. F. Native of the mountains of Norway and Lapland, among stones covered with moss; and New Hampshire, on the highest mountains, among moss; also of the Rocky mountains. Sweet, brit. fl. gard. n. s. t. 251. Wahl. fl. lapp. p. 58. t. 9. Œd. fl. dan. t. 47. Sims, bot. mag. t. 1108. D. obtusifòlia, Sal. par. lond. t. 104. Pursh, fl. amer. sept. 1. p. 147. Corollas salver-shaped, with obtuse segments, pure white.

Lapland Diapensia. Fl. Feb. March. Clt. 1801. Pl. 1 inch.

2 D. cuneifòlia (Sal. par. lond. t. 104. Pursh, fl. amer. sept. 1. p. 148.) leaves lanceolate-cuneated, downy below; anthers horizontal, beaked at the base. ♃. F. Native of North Carolina, on high mountains; plentiful on pine barrens of New Jersey, near the sea coast. In the island called Grand Cayman, we have seen this plant, or a nearly allied species, growing near the sea, along with *Jacquínea lineàris*, and *Heliotròpium gnaphaloìdes*. D. Americàna, Herb. Banks. Pyxidanthèra barbulàta, Michx. fl. bor. amer. 1. p. 152. t. 17. Calyxes ciliated? Flowers small, white. Leaves bearded inside at the base. Stems trailing.

Wedge-leaved Diapensia. Fl. July. Clt. 1806. Pl. 1 to 2 inches.

Cult. The species of *Diapénsia* are small, tufted, evergreen, alpine plants, difficult of culture. They should be grown in small pots, well-drained with sherds, in a mixture of sand and peat, and placed among other alpine plants. They require to be protected from frost and wet in winter, by placing them in a frame. They may be increased by dividing at the roots.

III. PHLOX (from φλοξ, *phlox*, flame; in reference to the bright colour of the flowers.) Lin. gen. no. 214. Schreb. gen. 284. Juss. gen. 139. edit. Usteri, 152. Gærtn. fruct. 1. p. 299. t. 62. Lam. ill. 108. Nutt. gen. amer. 1. p. 125. Lychnidèa, Dill. elth. 166.

LIN. SYST. *Pentándria, Monogýnia.* Calyx deeply 5-cleft (f. 27. *a.*), sub-cylindrical or sub-prismatic; segments acute, connivent. Corolla salver-shaped (f. 27. *d.*), with a narrow, sub-cylindrical tube, which is a little curved, and longer than the calyx; limb spreading, twisted in æstivation, as in *Apocýneæ;* segments cuneate. Stamens 5, unequal (f. 27. *b.*), 3 longer, and 2 shorter, inserted in the tube above the middle; filaments filiform; anthers sagittate, elevated to the orifice of the tube of the corolla. Capsule roundish; valves membranous; cells 1 seeded. Seeds oblong, convex outside. Albumen large. Radicle twice longer than the cotyledons.—Herbaceous, perennial, rarely suffruticose plants, with opposite, simple leaves: but the floral ones are sometimes alternate, sessile. Flowers terminal, panicled or corymbose, lilac, rose-coloured or red, blue, or white.

§ 1. *Leaves broad. Plants without any barren stems.*

1 P. PANICULA'TA (Lin. spec. 216. Ait. hort. kew. 1. p. 205.) erect, glabrous; leaves lanceolate, gradually narrowed, flat, with rough edges; corymbs panicled; segments of corolla roundish, of the calyx awned. ♃. H. Native of Virginia and Lower Carolina, in rich moist meadows. Mill. fig. 2. t. 205. f. 2.—Dill. elth. f. 166. f. 203. Flowers purple.

Var. β, álba; flowers white, with a tinge of red. ♃. H. Native of North America, Lyon. A more robust plant than var. *α*, and probably a distinct species.

Panicled-flowered Phlox. Fl. Aug. Sept. Clt. 1732. Pl. 3 to 4 feet.

2 P. UNDULA'TA (Ait. hort. kew. 1. p. 205.) erect, glabrous; leaves oblong-lanceolate, somewhat undulated, with scabrous edges; corymbs panicled; segments of corolla obovate, somewhat retuse; of the calyxes awned. ♃. H. Native of Virginia and Carolina, in high mountains and meadows. P. paniculàta, Michx. fl. amer. 1. p. 144. Flowers purple. A beautiful plant, resembling the preceding; and the flowers of the same colour.

Undulated-leaved Phlox. Fl. July, Aug. Clt. 1759. Pl. 4 to 5 feet.

3 P. PYRAMIDA'LIS (Smith, exot. bot. 2. p. 55. t. 87.) erect, glabrous; stem scabrous, spotted; leaves cordate-oblong, acuminated; panicle fastigiate, pyramidal; segments of corolla cuneately truncate; calycine teeth erect, lanceolate, acute, glabrous, with scabrous edges. ♃. H. Native from Pennsylvania to Carolina, in mountain meadows. Lodd. bot. cab. 342. Sweet, fl. gard. 233. P. Carolìna, Walt. fl. car. 296. Flowers pale flesh-coloured, or lilac.

Var. β, penduliflòra (Hort.) flowers rather pendulous.

Var. γ, corymbòsa (Hort.) flowers densely corymbose.

Pyramidal-flowered Phlox. Fl. Ju. Aug. Clt. 1800. Pl. 2 to 3 feet.

4 P. LATIFÒLIA (Michx. fl. amer. bor. 1. p. 143.) erect, glabrous; stem smooth; leaves cordate-ovate; flowers fastigiately corymbose; segments of corolla nearly orbicular; teeth of calyx lanceolate, hardly acuminated. ♃. H. Native of Carolina, in shady places, among *Sphágnum.* Flowers large, purple. Perhaps only a variety of *P. pyramidàlis.*

Broad-leaved Phlox. Fl. Ju. Aug. Clt. 1812. Pl. 3 feet.

5 P. CORDA'TA (Ell. fl. corol. 2. p. 40. Sweet, fl. gard. n. s. t. 13.) stems smooth, slightly tetragonal; leaves oblong-cordate, acuminated, with scabrous edges; corymbs panicled, pyramidal; pedicels and calyxes downy; calycine segments long-awned; corolla with a downy tube, and obovate, rounded, distinct segments. ♃. H. Native of Carolina. Corollas of a bright purplish lilac colour.

Cordate-leaved Phlox. Fl. July, Aug. Clt. 1827. Pl. 2 to 3 feet.

6 P. CORYMBÒSA (Hortul. ex Sweet, fl. gard. n. s. t. 114.) stem erect, downy, branched at top, rather tetragonal; leaves oblong-lanceolate, undulated, downy beneath, with scabrous edges; corymbs panicled; calycine teeth subulate; segments of corolla roundish-obovate, imbricate. ♃. H. Native of North America. Stems more or less purple. Branches of corymb many-flowered. Corollas purplish lilac, with a white star at the base. Tube of corolla downy.

Corymbose-flowered Phlox. Fl.? Clt. ? 3 to 4 feet.

7 P. MACULA'TA (Lin. spec. 216.) erect; stem scabrous, spotted; leaves oblong-lanceolate, glabrous, with rough edges; panicle oblong, crowded with flowers; segments of corolla roundish; teeth of calyx acute, recurved. ♃. H. Native from New England to Carolina, in wet meadows. Pursh, fl. 1. p. 149. Jacq. hort. vind. 2. p. 58. t. 127. Gærtn. fruct. p. 299. Flowers purplish, violet or purple. Stem marked with brown spots.

Spotted-stemmed Phlox. Fl. July, Aug. Clt. 1740. Pl. 3 feet.

8 P. ODORA'TA (Sweet, fl. gard. t. 224.) stems erect, branched at top, rather scabrous; leaves acuminated, glabrous, with scabrous edges: lower ones linear: middle oblong-lanceolate: superior ones cordate-ovate; branches corymbose, many-flowered, somewhat fastigiate; teeth of calyx ovate, shortly acuminated, erect; segments of corolla cuneately obovate. ♃. H. Native of North America. Phlóx bimaculàta, Hort. Flowers of a bright red lilac colour, sweet-scented. Branches of corymb forming a thyrsoid raceme. Nearly allied to *P. glabérrima* and *P. maculàta.*

Sweet-scented Phlox. Fl. Aug. Clt. ? Pl. 3 feet.

9 P. REFLE'XA (Hortul. Sweet, fl. gard. t. 232.) stems downy, scabrous, spotted; leaves reflexed, glabrous, shining above: lower ones narrow-lanceolate: superior ones cordate, acute; flowers crowded, panicled, with many-flowered branches; teeth of calyx lanceolate, mucronate, spreading; tube of corolla glabrous, curved; segments of the limb roundish-obovate, imbricated at the base. ♃. H. A hybrid production. Flowers dark purple, in close, crowded panicles, sweet-scented.

Reflexed-leaved Phlox. Fl. July, Sept. Clt. ? Pl. 2 or 3 feet.

10 P. SCA'BRA (Sweet, fl. gard. t. 248.) stem glabrous at bottom, and downy at top; leaves oblong-lanceolate, acute, scabrous above, with undulated, denticulately scabrous edges; flowers in loose panicles; calyxes pilose; teeth of calyx subulate, straight; tube of corolla curved, villous; segments of corolla obovate, spreading, slightly emarginate. ♃. H. Native of North America. Phlóx Americàna. Hortul. Flowers pale lilac, fragrant.

Scabrous Phlox. Fl. Aug. Clt.? Pl. 3 to 4 feet.

11 P. ACUMINA'TA (Pursh. fl. amer. sept. 2. p. 730. Sims, bot. mag. 1880.) erect, downy; stem angular; leaves ovate-

lanceolate, acuminated, narrowed below, somewhat petiolate, downy beneath; floral leaves subcordate; corymbs subpanicled; corolla with roundish segments, and a downy tube; calycine segments awned. ♃. H. Native of Georgia and South Carolina, on the mountains. Flowers variegated with pale and deep purple. P. decussàta, Lyon, mss.

Acuminated-leaved Phlox. Fl. Oct. Nov. Clt. 1812. Pl. 3 to 4 feet.

12 P. penduliflòra (Sweet, hort. brit. ed. 2d. p. 368. fl. gard. n. s. t. 46.) stem rather flexuous, obsoletely quadrangular, clothed with rough pubescence, spotted; leaves oblong-lanceolate, acuminated, nearly sessile, glabrous and shining above, having the margins and nerves scabrous beneath; corymbs many-flowered, panicled, drooping before expansion; calyxes downy, with lanceolate, mucronate segments; segments of corolla roundish, imbricate. ♃. H. Native of North America. Flowers of a rosy purple colour, sweet-scented; tube smooth, a little recurved.

Pendulous-flowered Phlox. Fl. Aug. Oct. Clt. 1823. Pl. 3 to 4 feet.

13 P. Carolìna (Lin. spec. 216.) erect; stem downy, scabrous; leaves ovate-lanceolate, acuminated, glabrous, except the margins and nerves, which are scabrous beneath; corymbs panicled, subfastigiate, with many-flowered branches; segments of corolla roundish; teeth of calyx glabrous, lanceolate, erect; segments of corolla roundly obovate. ♃. H. Native of Lower Carolina, in wet meadows; and on the mountains of Virginia. Sims, bot. mag. 1344. Mart. cent. t. 10. Sweet, fl. gard. 190. Flowers beautiful, pale purple, the size of those of *P. suavèolens;* tube of corolla smooth. P. Carolìna, Pursh, fl. amer. sept. 1. p. 149, is probably P. triflòra, Michx.

Carolina Phlox. Fl. July, Sept. Clt. 1728. Pl. 2 to 3 feet.

14 P. triflòra (Michx. fl. bor. amer. 1. p. 143.) erect; stem obsoletely tetragonal, rather downy; leaves lanceolate, glabrous; branches of corymb usually 3-flowered; teeth of calyx linear; segments of corolla roundly obcordate, slightly undulated, at length reflexed. ♃. H. Native of Virginia, on the mountains. Sweet, fl. gard. 49. P. cárnea, Sims, bot. mag. t. 2155. Lodd. bot. cab. 711. Flowers in loose spreading corymbs, pale lilac. Segments of calyx nearly as long as the tube of the corolla.

Three-flowered Phlox. Fl. July, Sept. Clt. 1816. Pl. 1 to 2 feet.

15 P. nítida (Pursh, fl. amer. sept. 2. p. 730.) erect, quite glabrous; stems terete, spotted, smooth; leaves ovate-oblong, rather fleshy, shining and dark green above, pale beneath; corymbs fastigiate; lower branches elongated, nearly naked; segments of corolla broad-obovate, rather retuse; calycine teeth lanceolate, mucronate. ♃. H. Native of South Carolina. P. suffruticòsa, Hort. Nearly allied to *P. Carolìna;* but the flowers are large, long, and of a beautiful purple colour.

Shining-leaved Phlox. Fl. July, Aug. Clt. 1800. Pl. 2 feet.

16 P. suffruticòsa (Vent. malm. 2. p. 107.) erect, glabrous; stem glabrous, trifid at top, and suffruticose at the base; leaves lanceolate, shining on both surfaces, and acute at both ends, almost veinless; corymbs crowded with flowers. ♃. H. Native of North America. Willd. enum. 1. p. 200. Poir. encycl. suppl. 4. p. 397. Mordaunt Delauny, herb. amat. 3. t. 4. Ker. bot. reg. 68. Stem much branched, ex Vent. Corolla deep purplish violet, with deeper lines at the base; segments of the limb roundish-obovate.

Suffruticose Phlox. Fl. July, Sept. Clt. 1790. Pl. 2 feet.

17 P. glabe'rrima (Lin. spec. 217. Sweet, fl. gard. n. s. t. 36.) plant tufted; stems erect, glabrous; leaves linear-lanceolate, smooth: corymbs terminal, trifid, sub-fastigiate; fascicles 3-4-flowered: segments of corolla roundish; teeth of calyx acuminated, spreading, mucronate. ♃. H. Native of Lower Carolina, in wet meadows; and on the mountains of Virginia. Pursh, fl. 1. p. 149.—Dill. elth. t. 166. f. 202.—St. Hil. 18. t. 6.—Kerner, œk. pflanz. t. 136. Flowers of a reddish lilac, dying off bluish.

Quite glabrous Phlox. Fl. Ju. Aug. Clt. 1725. Pl. 1½ to 2 feet.

18 P. tardiflòra (Penny, in Young, hort. eps. p. 38. Loud. hort. brit. p. 596.) stem roughish, obscurely spotted; leaves lanceolate, acuminated, quite glabrous on both surfaces, shining, with scabrous edges: upper leaves the broadest; racemes panicled; segments of corolla rounded; tube very long, 3 times longer than the calyx; calycine teeth lanceolate, acute, erectish. ♃. H. Native of North America. P. longiflòra, Sweet, brit. fl. gard. n. s. t. 31. Stem bluntly tetragonal. Flowers pure white, fragrant. Very nearly allied to *P. suavèolens.*

Late-flowering Phlox. Fl. Aug. Oct. Clt. 1825. Pl. 2 to 3 ft.

19 P. Sickma'nni (Lehm. sem. hort. hamb. 1826. p. 17. act. bonn. 14. p. 814. t. 46.) stems erect, obscurely tetragonal, glabrous; leaves lanceolate, acuminated, scabrous, but glabrous beneath; flowers disposed in large corymbose panicles, which are, as well as the calyxes, downy; bracteas ciliated; teeth of calyx subulate, margined with red, ciliated; segments of corolla obovate; stigma bifid. ♃. H. Native of North America. P. scàbra, Sweet, fl. gard. 3. t. 248. Stem pale purple above, marked with dark purple spots at the axils of the leaves. Leaves rather undulated; lower ones attenuated at the base; upper ones subcordate. Limb of corolla violaceous, each segment marked by an obcordate, white spot at the base.

Sickmann's Phlox. Fl. Aug. Clt. 1826. Pl. 2 to 3 feet.

20 P. suave'olens (Ait. hort. kew. 1. p. 206.) erect; stem quite glabrous, without spots; leaves ovate-lanceolate, smooth; racemes panicled; segments of corolla roundish; calycine teeth lanceolate, acute, erectish. ♃. H. Native from Canada to Virginia, in meadows. P. maculàta, *β*, cándida, Michx. fl. bor. 1. p. 145. Flowers white, sweet-scented. There is a variety of this species, having the leaves edged with white, or pale yellow.

Sweet-scented-flowered Phlox. Fl. July, Aug. Clt. 1766. Pl. 1 to 2 feet.

21 P. Drummóndi (Hook. bot. mag. t. 3441.) annual; stems erect, simple at bottom, but a little branched at top, beset with spreading hairs, as well as the edges of the leaves, calyxes, bracteas, &c.; leaves ovate-lanceolate, half stem-clasping, all mucronate and downy, lower ones opposite, upper ones alternate; panicle trichotomously corymbose; flowers on very short pedicels; calycine segments linear-subulate, mucronate, a little reflexed; tube of corolla much curved, hairy, 3 times longer than the calyx; segments of corolla imbricate, cuneate, obtuse, entire. ☉. H. Native of Mexico, in the Texas. D. Don, in Sweet, fl. gard. n. s. t. 316. Flowers of a beautiful purple, with a darker eye. Lower leaves always opposite; upper ones nearly ovate.

Drummond's Phlox. Fl. Aug. Sept. Clt. 1835. Pl. 1 foot.

§ 2. *Leaves broad. Plants with barren stems.*

22 P. ova'ta (Lin. spec. 217.) erect, glabrous; radical leaves ovate, acute, rather fleshy, cauline ones ovate-oblong; corymbs subfastigiate; segments of corolla undulated, retuse; teeth of calyx linear, acute. ♃. H. Native of North America. Willd. spec. 1. p. 842. Pursh, fl. 1. p. 150.—Plukn. mant. p. 122. t. 348. f. 4. Flowers beautiful, reddish purple.

Var. β, Listoniàna (Hort.) radicle leaves ovate: cauline ones lanceolate. ♃. H. Native of North America. P. ovàta, Curt. bot. mag. t. 582.

Ovate-leaved Phlox. Fl. May, July; *β*, July, Aug. Clt. 1759; *β*, 1816. Pl. 1 to 1½ foot.

23 P. re'ptans (Michx. fl. amer. bor. 1. p. 144. Vent. malm.

t. 107.) plant creeping, stoloniferous, downy; radical leaves obovately-spatulate: cauline leaves lanceolate; corymbs divaricate, few-flowered; segments of corolla obovate; teeth of calyx linear, reflexed. ♃. H. Native of Virginia and Carolina, on high mountains. Phlóx stolonífera, Curt. bot. mag. 563. Flowers blue, with a purple centre, very handsome.

Var. β, crassifòlia (D. Don, in Sweet, fl. gard. n. s. t. 293.) leaves thicker; flowers deeper coloured. ♃. H. Native of North America. Phlóx crassifòlia, Lodd. bot. cab. 1596. Flowers rose-coloured. Branches simple. Leaves and petioles mucronately fringed with soft hairs on the midrib and edges. Calycine segments white, lanceolate, acuminated, erect, connivent, with scarious edges. Tube of corolla deep purple, clothed with glandular hairs, twice as long as the calycine segments; limb purple, with rounded, slightly crenulated segments.

Creeping Phlox. Fl. June, Sept. Clt. 1800. Pl. ½ foot.

24 P. DIVARICA'TA (Lin. spec. 217.) decumbent, downy; leaves oval-lanceolate, superior ones alternate; branchlets divaricate, loose, few-flowered; segments of corolla somewhat obcordate; teeth of calyx linear-subulate. ♃. H. Native from Pennsylvania to Virginia, on the mountains, and on the banks of the Missouri. Curt. bot. mag. 163. Mill. fig. t. 205. f. 1. Flowers purplish blue. Corymbs dichotomous.

Divaricate Phlox. Fl. May, July. Clt. 1746. Pl. ½ to 1 foot.

25 P. CANADE'NSIS (Hort. ex Sweet. fl. gard. t. 221.) erect; stems rather downy; lower leaves ovate: superior ones broad-lanceolate, opposite and alternate; branches downy, few-flowered, compact; teeth of calyx subulate-linear; segments of corolla broad, obcordate; tube a little curved, ascending, much longer than the calyx. ♃. H. Native of Canada. Flowers blue, tinged with lilac, disposed in a terminal, corymbose panicle. This plant is very nearly related to *P. divaricàta*.

FIG. 27.

Canadian Phlox. Fl. April, May. Clt. 1825. Pl. 1 foot.

§ 3. *Leaves linear-lanceolate, linear, or subulate.*

26 P. ARISTA'TA (Michx. fl. bor. amer. 1. p. 144.) weak, erect, clothed with viscid down; leaves linear-lanceolate; panicle loose, fastigiate; pedicels generally twin; segments of corolla oboval; tube curved, downy; calycine teeth very long, subulate. ♃. F. Native from Pennsylvania to Carolina, in sandy fields; and of the Rocky mountains, in the valley of the Loup, Fork. ex Torrey. Pursh, fl. 1. p. 150. Lodd. bot. cab. 1731. P. pilòsa, Sims, bot. mag. 1307.? Flowers usually red, but sometimes white.

Var. α, vìrens (Pursh, fl. 1. p. 150.) corollas reddish purple.

Var. β. canéscens (Pursh, l. c.) corolla whitish rose-coloured.

Awned-calyxed Phlox. Fl. April. Clt. 1828. Pl. procumbent.

27 P. PILÒSA (Michx. fl. bor. amer. 1. p. 145.) humble, decumbent, downy; leaves linear-lanceolate, short, roughish; upper ones furnished with nearly sessile fascicles of flowers; segments of corolla roundish, obtuse; tube straight, glabrous; calycine teeth subulately acuminated. ♃. H. Native of Carolina, in sandy fields; and on the mountains of Georgia. Lodd. bot. cab. 1251.—Plukn. alm. t. 98. f. 1. Flowers usually purple, sometimes white, smaller than those of *P. aristàta*.

Var. β, amœ'na (Sims, bot. mag. 1308.) this is probably nothing more than a luxuriant garden production of the species. ♃. H.

Pilose Phlox. Fl. Ju. July. Clt. 1759. Pl. ½ to 1 foot.

28 P. PROCU'MBENS (Lehm. cat. hort. hamb. 1829. Sweet, fl. gard. n. s. t. 7.) stems procumbent, branched; branches ascending, clothed with hair-like down, as well as the peduncles and calyxes; leaves lanceolate, acute, attenuated at the base, smoothish, ciliated on the edges; calycine segments linear, acute; segments of corolla cuneately obcordate, with a hairy, erect tube, twice longer than the calyx. ♃. H. Native of North America. Flowers disposed in terminal, few-flowered panicles, composed of 1-2-flowered peduncles. Corollas bluish purple. In habit this species is intermediate between *P. subulàta* and *P. pilòsa*.

Procumbent Phlox. Fl. May, Clt. 1827. Pl. procumbent.

29 P. SPECIÒSA (Pursh, fl. amer. sept. 1. p. 149.) erect, branched, frutescent, glabrous; leaves linear, acuminated, pungent, dilated and somewhat ciliated at the base, with calycine segments broad from the base, membranous, acuminated, about equal in height to the tube of the corolla; segments of corolla cuneate-oblong, entire. ♄. F. Native of North America, on the plains of the Columbia. Dougl. in bot. reg. 1351. Branches of corymb 3-flowered. Corollas flesh-coloured.

Showy Phlox. Fl. May, Ju. Clt. 1826. Shrub ½ to 1 foot.

30 P. SUBULA'TA (Lin. spec. 217.) plant tufted, whitish from down; leaves linear, pungent, ciliated; corymbs few-flowered; peduncles trifid; teeth of calyx subulate, hardly shorter than the tube of the corolla; segments of corolla cuneately obcordate. ♃. H. Native from New Jersey to Carolina, on dry sandy hills and rocks. Curt. bot. mag. 411. Jacq. fragm. t. 44. f. 4.—Plukn. phyt. t. 98. f. 2. Flowers pink-coloured, with a handsome purple star in the centre. Calyx villous.

Subulate-leaved Phlox. Fl. April, June. Clt. 1786. Pl. ½ ft.

31 P. HOÒDII (Richards. in Frankl. journ. append. ed. 2d. p. 6. t. 28.) plant humble, many-stemmed: leaves subulate, with woolly edges; flowers sessile, solitary; segments of the limb obovate. ♃. H. Native of the west coast of America, about Carlton House; and of the Rocky Mountains, in the valley of the Loup Fork. This is a singular and beautiful species.

Hood's Phlox. Pl. dwarf, tufted.

32 P. CŒSPITÒSA (Nutt. journ. acad. nat. sc. phil. 7. p. 41.) plant diffuse, procumbent; leaves subulate, ciliated, short, with reflexed edges; flowers solitary, on short pedicels; calycine segments spinulose; segments of corolla cuneated, entire. ♃. H. Native of the Rocky mountains, at Flat Head river, on the sides of dry hills. General habit of *P. subulàta*. Stems downy. Leaves ending in pungent points. Flowers terminating the branches solitary, pale violet or white.

Tufted Phlox. Pl. tufted.

33 P. LONGIFÒLIA (Nutt. journ. acad. phil. 7. p. 41.) plant somewhat tufted, many-stemmed; leaves subulate, very long, and very narrow, glabrous; stems few-flowered, very short, puberulous, irregularly trichotomous; peduncles filiform, elongated; calycine segments acuminated; segments of corolla oblong-cuneated, entire. ♃. H. Native of the Rocky mountains, in valleys, flowering most part of the summer. Stems almost a span high, many from the same root. Flowers apparently white. Very nearly allied to *P. Hoòdii*.

Long-leaved Phlox. Fl. summer. Pl. ½ foot.

34 P. MUSCOÌDES (Nutt. l. c. p. 42. t. 6. f. 2.) plant densely tufted, small; leaves closely imbricated, oblong-lanceolate, copiously ciliated, very short; flowers sessile, hardly exserted; segments of corolla cuneated, entire. ♃. H. Native of Alpine situations, at the sources of the Missouri. Root large, descend-

ing. The whole plant depressed to the appearance of a hoary *Brýum*, no part of it hardly rising to the height of ½ an inch from the ground. Leaves all hoary, lanuginose at the edges, ending in acute points. Flowers large, white, with a yellow spot towards the orifice.

Moss-like Phlox. Pl. tufted, ½ inch.

35 P. He'ntzii (Nutt. l. c. p. 110.) plant tufted, downy; leaves linear or lanceolate, ciliated, pungent; flowers corymbose, glomerate, few-flowered; segments of corolla cuneated, obtuse, entire; teeth of calyx acute, shortish. ♃. H. Native of the United States in the southern pine barrens. Habit of *P. subulàta*, but producing short, leafy stems, the summits of which only are floriferous.

Hentzius's Phlox. Pl. ½ foot

36 P. niva'lis (Sweet, fl. gard. 185.) plant suffruticose, much branched, procumbent; branches ascending, crowded, downy, usually 3-flowered; leaves linear, in fascicles, cuspidate, ciliated, recurved; pedicels and calyxes villous; tube of corolla twice as long as the calycine segments, which are linear, and sharp-pointed: segments of corolla obcordate, plicately lined. ♃. H. Native of North Carolina. Phlóx nívea, Lodd. bot. cab. 780. Flowers snow-white.

Snowy-flowered Phlox. Fl. April, May. Clt. 1820. Pl. procumbent.

37 P. seta'cea (Lin. spec. 217.) tufted, downy; leaves in fascicles, subulate, pungent, ciliated; peduncles few, terminal, subumbellate; segments of corolla cuneated, emarginate; teeth of calyx subulate, 3 times shorter than the tube of the corolla. ♃. H. Native from Virginia to Carolina, on rocks and barren sandy hills. Curt. bot. mag. 415. Pursh, 1. p. 151.—Plukn. phyt. t. 98. f. 2. Flowers pale rose-coloured, with a purple star in the centre. Calyx hairy.

Setaceous-leaved Phlox. Fl. April, July. Clt. 1786. Pl. procumbent.

38 P. Sibírica (Lin. amœn. acad. 2. p. 342. spec. 217.) tufted; stems numerous, from the same centre, pale green; leaves linear, villous; pedicels 2-4, hairy from the axils of the upper leaves; segments of corolla cuneated, entire, and are, as well as the calyxes, the length of the tube of the corolla. ♃. H. Native of Siberia, at the Lena.—Gmel. sib. 4. p. 81. t. 46. f. 2. Flowers purplish, as also white, with 10 purple stripes. Calyx cylindrical, hairy, ex Gmel. Segments of corolla from 4 to 6, often emarginate.

Siberian Phlox. Pl. ¼ to ½ foot.

N.B.—*The following names occur in garden catalogues; but these, in most instances, are synonymous with some of the above, or are names given to hybrids or trifling varieties.*

1 P. excélsa, Penny. 2 P. Wheeleriàna, Sweet, a hybrid. 3 P. Shephérdii, Sweet, a hybrid. 4 P. dísticha, Sabine. 5 P. involucràta, Nutt. 6 P. læ'ta, Penny. 7 P. elàta, Penny. 8 P. Virgínica, Lodd. 9 P. intermèdia, Lodd. cat. 10 P. acutifòlia, Sweet.

Cult. *Phlóx* is a genus of elegant border flowers; the most of them thrive in common garden earth, but prefer a rich loamy soil. Those species belonging to the third section of the genus, being tender, more dwarf kinds, will require to be protected under frames in winter, if severe; and it is therefore safest to have a plant or two of all these dwarfer kinds in pots. The larger kinds are easily increased by dividing at the root; and cuttings of the dwarf kinds strike root freely if planted under a hand-glass.

IV. HU'GELIA (named by Bentham, in honour of Baron Charles de Hugel, of Vienna.) Benth. in bot. reg. under no. 1622., but not of Rchb., which is *Didiscus*.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubularly campanulate, half 5-cleft, with the recesses hardly membranous; segments rather unequal, linear, stiff, somewhat spinose. Corolla funnel-shaped, with a short exserted tube, a 5-parted limb, and oblong, quite entire segments. Stamens inserted at the throat; anthers linear, sagittate. Cells of capsule many-seeded.—Annual or perennial herbs, clothed more or less with white woolliness. Leaves alternate, linear, entire or pinnatifid. Flowers disposed in dense, corymbose heads; with the calyxes and bracteas imbricate, immersed in dense wool. *Hùgelia* differs from *Gília* in the anthers and habit.

1 H. densifòlia (Benth. l. c.) plant humble; stem smoothish; leaves numerous, nearly all pinnatifid, glabrous, with 2-3 acerose segments on each side; tube of corolla longer than the calyx; stamens about equal in length to the corolla. ⊙.? H. Native of California, Douglas. Corollas blue.

Dense-leaved Hugelia. Pl. ½ foot.?

2 H. elonga'ta (Benth. l. c.) branches elongated, divaricate or procumbent, tomentose; leaves short, simple, or furnished with 1-2 segments on each side, all clothed with white tomentum, or at length hardly glabrous; tube of corolla exserted; stamens exceeding the corolla. ⊙.? H. Native of California, Douglas. Flowers deep blue.

Elongated Hugelia. Pl. 1 foot.?

3 H. virga'ta (Benth. l. c.) plant erect; leaves elongated, simple or pinnatifid, clothed with loose white wool; tube of corolla longer than the calyx; stamens shorter than the corolla. ⊙.? H. Native of California, Douglas. Flowers deep blue.

Twiggy Hugelia. Pl. ½ foot.?

4 H. lu'tea (Benth. l. c.) erect; lower leaves elongated, simple, glabrous: superior ones short, pinnatifid, clothed with white wool; corymbs small; tube of corolla shorter than the calyx; stamens equal in length to the corolla. ⊙.? H. Native of California, Douglas. Flowers yellow.

Yellow-flowered Hugelia. Pl. ½ foot.?

Cult. For culture and propagation see *Gília*, p. 245.

V. LINA'NTHUS (from λινον, *linon*, flax; and ανθος, *anthos*, a flower; from the resemblance of the flowers to several species of *Lìnum*.) Benth. in bot. reg. under no. 1622.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, membranous; with 5 strong, green nerves, which are drawn out into subulate, recurved teeth at the apex. Corolla funnel-shaped; with a short tube, a 5-cleft limb, and obovate segments, which are crenulated at the apex. Stamens inclosed in the tube; anthers filiform, hardly sagittate at the base. Cells of capsule many-seeded. This is a very distinct genus, from the calyx, anthers, and habit.

1 L. dichótomus (Benth. l. c.) ⊙. H. Native of California. Douglas. A glabrous, annual herb. Leaves opposite, sessile, palmate, with 3-5 linear-subulate segments. Flowers solitary in the forks, almost sessile, bractless, but numerous and approximate towards the tops of the branches. Corolla size, colour, and form of *Lìnum suffruticòsum*.

Dichotomous Linianthus. Pl.

Cult. For culture and propagation see *Gília*, p. 245.

VI. LEPTOSI'PHON (from λεπτος, *leptos*, slender; and σιφων, *siphon*, a tube; the tube of the corolla is long and slender.) Benth. in bot. reg. under no. 1622.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubularly campanulate, equal, semi-5-cleft; lobes linear-subulate, acute; sinuses membranous. Corolla funnel-shaped; with a very long, very slender tube, and a campanulate 5-cleft limb, with oval, obtuse, quite entire lobes. Stamens inserted at the throat of the corolla; anthers oblong, sagittate at the base. Cells of capsule many-seeded.—Annual herbs, glabrous at the base, and downy at top. Leaves opposite, sessile, palmately cut; with linear or subulate segments. Flowers disposed in dense corymbose heads,

with the axis rather woolly. Bracteas imbricate, conforming to the leaves; with ciliately-hairy segments. This genus differs from *Gília*, sect. *Dactylophýllum*, in the form of the corolla.

1 L. GRANDIFLO'RUS (Benth. l. c.) plant nearly simple; leaves 7-11 cleft; segments subulate, straight, with revolute margins; tube of corolla hardly twice longer than the limb; filaments very short. ⊙. H. Native of California, Douglas. Corolla blue, with a golden yellow or purple bottom.

Great-flowered Leptosiphon. Pl. ½ foot.

2 L. ANDROSA'CEUS (Benth. l. c. hort. trans. n. s. 1. t. 18. f. 1. bot. reg. 1710.) leaves 5-7-cleft; segments oblong-linear; tube of corolla 2-3 times longer than the limb; stamens 3 times shorter than the limb of the corolla. ⊙. H. Native of California, Douglas. A bushy, pilose herb. Corolla smaller, and more intensely coloured than the preceding, from white to pale blue or pink: the tube usually red. The multitude of flowers gives the plant a very gay appearance.

Androsace-like Leptosiphon. Fl. June, July. Clt. 1833. ½ foot.

3 L. LU'TEUS (Benth. in bot. reg. under no. 1622.) leaves 5-7-cleft; segments oblong-linear; tube of corolla about 4 times longer than the limb; stamens about 3 times shorter than the limb of the corolla; style scarcely equal in length to the corolla. ⊙. H. Native of California, Douglas. Corolla yellow, having the throat deeper coloured.

Var. β; corollas paler.

Yellow-flowered Leptosiphon. Pl. ½ foot.

4 L. PARVIFLO'RUS (Benth. l. c.) leaves 5-7-cleft; segments oblong-linear; tube of corolla 4 times longer than the limb; stamens hardly one-half shorter than the limb of the corolla; style a little exserted. ⊙. H. Native of California, Douglas. Corolla pale yellow, with a deep yellow bottom.

Small-flowered Leptosiphon. Pl. ½ foot.

5 L. DENSIFLO'RUS (Benth. l. c. hort. trans. n. s. 1. t. 18. f. 2. bot. reg. 1725.) leaves 9-11-cleft; segments subulate, erect, with revolute margins; tube of corolla shorter than the limb. ⊙. H. Native of California, Douglas. Habit of *L. androsàceus*, only it is gayer in appearance, being more glandular. The corollas in this are, however, 3 times larger, with a short, thick tube, instead of a long, slender one; its colour varies from purple to blue and white; but are not produced in the same profusion as those of *L. androsàceus*. From the short tube of the corolla, this plant probably belongs to *Gília*, sect. I. *Dactylophýllum*, Benth.

Dense-flowered Leptosiphon. Fl. July, Nov. Clt. 1833. Pl. ½ foot,

Cult. All the species of this genus are very gay when in blossom, and are therefore worth cultivating in every garden. The seeds of them only require to be sown in the open ground, in April; and if sown in large patches, the plants, when in blossom, will have, according to the size of the patch or bed, a gayer appearance.

VII. FE'NZLIA (so called by Bentham, in honour of Dr. Fenzl, of Vienna, now publishing a monograph of *Alsíneæ*.) Benth. in bot. reg. under no. 1622.

LIN. SYST. *Pentándria, Monogýnia.* Calyx tubularly-campanulate, deeply 5-cleft, with membranous sinuses, and linear, acutish, erect segments. Corolla somewhat funnel-shaped, with a short tube, and a 5-parted limb; segments of the limb obovate, toothed. Anthers ovate-sagittate, a little exserted from the tube. Cells of capsule many-seeded.

1 F. DIANTHIFLÒRA (Benth. l. c.) ⊙. H. Native of California, Douglas. A small, annual, nearly simple herb, about 2-3 inches in height, glabrous or downy. Leaves opposite. linear, quite entire. Flowers 1-3 together, pedunculate. Corolla nearly an inch long, purplish, with a yellow bottom.

Pink-flowered Fenzlia. Pl. 2 to 3 inches.

Cult. For culture and propagation, see *Leptosìphon*, above.

VIII. GI'LIA (named after Philippe Salvador Gilio, a Spanish botanist.) Ruiz. et Pav. fl. per. 2. p. 17. t. 123. Benth in bot. reg. under no. 1622.—Ipomópsis, Smith, exot. bot. 1. p. 23. t. 13.

LIN. SYST. *Pentándria, Monogýnia.* Calyx campanulate, 5-cleft (f. 28 *a*.), with the margins and recesses membranous. Corolla funnel-shaped, or sub-campanulate (f. 28. *b*.); limb 5-parted; segments obovate, entire. Stamens inserted at the throat of the corolla, or hardly within the tube; anthers ovate-roundish. Capsule oblong, subtrigonal; valves membranous; cells many-seeded. Seeds angular. Albumen sparing. Radicle shorter than the cotyledons.—Usually annual, rarely biennial herbs. Leaves alternate, pinnate, with entire or cut segments, in the sections *Ipomópsis* and *Eugília;* but in the section *Dactylophýllum*, the leaves are opposite, palmately cut, with entire, subulate segments.

SECT. I. DACTYLOPHYLLUM (from δακτυλον, *dactylon*, a finger; and φυλλον, *phyllon*, a leaf; in reference to the palmate-cut leaves.) Benth. in bot. reg. under no. 1622. Lower leaves opposite, all sessile, and palmately cut. Flowers solitary, on long peduncles. Corolla with a very short tube, and spreading limb. Perhaps a proper genus ?, Benth. l. c.

1 G. LINIFLO'RA (Benth. l. c.) lower leaves opposite, all sessile, and palmately cut; corolla 3 times longer than the calyx. ⊙. H. Native of California, Douglas. Flowers white ?, form and size of those of *Lìnum tenuifòlium*.

Flax-flowered Gilia. Pl. ?

2 G. PHARNACEOÌDES (Benth. l. c.) lower leaves opposite, all sessile, and palmately cut; corolla twice longer than the calyx. ⊙. H. Native of California, Douglas. This species differs from the preceding, in the flowers being one half smaller.

Pharnaceum-like Gilia. Pl. ?

3 G. PUSÍLLA (Benth. l. c.) lower leaves opposite, all sessile, and palmately cut; corolla hardly exceeding the calyx. ⊙. H. Native of Chili, Bertero. Habit of *Arenària tenuifòlia*. It differs from *G. pharnaceoìdes*, in the flowers being one half smaller, and in the corollas being less spreading.

Least Gilia. Pl. ¼ foot.

SECT. II. IPOMO'PSIS (from ιπω, *ipo*, to strike forcibly; and οψις, *opsis*, sight; brilliancy of flowers.) Benth. in bot. reg. under no. 1622. Ipomópsis, Michx. and other authors. Leaves alternate, pinnate or pinnatifid. Flowers solitary, or somewhat glomerate. Tube of corolla elongated, much exserted beyond the calyx.

4 G. CORONOPIFO'LIA (Pers. ench. 1. p. 187.) stem erect, tall, panicled at top, and clothed with glandular down; leaves pectinately pinnate; leaflets linear, acuminated; tube of corolla 5 times longer than the calyx; limb of corolla spreading, with oblong or ovate, acute, flat segments. ♂. H. Native of Carolina; and on the banks of the Canadian river. Lindl. bot. reg. 1691. Sweet, fl. gard. n. s. t. 289. Ipomópsis pícta, Hort. gall. Ipomópsis élegans, Michx. fl. bor. amer. 1. p. 141. Smith, exot. bot. 1. p. 23. t. 13. Ipomópsis coronopifòlia, Nutt. gen. amer. 1. p. 124. Cántua coronopifòlia, Willd. spec. 2. p. 879. Andr. bot. rep. 415. Pursh, 1. p. 147. Cántua pinnatífida, Lam. ill. 1. p. 473. C. élegans, Poir. dict. suppl. 2. p. 80. Polemònium rùbrum, Lin. spec. 1. p. 231. Ipomæ'a rùbra, Lin. syst. 171. Cántua thyrsoìdea, Juss. ann. mus. 3. p. 119.—Dill. elth. 2. p. 321. t. 241. f. 312. Stem clothed with fine glands, mixed with downiness. Corollas scarlet, blotched with white.

Buckhorn-leaved Gilia. Fl. Aug. Sept. Clt. 1726. Pl. 3 to 5 feet.

5 G. AGGREGA'TA (D. Don, in edinb. phil. journ. 1822. Sweet, fl. gard. n. s. t. 218.) stem erect, tall, glabrous, panicled at top; leaves pectinately pinnate, and are, as well as the bracteas, covered with cobwebbed villi; leaflets or segments linear, mucronate; flowers fascicled at the extremities of the branches, drooping a little; tube of the corolla 5 times longer than the calyx; segments of the limb ovate-lanceolate, acuminated, channelled. ⊙. H. Native of the north-west coast of America, particularly towards the sources of the Columbia, and on the Canadian river. Ipomópsis élegans, Lindl. bot. reg. 1281. Gília pulchélla, Dougl. mss. Cántua aggregàta, Pursh, amer. 1. p. 147. Upper leaves undivided. Calyx clothed with glandular hairs. Corolla an inch long, scarlet; limb at first erect, at length recurved. Stamens a little exserted. Segments of corolla spotted.

Aggregate-flowered Gilia. Fl. Aug. Sept. Clt. 1827. Pl. 3 feet.

6 G. FLORIDA'NA; plant glabrous; leaves pinnate, capillary; flowers disposed in loose racemes; corolla tubular, narrowed at bottom; limb 4 times shorter than the tube; calyx short, with setaceous segments. ♂. F. Native of Florida. Cántua floridàna, Nutt. in journ. acad. phil. 2. p. 110. Very like *G. coronopifòlia*, but is a more slender plant.

Florida Gilia. Pl. 2 to 3 feet.

7 G. SE'SSEI; stem dwarf, branched, clothed with glandular down; leaves pinnatifid; segments cuneated, with pointed teeth; bracteas ovate-lanceolate, mucronate, longer than the calyx; corolla with a filiform tube, double the length of the calyx; flowers fascicled. ⊙. H. Native of Mexico. Gília pinnatífida, Sesse et Mocino, in herb. Lamb. Stamens inclosed.

Sesse's Gilia. Pl. ¼ foot.

8 G. TENUIFLO'RA (Benth. l. c.) stem erect, tall, clammy, nearly naked, and panicled at top; leaves glabrous, bipinnate; flowers usually solitary; corymbs loose, on long peduncles; corolla 4 times longer than the calyx. ⊙. H. Native of California, Douglas. Flowers blue.

Thin-flowered Gilia. Pl. 3 to 4 feet.

9 G. LONGIFLÒRA; plant quite glabrous; leaves scattered, finely pinnatifid; stem much branched, panicled at top; flowers disposed in loose terminal, panicled, pedunculate corymbs; tube of corolla very long. ⊙. H. Native on the banks of the Canadian river. Cántua longiflòra, Torrey, in ann. lyc. p. 221. Corolla salver-shaped, having the tube an inch long. A remarkable species, having much the appearance of a *Phlóx*. It differs from all other species, in the salver-shaped corolla.

Long-flowered Gilia. Pl. 2 to 3 feet.?

10 G. ARENA'RIA (Benth. l. c.) stem humble, clammy, nearly naked; leaves pinnatifid; lobes ovate; flowers somewhat glomerate; corollas 3 times longer than the calyx. ⊙. H. Native of California, Douglas. Flowers blue.

Sand Gilia. Pl. dwarf.

11 G. CRASSIFO'LIA (Benth, l. c.) stem erect, clammy, nearly naked, and panicled at top; leaves pinnatifid, rather woolly, but at length glabrous: segments oblong-lanceolate, entire or cut; flowers nearly solitary, divaricately panicled; corollas twice longer than the calyx. ⊙. H. Native of Chili, Cuming. Flowers yellowish?

Thick-leaved Gilia. Pl. 1 to 2 feet?

SECT. III. EUGI'LIA (from *eu*, well, and *Gilia;* this section is considered to contain the true species of the genus.) Benth. l. c. Leaves alternate, pinnatifid or pinnate. Flowers almost solitary, but usually glomerate. Tube of corolla rather shorter than the calyx.

12 G. PARVIFLO'RA (Spreng. syst. 1. p. 626.) stem much branched, and is, as well as the calyxes, clothed with glandular down; leaves pinnatifid, lower ones bipinnate; segments linear; flowers solitary, terminal, panicled; corolla about twice the length of the calyx. ⊙. H. Native of North-west America. Gília inconspícua, Dougl. in bot. mag. 2883. Ipomópsis inconspícua, Smith, exot. bot. 1. t. 14. Cántua parviflòra, Pursh, amer. 2. suppl. p. 730. Corolla small, blue; tube nearly white.

Inconspicuous Gilia. Fl. Sept. Nov. Clt. 1793. Pl. ½ to 1 foot.

13 G. TRÍCOLOR (Benth, l. c. hort. trans. 1. t. 18. f. 3. bot. reg. t. 1704.) stem erect, glabrous, leafy; leaves bipinnate; leaflets or segments linear-subulate; corymbs 3-6-flowered, virgately panicled; corolla about 3 times longer than the calyx. ⊙. H. Native of California, Douglas. Sweet, fl. gard. n. s. t. 264. The peduncles form a large and rather dense panicle. Corolla with an orange yellow tube and centre, and the light purple or white of the margin separated by a circle of deep purple. Nothing can be prettier than this, and other species, when thickly covering a bed a few feet in length and breadth.

Three-coloured-flowered Gilia. Fl. June, Sept. Clt. 1833. Pl. 1 foot.

14 G. LACINIA'TA (Ruiz, et Pav. fl. per. 2. p. 17. t. 123. f. *b*. Pers. ench. 1. p. 187.) downy; stem erect; leaves pinnatifid; segments narrow-oblong, sinuated; peduncles axillary, solitary, 1-3-flowered; corolla tubular, hardly longer than the calyx; calycine segments subulate. ⊙. H. Native of Chili, Peru, California, &c., on sandy hills. Cántua breviflòra, Juss. ann. mus. 3. p. 119. Thónnia multífida, Domb, herb. Corollas purplish, with lanceolate segments.

Jagged-leaved Gilia. Fl. July. Clt. 1831. Pl. ½ to 1 foot.

15 G. MULTICAU'LIS (Benth, l. c.) stem erect, smoothish; leaves somewhat bipinnate, smoothish; segments linear; corymbs 3-10-flowered, on very long peduncles, scarcely panicled; corollas hardly twice longer than the calyx. ⊙. H. Native of California, Douglas. Corollas blue.

Many-stemmed Gilia. Pl. 1 foot.

16 G. ACHILLEÆFO'LIA (Benth, l. c.) stem erect, smoothish; leaves twice or thrice pinnate; segments or leaflets linear-subulate; corymbs capitate, many-flowered, on very long peduncles; calyxes rather woolly; corollas twice longer than the calyx; stamens shorter than the corolla. ⊙. H. Native of California, Dougl. Lindl. bot. reg. 1682. Sweet, fl. gard. n. s. t. 280. Herb branched, pale green, glabrous. Bases of leaves ciliated. Corollas purplish blue. This species resembles *G. capitàta*.

Milfoil-leaved Gilia. Fl. Aug. Dec. Clt. 1833. Pl. 1 foot.

17 G. CAPITA'TA (Doug. in bot. mag. 2698. bot. reg. 1170.) plant glabrous, erect; leaves bipinnatifid; segments linear, cut; flowers sessile, disposed in dense heads, similar to those of *Jasiòne*, on long peduncles; corolla longer than the calyx; stamens shorter than the corolla. ⊙. H. Native of North-west America. Flowers blue.

Capitate-flowered Gilia. Fl. Jun. Sept. Clt. 1826. Pl. 1 to 2 feet.

Cult. All the species of *Gília* are elegant, hardy annuals, of easy culture, the seeds only requiring to be sown in the

FIG. 28.

open border in spring. The larger the quantity of each grown together, the more showy they appear.

IX. ÆGOCHLO'A (from *αιξ αιγος, aix aigos*, a goat; and *χλοα, chloa*, a green herb; from the fetid smell of some of the species.) Benth, in bot. reg. under no. 1622.—Gília species, Dougl.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubularly campanulate, membranous at the base, 5-cleft at the apex; segments unequal, stiff, entire or multifid, spinose. Corolla somewhat salver-shaped; tube about equal in length to the calyx; limb 5-parted; segments oblong, entire. Stamens inserted in the upper part of the tube inside; anthers ovate-roundish. Cells of capsule many-seeded.—Herbs usually clammy and fetid. Leaves pinnate; segments or leaflets cut, very acute.

1 Æ. interte'xta (Benth. l. c.) plant erect, branched; leaves glabrous, pinnate; leaflets or segments linear-subulate, very acute, cut, divaricate, rather spinose; calyx woolly, having the teeth for the most part multifid; corolla rather shorter than the calyx; stamens exserted. ⊙. H. Native of California and North-west America, Douglas.

Interwoven Ægochloa. Pl. 1 foot.

2 Æ. cotulæfo'lia (Benth. l. c.) plant erect, strict; leaves glabrous, bipinnate; segments linear-subulate, very acute, those of the upper and floral leaves spinose; bracteas villous; calycine teeth nearly entire; corolla equal in length to the calyx; stamens exserted. ⊙. H. Native of California, Douglas.

Cotula-leaved Ægochloa. Pl. 1 foot.

3 Æ. pube'scens (Benth. l. c.) plant clothed with soft down; stem branched; leaves pinnate; leaflets deeply pinnatifid; lobes divaricate, rather spinose; calyxes and bracteas membranous at the base, glabrous, deeply pinnatifid, and villous at the apex; corolla about twice longer than the calyx; stamens exserted from the tube. ⊙. H. Native of California, Dougl.

Downy Ægochloa. Pl. 1 foot.?

4 Æ. pu'ngens (Benth. l. c.) plant erect, much branched, clothed with clammy down; leaves pinnate; leaflets entire or cut, the lobes lanceolate-linear, very acute and spinose; bracteas ciliately hairy, dilated at the base; calycine segments lanceolate, nearly entire; corolla longer than the calyx; stamens inclosed. ⊙. H. Native of California, Douglas; and of the west coast of America, in moist ground, in mountain valleys, near the sources of the Mulnomack river, one of the southern branches of the Columbia. Gília púngens, Doug. in bot. mag. t. 2977. Gília squarròsa, Hook. et Arn. in Beech. voy. pt. bot. p. 115. Hoítzia squarròsa, Eschscholz, in mem. acad. petersb. 10. p. 283, and in Linnæa, 1823. p. 147. Flowers glomerate, terminal. Calyx longer than the corolla, ex Hooker. Tube of corolla swelling upwards, almost white; limb spreading, pale blue; segments ovate.

Pungent Ægochloa. Fl. July. Clt. 1833. Pl. 1½ foot.

5 Æ. eryngioìdes (Benth. l. c.) plant smoothish; leaves linear, opposite, floral ones pinnatifid, spiny; flowers glomerate; calyx multifid. ⊙. H. Native of Chili. Gília eryngioìdes, Bot. zeit. 1833. 1. p. 122. Gília mucronàta, Lehm. cat. sem. hort. hamb. 1832? Nearly allied to the preceding; but differs, in the smoothness of the plant, and in the leaves, calyx and corolla.

Eryngium-like Ægochloa. Pl. 1 foot.?

6 Æ. atractylioìdes (Benth. l. c.) plant very clammy; leaves pinnatifid; raches dilated; segments subulate, divaricate, spinose; floral leaves ovate, imbricated, spiny-toothed, clasping the flowers; calycine teeth subulate, entire. ⊙. H. Native of California, Douglas. Habit of *Atráctylis hùmilis.*

Atractylis-like Ægochloa. Pl. 1 foot.

7 Æ.? Torre'yi; plant erect, simple, or a little branched, stiff, glabrous; leaves sessile, digitate, alternate, imbricate; segments 5-6, pungent; flowers axillary in the upper part of the stem, solitary, sessile; segments of corolla obovate, obtuse. ⊙. H. Native of the Rocky mountains, in the valleys of Loup river. Cántua púngens, Torrey, in ann. lyc. 2. p. 220. Leaves sessile, digitate, appearing as if in clusters. Corolla salver-shaped, with a long, slender tube. Stamens inclosed. Cells of capsule many-seeded. Seeds angular. This has a very distinct habit from the other species.

Torrey's Ægochloa. Pl. 1 foot.

Cult. The species of *Ægochlòa* require the same treatment as those of *Gília.* They are singular, but by no means showy plants.

X. COLLO'MIA (from *κολλα, colla*, glue; in reference to the seeds being enveloped in a kind of gluey, sticking substance.) Nutt. gen. amer. 1. p. 126. Dougl. in bot. reg. 1166. and 1174. Gília species, Hook.

Lin. syst. *Pentándria, Monogýnia.* Calyx campanulate, 5-cleft, or somewhat 5-parted; lobes lanceolate or linear, equal, entire. Corolla salver-shaped; with a slender, exserted tube; and a spreading, 5-parted limb; segments oblong, entire. Stamens inserted towards the middle of the tube; anthers ovate-roundish. Cells of capsule 1-2-seeded.—Annual herbs. Leaves alternate, the lower ones rarely opposite, quite entire, or deeply toothed, rarely pinnatifid. Flowers disposed in dense heads, propped by broad ovate, quite entire bracteas.

1 C. heterophy'lla (Hook. bot. mag. 2895. Lindl. bot. reg. 1347.) plant prostrate, branched, clothed with glandular down; lower leaves pinnatifid and cut; superior ones cuneated, pinnatifid or cut; bracteas or involucral leaves, oblong, acute, quite entire. ⊙. H. Native of North-west America. Flowers crowded, shorter than the involucral leaves. Corolla red, with a white centre.

Various-leaved Collomia. Fl. Ju. Aug. Clt. 1826. Pl. ½ to ¾ foot.

2 C. coccínea (Lehm. del. sem. hort. hamb. 1832. Benth. bot. reg. 1622.) plant erect, branched, beset with glandular down; leaves lanceolate-linear; upper ones ovate-lanceolate, quite entire, or deeply 2-4-toothed at the apex; calyx semi-5-cleft, with broad-lanceolate, obtuse segments; corolla more than twice longer than the calyx; cells of capsule 1-seeded. ⊙. H. Native of Chili, about Conception and Talcahuana. C. Cavanillèsii, Hook. et Arn. p. 37. Phlóx lineàris, Cav. icon. 6. p. 17. t. 527. Phlóx biflòra, Ruiz. et Pav. fl. per. 2. p. 17. C. laterítia, D. Don, in Sweet, fl. gard. t. 206. This species resembles *C. lineàris;* but from which it is distinguished by its deep red flowers, and by the leaves being frequently divided at the apex into 2-3 sharp segments, of unequal size.

Scarlet-flowered Collomia. Fl. Ju. Oct. Clt. 1832. Pl. 1 to 1½ foot.

3 C. linea'ris (Nutt. gen. amer. 1. p. 126. Lindl. bot. reg. 1166.) plant erect, branched, clothed with glandular hairs; leaves ovate-lanceolate, quite entire, opaque, uniform, superior ones downy beneath; calyx cup-shaped, 5-parted; corolla more than twice longer than the calyx; cells of capsule 1-seeded. ⊙. H. Native of North America, from Lake Winepeg to the Western Ocean; and at the sources of the Arkansas. Hook. bot. mag. 2893. Heads of flowers involucrated like the rest. Corolla with a rufous tube, and a rose-coloured limb. Segments of calyx 3-veined.

Linear-leaved Collomia. Fl. Ju. Oct. Clt. 1826. Pl. 1 foot.

4 C. grandiflo'ra (Dougl. in bot. reg. t. 1274. Hook. bot.

mag. 2894.) plant erect, branched, rather downy at top; leaves oblong-lanceolate, entire, shining, ciliated with glands; calyx 5-cleft, villous, glandular; corolla ventricose; limb spreading; cells of capsule 1-seeded. ⊙. H. Native of North-west America, in the country bordering on the river Columbia; and as far eastward as the Rocky mountains. Stem purple. Heads of flowers hemispherical, pruinose, clammy. Corollas like those of *C. lineàris*, of a peculiar reddish yellow, or nankeen colour.

Great-flowered Collomia. Fl. Ju. Oct. Clt. 1826. Pl. 1½ to 2 feet.

5 C. gilioìdes (Benth. in bot. reg. under no. 1622.) leaves pinnate; leaflets linear, entire; calyx deeply 5-cleft; stamens inclosed; cells of capsule 1-seeded. ⊙. H. Native of California, Douglas. Corollas very like those of *C. grácilis*.

Gilia-like Collomia. Pl. 1 foot.

6 C. glutino`sa (Benth. l. c.) procumbent; leaves deeply pinnatifid, almost pinnate; segments oblong-linear, entire, or a little cut; calyx nearly 5-parted; stamens longer than the corolla; cells of capsule 1-seeded. ⊙. H. Native of California, Douglas. Corollas like those of *C. gràcilis*.

Clammy Collomia. Pl. procumbent.

7 C. Navarre`tia; leaves pinnately multifid; segments linear-subulate; flowers capitate, involucrated by numerous bracteas; stem downy, simple, or a little branched. ⊙. H. Native of Chili. Navarrètia involucràta, Ruiz. et Pav. fl. per. 2. p. 8. Segments of calyx furnished with 3 pungent teeth. Stamens exserted. Stigma bifid. Capsule 2-celled, few-seeded, ex Ruiz. et Pav. l. c. Corolla purple.

Navarretia Collomia. Pl. ½ to 1 foot.

8 C. gra`cilis (Benth. l. c.) plant erect, branched, clothed with glandular down; leaves lanceolate-oblong, obtuse; calyx 5-parted; calycine segments long, subulate; stamens inclosed; cells of capsule 1-seeded. ⊙. H. Native of the north-west coast of America, on the banks of the Spokan river; and on high ground, near Flat Head river, on light soils; and California, Douglas; Chili, Cuming; &c. Gília gràcilis, Doug. in bot. mag, 2924. Lower leaves opposite. Flowers crowded at the extremities of the branches, at length elongated into racemes. Calyx clothed with black glands. Corolla small, with a yellow tube, rose-coloured limb, and oval segments.

Slender Collomia. Fl. Ju. Oct. Clt. 1826. Pl. 1 foot.

9 C. Cavanillesia`na; suffruticose; leaves pinnate; leaflets long, linear, entire; peduncles axillary, solitary, usually 5-flowered; corolla 3 times longer than the calyx, which is 5-cleft; cells of capsule 1-seeded. ♄. G. Native of Monte Video and Buenos Ayres. Phlóx pinnàta, Cav. icon. 6. p. 17. t. 528. f. 1. Poir. dict. suppl. 4. p. 397. Cántua glomeriflòra, Juss. ann. mus. 3. p. 119. Rœm. et Schultes, syst. 4. p. 368. Flowers disposed in heads, small, cream-coloured.

Cavanilles's Collomia. Pl. 1 to 2 feet.

Cult. All the species are of the most easy culture, the seeds only requiring to be sown in the open border in spring. Some of the kinds are rather showy.

XI. CALDA`SIA (named after J. Caldas, a botanist of Santa Fe de Bogota.) Willd. hort. berol. 1. p. 71. t. 71. enum. 1. p. 202. H. B. et Kunth, nov. gen. amer. 3. p. 166. D. Don, in edinb. phil. journ. Bonplándia, Cav. icon. 6. p. 21. t. 532.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, 5-toothed, equal to the corolla in length. Corolla somewhat funnel-shaped, unequal; limb 5-lobed; lobes cuneated, emarginate. Stamens 5, equal, inserted in the middle of the tube, declinate, exserted. Capsule oblong, trigonal; valves membranous; cells 1-seeded. Seeds oblong, somewhat trigonal, convex outside, mucilaginous. Albumen sparing. Radicle hardly shorter than the cotyledons.—A much branched, annual, erect herb, clothed with glandular hairs. Leaves alternate, simple, elliptic-acuminated, serrated. Flowers axillary, twin, pedicellate, bractless. Corolla of a violet-blue colour, or purple.

1 C. heterophy`lla (Willd. l. c.) ⊙. S. Native of New Spain, gathered by Humboldt and Bonpland, in the Botanic Garden of Mexico. Bonplándia geminiflòra, Cav. l. c. Pers. ench. 1. p. 187. Rœm. et Schultes, syst. 4. p. 370. Leaves lanceolate. Corolla an inch long; with linear segments, red filaments, and yellow anthers.

Various-leaved Caldasia. Fl. Ju. Aug. Clt. 1813. Pl. 1½ foot.

Cult. This plant requires the treatment of other tender annuals; that is, the seeds should be sown on a hot-bed, in spring, and the plants, when of sufficient size, should be planted in separate pots, and placed in the greenhouse during summer.

XII. LŒSE`LIA (so named, by Linnæus, after John Lœsel, author of Flora Prussica, 1654, published at Gottsched, with additions, in 1703.) Lin. gen. 767. Schreb. gen. no. 1029. Gærtn. fruct. 1. p. 295. t. 62. Juss. gen. p. 135. Lam. ill. 527. Royèna, Houston, in phil. trans.—Cántua species, Willd. Hoítzia, Juss. gen. ed. Usteri, p. 152. Cav. icon. 4. p. 44. t. 366. H. B. et Kunth, nov. gen. amer. 3. p. 162.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, dry, 5-cleft (f. 29. *a.*), with pungent segments, furnished with 5 lanceolate, pungently mucronate bracteas outside (f. 29. *f.*). Corolla funnel-shaped (f. 29. *b.*), 3 times longer than the calyx; tube a little curved; limb 5-lobed; lobes broadly obovate, entire. Stamens equal, exserted (f. 29. *c.*). Capsule trigonal; cells few-seeded; valves membranously crustaceous. Seeds compressed, nearly orbicular, girded by a very narrow membrane. Albumen sparing. Radicle about equal in length to the cotyledons.—Stiff, branched shrubs, natives of Mexico; branches terete, downy or villous. Leaves alternate, ovate or lanceolate, mucronate, hairy, sharply serrated, reticulately veined, cuneated at the base, on very short petioles. Flowers solitary or twin, axillary, pedicellate, large, showy, scarlet or violaceous.

1 L. cilia`ta (Lin. spec. 875.) leaves ovate-lanceolate, acutely serrated; corymbs many-flowered; stamens, 4 of which are exserted, and the fifth short, seated on the middle of the segment; bracteas roundish-ovate, cordate, ciliately toothed. ♄. G. Native of Vera Cruz. Lam. ill. 527. Gærtn. fruct. 1. p. 295. t. 62. f. 3. Stem quadrangular, branched. Flowers yellow. Bracteas imbricated. Cells of capsule 2-seeded.

Ciliated-bractead Lœselia. Shrub 4 to 6 feet.

2 L. coccínea; leaves nearly sessile, ovate; flowers axillary, solitary, on short peduncles; bracteas lanceolate, subserrated, veiny, hairy. ♄. G. Native of Mexico, plentiful near Guanaxuato, and elsewhere.; it is also cultivated in the gardens. Hoítzia coccínea, Cav. icon. 4. p. 44. t. 365. H. B. et Kunth, nov. gen. amer. 3. p. 162. Hoítzia Mexicàna, Lam. dict. 3. p. 134. Cántua Hoítzia, Willd. spec. 1. p. 878. Cántua coccínea, Poir. suppl. 2. p. 80. Bracteas villous. Leaves acutely mucronate, cuneated at the base, scabrous above, and hairy beneath; serratures mucronately awned. Calycine segments lanceolate-subulate, 1-nerved. Corollas scarlet, glabrous; segments of the limb obovate, spreading.

FIG. 29.

Scarlet Lœselia. Fl.? Clt. 1824. Shrub 3 to 4 feet.

3 L. cœrùlea; leaves nearly sessile, lanceolate or oblong-lanceolate, sharply serrated; flowers usually solitary, on the tops of the branchlets; bracteas obovate, mucronately serrated, diaphanous, white, veined with green, smoothish. ♄. G. Native of Mexico, along with the preceding species. Hoítzia cœrùlea, Cav. icon. 4. p. 44. t. 366. H. B. et Kunth, nov. gen. 3. p. 163. Cántua cœrùlea, Poir. suppl. 2. p. 80. Stems diffuse. Branches clothed with hair-like down. Leaves acutely mucronate, obtuse at the base, scabrous above, and hairy on the veins beneath; serratures mucronately awned. Flowers usually solitary, but sometimes twin or tern, ex Bonpl. Calycine segments oblong, mucronate, 3-nerved in the middle. Corolla blue, glabrous, with obovate, spreading segments.

Blue-flowered Lœselia. Fl.? Clt. 1824. Shrub 1 to 2 feet.

4 L. glandulòsa; leaves ovate-lanceolate, petiolate, spiny-toothed; those of the branches nearly linear; flowers axillary, solitary, pedunculate; bracteas lanceolate, obsoletely denticulated. ♄. G. Native of Mexico, between Actopan and Salvatierra, where it is called by the natives, *Huitzitziltzin;* hence the generic name. Hoítzia glandulòsa, Cav. icon. 4. p. 45. t. 367. Cántua glandulòsa, Poir. suppl. 2. p. 80. Stem beset with glandular hairs. Calycine segments subulate. Bracteas beset with glandular pili on the back. Corolla red. Capsule ovate-oblong.

Glandular Lœselia. Fl.? Clt. 1825. Shrub 2 feet.

5 L. arista'ta; leaves petiolate, ovate, doubly serrated; flowers numerous, crowded at the tops of the branches; bracteas ovate, dentately awned, diaphanous, reticulated with green veins, glabrous, outer ones cordate, remote, and smaller. ♄. G. Native of Mexico, between Lagura and Actopan, &c. Hoítzia aristàta, H. B. et Kunth, nov. gen. amer. 3. p. 164. Branches glabrous, but the branchlets are downy. Leaves acute, rounded at the base, scabrous above, and paler and hairy on the nerves and veins beneath; teeth mucronately awned. Calycine segments lanceolate, subulate at the apex, 1-nerved. Corolla violaceous; with spatulate, rounded, ciliated segments.

Awned Lœselia. Shrub.

6 L. Cervante'sii; branches clothed with glandular hairs; leaves nearly sessile, oblong or oblong-lanceolate, sharply serrulated; flowers twin, crowded at the tops of the branches; bracteas linear, 1-nerved, mucronate, acutely serrulated towards the top, and beset with glandular villi. ♄. G. Native of Mexico, with the preceding. Hoítzia Cervantèsii, H. B. et Kunth, nov. gen. amer. 3. p. 164. H. spicàta, Rœm. et Schultes, syst. 4. p. 165. Shrub much branched. Leaves scabrous on the nerves and veins, on both surfaces; teeth mucronate. Calycine segments lanceolate, acutely mucronate, serrulated at apex, marked with 3 green nerves. Corolla violaceous; with obovate segments.

Cervantes' Lœselia. Shrub.

7 L. conglomera'ta; branches clothed with glandular villi; leaves on short petioles, ovate, sharply serrated; flowers solitary, crowded into heads at the tops of the branchlets; bracteas lanceolate, acutely serrulated, veiny, and clothed with glandular hairs. ♄. G. Native of Mexico. Hoítzia conglomeràta, H. B. et Kunth, nov. gen. 3. p. 165. H. capitàta, Willd. rel. in Rœm. et Schultes, syst. 4. p. 370. Shrub canescent. Leaves acuminated, narrowed at the base, hairy on both surfaces; teeth mucronate. Calycine segments 5-toothed at top; teeth subulate. Corolla violaceous.

Conglomerate-flowered Lœselia. Shrub.

8 L. nepetæfòlia (Schlecht. et Cham. in Linnæa, 6. p. 385, under Hoítzia.) stems erect, terete, compressed at the nodi, and are, as well as the bracteas, downy; cauline leaves cuneated, entire, ovate, acute, serrated, tapering into the petioles; serratures acuminated, paler beneath, with that part of the stem ciliated which runs from the middle of the nerves of the leaves; flowers nearly sessile, solitary, or loosely approximate, each involucrated by 4-5 bracteas; teeth of bracteas cuspidate; stamens equal in length to the corolla. ♄. G. Native of Mexico, in meadows, about Misàntla and Colipa. Habit of *Labiàtæ*. Flowers small, purple, or bluish purple.

Nepete-leaved Lœselia. Shrub.

9 L. involucra'ta; plant clothed with minute, glandular pubescence; leaves petiolate, ovate, acute, doubly toothed, and fringed on the margins; bracteas about as long as the flowers; flowers in fascicles. ♄. G. Native of Mexico. Phlóx involucràta, Sesse et Moc. in herb. Lamb. Calyx with membranous, acuminated segments. Stem nearly glabrous, slender.

Involucrated Lœselia. Shrub 2 to 3 feet.

Cult. The species of *Lœsèlia* are extremely elegant shrubs, particularly while in blossom. A mixture of loam, peat, and sand, is the best soil for them; and cuttings will strike root in sand, under a hand-glass.

XIII. CA'NTUA (Cantu is the Peruvian name of one of the species.) Juss. gen. ed. Usteri, p. 152. ann. mus. 3. p. 117. Lam. ill. t. 106. f. 1. H. B. et Kunth, nov. gen. amer. 3. p. 161. D. Don, in edinb. phil. journ.—Periphrágmos, Ruiz. et Pav. fl. per. 2. p. 17.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, 5-toothed, usually cleft to the middle on both sides. Corolla funnel-shaped, 3 times longer than the calyx; tube curved a little; limb 5-lobed; lobes obcordate, convolute in æstivation. Stamens inserted in the tube near the base, exserted. Capsule oblong, trigonal, with 3 deep furrows opposite the dissepiments; valves coriaceously crustaceous; cells many-seeded; seeds oval, compressed, girded by an oblong, membranous wing. Albumen sparing. Radicle shorter than the cotyledons.—Erect, branched shrubs, natives of Peru, with the habit of *Lýcium*. Leaves alternate, petiolate, elliptic, acuminated, or cuneate-oblong, quite entire, or serrated, or rarely pinnatifidly sinuated, downy on both surfaces while young, but always on the under surface. Flowers terminal, corymbose, rarely almost solitary, as in *C. ovàta*, white or purple; in *C. buxifòlia*, large and showy.

1 C. pyrifòlia (Juss. ann. mus. 3. p. 117. t. 7.) leaves elliptic, acuminated, quite entire; corymbs dense-flowered; peduncles downy; stamens twice as long as the corolla, which is curved. ♄. G. Native of Peru, near Loxa, where it is called *Turu* by the natives. Lam. ill. 1. t. 106. f. 1. H. B. et Kunth, nov. gen. amer. 3. p. 161. Periphrágmos flexuòsus, Ruiz. et Pav. fl. per. 2. p. 17. t. 131. Cántua flexuòsa, Pers. ench. 1. p. 187. Cántua Peruviàna, Gmel. syst. 1. p. 347. Cántua Loxénsis, Willd. herb. in Rœm et Schultes, syst. 4. p. 369. Leaves fascicled. Corolla white. Calyx 3-5-toothed, ex Ruiz. et Pav. The saliva becomes yellow by chewing the leaves of this species.

Pear-leaved Cantua. Shrub 5 to 6 feet.

2 C. theæfòlia (D. Don, in edinb. phil. journ. 1823.) leaves ovate-lanceolate, bluntly acuminated, serrated; corymbs few-flowered; peduncles glabrous; stamens shorter than the corolla, which is curved. ♄. G. Native of Peru. Periphrágmos species, nova Pavon mss. Habit of the preceding; but differs in characters indicated above, and in the larger flowers, in the longer capsules, and much larger seeds.

Tea-leaved Cantua. Shrub 5 to 6 feet.

3 C. quercifòlia (Juss. ann. mus. 3. p. 118.) leaves oblong, sinuately pinnatifid, acuminated; corymbs many-flowered; peduncles clothed with glandular hairs; stamens much exceeding the corolla, which is salver-shaped. ♄. G. Native of Peru, where it is called *Pipiso* by the natives; and on the Andes, near Nabon. H. B. et Kunth, nov. gen. 3. p. 161. Branches

clothed with clammy, glandular hairs. Leaves truncate at the base, hairy and clammy beneath. Calyx 5-cleft. Corollas white.

Oak-leaved Cantua. Shrub 10 to 12 feet.

4 C. buxifòlia (Juss. ann. mus. 3. p. 118. t. 8.) tomentose; leaves cuneate-oblong, mucronulate, quite entire; corymbs few-flowered; peduncles tomentose; stamens longer than the corolla, which is straight. ♄. S. Native of Peru, where it is called *Cocantu* by the natives. Lam. dict. 1. p. 603. ill. 1. t. 106. f. 2. Cántua depéndens, Pers. ench. 1. p. 187. Periphrágmos depéndens, Ruiz. et Pav. fl. per. 2. p. 18. t. 133. Cántua tomentòsa, Cav. icon. 4 p. 43. t. 364. Tops of branches, calyxes, and young leaves, downy. Corollas pale red. The showy flowers of this beautiful shrub are used in adorning temples. Leaves and wood of this, as well as of other species, when bruised or chewed, affords an elegant yellow colour, and might therefore be useful in dyeing cloth.

Box-leaved Cantua. Shrub 5 to 6 feet.

5 C. ova'ta (Cav. icon. 4. p. 43. t. 363. Juss. ann. mus. 3. p. 118.) glabrous; leaves obovate, mucronate, entire, rarely cut or toothed; peduncles solitary, 1-flowered, glabrous; stamens longer than the corolla, which is straight. ♄. S. Native of Peru, where it is called *Cantuttica*, i. e. *Cantu flos*, by the natives. Corolla bluish red, or white.

Ovate-leaved Cantua. Shrub 6 to 8 feet.

6 C.? corda'ta (Juss. ann. mus. 3. p. 119.) branches opposite, sarmentose, downy; leaves nearly opposite, cordate, downy; flowers axillary, solitary, pedicellate; corolla tubular, much exceeding the calyx, which is short, 5-cleft, and downy; anthers exserted; fruit unknown. ♄. S. Native of Peru.

Cordate-leaved Cantua. Shrub 4 to 6 feet.

7 C. cuneifòlia (Juss. l. c.) this is a very doubtful species of the genus. ♄. S. Native of Peru.

Wedge-leaved Cantua. Shrub 4 to 6 feet.

8 C.? Megapota'mica (Spreng. syst. add. p. 64.) leaves oblong-lanceolate, attenuated at both ends, quite glabrous, entire, shining above; panicles axillary. ♄. S. Native of Brazil, at Rio Grande, Sello.

Rio Grande Cantua. Shrub.

Cult. All the species are showy, and worth cultivating. See *Lœsèlia*, p. 248, for culture and propagation.

Order CLXIII. HYDROLEA'CEÆ (this order contains plants agreeing in important characters with the genus *Hydròlea*.) D. Don, in edinb. phil. journ. July 1833. Choisy. in mem. soc. phys. gen. 6. p. 106. Hydròleæ, R. Br. cong. p. 32.—Convolvulàceæ, part. Juss. gen.

Calyx 5-cleft; segments equal, usually distinct even to the base, frequently spatulately dilated at top, permanent. Corolla monopetalous, usually campanulate, 5-lobed at top. Stamens inserted in the corolla, alternating with its lobes, sometimes inclosed, and sometimes exserted. Styles 2, exceeding the stamens; stigmas thick or capitate. Ovarium 2-celled; cells many-seeded. Capsule 2-celled, loculicidal-2-valved; dissepiment fixed to the middle of the valves; placentas 2 in each cell, fixed to the middle of the dissepiment, sometimes spongy and combined, sometimes laminæform and separated. Seeds very numerous, sessile on the placentas. Albumen fleshy. Embryo straight.—Annual, herbaceous, or shrubby plants. Stems straight or diffuse, glabrous or downy, also very hispid, rarely exceeding 2 feet in height; with alternate branchlets. Leaves alternate, simple, entire, or usually toothed, more or less crowded, usually petiolate. Flowers corymbose or spicate, sometimes also disposed in the manner of *Heliotròpium*.

This order is often combined with *Convolvulàceæ*, but is more closely allied to *Scrophularíneæ* and *Solàneæ*; but it differs from these orders, in the regular corolla, 5 stamens, and straight embryo.

Synopsis of the genera.

1 Hydròlea. Calyx 5-sepalled. Corolla rotately campanulate. Stamens inserted in the tube of the corolla. Stigmas depressedly capitate. Capsule 2-celled; placentas spongy, terete.

2 Hydròlia. Calyx 5-cleft. Corolla rotate. Stamens inserted in the lobes of the corolla. Capsule 2-celled, dehiscing at top; receptacles or placentas fleshy.

3 Na'ma. Calyx 5-sepalled. Corolla tubularly funnel-shaped. Stamens nearly inclosed. Stigmas bluntish. Capsule 2-celled; placentas 4, laminæform, at first joined by twos, afterwards free.

4 Wiga'ndia. Calyx 5-sepalled. Corolla funnel-shaped. Stamens exserted. Stigmas depressedly capitate. Capsule 2-celled; placentas like those of *Nàma*.

5 Còdon. Calyx 10-12-parted. Corolla tubular; limb 10-12-cleft. Stamens 10-12. Stigmas simple. Capsule 2-celled, dehiscing at top; dissepiment double, with seminiferous edges.

I. HYDRO'LEA (from ὑδωρ, *hydor*, water; and ελαια, *elaia*, an olive; in reference to the habitats of the species, and their oiliness.) Lin. gen. no. 318. Gærtn. fruct. 1. p. 268. t. 55. Juss. gen. 134. Stèris, Lin. gen. edit. Reich. 342. Nàma species, Lin. Sagònea, Aubl. guian. 1. p. 285. t. 111. Reichèlia, Schreb. gen. no. 512.

Lin. syst. *Pentándria Digýnia*. Calyx permanent, of 5 sepals. Corolla rotately campanulate. Stamens inserted in the tube of the corolla. Styles 2; stigmas depressedly capitate. Capsule 2-celled; dissepiment placentiferous in the middle; placentas terete, spongy.—Annual or perennial plants, either unarmed or spiny. Flowers panicled or corymbose, axillary or terminal.

§ 1. *Plants unarmed.*

1 H. Zeyla'nica (Vahl, symb. 2. p. 46.) branched; leaves lanceolate, attenuated at both ends, glabrous; panicles axillary, branched, leafy; sepals lanceolate-linear, clothed with viscid down at the base. ⊙. S. Native of the East Indies. Nàma Zeylánica, Lin. spec. p. 327. fl. zeyl. 117. 49. t. 2. Stèris Javàna, Lin. mant. p. 54. syst. p. 264. Stèris aquática, Burm. ind. p. 73. t. 39. f. 3. Attalerie, Poir. suppl. 1. p. 535.—Plukn. alm. 22. t. 130. f. 2.—Anagállis Zeylánica, &c. Herm. mus. zeyl. p. 36. Burm. zeyl. 19. Tsjeru-vallel, Rheed, mal. 10. p. 55. t. 28. Stem a little compressed, glabrous. Leaves 1-2 inches long. Peduncles usually opposite the leaves, downy, viscid. Corollas blue, a little longer than the calyx.

Var. β; leaves finely ciliated above. ⊙. S. Native of Java, about Bamtam. Hydròlea Javánica, Blum. bijdr. p. 725.

Var. γ; stem downy at top; flowers on short peduncles. ⊙. H. Native of Mexico. Stèris villòsa, Pav. mss. in herb. Deless.

Var. δ; plant quite glabrous; flowers on short peduncles; peduncles in the forks; sepals quite glabrous. ⊙. S. Native about Rio Janiero. Evólvulus, no. 1365, Burchell, mss.

Ceylon Hydrolea. Pl. 1 foot.?

2 H. ine'rmis (Lour. coch. p. 172.) simple; leaves linear-

lanceolate, nearly sessile, glabrous; peduncles 1-3-flowered; sepals acute, quite glabrous. ⊙. G. Native of China, about Canton, in humid places. Flowers blue. Very nearly allied to the preceding; but the leaves are longer and broader, and the peduncles axillary, 1-3-flowered, twin and tern, 1-flowered. Capsule wrinkled, ovate.

Unarmed Hydrolea. Pl. 1 foot.

3 H. corymbòsa (Ell. carol. 1. p. 336.) branched; leaves ovate-lanceolate, sessile, smoothish; flowers terminal, corymbosely approximate; sepals acute, lanceolate, hispid; corolla 3 times higher than the calyx. ♃. F. Native of Carolina, in sterile, stagnate places, at St. Stephens; and of Georgia, in like situations. Branchlets hairy. Leaves rather downy on the veins and edges, reflexed. Corolla azure blue, veined with yellow, marked by 5 white spots at the base, much longer than the calyx. Capsule globose, glabrous.

Corymbose-flowered Hydrolea. Pl. 2 feet.

§ 2. *Spiny shrubs.*

4 H. quadriva'lvis (Walt. fl. carol. 1. p. 109—110.) leaves lanceolate, very acute, attenuated at both ends; flowers 1-5 together, axillary, almost sessile; sepals ovate-lanceolate; capsule glabrous. ♃. F. Native of South Carolina, in stagnate places. Hydròlea Caroliniàna, Michx. fl. bor. amer. 1. p. 177. Stem somewhat compressed, hispid from long, rarely spreading, white hairs. Leaves 1-3 inches long, quite glabrous, or hardly hispid on the middle nerves. Spines straight, axillary, acutish. Peduncles and sepals hispid. Corolla blue, a little longer than the calyx.

Var. β; unarmed; flowers commonly trigynous. ♃. S. Native of Guiana, on the banks of rivulets. Sagònea palústris, Aubl. guian. 1. p. 285. t. 111. Reichèlia palústris, Schreb. gen. no. 512. Willd. spec. 1. p. 1502. Stem glabrous, or hardly downy. Leaves 3-4 inches long, glabrous, rough from dots. Flowers axillary, 5-6 together.

Four-valved capsuled Hydrolea. Fl. July, Aug. Clt. 1824. Pl. 1 to 2 feet.

5 H. ova'ta (Nutt. in amer. phil. trans. n. s. 5. p. 196. ex Choisy, in mem. soc. phys. gen. 6. p. 109. t. 1.) leaves ovate, acute at both ends, petiolulate; flowers corymbose, somewhat dichotomously disposed; sepals lanceolate; capsule downy. ♃. F. Native of the Arkansas territory, on the edges of ponds. The whole plant downy, branching only at the time of flowering. Stem a little compressed, clothed with grey, velvety down. Leaves deciduous, soft, downy on the nerves beneath, $1\frac{1}{2}$ inch long, those of the radical shoots almost linear. Spines long, acute, terete, downy. Flowers bright blue, crowded towards the summits of the fastigiate branches. Sepals hairy. Corolla pelviform, campanulate, larger than those of *H. spinòsa*. Styles 2-3-filiform. Capsule 2-3-valved.

Ovate-leaved Hydrolea. Pl. 1 to 2 feet.

6 H. spinòsa (Lin. spec. p. 328. Aubl. guian. 1. p. 281. t. 110.) leaves ovate-lanceolate, acute, attenuated at both ends, nearly sessile; flowers terminal, sub-corymbose; sepals linear-lanceolate; capsule glabrous. ♄. S. Native of South America, by the sides of rivulets. Andr. bot. rep. 566. Hydròlea trígyna, Swartz, fl. ind. occ. 1. p. 558. Cav. icon. 6. p. 10. t. 529. f. 1. Plant downy and clammy. Spines axillary, spreading, villous. Peduncles 5-6-flowered, villous. Sepals joined at the base, villous and ciliated. Corollas blue, exceeding the calyx.

Var. β; styles 3; stamens, sepals, and lobes of corolla, 6; cells of capsule 3.

Spiny Hydrolea. Fl. Ju. July. Clt. 1791. Shrub 1 to 2 feet.

7 H. gla'bra (Herb. mus. brit. ex Miller. Choisy, in mem. soc. phys. gen. 6. p. 110.) leaves lanceolate, acute, attenuated at both ends, nearly sessile, quite glabrous; flowers terminal, few; sepals linear-lanceolate; capsule glabrous. ♄. S. Native of New Spain; and of Guinea, ex Schum. pl. guin. p. 161. Stems terete, glabrous; branches ascending. Spines axillary, stiff, horizontal, very acute, glabrous. Peduncles few, at the tops of the branches, 1-flowered, villous. Sepals downy. Corolla blue, a little longer than the calyx. Very nearly allied to *H. spinòsa*.

Glabrous Hydrolea. Shrub 1 to 2 feet.

Cult. All the species of *Hydròlea* are rather handsome when in blossom. The shrubby and perennial species grow well in a mixture of loam and peat; and cuttings of them will root, if planted in sand, with a hand-glass over them. The annual kinds require the treatment of other tender annuals.

II. HYDRO'LIA (see last genus for derivation.) Pet. Th. gen. mad. p. 9. Choisy, in mem. soc. phys. gen. 6. p. 111.

Lin. syst. *Pentándria, Digýnia.* Calyx 5-cleft. Corolla rotate. Stamens inserted in the lobes of the corolla. Styles 2, arched. Capsule 2-celled, dehiscing at top; receptacle fleshy. —A marsh herb. Segments of the calyx dilated at the base. Corolla with a short, ventricose tube. Filaments short; anthers sagittate. Ovarium simple; valves 2, bent in a little, conniving with the receptacle. Seeds minute, nestling, sulcate. Pet. Th. l. c.

1 H. Madagascarie'nsis (Choisy, in mem. soc. phys. gen. 6. p. 111.) stems simple, terete, naked at the base; flowers axillary, pedunculate, twin or solitary. ♃. S. Native of Madagascar, in marshes.

Madagascar Hydrolia. Pl. 1 foot.

Cult. For culture and propagation see *Hydròlea.*

III. NA'MA (from *ναμα, nama,* a stream or spring of water; habitat of plants.) Lin. gen. no. 317. Schreb. gen. no. 444. Gærtn. fruct. t. 44. Juss. gen. p. 134.—Nàma and Hydròlea species, Willd. and Ruiz et Pav.

Lin. syst. *Pentándria, Digýnia.* Calyx permanent, of 5 sepals. Corolla tubularly funnel-shaped. Stamens sub-inclosed. Styles 2; stigmas bluntish. Capsule 2-celled, loculicidal-2-valved. Dissepiment placentiferous in the middle; placentas 4, laminiform, at first combined by pairs, afterwards free.

1 N. undula'ta (H. B. et Kunth, nov. gen. amer. 3. p. 130. Choisy, in mem. acad. phys. 6. p. 112. t. 2. f. 1.) herbaceous; leaves lanceolate-linear, sessile, with undulately curled edges; flowers terminal or axillary, 3-5 in a fascicle, on short pedicels; corolla hardly exceeding the calyx. ♃. S. Native among rubbish, near Mexico, Laredo, Matamoros, &c. Hydròlea congésta, Willd. mss. in Rœm. et Schultes, syst. 6. p. 192. Hydròlea rupícola, Moc. et Sesse, fl. mex. ined. Hyd. ràdians, Moc. et Sesse, fl. mex. ined. with a figure. Stem multifid at the base, ascending, clothed with cinereous down. Leaves obtuse, sometimes obovate-lanceolate, downy. Sepals downy. Corolla violaceous, glabrous inside, downy outside.

Var. β, macrántha (Choisy, in mem. soc. phys. gen. 6. p. 112.) leaves obovate-lanceolate, sessile, with sub-undulated edges; flowers axillary or terminal, 3-5 together, on long pedicels; corolla twice longer than the calyx.

Undulated-leaved Nama. Pl. 1 foot.

2 N. Jamaice'nsis (Lin. spec. p. 327.) herbaceous; leaves obovate-sub-spatulate, attenuated into the petioles at the base, and a little decurrent; flowers 1-3, axillary, on short pedicels; corolla hardly exceeding the calyx. ⊙. S. Native of Jamaica, St. Domingo, and Mexico. Brown, jam. 185. t. 18. f. 2. Hydròlea decúrrens, Moc. et Sesse, fl. mex. ined. Stem diffuse, prostrate, hairy. Leaves hairy. Pedicels hispid. Sepals hairy. Valves of capsule keeled.

Jamaica Nama. Pl. prostrate.

3 N. dichótoma (Ruiz et Pav. fl. per. 3. p. 22. t. 244. f. *b.*) herbaceous; leaves oblong-spatulate, tapering into the petioles;

floriferous branches dichotomous; flowers solitary, and nearly sessile in the forks; corolla shorter than the calyx. ☉. S. Native of Peru, near Huanaco; and of Mexico. Nàma tetrándra, Pav. mss. Stems branched, reddish, clothed with clammy down. Leaves downy and ciliated. Floriferous branches fastigiate. Sepals linear-spatulate. Capsule ovate, villous.

Var. β; leaves long-lanceolate; flowers few. ☉. H.

Dichotomous Nama. Pl. 1 foot.

4 N. ORIGANIFÒLIA (H. B. et Kunth, nov. gen. amer. 3. p. 130. t. 218.) woody; leaves oblong-lanceolate, very obtuse, tapering into short petioles; flowers 2-4 together, terminal, or in the axils of the superior leaves, pedunculate; corolla a little higher than the calyx. ♄. S. Native of St. Jago, in valleys. Nàma subincàna, Willd. mss. ex Rœm. et Schultes, syst. 6. p. 189. Hydròlea tenélla, Moc. et Sesse, fl. mex. ined. icon. Root thick, twisted. Stems tufted, clothed with greyish down, as well as the leaves and pedicels. Sepals spatulate, downy. Corolla white, downy outside.

Marjoram-leaved Nama. Pl. ½ foot.

5 N. RUPÍCOLA (Bonpl. herb. ex Choisy, in mem. phys. gen. 6. p. 114.) suffruticose; leaves ovate, obtuse, petiolate; flowers few, terminal, pedicellate; corolla exceeding the calyx. ♄. S. Native along with the preceding. Stem slender, having the epidermis separating at the base, clothed with grey down. Leaves clothed with velvety down; petioles villous. Flowers intermixed with leaves. Pedicels villous. Sepals sub-spatulate, downy. Capsule small, smoothish.

Rock Nama. Shrub.

6 N. LONGIFLÒRA (Choisy, in mem. soc. phys. 6. p. 114.) suffruticose; leaves ovate-lanceolate, acute at both ends, clothed with silky, hoary down beneath, on short petioles; flowers disposed in loose, few-flowered, leafy cymes; corollas twice longer than the calyx. ♄. G. Native of Mexico. Nàma serícea, Bonpl. herb. Willd. mss. Rœm. et Schultes, syst. 6. p. 189. Hydròlea violàcea, Moc. et Sesse, fl. mex. icon. ined. Stem villous. Leaves ciliated, downy and blackish above; petioles villous. Peduncles villous. Sepals spatulate, clothed with silky down. Corolla of a bluish violet colour. Stigmas acutish.

Long-flowered Nama. Shrub dwarf.

N.B.—Nama evolvuloìdes, and N. convolvuloìdes, Willd. mss. in Rœm. et Schultes, syst. 6. p. 189, is *Evólvulus alsinoìdes.*

Cult. For culture and propagation see *Hydròlea*, p. 250.

IV. WIGA'NDIA (named by Kunth, in memory of John Wigand, author of Veræ Historiæ de succino Prussico, et de herbis in Borussia nascentibus, Jen. 1590.) H. B. et Kunth, nov. gen. amer. 3. p. 126. Choisy, in mem. soc. gen. 6. p. 115.—Hydròlea species, Ruiz et Pav. Willd. and Lam.

LIN. SYST. *Pentándria, Digýnia.* Calyx permanent, of 5 sepals. Corolla funnel-shaped. Stamens exserted. Styles 2; stigmas depressedly capitate. Capsule 2-celled, loculicidal-2-valved; dissepiment placentiferous in the middle; placentas 4, laminiform, at first combined by twos, but at length free.—Usually suffruticose herbs, very hispid and unarmed. Leaves alternate, entire. Spikes terminal, panicled, secund. Flowers sessile, bractless, violaceous, white or yellow.

1 W. U'RENS (Ruiz et Pav. fl. per. 3. p. 21. t. 243.) plant very hispid; leaves ovate-cordate, doubly serrated, acutish, pilose on both surfaces: spikes unilateral, scorpioid; sepals linear-lanceolate, very acute, clothed with hispid tomentum on both surfaces; capsule hispid or smoothish. ♃. S. Native of Peru, among broken rocks. Stem angular. Flowers dense, disposed in 2 rows. Corolla pale violet.

Stinging Wigandia. Pl. 3 to 4 feet.

2 W. KU'NTHII (Choisy, in mem. phys. gen. 6. p. 116.) plant very hispid; leaves ovate-cordate, doubly crenated, pilose on both surfaces obtuse; panicles terminal, branched; sepals linear-lanceolate, acutish, clothed with hoary tomentum; capsule densely clothed with hoary hairs. ♃. A. Native of Mexico, near Tasco. Wig. ùrens, H. B. et Kunth, nov. gen. amer. 3. p. 127, but not of Ruiz et Pav. Hydròlea auriculàta, Moc. et Sesse, fl. mex. icon. ined. Hydròlea ùrens, Willd. herb. no. 5459. Leaves clothed with rusty tomentum above, as well as the petioles. Corolla pale violet, clothed with silky hairs outside.

Kunth's Wigandia. Shrub 6 feet.

3 W. CARACASSA'NA (H. B. et Kunth, nov. gen. amer. 3. p. 128.) plant hairy; leaves elliptic-cordate, doubly crenated: teeth acutish, and are, as well as the tips of the leaves, clothed with hairy tomentum on both surfaces; spikes secund, revolute at the apex; sepals linear-lanceolate, clothed with hoary tomentum; capsule hardly clothed with hoary down. ♄. S. Native near Caraccas. Hydròlea móllis, Willd. rel. in Rœm. et Schultes, syst. 6. p. 190. Very nearly allied to the preceding. Leaves longer and acuter, clothed with rusty tomentum above, as well as the petioles. Corolla villous outside, violaceous.

Caraccas Wigandia. Shrub 12 feet.

4 W. CRÍSPA (H. B. et Kunth, nov. gen. amer. 3. p. 129.) plant very hairy; leaves ovate-cordate, acutish, irregularly and doubly serrated, pilose on both surfaces: teeth acute; spikes panicled, secund, revolute at top, very hispid; sepals linear-lanceolate, very hispid; corolla showy. ♄. S. Native of Quito, near Alausi; and on the banks of the river Pozuzo. Hydròlea crísp a, Ruiz et Pav. fl. per. 3. p. 22. t. 244. f. a. Nicotiàna ùrens, Plum. amer. p. 204. t. 211. Wigándia pruritìva, Spreng. syst. 1. p. 865. Leaves long and broad, hoary, tomentose. Corolla large, yellow, ex Humb., campanulate, hoary from down outside.

Curled-leaved Wigandia. Shrub 2 to 3 feet.

5 W. MACROPHY'LLA (Cham. in Linnæa, 6. p. 382.) stinging; stem branched; spikes scorpioid, thin, bractless; flowers sessile, subalar, on short pedicels. ♄. S. Native of Mexico. Plant 6 feet high. Flowers blue.

Large-leaved Wigandia. Shrub 6 feet.

6 W. HERBA'CEA (Choisy, in mem. soc. phys. 6. p. 117.) plant villous; leaves lanceolate, entire, acute at both ends, attenuated into the short petioles; flowers disposed in loose, corymbose panicles; sepals linear-lanceolate. ♃.? S. Native of Monte-Video. Leaves 1-2 inches long. Sepals acute. Capsule glabrous. Hydròlea Megapotámica, Herb. Kunth, ex Otto.

Herbaceous Wigandia. Pl. 1 to 2 feet.

† *A species hardly known.*

7 W. SCORPIOÌDES (Choisy, in mem. soc. phys. 6. p. 117.) plant downy; leaves ovate-cordate, toothed, acutish, clothed with white tomentum beneath; spikes loosely panicled, revolute; sepals acutish, downy. ♃. G. Native of Mexico. Hydròlea scorpioìdes, Moc. et Sesse, fl. mex. icon. ined. Leaves petiolate. Panicles terminal. Flowers superior. Corolla violaceous, with a short tube, and a spreading, 5-cleft limb.

Scorpion-like Wigandia. Pl.?

Cult. The species are all very pretty when in flower. A mixture of loam, peat, and sand, is the best soil for them; and young cuttings will strike root readily in sand, under a hand-glass, in a little bottom heat.

V. CO'DON (from *κωδων, kodon,* a bell; shape of corolla.) Lin. gen. edit. Reich. no. 563. Schreb. gen. 715. Juss. gen. 424. Gærtn. fruct. 2. p. 88. t. 95. D. Don, in edinb. phil. journ. July 1833.

LIN. SYST. *Decándria, Monogýnia.* Calyx 10-12-parted; segments subulate, erect; alternate ones smaller. Corolla tubular, longer than the calyx, torulose at the base, and furnished

with as many ribs as there are lobes of the limb; limb 10-12-cleft: lobes oblong, obtuse, keeled, imbricate in æstivation; alternate ones smaller. Stamens 10-12, alternating with the lobes of the corolla, rising from an equal number of compressedly tetragonal arches, which are inserted in the bottom of the corolla; filaments subulate, glabrous. Anthers adnate by their middle, incumbent, 2-celled; cells combined at the extremities; pollen mealy. Style semi-bifid, pilose at the base; stigmas simple, obtuse. Capsule ovate-acuminated, 2-celled, 2-valved, dehiscing at top. Dissepiment double, with revolute, seminiferous edges. Seeds numerous, angular, papillose; testa simple, cartilaginous. Albumen copious, horny. Embryo erect, slender, a little arched, with very short cotyledons, and a long, filiform, obtuse radical, looking to the hylum. This genus agrees with *Hydroleàceæ*, although the stamens, and the divisions of the calyx and corolla, are double in number, the symmetry of the flower is preserved; but this mere increase of parts is of little importance, when the number of points of agreement are taken into account. In *Còdon*, and some of the *Hydroleàceæ*, particularly in *Wigándia*, the leaves have lobed margins, and are clothed with bristly points, which in the former genus are developed into prickles. The stamina and pistilla entirely agree in both genera; but the albumen is more copious, and the stigmata less developed in *Còdon*, whose affinities, however, to the *Hydroleàceæ*, may be considered as completely established.

1 C. Roye'ni (Lin. syst. nat. ed. 13. p. 292. Thunb. prod. p. 80. Willd. spec. 2. p. 540. Andr. bot. rep. t. 325.) ⊙. F. Native of the Cape of Good Hope. Codòn aculeàtum, Gærtn. fruct. 2. p. 88. An annual herb, furnished with copious white, straight, subulate prickles. Root fusiform? Stem erect, branched, terete, flexuous, robust. Leaves alternate, petiolate, ovate-oblong, a little attenuated towards the apex, but obtuse, thickish, fleshy, and ribbed beneath, with recurved, sub-repand edges. Flowers large, solitary, pedunculate, extra-axillary, somewhat racemose at the top of the stem, usually bracteate by two narrower leaves at the base. Corolla white, variegated with purple.

Royen's Codon. Fl. Sept. Clt. 1801. Pl. 1 to 1½ foot.

Cult. This is a singular plant, the seeds of which should be sown in a pot, in rich, light earth, and the pot placed in a frame; and when the plants are of sufficient size, they may be moved into separate, small pots, and shifted into other larger ones by degrees, as they grow. They may afterwards be placed among other greenhouse plants.

Order CLXIV. CONVOLVULA'CEÆ (this order contains plants agreeing with the genus *Convólvulus* in important characters.) Juss. gen. p. 132. edit. Usteri. p. 148. R. Br. prod. p. 481. H. B. et Kunth, nov. gen. amer. 3. p. 94. Choisy, in mem. soc. phys. gen. 6. p. 383.

Calyx of 5 sepals (except in *Wilsònia*, which is gamosepalous and 5-toothed;) sepals permanent, equal or unequal, disposed in one, two, or three series, often enlarged round the fruit. Corolla monopetalous, hypogynous, regular, tubular, campanulate or funnel-shaped; having the limb sometimes of 5 plaits, and sometimes of 5 lobes, which are twisted in æstivation. Stamens 5, opposite the sepals, and therefore alternating with the lobes or plaits of the corolla; filaments usually unequal, dilated at the base, sometimes villous, naked, or furnished with scales, usually inclosed, rarely exserted; anthers long, usually sagittate, and adnate at the base, often twisted afterwards. Nectarium or hypogynous disk annular, surrounding the ovarium in most of the species, more or less showy. Ovarium usually simple, 2-4-celled, rarely almost 1-celled, or altogether 1-celled: sometimes the ovarium is double or quadruple; in each cell there is 1 or 2 erect ovula. Style usually simple, entire, or more or less deeply cleft; rarely two. Stigmas acute, flattened or globose; in those with the simple style, 2-lobed. Fruit a capsule or a dry berry, 1-4-celled; cells 1-2-seeded. Capsule usually dehiscing valvately, rarely transversely. Seeds usually rounded on one side, and flattened on the other, inserted by the base, glabrous or villous; having the testa usually black and hard. Albumen mucilaginous. Cotyledons foliaceous, corrugated, except in the genus *Marìpa*, in which they are thick and straight. Radicle incurved, inferior.—Stems herbaceous, suffruticose, fruticose, also arboreous; sometimes erect, sometimes creeping, but for the most part twining. Leaves alternate, simple, entire or lobed, sessile or petiolate. Peduncles axillary or terminal, 1 or many-flowered. Pedicels articulated to the peduncles, usually bibracteate; bracteas more or less, approximating the flower, sometimes also involving the flower. Roots simple or tuberous, edible or medicinal. Juice milky, purgative, often filling the stem.

Nearly the whole of the *Convolvulàceæ* are twining plants, with showy flowers, expanding under the influence of sunshine. A few are shrubs, but the greater part are herbaceous, and very many annual. All parts of the world produce them. *Cuscùta* is a singular parasite, wholly destitute of leaves. The root of many is filled with a milky, acrid juice, which is very purgative. Scammony, jalap, and some other drugs, are the produce of *Convolvulàceæ*. The roots of *Ipomæ'a flórida, scopària*, and *Quámoclit*, are stimulatory; that of *Ipomæ'a Batàtas*, which is the sweet potato of America and South Europe; and that of *Ipomæ'a edùlis*, are wholesome articles of food.

Synopsis of the genera.

Tribe I.

Argyre'ieæ. Embryo cotyledonous. Carpels combined into a simple ovarium. Pericarp baccate, indehiscent.

1 Rìvea. Ovarium 4-celled; cells 1-seeded.

2 Marìpa. Ovarium 2-celled; cells 2-seeded. Cotyledons not plicate? Stigma furrowed.

3 Argyre'ia. Ovarium 2-celled; cells 2-seeded. Stigma 2-lobed; lobes capitate. Corolla campanulate.

4 Blinkwórthia. Ovarium 2-celled; cells 2-seeded. Corolla urceolate. Calyx calyculate.

5 Humbe'rtia. Ovarium 2-celled; cells 2-seeded. Stigma hollow-flattened. Stamens exserted.

6 Moorcróftia. Ovarium 2-celled; cells 1-seeded.? Fruit 2-seeded.

Tribe II.

Convolvu'leæ. Embryo cotyledonous. Carpella combined into a simple ovarium. Pericarp capsular, dehiscent.

§ 1. *Style simple, entire even to the stigma.*

7 Qua'moclit. Ovarium 4-celled; cells 1-seeded. Corolla tubular. Genitals exserted.

8 Leptoca'llis. Ovarium 4-celled; cells 1-seeded. Stigma 2-lobed, capitate. Corolla with a slender tube, and a spreading limb.

9 Bata'tas. Ovarium 4-celled; cells 1-seeded. Corolla campanulate. Genitals inclosed.

10 Pharbìtis. Ovarium 3-celled; cells 3-seeded.

11 Calony'ction. Ovarium 2-celled, or somewhat 4-celled, 4-seeded. Corolla funnel-shaped. Genitals exserted.

12 Exogònium. Ovarium 2-celled; cells 2-seeded. Corolla tubular. Genitals exserted.

13 Lepiste'mon. Ovarium 2-celled; cells 2-seeded. Stamens inclosed, with a scale at the base of each.

14 Ipomæ'a. Ovarium 2-celled; cells 2-seeded. Stamens inclosed. Stigma 2-lobed; lobes capitately globose.

15 Jacquemóntia. Ovarium 2-celled; cells 2-seeded. Stamens inclosed. Stigma 2-lobed; lobes complanately ovate.

16 Convólvulus. Ovarium 2-celled; cells 2-seeded. Stamens inclosed. Stigma 2-lobed; lobes teretely filiform.

17 Anise'ia. Ovarium 2-celled; cells 2-seeded. Lobes of stigma capitate. Sepals not verticillately inserted.

18 Polyme'ria. Ovarium 2-celled; cells 1-seeded; stigmas 4-6, teretely filiform.

19 Calyste'gia. Ovarium 1-celled, as also somewhat 2-celled, 4-ovulate. Lobes of stigma filiform. Bracteas 2, involucrate.

20 Shutere'ia. Ovarium 1-celled, 4-ovulate. Stigma 2-lobed; lobes complanately ovate.

21 Skinne'ria. Ovarium 1-celled, 4-ovulate. Stigma 2-lobed; lobes capitately globose.

22 Pora'na. Ovarium 1-celled, 2-4-ovulate. Sepals increasing unequally after flowering. Stigmas globose.

23 Duperrè'ya. Capsule 1-celled, 1-seeded. Stigma large, thick. Calyx propped by 2 small bracteas.

§ 2. *Style bifid, or styles two.*

24 Neurope'ltis. Ovarium 1-celled. Styles 2; stigmas fleshy. Capsule 1-seeded. Bracteas large, surrounding the capsule.

25 Prevóstea. Ovarium 2-celled. Style 1, bifid. Outer sepals involving the flower.

26 Brewe'ria. Ovarium 2-celled. Style 1, bifid. Sepals nearly equal. Genitals inclosed.

27 Bona'mia. Ovarium 2-celled. Style 1, bifid. Sepals nearly equal. Genitals exserted.

28 Cre'ssa. Ovarium 2-celled. Styles 2; stigmas globose. Stamens exserted.

29 Evólvulus. Ovarium 2-celled. Styles 2, bifid.

30 Cladóstyles. Capsule 1-celled, 1-seeded. Styles 2, bifid.

31 Wilsònia. Ovarium small, 2-seeded. Style 1, bifid. Calyx tubular.

Tribe III.

Dichóndreæ. Embryo without cotyledons. Carpella distinct.

32 Dichóndra. Ovaria two.

33 Fa'lkia. Ovaria 4.

Tribe IV.

Cuscu'teæ. Embryo acotyledonous.

34 Cuscu'ta. Plants parasitical.

† *A genus doubtful whether it belongs to the present order.*

35 Mouroucòa. Calyx 5-parted: the 2 outer segments covering the rest. Corolla funnel-shaped; limb large, spreading, 5-lobed. Stamens inserted in the upper part of the tube, and opposite the lobes. Stigma bilamellate. Capsule girded by the calyx, 3-celled; cells 1-seeded.

Tribe I.

ARGYRE'IEÆ (this tribe contains plants agreeing with the genus *Argyrèia*, in having a baccate pericarp.) Choisy, in mem. soc. phys. genev. 6. p. 407. Embryo cotyledonous. Carpels combined into a single ovarium. Pericarp baccate, indehiscent.

I. RI'VEA (this genus is dedicated by Choisy, to his friend Auguste de la Rive, a physician of Geneva.) Choisy, in mem. soc. phys. gen. 6. p. 407.—Convólvulus, Ipomæ'a, and Lettsòmia, species of authors.

Lin. syst. *Pentándria, Monogýnia.* Sepals 5. Corolla tubular or funnel-shaped, showy, Style 1; stigma capitate or lamelliform, 2-lobed. Ovarium 4-celled, 4-ovulate. Capsule baccate.—Twining, suffruticose, very showy plants, the flowers of which exceed in size all other convolvulaceous plants.

1 R. tiliæfòlia (Choisy, l. c. p. 407.) leaves cordate-roundish; peduncles usually 1-flowered, rarely 2-4-flowered; sepals ovate-roundish, very blunt, equal; corolla inflato-cylindrical. ♄. ⌒. S. Native of the East Indies, as of Penang, Travancore, Philippine Islands, banks of the Ganges, &c; also of the Isle of France, Cape of Good Hope. The same plant is said also to be found in America, as in St. Domingo, St. Vincent, and Peru. Convólvulus tiliæfòlius, Desr. in Lam. dict. 3. p. 544. Ipomæ'a tiliæfòlia, Rœm. et Schultes, syst. 4. p. 229. Ipomæ'a Gangética, Sweet, hort. brit. ed. 2d. p. 288. Ipomæ'a Benghalénsis?, Roth. ex Rœm. et Schultes, syst. 4. p. 229. Convólvulus Gangéticus, Roxb. fl. ind. 2. p. 46. Convólvulus spectábilis, Brit. mus. Conv. grandiflòrus, Brit. mus. Lettsòmia microcàlyx, Wight. Convólvulus leucántha, and Ipomæ'a salicifòlia, Herb. madr. Conv. marginàtus, Hamilt. herb. Ipomæ'a baccífera, Russell, herb. Stem downy or smoothish. Young branches villous. Leaves obtuse or acuminated, downy beneath, while young rather tomentose. Corolla tubular, 2-3 inches long, white. Seeds silky on the angles. Sepals reniform, emarginate, increasing in size with the fruit, and covering it at all times, ex Roxb. Lobes of stigma round.

Tilia-leaved Rivea. Fl. May, Aug. Clt. 1812. Shrub tw.

2 R. hypocraterifórmis (Choisy, l. c. p. 408.) leaves cordate-roundish; peduncles 1-flowered, sometimes axillary and solitary, sometimes disposed in a spicate manner at the tops of the branches; sepals ovate, obtuse, unequal; limb of corolla salver-shaped: tube very narrow. ♄. ⌒. S. Native of the East Indies, in forests, over the southern parts of the Carnatic and Tanjore country, Trincomala, and Travancore. Convólvulus hypocraterifórmis, Desr. in Lam. dict. 3. p. 561. Conv. candícans, Rœm. et Schultes, syst. 4. p. 302. but not of Roth. Lettsòmia uniflòra, Roxb. fl. ind. 2. p. 85. Ipomæ'a candícans, Roxb. herb. Argyrèia uniflòra, Sweet, hort. brit. p. 289. Stem downy or villous. Leaves obtuse, rarely white and villous beneath. Peduncles villous, furnished with 2 bracteas at or near

the top. Corolla pure white, 3-4 inches long; tube very long, and limb large. Lobes of stigma linear-oblong.

Salver-shaped-flowered Rivea. Fl.? Clt. 1817. Shrub tw.

3 R. ORNA'TA (Choisy, l. c. p. 409. t. 3.) leaves orbicularly cordate, or reniform; peduncles elongated, spicately panicled or umbellate; sepals ovate-lanceolate, bluntish; corolla tubular, very narrow. ♄. ⌒. S. Native of the East Indies, as of Cawnpore, Nipaul, Coromandel, Mungger, &c. Convólvulus candícans, Roth, nov. spec. p. 106. Rœm. et Schultes, syst. 4. p. 273, 790. Lettsòmia ornàta, Roxb. fl. ind. 2. p. 86. Argyrèia ornàta, Sweet, hort. brit. p. 289. Conv. ornàtus, Roxb. mss. Wall. cat. no. 1369. Conv. tarìta, Wall. cat. no. 2253. Stem white; branches silky. Leaves clothed with cinereous tomentum beneath, large. Bracteas villous. Corolla 3 inches long, purple. Berry cherry-shaped. Lobes of stigma linear-oblong. According to Roxb. l. c., the flowers are large, and pure white.

Adorned Rivea. Fl.? Clt. 1824. Shrub tw.

4 R. BÒNA-NÓX (Choisy, l. c.) leaves cordate-roundish, or altogether roundish, sometimes villous beneath; peduncles shorter than the petioles, commonly 3-flowered; sepals ovate-cordate, obtuse; corolla very wide. ♄. ⌒. S. Native of Bengal, in the forests of Midnapore. Lettsòmia Bòna-nóx, Roxb. fl. ind. 2. p. 84. Argyrèia bòna-nóx, Sweet, hort. brit. p. 289. Clove-scented creeper, Asiat. res. 4. p. 257. Young branches hairy. Leaves acuminated or obtuse, sometimes emarginate; petioles villous. Peduncles 1-3-flowered. Corolla white, fragrant; lobes of stigma capitate. Berry 1-celled, 1-4-seeded. The flowers of this species are large. and pure white, expanding at sun-set, and perfuming the air to a considerable distance, with a fragrance resembling that of the finest cloves; in fact, it is the prince of convolvulaceous plants.

Good-night Rivea, or Midnapore Creeper. Fl. July, Oct. Clt. 1799. Shrub tw.

5 R.? OBTE'CTA (Choisy, l. c. p. 410.) leaves lanceolate, acuminated, glabrous above, and silky beneath; peduncles many-flowered, longer than the petioles, but not so long as the leaves; sepals ovate-obtuse, tomentose outside; corolla campanulate. ♄. ⌒. S. Native of Tavoy and Amherst. Convólvulus obtéctus, Wall. cat. no. 1416. Branches strigosely tomentose, from adpressed white hairs. Flowers umbellate. Corolla showy, silky and hairy outside, 3 inches long. Stigma capitate, 2-lobed.

Covered Rivea. Shrub tw.

Cult. The species of *Rìvea* are strong, growing, extensive, twining plants, bearing very large and very showy flowers. They require a great deal of room to flower them. They may be trained up the rafters, or upon trellis-work, in a stove. A rich, light soil, or a mixture of loam and peat, is the best for them; and cuttings strike root readily in sand or mould, under a hand-glass, if placed in heat.

II. MARI'PA (the Caribbean name of the tree.) Aubl. guian. 1. p. 230. t. 91. Lam. ill. t. 110. Choisy, in mem. soc. phys. genev. 6. p. 411.—Ehrètia species, Lam. and Poir.

LIN. SYST. *Pentándria, Monogy'nia.* Sepals 5, coriaceous, imbricate. Corolla campanulate, 5-lobed at top. Stamens 5, equal in height to the tube of the corolla. Style 1; stigma capitate, simple, furrowed. Ovarium 2-celled; cells 2-ovulate. Fruit baccate, coriaceously woody, 1-celled by abortion, and 1-seeded. Albumen wanting.? Cotyledons thick, ovate. ?—Trees and shrubs, natives of Guiana. Branches scandent, tendrilled at top. Leaves alternate, smooth. Flowers white, disposed in loose or thick panicles; bracteas scale-formed at the peduncles, which are villous.

1 M. SCA'NDENS (Aubl. l. c.) scandent, cirrhiferous; leaves ovate, petiolate, acuminated, glabrous; panicles loose, bracteate; calyx villous; corolla spreading; style elongated. ♄. ⌒. S. Native of Guiana, on the banks of the river Sinemari. Ehrètia cirrhòsa, Lam. dict. 1. p. 527. Ehrètia scándens, Poir. suppl. 3. p. 590. Segments of corolla short, ovate-roundish, obtuse, crenulated.

Climbing Maripa. Shrub tw.

2 M. ERE'CTA (Meyer. pim. ess. p. 115.) arboreous, erect; leaves oblong, glabrous; panicle strict; limb of corolla erect, exceeding the style. ♄. S. Native of Guiana, about the river Essequibo.

Erect Maripa. Tree.

3 M. VILLÒSA (Spreng. syst. 1. p. 648.) stem suffruticose, erect; leaves sessile, roundish, acutish, villous, ciliated; panicles strict, bracteate. ♄. S. Native of Brazil.

Villous Maripa. Shrub erect.

Cult. For culture and propagation see *Rìvea*, above.

III. ARGYRE'IA (from *αργυρειος, argyreios,* silvery; in reference to the silvery undersides of the leaves.) Lour. coch. p. 134. Choisy, in mem. soc. phys. gen. 5. p. 411.—Lettsòmia, species, Roxb. and Wall.—Convólvulus and Ipomæ'a, species of authors.

LIN. SYST. *Pentándria, Monogy'nia.* Sepals 5. Corolla campanulate. Style 1; stigma capitate, 2-lobed. Ovarium 2-celled; cells bi-ovulate. Capsule baccate.—Extensive, twining shrubs, with a showy aspect, for the most part silvery, but sometimes silky and tomentose.

SECT. I. PTYXA'NTHUS (from *πτυξ, ptyx,* a plait; and *ανθος, anthos,* a flower; in reference to the plicate corolla.) Corolla nearly entire, with 5 plaits at top. Stamens inclosed.

1 A. SPECIO'SA (Sweet, hort. brit. p. 289. Choisy, in mem. soc. phys. 6. p. 411.) tomentose; leaves large, cordate, acute, glabrous above, or rarely villous, thickly nerved beneath, and clothed with silky, silvery down; peduncles about equal in length to the petioles, umbellately capitate; bracteas acute, unequal; sepals ovate, very blunt. ♄. ⌒. S. Native of the East Indies, in forests and hedges in Hindostan, Java, and the Isle of France. Convólvulus nervòsus, Burm. ind. 48. t. 20. f. 1. Conv. speciòsus, Lin. suppl. p. 137, exclusive of the country. Smith, icon. ined. 17. Ipomæ'a speciòsa, Pers. ench. 1. p. 183. Sims, bot. mag, 2446. Lettsòmia nervòsa, Roxb. fl. ind. 2. p. 78. Samùdra stògam, Rheed, mal. 11. p. 125. t. 61. Leaves 3-12 inches long, and 2-4 broad, dark green above. Corolla nearly 2 inches long, of a deep rose-colour, hairy in the plicæ outside.

Showy Argyreia. Fl. July, Aug. Clt. 1818. Shrub tw.

2 A. BRACTEA'TA (Choisy, in mem. soc. phys. gen. 6. p. 412.) clothed with silky hairs; leaves oblong-roundish, acute at apex, glabrous above, and clothed with silky, rufescent down beneath; peduncles exceeding the petioles a little, cymose, many-flowered; bracteas lanceolate, compassing the cyme; sepals ovate-lanceolate or elliptic, acutish. ♄. ⌒. S. Native of the East Indies. Convólvulus pomàceus? Roxb. ex Wall. cat. no. 1419. Ipomæ'a bracteàta, Heyne, herb. Leaves 2-3 inches long, and 1-2 broad, clothed with silky, rufescent down beneath, with ciliated edges; petioles, bracteas, and outside of sepals, villous.

Bracteate-flowered Argyreia. Shrub tw.

3 A. LESCHENAU'LTII (Choisy, mem. soc. phys. gen. 6. p. 413) clothed with cinereous, silky down; leaves ovate-elliptic, acutish, beset with strigose hairs above, and silky tomentum beneath; peduncles shorter than the leaves, cymose, many-flowered; bractéas ovate or linear, intermixed with the flowers; sepals ovate, bluntish, glabrous. ♄. ⌒. S. Native of Mysore, and the Neelgherry mountains. Convólvulus Choisyànus, Wall. cat. no. 2259. 1. no. 2. Stem fistular. Leaves nerved, 2-3 inches long,

and 1-2 broad. Petioles and peduncles clothed with hoary tomentum. Corolla 18 lines long, hairy outside. Sepals rather hairy outside, with scarious edges.

Leschenault's Argyreia. Shrub tw.

4 A. pomàcea (Choisy, l. c. p. 413.) clothed with cinereous tomentum; leaves ovate-elliptic, obtuse, clothed with cinereous, velvety down on both surfaces, but especially beneath; peduncles exceeding the petioles a little, cymose, many-flowered; bracteas linear-lanceolate, adpressed to the flowers; sepals ovate-lanceolate, obtuse, rather villous. ♄. ◠. S. Native of Mysore. Lettsòmia pomàcea, Roxb. fl. ind. 2. p. 83. Ipomæ'a Zeylánica, Gærtn. fruct. 2. p. 482. t. 178. f. 1. Convólvulus Rottlèri. Spreng. syst. 4. p. 61. Lettsòmia strigòsa, Roxb. fl. ind. 2. p. 80. Ipomæ'a strigòsa, Roth. Convólvulus capitàtus, Vahl, symb. 3. p. 28.? Convólvulus Choisyànus, Wall. cat. Leaves sometimes sub-emarginate at apex. Petioles and peduncles villous. Bracteas sometimes cuneated. Flowers large, rose-coloured. Berry 4-seeded, size of a cherry, yellow. Peduncles dichotomous, 3-7-flowered.

Apple-fruited Argyreia. Shrub tw.

5 A. Neelghe'rya (Choisy, l. c. p. 414.) clothed with rufescent hairs; leaves cordate-orbicular, or oblong, acuminated, sinuated, beset with strigose hairs on both surfaces; peduncles exceeding the petioles, umbellately many-flowered; bracteas ovate or linear, intermixed with the flowers; sepals ovate-elliptic, obtuse, hairy outside. ♄. ◠. S. Native of Neelgherry mountains. Stem fistular. Leaves 3-4 inches long, scabrous and green above. Corolla 2-3 inches long, campanulately funnel-shaped, rose-coloured. Very nearly allied to the preceding species.

Neelghery Argyreia. Shrub tw.

6 A. populifòlia (Choisy, l. c. p. 414.) glabrous; leaves cordately-orbicular, short-acuminated; peduncles usually exceeding the leaves, dichotomously cymose; flowers loose, intermixed with linear-lanceolate bracteas; sepals small, ovate-roundish, very obtuse, villous. ♄. ◠. S. Native of the East Indies, at Gualpara and Colomba. Ipomæ'a Kleiniàna, Rœm. et Schultes, syst. 4. p. 789. Ipomæ'a bracteàta, Willd. herb. Convólvulus Malabáricus, Hamilt. herb. madr. Wall. cat. no. 1414. Conv. fastigiàtus, Roxb. ex Wall. cat. no. 2258. Tops of branchlets rather villous. Leaves paler beneath. Petioles sometimes rather villous. Peduncles a foot long. Corolla tubularly campanulate, hairy outside; tube coarctate at the base.

Poplar-leaved Argyreia. Shrub tw.

7 A. sple'ndens (Sweet, hort. brit. p. 289. Choisy, l. c. p. 415.) leaves ovate-oblong, or ovate-elliptic, entire, or pandurately sinuated, sometimes somewhat 3-lobed, smooth above, but clothed with silvery, silky down beneath; peduncles exceeding the petioles, corymbosely many-flowered; bracteas none; sepals ovate, obtuse, clothed with hoary tomentum. ♄. ◠. S. Native of the East Indies. Lettsòmia splèndens, Roxb. fl. ind. 2. p. 75. Convólvulus splèndens, Horn. hort. hafn. suppl. p. 123. Ipomæ'a splèndens, Sims, bot. mag. t. 2628. Conv. splèndidus, Hamilt. herb. Stem clothed with hoary villi. Leaves acuminated, 6 inches long; petioles hoary. Corolla tubularly campanulate, 1½ inch long, rather villous outside, pale red. Berry scarlet, size of a large pea.

Splendid Argyreia. Fl. Nov. Clt. 1820. Shrub tw.

8 A. fu'lgens (Choisy, l. c. p. 415.) tomentose; leaves lanceolate, long-acuminated, glabrous and dark green above, but clothed with silvery tomentum beneath; peduncles not exceeding the petioles, brachiately and loosely many-flowered; bracteas almost wanting; sepals ovate, very obtuse, equal, villous. ♄. ◠. S. Native of the East Indies, at Quilon. Convólvulus fulgens, Wall. cat. no. 1394. Conv. argénteus, Heyne, herb. Leaves nerved beneath, 3-4 inches long, 9-15-lines broad. Pedicels villous. Corolla tubular, 1½ inch long, glabrous.

Fulgent Argyreia. Shrub twining.

9 A. pa'llida (Choisy, l. c. p. 416.) smoothish; leaves ovate-oblong, acute and mucronate at the apex, glabrous above, clothed with cinereous down beneath; peduncles very short, shorter than the petioles, 3-4-flowered; sepals ovate-orbicular, very blunt, villous. ♄. ◠. S. Native of the East Indies, between Yandaboo and Paghumew, on the road to Petiwell Wells. Convólvulus pállidus, Wall. cat. no. 1418. Branches clothed with cinereous, white wool at top. Corolla tubular, glabrous, hardly 5-8 lines long. Fruit black, acute, 2-celled.

Pale Argyreia. Shrub tw.

10 A. cunea'ta (Ker. bot. reg. 661.) smoothish; leaves obovate-cuneated, emarginate, glabrous above, but beset with short, crowded hairs beneath, hardly petiolate; peduncles shorter than the leaves, 3-6-flowered; bracteas linear, very acute; sepals ovate, obtuse, equal, villous. ♄. ◠. S. Native of the East Indies. Convólvulus cuneifórmis, Buch. draw. mys. pl. Ipomæ'a atrosanguínea, Sims, bot. mag. 2170. Lettsòmia cuneata, Roxb. fl. ind. 2. p. 81. Conv. cuneàtus, and Conv. cymòsus, Herb. madr. Stem clothed with powdery down at top. Petioles villous. Peduncles and pedicels downy. Corolla large, of a beautiful deep bright purple colour. Berry smooth, yellowish outside.

Cuneate-leaved Argyreia. Fl. July, Aug. Clt. 1822. Shrub tw.

11 A. ellíptica (Choisy, in mem. soc. phys. gen. p. 417.) smoothish or downy; leaves ovate or obovate-elliptic, usually villous; peduncles sometimes exceeding the leaves; flowers in loose, corymbose panicles; bracteas small, linear, caducous; sepals equal, very blunt. ♄. ◠. S. Native of the East Indies, as of Mysore, Ceylon, Taong Dong, and Lower Nipaul. Convólvulus ellípticus, Spreng, syst. 1. p. 613. Ipomæ'a ellíptica, Roth. nov. spec. 113. Rœm. et Schultes, syst. 4. p. 248. Convolv. laurifòlius, Roxb. fl. ind. 2. p. 50. and 573. Ipomæ'a laurifòlia, Sweet, hort. brit. p. 288. Convolv. pedunculàris, Wall. cat. no. 1417. Branches and peduncles downy or villous. Bracteas and calyx villous. Corolla tubularly campanulate, an inch long, of a rose-colour. Berry round, 4-seeded.

Elliptic-leaved Argyreia. Shrub twining.

12 A. arge'ntea (Choisy, l. c. p. 418.) stem downy; leaves roundish-cordate, short-acuminated, glabrous above, rarely beset with short hairs, and clothed with silvery, silky down beneath; peduncles stiff, about equal in length to the petioles; flowers loosely umbellate; bracteas lanceolate or linear, intermixed with the flowers; sepals lanceolate: exterior ones larger, with revolute margins, villous outside. ♄. ◠. S. Native of Silhet, and Chittagong; and in woods about Calcutta. Lettsòmia argéntea, Roxb. fl. ind. 2. p. 79. Convolv. argénteus, Herb. madr. Leaves 3-4 inches long, and the same broad. Bracteas silky. Flowers many, large, of a beautiful rich pink colour, glabrous, except the outside of the plicæ, which is villous. Berry 4-seeded.

Silvery Argyreia. Shrub tw.

13 A. venu'sta (Choisy, l. c. p. 419.) altogether like the preceding, except the leaves, which are not silky beneath, but clothed with wool-like down. ♄. ◠. S. Native of the East Indies, as of Goalpara, Rangoon, Pegu, Ava, Prome, Segaen. Convolv. Malabáricus, Wall. cat. no. 1414. Lettsòmia argéntea, Roxb., from Rangoon. Berry glabrous, black in the dried state, 4-seeded. Sepals stiff, glabrous, and bluntish.

Beautiful Argyreia. Shrub tw.

14 A. Roxbu'rghii (Choisy, l. c. p. 419.) very nearly allied to the two preceding species; but the leaves are clothed with cinereous villi on both surfaces, but particularly beneath. ♄. ◠. S. Native of the East Indies, in woods and hedges. Ipomæ'a multiflòra, Roxb. fl. ind. 2. p. 89. Ipomæ'a Burmánni? Kœn. mss. ex Wall. Ipomæ'a Roxbúrghii, Sweet, hort. brit. p. 289. Ipomæ'a amœ'na, Blum. bijdr. 718. Convólvulus Roxbúrghii, Wall. cat. no. 1415. Stems clothed with cinereous

villi. Bracteas and sepals villous outside. Corolla 2 inches long, rose-coloured; inside of the tube a bright red.

Roxburgh's Argyreia. Fl. June, Aug. Clt. 1816. Shrub tw.

15 A. Malaba'rica (Choisy, l. c. p. 420.) stem downy; leaves roundish-cordate, acute, glabrous, or furnished with a few scattered hairs on both surfaces; peduncles about equal to, or exceeding the leaves, many-flowered at the apex; sepals lanceolate, acute, exterior ones larger, and clothed with hoary villi, with revolute edges. ♄. ⌒. S. Native of Coromandel, Malabar, Mysore, Cochinchina, Java. Convólvulus Malabáricus, Lin. spec. 221. Willd. spec. 1. p. 857. Ipomæ'a Malabárica, Rœm. et Schultes, syst. 4. p. 235. Kattu-Kalengu, Rheed. mal. 11. p. 105. t. 51. Petioles villous. Leaves paler beneath, 3-4 inches long, and the same in breadth. Peduncles trifid, villous. Flowers rather small; the bottom of the bell deep purple; throat pink, with the edges paler, almost white, and slightly 10-lobed. Desrousseaux and Blum. say, that the peduncles are 1-3-flowered; the flowers cream-coloured, with a purple bottom.

Malabar Argyreia. Fl. Ju. Aug. Clt. 1823. Shrub tw.

16 A. a'mpla (Choisy, l. c.) leaves ovate-roundish, somewhat cordate at the base, short-acuminated at the apex, clothed with woolly tomentum on both surfaces while young, but when old nearly glabrous; peduncles very short, umbellately many-flowered; bracteas linear-lanceolate, villous; sepals equal, linear-lanceolate, hairy outside. ♄. ⌒. S. Native of Nipaul. Convólvulus ámplus, Wall. cat. no. 1420. Stem fistular, villously tomentose while young. Leaves 6 inches long, and about the same in breadth. Umbels 4-6-flowered. Corolla $2\frac{1}{2}$ inches long, showy, glabrous.

Large-leaved Argyreia. Shrub twining.

17 A. Wallíchii (Choisy, l. c. 421.) leaves ovate or lanceolate, hardly cordate at the base, acuminated at the apex, glabrous and wrinkled above, nerved and clothed with white tomentum beneath; peduncles almost wanting, many-flowered; bracteas permanent, linear-lanceolate, rather villous; sepals linear-lanceolate: exterior ones the longest. ♄. ⌒. S. Native of the Burman Empire, on mount Taong Dong. Convólvulus erythrocárpus, Wall. cat. no. 1413. Petioles villous, 4-6 inches long. Leaves length of petioles. Flowers 3-4 in a fascicle, nearly sessile. Berry red.

Wallich's Argyreia. Shrub twining.

18 A.? lanceola'ta (Choisy, l. c.) clothed with cinereous, silky down; leaves linear-lanceolate, acute, glabrous above, and blackish, clothed with silky, silvery down beneath; flowers solitary, nearly sessile; sepals ovate-lanceolate, acute, clothed with silky hairs outside. ♄. ⌒. S. Native of Martaban and Tavoy, in the East Indies. Convólvulus argyrophýllus, Wall. cat. no. 1395. Leaves $2\frac{1}{2}$ inches long, and 3-5 lines broad. Corolla tubularly campanulate, an inch long, purple, hairy outside.

Lanceolate-leaved Argyreia. Shrub twining.

19 A.? móllis (Choisy, l. c.) stem glabrous, or hardly downy; leaves elliptic-lanceolate, hairy above, and blackish, but clothed with silvery-silky down beneath; peduncles equal in length to the petioles, many-flowered; flowers umbellate; bracteas involucrating the flowers, ovate-obtuse; sepals ovate-oblong, obtuse, hairy outside. ♄. ⌒. S. Native of the Prince of Wales Island. Convólvulus móllis, Burm. ind. 44. t. 17. Convolv. seríceus, Lin. mant. p. 43. Convolv. gràcilis, Sal. prod. 124.? Ipomæ'a serícea, Blum. bijdr. p. 720. Lettsòmia híspida, Hook. mss. Leaves 2-3 inches long. Peduncles hoary, 3-6-flowered. Corolla 2 inches long, pur[illegible], beset with long white hairs outside. Berry red. *Convólvulus Kàtion*, and *C. Kleiniàna*, Herb mus. par. is probably referrible to this species.

Soft Argyreia. Fl.? Clt.? Shrub tw.

20 A. nítida (Choisy, l. c. p. 422.) clothed with silvery-silky villi; leaves ovate-elliptic, acute, silky on both surfaces, blackish above, and silvery beneath; peduncles very short, 2-3-flowered, but usually 1-flowered; bracteas small, linear-lanceolate; sepals acute, outer ones the longest. ♄. ⌒. S. Native of the East Indies and Philippine Islands. Convólvulus nítidus, Desr. in Lam. dict. 3. p. 544. Leaves 3 inches long, and 2 broad, sometimes furnished with fascicles of smaller ones in the axils of the older ones. Petioles 1-2 inches long. Corolla inflated, tubular, 2 inches long, coarctate at the base, clothed with silky hairs outside; limb spreading a little.

Shining Argyreia. Shrub twining.

21 A. Guichenòtii (Choisy, l. c. p. 423.) clothed with silvery down; leaves ovate-cordate, quite glabrous above, clothed with adpressed down beneath; peduncles shorter than the leaves, commonly 3-flowered; sepals clothed with silky-silvery down: outer ones ovate-orbicular: inner ones smaller, ovate-oblong. ♄. ⌒. S. Native of the islands of Timor and Java. Ipomæ'a púlchra, Blum. bijdr. p. 716. Leaves acute, cordate at the base, 3-5 inches long, and 1-3 broad. Corolla tubularly funnel-shaped, fine red, silky outside; limb obtuse, 5-lobed.

Guichenot's Argyreia. Shrub twining.

22 A. capita'ta (Choisy, l. c.) clothed with strigose hairs; leaves cordate-ovate, acuminated, hairy on both surfaces; hairs glandular at the base; peduncles exceeding the petioles; flowers capitate; bracteas ovate-lanceolate, involucrate, hairy, as well as the sepals, which are linear-lanceolate. ♄. ⌒. S. Native of Silhet, Goalpara, Tavoy, Madras, &c. Convólvulus capitifórmis, Poir. ency. suppl. 3. p. 469. Convolv. capitàtus, Vahl, symb. 3. p. 28. Ipomæ'a capitàta, Rœm. et Schultes, syst. 4. p. 238. Lettsòmia strigòsa, Roxb. fl. ind. 2. p. 80. Ipomæ'a trichótoma, Blum. bijdr. p. 717. Convólvulus strigòsus, Roxb. herb. Leaves 2-5 inches long, and 1-3 broad. Corolla 1-2 inches long, rose-coloured or purple, hairy outside. Berry red, 4-seeded, round.

Var. β, conférta (Choisy, l. c. p. 424.) peduncles very short, crowded on the tops of the branches, forming long, hairy spikes; bracteas and sepals smaller than in the species. ♄. ⌒. S. Native of the Burman empire, on mount Taong Dong. Convólvulus hirsutíssimus, Wall. cat. no. 1400.

Capitate Argyreia. Fl. July, Aug. Clt. 1823. Shrub tw.

23 A. barbígera (Choisy, l. c. p. 424.) clothed with adpressed hairs; leaves cordate, acuminated; clothed with strigose hairs on both surfaces, but particularly beneath; peduncles exceeding the petioles, stiff, many-flowered; flowers capitate; bracteas ovate, very blunt, surrounding the pedicels and flowers; sepals like the bracteas, but more strigose. ♄. ⌒. S. Native of the Burman empire, at Prome. Convólvulus bárbiger, Wall. cat. no. 1404. Lettsòmia strigòsa, Roxb. hort. beng., but hardly of fl. ind. Hairs on the petioles and peduncles spreading. Corolla purple, hairy outside. Leaves 2-3 inches long, and 1-2 broad.

Beard-bearing Argyreia. Shrub twining.

Sect. II. Schizan'thus (from σχιζω, *schizo*, to cut; and ανθος, *anthos*, a flower; the corolla is 5-cleft.) Corolla 5-cleft, or 5-parted at the apex. Stamens exserted.

24 A. setòsa (Choisy, l. c. p 425.) clothed with adpressed hairs; leaves cordate-ovate, or cordate-roundish, acuminated, quite glabrous above, and beset with adpressed strigæ beneath; peduncles exceeding the petioles, stiff, corymbosely many-flowered; bracteas compassing the flowers and pedicels, reniformly orbicular, very obtuse; sepals very strigose outside; ovate, orbicular, obtuse. ♄. ⌒. S. Native of Sukanagur and Lower Nipaul, as well as of the island of Timor. Ipomæ'a strigòsa, Roth, nov. spec. p. 113. Rœm. et Schultes, syst. 4. p. 242. Lettsòmia setòsa, Roxb. fl. ind. 2. p. 80. Convólvulus strigòsus, Spreng. syst. 1. p. 600. Convólvulus setòsus, Roxb.

mss. Convolv. multiflòrus, Heyne, herb. Conv. confértus, Ham. herb. Leaves 2-3 inches long, and 1 to 2½ broad; the older leaves sometimes 6 inches long, and as much broad. Corolla 6-9 lines long, pink-coloured, clothed with strigose hairs outside; lobes acute. Berry pea-formed, red. Flowers sessile on the branches of the peduncle.

Bristly Argyreia. Fl. July, Aug. Clt. 1818. Shrub tw.

25 A. rubicu'nda (Choisy, l. c. p. 426.) downy; leaves roundish, hardly-cordate, obtuse, furnished with a few hairs above, tomentose beneath; peduncles stiff, exceeding the petioles, brachiately corymbose; bracteas ovate or ovate-roundish; sepals unequal: outer ones the largest, ovate-roundish, very blunt: inner ones shorter and narrower; corolla small. ♄. ⌒. S. Native of the Burman Empire, on Mount Taong Dong. Convólvulus rubicúndus, Wall. cat. no. 1409. Leaves rather silvery beneath, an inch long, and as much broad. Peduncles tomentose. Corolla 4-5 lines long, glabrous, silky outside; lobes acute. Flowers disposed loosely.

Reddish-flowered Argyreia. Shrub twining.

26 A. tomentòsa (Choisy, l. c.) clothed with down; leaves ovate, obtuse at the base, bluntish at the apex, and mucronulate, smoothish above, but clothed with cinereous tomentum beneath; peduncles very short, capitately many-flowered; bracteas ovate or ovate-orbicular, or ovate-lanceolate, repand; sepals linear-lanceolate: outer ones the largest. ♄. ⌒. S. Native of the Burman empire, on the banks of the Irawaddi. Convólvulus multibracteàtus, Wall. cat. no. 1408. 1. Leaves 2-3 inches long, and 1 to 1½ broad. Corolla tubularly salver-shaped; tube glabrous; limb acute, silky outside.

Var. β, cordàta (Choisy, l. c. p. 427.) leaves dilated at the base, and cordate, with a rather deep, very blunt recess. ♄. S. Native on the banks of the Irawaddi, and Lower Nipaul. Convólvulus *β* cordàtus, Wall. mss. Conv. vestìtus, Wall. cat. no. 1411. Berry pea-shaped.

Tomentose Argyreia. Shrub twining.

27 A. aggrega'ta (Choisy, l. c. p. 427.) clothed with hoary tomentum; leaves ovate-cordate, glabrous above, but clothed with hoary tomentum beneath; peduncles exceeding the petioles a little; many-flowered; flowers capitate; bracteas involucrating, ovate-orbicular, hoary; sepals ovate, obtuse; corolla small. ♄. S. Native of Coromandel, Orissa, Ceylon, Mysore, Taong Dong, Ava, &c. Lettsòmia aggregàta, Roxb. fl. ind. 2. p. 76. Convólvulus Orixénsis, Rottler, and Klein, mss. Conv. canéscens?, Roth, nov. spec. p. 107. Rœm. et Schultes, syst. 4. p. 274.? Conv. Hèynii?, Spreng. syst. 1. p. 699. Ipomæ'a imbricàta, Roth, nov. spec. p. 112. Rœm et Schultes, syst. 4. p. 249. Conv. imbricàtus, Spreng. syst. 1. p. 613. Conv. aggregàtus, Bot. gard. Conv. canéscens, Spreng. Leaves obtuse at top, sometimes sub-emarginate, 2-3 inches long, and about the same in breadth. Corolla campanulate, hardly longer than the calyx, red; lobes acute, villous outside, emarginate, ex Wall.

Aggregate-flowered Argyreia. Shrub not tw.

28 A. cymòsa (Sweet, hort. brit. p. 289. Choisy, l. c. p. 428.) clothed with pruinose down; leaves roundish-cordate, or reniformly-cordate, obtuse, terminated by a very short mucrone, glabrous on both surfaces, or clothed with pruinose down; peduncles equal in length to the leaves, as also exceeding them, leafy at top, and cymosely many-flowered; bracteas ovate-roundish, obtuse, plicately recurved; outer sepals like the bracteas; inner sepals ovate-linear; corolla showy. ♄. ⌒. S. Native of Malabar, on the mountains. Lettsòmia cymòsa, Roxb. fl. ind. 2. p. 82. Stems compressed. Leaves green, 1-2 inches long, and about the same in breadth. Corolla tubularly funnel-shaped, villous outside, pale pink. Berry yellow, 1-4-seeded.

Cymose-flowered Argyreia. Clt. 1823. Shrub twining.

29 A. acu'ta (Lour. coch. p. 135.) frutescent; leaves ovate, subcordate, mucronate, clothed with silvery-silky down beneath, glabrous above; flowers numerous, disposed in loose, terminal panicles; bracteas oblong, obtuse, clothed with hoary, silky down outside; outer sepals largest, ovate, bluntish: all clothed with hoary tomentum outside; corolla white, showy. ♄. ⌒. S. Native of China. Argyrèia festìva, Wall. pl. asiat. rar. 1. p. 68. t. 76. Leaves 4-5 inches long, and 3 to 3½ broad. Panicle corymbose. Corolla an inch long, campanulate, much higher than the calyx; lobes lanceolate, obtuse, hairy, outside. Berry red.

Acute Argyreia. Shrub tw.

30 A. obtusifo'lia (Lour. coch. p. 134. Choisy, l. c. p. 429.) frutescent; leaves ovate, obtuse, glabrous above, but clothed with silky down beneath; flowers disposed in loose, panicled corymbs; bracteas linear-lanceolate; flowers adpressed; sepals oblong-linear, outer ones the largest. ♄. ⌒. S. Native of Cochinchina, in hedges. Stem clothed with velvety down. Leaves 2-4 inches long, and 1-2 broad, sometimes mucronulate. Corolla white. Berry red.

Blunt-leaved Argyreia. Shrub twining.

† *A species hardly known.*

31 A. arbòrea (Lour. coch. p. 135. Choisy, l. c. p. 430.) arboreous; leaves ovate, acute, wrinkled, entire, glabrous, reflexed; racemes terminal; sepals inflated, red; corolla with a longish, filiform tube, and roundish segments. ♄. G. Native of Cochinchina, in woods. Stem 8 feet high, with spreading branches. Corolla white or yellow. Berry 4-celled, 1-seeded.

Arboreous Argyreia. Shrub 8 feet.

Cult. Argyrèia is a most splendid genus of plants, well worth the cultivator's care. The greater number of the species are robust, extensive twiners or climbers, usually requiring more space to run than can well be spared for that purpose in any stove or hothouse, before they will flower; some of them, however, as *A. cuneifòlia*, being dwarfer plants, produce their elegant blossoms in abundance. All the species grow well in rich light soil, or a mixture of peat, loam, and sand; and cuttings root readily if planted in sand or mould, with a hand-glass placed over them, in a little bottom heat.

IV. BLINKWO'RTHIA (named by Choisy, after Mr. Blinkworth, who collected numerous specimens of plants, around Rangoon, and transmitted them to Dr. Wallich.) Choisy, in mem. soc. phys. genev. 6. p. 430. t. 4.

Lin. syst. *Pentándria, Monogýnia.* Bracteas 3, forming an involucrum, and as if it were another calyx. Sepals 5. Corolla short, cylindrically urceolate. Style 1; stigma capitately 2-lobed. Berry 1-seeded.—A shrub, allied to *Argyrèia*; but is distinguished from it, in the involucrum, corolla, and habit.

1 B. lycioìdes (Choisy, l. c.) stem terete, villous; leaves linear, obtuse, mucronulate, on very short petioles, glabrous above, and rather silky beneath; peduncles short, 1-flowered; sepals ovate-orbicular. ♄. ⌒.? S. Native on the banks of the Irawaddy, &c. Convólvulus lycioìdes, Wall, cat. no. 1390. Leaves 6-9 lines long, and 1-3 broad. Corolla a little longer than the calyx, 5-toothed at apex, blackish in the dried state, and glabrous. Berry girded by the calyx.

Lycium-like Blinkworthia. Shrub tw.?

Cult. For culture and propagation see *Argyrèia*, above.

V. HUMBE'RTIA (probably named after some individual of the name of Humbert.) Lam. dict. 2. p. 356. ill. t. 103. Choisy, conv. in. mem. soc. phys. gen. 6. p. 431.—Endràchium, Gmel. syst. veg. 1. p 339. Juss. gen. p. 133.—Thouínia, Smith,

icon. ined. 1. p. 7. t. 7. Smíthia, Gmel. syst. 1. p. 308.—Endrach, Flacourt, hist. mad. p. 137. t. 100.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 sepals. Corolla 5-cleft. Stamens exserted, deflexed. Ovarium one; stigma hollow, complanate. Capsule baccate, woody, 2-celled; cells 2-seeded.—A tall tree, native of Madagascar. Branches terete. Leaves obovate-lanceolate, quite entire, emarginate. Peduncles 1-flowered, axillary, on the tops of the branches, shorter than the leaves, furnished with 2 little teeth in the middle of each. Flowers large, similar to those of other Convolvulaceous plants.

1 H. Madagascarie'nsis (Lam. dict. 2. p. 357.) ♄. S. Native of Madagascar. Endràchium Madagascariénse, Juss. et Gmel. syst. 1. p. 339, exclusive of the syn. of Bruce. Pers. ench. 1. p. 176. Thouínia spectábilis, Smith, icon. ined. 1. p. 7. t. 7. Smíthia Thouínia, Gmel. syst. 1. p. 389. Humbértia ævitérnia, Commers.

Madagascar Humbertia. Tree tall.

Cult. For culture and propagation see *Argyrèia*, p. 257.

VI. MOORCRO'FTIA (named after William Moorcroft, a gentleman in the service of the East India Company, who travelled in Nipaul, and in the neighbouring countries to the north.) Choisy, conv. in mem. soc. phys. gen. 6. p. 431.—Convólvulus species, Wall. Perhaps this genus is not distinct from *Erysìbe*.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 sepals. Corolla unknown. Style one. Berry 1-seeded, 1-celled by abortion, very rarely 2-celled.—*M. Pinangiàna*, from the baccate fruit, is nearly allied to *Argyrèia;* but the habit and inflorescence are quite distinct.

1 M. adpre'ssa (Choisy, l. c.) stem hairy; leaves ovate or lanceolate, hairy on both surfaces; peduncles brachiately corymbose, exceeding the petioles a little, 3-6-flowered; sepals linear, recurved at apex. ♄. S. Native of Penang. Convólvulus adpréssus, Wall. cat. no. 1424. Leaves obtuse or acutish, 2-4 inches long, and 1-2 broad, pale beneath. Flowers hairy. Berry usually 1-celled, 1-seeded.

Adpressed Moorcroftia. Shrub.

2 M. Pinangia'na (Choisy, l. c. p. 432.) stem glabrous; leaves ovate-lanceolate, acuminated, quite glabrous on both surfaces; peduncles slender, much exceeding the petioles, loosely 4-8-flowered; sepals cuneate-ovate, stiff, small. ♄. ◠. S. Native of Penang. Convólvulus Pinangiànus, Wall. cat. no. 1425. Leaves 2-3 inches long, and 1½ to 2 broad, whitish beneath the nerves, sometimes furnished with a few adpressed hairs. Outer sepals and corolla hairy outside. Berry 1-celled, 1-seeded.

Pinang Moorcroftia. Shrub tw.

Cult. For culture and propagation see *Argyrèia*, p. 257.

Tribe II.

CONVOLVU'LEÆ (so called, because the genera contained in the section agree with *Convólvulus* in the characters indicated below.) Choisy, in mem. soc. phys. gen. 6. p. 433. Embryo cotyledonous. Carpella combined into a single ovarium. Pericarp capsular, dehiscent.

VII. QUA'MOCLIT (from κυαμος, *kyamos*, a kidney bean; and κλιτος, *klitos*, dwarf; because it resembles the kidney bean in its climbing stems, but is less tall.) Tourn. inst. 116. Mœnch, meth. Choisy, in mem. soc. phys. gen. 6. p. 433.—Convolvulus and Ipomœ'a, species of authors.—Calbòa, Cav. icon. 5. p. 51. t. 476.- Macrostémma, Pers. ench. 1. p. 185.—Exogònium, Moc. et Sesse, ined.—Mìna and Morenòa, La Lav. et Lexar.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 sepals, which are usually mucronate on the back under the apices. Corolla tubularly cylindrical. Stamens exserted. Style one; stigma capitate, 2-lobed. Ovarium 4-celled; cells 1-seeded.—Twining herbs, mostly natives of America.

1 Q. phœnícea (Choisy, in mem. soc. phys. gen. 6. p. 433.) leaves cordately reniform, with angularly toothed margins, sometimes 3-lobed; lobes acute, with dentately sinuated edges, glabrous on both surfaces; peduncles many-flowered, loosely spicate. ⊙. ◠. S. Native of the southern parts of the Coromandel Coast, Moluccas, &c. Ipomœ'a phœnícea, Roxb. Wall. fl. ind. 2. p. 92. Convólvulus phœníceus, Spreng. syst. 1. p. 596. Ipomœ'a angulàris, Willd. act. am. N. C. berol. 4. p. 197. Convólvulus angulàtus, herb. Ham. Ipomœ'a coccínea. Andr. bot. rep. t. 449. Plant glabrous. Leaves paler beneath. Sepals awned. Flowers remote, of a beautiful bright crimson colour; tube 2 inches long. This is a very gaudy plant; no painter can do justice to the brightness of its flowers.

Crimson Quamoclit. Fl. June, Sept. Clt. 1806. Pl. tw.

2 Q. angula'ta; leaves cordate, angular, somewhat 3-lobed, glabrous on both surfaces: upper ones entire, mucronate; peduncles many-flowered, racemose, usually dichotomous. ⊙. ◠. S. Native of the Isle of France and Bourbon. Ipomœ'a angulàta, Lam. ill. no. 2116. Poir. dict. 6. p. 12. Ipomœ'a dentàta, Willd. herb. Leaves large. Calycine segments narrow, acute. Corolla scarlet, with a long tube; lobes of limb ovate. Capsule 3-celled.

Angular-leaved Quamoclit. Pl. tw.

3 Q. Ruizia'na; leaves cordately sagittate, acuminated, and acute; peduncles usually 2-flowered. ⊙. ◠. S. Native of Peru, in elevated, stony places, about Lima. Ipomœ'a angulàta, Ort. dec. 7. p. 8. Ruiz. et Pav. fl. per. 2. p. 11. t. 120. f. b. Ipomœ'a dùbia, Rœm. et Schultes, syst. 4. p. 216. Leaves entire; segments of calyx unequal, somewhat tubercled. Peduncles 1-3-5-flowered; bracteas ovate, dilated at top. Tube of corolla long, slender, of a reddish copper colour; limb short, spreading, scarlet, with revolute edges. Capsule 3-4-celled. Perhaps a variety of *Q. coccínea*.

Ruiz's Quamoclit. Pl. tw.

4 Q. coccínea; leaves cordate, acuminated, angular at the base; peduncles 3-6-flowered; calyxes warted, awned. ⊙. ◠. H. Native of St. Domingo, New Spain; and of Carolina, at the Mississippi. Ipomœ'a coccínea, Lin. hort. ups. p. 39. spec. p. 163. Michx. fl. bor. amer. 1. p. 140. Curt. bot. mag. t. 221. St. Hil. 30. t. 6. Ipomœ'a stylòsa, Comm. rar. t. 21. Conv. coccíneus, Spreng. syst. 1. p. 599.—Plum. icon. 89. t. 103. Plant nearly glabrous. Leaves 3-4 inches long, and 2 broad. Tube of corolla long; limb small, pale scarlet. Capsule 3-4-celled.

Var. β, pubéscens (Cham. et Schlecht. in Linnæa, 5. p. 118.) leaves hastately-cordate, never 3-lobed; hind lobes angularly-toothed at the base, down dense, soft, adpressed. ⊙. ◠. H. Native of Mexico, near Hacienda de la Laguna.

Scarlet-flowered Quamoclit. Fl. June, Sept. Clt. 1713. Pl. tw.

5 Q. lute'ola; leaves cordate, acuminated, rather angular, glabrous; peduncles at first dichotomous, then racemose. ⊙. ◠. H. Native of Guatimala. Ipomœ'a lutèola, Jacq. icon. rar. 1. t. 35. coll. 2. p. 266. Willd. enum. 1. p. 207. Ipomœ'a coccínea, *β*, Willd. spec. 1. p. 880. Conv. lutèolus, Spreng. syst. 1. p. 599. Sepals lanceolate-linear. Corolla of an orange yellow colour; limb acute, short. Perhaps only a variety of *Q. coccínea*.

Yellow-flowered Quamoclit. Fl. Ju. Sept. Clt. 1759. Pl. twining.

6 Q. leuca'ntha; leaves cordate, bluntly acuminated, glabrous; flowers solitary; calyx rather hairy, bractless; corolla

tubular; stigmas globose. ⊙. ? ⌒. S. Native of Cuba. Ipomœ'a leucántha, Desv. herb. ex Ham. prod. p. 25. Corolla white. Genitals exserted.

White-flowered Quamoclit. Pl. twining.

7 Q. serótina; leaves cordate, acuminated, angular at the base; peduncles thickened, 3-flowered. ⊙. ⌒. S. Native country unknown. Ipomœ'a serótina, Rœm. et Schultes, syst. 4. p. 215. Plant glabrous. Leaves $2\frac{1}{2}$ inches long, and 2 broad. Sepals obtuse, unequal. Said to be nearly allied to *Q. lutèola*. Convólvulus serótinus, D. C. icon. t. 27. ex Spreng. syst. 1. p. 598.

Late Quamoclit. Fl. June, Sept. Clt. 1824. Pl. tw.

8 Q. hederifòlia; leaves cordate, 3-lobed, glabrous; peduncles racemose, many-flowered. ⊙. ⌒. S. Native of West Indies. Ipomœ'a hederifòlia, Lin. spec. p. 229. Willd. spec. 1. p. 885. Conv. hederifòlius, Spreng. syst. 1. p. 594.—Plum. spec. 3. edit. Burm. t. 93. f. 2.—Tourn. inst. p. 116. Corolla 4 times longer than in *C. trîloba*, violaceous, cylindrical. Stem rather angular.

Ivy-leaved Quamoclit. Fl. July. Clt. 1773. Pl. tw.

9 Q. vitifòlia; leaves cordate, 3-lobed, toothed at the base, glabrous; peduncles bifid, umbelliferous; sepals acute; tube of corolla widened above: limb obtuse, 5-cleft. ⊙. ⌒. S. Native of South America. Calbòa vitifòlia, Cav. icon. 5. p. 51. t. 476. Macrostèma vitifòlia, Pers. ench. 1. p. 185. Convólvulus Neèi, Spreng. syst. 1. p. 593. Lobes of leaves acuminated: middle one contracted at the base. Corolla yellowish outside, purplish-red inside, an inch long.

Vine-leaved Quamoclit. Pl. twining.

10 Q. trîloba; leaves cordate, 3-lobed, glabrous, intermediate lobe ovate, lateral ones semicordate; peduncles 3-flowered. ⊙. ⌒. S. Native of South America. Ipomœ'a trîloba, Lin. spec. p. 229. Mill. dict. no. 6. Willd. spec. 1. p. 884. Convólvulus trîlobus, Desr. in Lam. dict. 3. p. 564.—Knip. cent. 7. no. 37. Stem angular. Corolla cylindrical, violaceous. Capsule pilose.

Three-lobed-leaved Quamoclit. Fl. Ju. July. Clt. 1752. Pl. tw.

11 Q. Eustachia'na; leaves cordate, 3-lobed, glabrous; peduncles 2-flowered. ⊙. ⌒. S. Native of the Island of St. Eustache, among *Opúntias*; and of Mexico, on hills, between Funas and Vera Cruz. Ipomœ'a Eustachiàna, Jacq. obs. 2. t. 36. Vittm. summ. 1. p. 440. Corolla deep purple, funnel-shaped; segments short, acute.

Eustache Quamoclit. Pl. tw.

12 Q. hastígera; leaves hastately trifid, glabrous: intermediate segment lanceolate, large: lateral ones angular; peduncles axillary, many-flowered. ↄ. ⌒. S. Native near the city of Mexico. Ipomœ'a hastígera, H. B. et Kunth, nov. gen. amer. 3. p. 111. Ipomœ'a angulàris, Willd. mss. Ip. Humboldtiàna, Rœm. et Schultes, syst. 4. p. 789. Conv. hastígerus, Spreng. syst. 1. p. 605. Stem angularly striated. Leaves 2 inches long, cordate: lateral segments triangular. Peduncles dichotomous, 6-7-flowered. Sepals roundish, obtuse, awned. Corolla flesh-coloured. Capsule 3-celled.

Halbert-bearing Quamoclit. Fl. May, July. Clt. 1824. Pl. tw.

13 Q. sanguínea; glabrous; leaves cordately 3-lobed or hastate; peduncles longer than the leaves, cymosely trichotomous, ex Ker; 3-flowered, ex Vahl. ♄. ⌒. S. Native of the Island of Santa Cruz. Ipomœ'a sanguínea, Vahl. symb. 3. p. 33. Ker. bot. reg. t. 9. Willd. spec. 1. p. 885. Conv. sanguíneus, Spreng. syst. 1. p. 595. Hind lobes of leaves angularly lobed, ex Vahl. The two lateral pedicels trifid, 3-flowered, middle one 1-flowered. Sepals setaceous, dilated at bottom. Corolla erect, arched, of a crimson-blood colour, an inch long, narrow, clavately tubular, compressed; limb oblately globose, with a contracted, 5-toothed mouth. Stamens ascending, much exserted. Stigma papillosely granular.

Bloody-flowered Quamoclit. Fl. Feb. Nov. Clt. 1812. Shrub tw.

14 Q. longiflòra; leaves hastately 3-lobed, glabrous: intermediate lobe large, oblong: lateral ones quite entire; peduncles axillary, many-flowered; tube of corolla very long. ↄ. ⌒. S. Native of Cuba, near Havannah. Ipomœ'a longiflòra, H. B. et Kunth, nov. gen. 3. p. 111. Stems angular. Leaves cordate; lateral segments triangular. Sepals oblong, obtuse, awned. Corolla white; tube 3 inches long.

Long-flowered Quamoclit. Fl. May, July. Clt. 1803. Pl. tw.

15 Q. hasta'ta; leaves sagittately hastate, glabrous; peduncles 2-flowered. ⊙. ⌒. S. Native of Java. Ipomœ'a hastàta, Lin. mant. p. 204. Willd. spec. 1. p. 884. Ipomœ'a sagittæfòlia, Burm. ind. 50. t. 18. f. 2. Conv. Javánicus, Garc. Hind lobes of leaves acuminated. Corolla yellow, tubularly funnel-shaped, an inch long; limb short, flattish, with ovate, acute lobes.

Hastate-leaved Quamoclit. Pl. tw.

16 Q. Cholule'nsis; leaves roundish-ovate, acuminately cuspidate, deeply cordate, downy above, glabrous beneath; peduncles terminal and axillary, 5-flowered; calyx glabrous. ⊙. ⌒. S. Native of New Spain, near the city of Cholula. Ip. Cholulénsis, H. B. et Kunth, nov. gen. amer. 3. p. 112. Convólvulus Cholulénsis, Spreng. syst. 1. p. 599. Stem somewhat trigonal. Flowers size of those of *Q. coccínea*, scarlet.

Cholula Quamoclit. Pl. tw.

17 Q. dichótoma; leaves ovate, acuminated, glabrous; panicles terminal, dichotomous; calyx glabrous. ⊙. ⌒. S. Native of New Granada, at the mouth of the river Sinu, in humid places. Ipomœ'a dichótoma, H. B. et Kunth, nov. gen. 3. p. 112. Stems nearly terete. Pedicels and bracteas downy. Sepals linear, acuminated. Corolla tubularly funnel-shaped, scarlet.

Dichotomous-panicled Quamoclit. Pl. twining.

18 Q. Mìna; stems glabrous, terete; leaves roughish, and rather villous below, and glabrous above, cordate, 3-lobed; peduncles long, bearing twin, secund racemes, each bearing 7-9-11 flowers; calyx fleshy, with oblong, keeled segments, which are mucronate. ⊙. ? ↄ. ? ⌒. S. Native of Mexico. Mìna lobàta, La Lave, et Lexarza, nov. veg. mex. fasc. 1. p. 3. Corolla tubular, curved, dilated at the base, red at top, the rest yellowish red, fading to yellowish white: limb narrow, 5-toothed; teeth roundish, mucronate; tube 5-angled. Stamens inserted in the mouth of the tube. Ovarium girded by a fleshy gland.

Mina's Quamoclit. Pl. tw.

19 Q. grandiflòra; stems terete, scabrous; leaves somewhat hastately 3-lobed, deeply cordate, glabrous; peduncles longer than the petioles; flowers disposed in racemose fascicles; sepals furnished with a small fleshy horn at the top of each; limb of corolla explicate. ↄ. ⌒. S. Native of Mexico, at St. Jose del Corral. Morenòa grandiflòra La Lave, et Lexarza, nov. veg. mex. fasc. 1. p. 17. Corolla scarlet, with a narrow curved tube and a wide limb, 2 inches long. Stamens a little exserted. The leaves of the specimens of this plant we have seen are angularly cordate, acuminated, and sometimes 3-lobed; the lobes and auricles acuminated.

Great-flowered Quamoclit. Fl. Year. Clt. 1826. Pl. tw.

20 Q. globòsa; stems terete; leaves on long petioles, glabrous, hastate: middle lobe lanceolate, acuminated: lateral ones protracted into acute angles in front, which are prolonged, angular, and truncate behind; peduncles elongated: flowers somewhat fascicled; sepals rounded, equal; corolla with a

globose limb. ♃. ⌒. S. Native of Mexico, at St. Jose del Corral. Morenòa globòsa, La Lave et Lexarza, nov. veg. mex. fasc. 1. p. 5. Corollas scarlet.

Globose-flowered Quamoclit. Fl. Year. Clt. 1827. Pl. tw.

21 Q. digita'ta; glabrous; leaves palmate: segments 5-7, lanceolate, obtuse; peduncles 2-3-flowered. ⊙. ? ⌒. S. Native of tropical America. Ipomœ'a digitàta, Lin. spec. p. 162. Mill. dict. no. 8. Willd. spec. 1. p. 882. Conv. digitàtus, Spreng. syst. 1. p. 592. Quámoclit, foliis digitatis, flore coccineo, Plum. spec. 3. icon. 92. f. 1. Corolla funnel-shaped or tubular, fine purple or scarlet. Stigma globose, obsoletely 3-lobed. Capsule globose, 3-celled; cells 1-seeded.

Digitate-leaved Quamoclit. Fl. Aug. Oct. Clt.? Pl. tw.

22 Q. vulga'ris (Choisy, in mem. soc. gen. 6. p. 434.) leaves pinnatifid, even to the middle nerve; segments linear, parallel, acute; peduncles 1-flowered; sepals ovate-lanceolate. ⊙. ⌒. S. Native of various parts of the East Indies; Isle of France; and North and South America. Ipomœ'a Quámoclit, Lin. spec. 227. Curt. bot. mag. t. 244. Lam. ill. t. 104. f. 1. Convólvulus pinnàtus, Lam. dict. 3. p. 567. Conv. Quámoclit, Spreng. syst. 1. p. 591. Conv. pennatifòlius, Sal. prod. p. 124. Flós cardinàlis, Rumph. amb. 5. p. 421. t. 155. f. 2. Tsiùria-Cránti, Rheed, mal. 11. p. 123. t. 60. Camalàta, Asiat. res. 4. p. 256.—Sabb. hort. 1. t. 515. Plant glabrous. Sepals acute. Corolla scarlet, an inch long; tube narrow; limb acute. Capsule usually 4-celled. The American plant is said to have the peduncles generally 2-flowered.

Var. β, albiflòra; flowers white.

Common Quamoclit. Fl. July, Sept. Clt. 1629. Pl. tw.

Cult. The most of the species of *Quámoclit* are beautiful half hardy annual plants. They should be reared on a hot bed; and about the end of May they may be planted out in an open border, in a warm, sheltered situation, where they will flower freely, and ripen their seed. Some of the more tender kinds may be grown in pots, in the greenhouse, during summer. The perennial herbaceous and shrubby kinds should be treated in the manner recommended for *Batàtas*, p. 262.

VIII. LEPTOCA'LLIS (from λεπτος, *leptos*, slender; and καλλος, *kallos*, beauty; the plants are slender, and very pretty.) Ipomœ'a species of Cav.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla tubularly funnel-shaped, narrow. Stamens inclosed. Style 1; stigma globose, 2-lobed. Ovarium 4-celled? 4-valved; cells 1-seeded? Capsule roundish. Seeds angular.—Small erect plants, with quinate or ternate leaves, and flowers resembling those of *Quámoclit vulgàris* in shape; except that the stamens are inclosed.

1 L. quina'ta; glabrous; leaves quinate; leaflets linear; peduncles axillary, 1-flowered. ♃. G. Native of Mexico. Ipomœ'a muricàta, Cav. icon. 5. p. 52. t. 478. f. 2. Ipomœ'a armàta, Rœm. et Schultes, syst. 4. p. 214. Stems filiform, erect. Peduncles furnished with 2 scale-formed bracteas under the calyx. Calyx muricated?, with ovate, acuminated segments. Corolla of a reddish-violet colour, tubular, an inch long; segments of the limb ovate, acuminated. Filaments villous at the base.

Quinate-leaved Leptocallis. Pl. 1 to 1½ foot.

2 L. terna'ta; glabrous; leaves ternate; leaflets linear; peduncles axillary, 1-flowered. ♃. G. Native of Mexico, about Acapulco. Ipomœ'a ternifòlia, Cav. icon. 5. p. 52. t. 478. f. 1. Stems filiform, erect. Calycine segments acuminated. Corolla tubular, purplish-violet, with ovate, obtuse segments. Stamens villous at the base.

Ternate-leaved Leptocallis. Pl. 1 to 1½ foot.

Cult. The species of *Leptocállis* are very elegant, slender, upright plants, with flowers similar to those of *Quámoclit*. They will do well in a mixture of loam, peat, and sand, or any rich light soil; and cuttings of them will readily strike under a hand-glass, in a little bottom heat.

IX. BATA'TAS (Batatas is Malay according to Rumphius, Mexican according to Nieremberg.) Rumph. amb. 5. p. 367. t. 130. Choisy, in mem. soc. phys. gen. 6. p. 434.—Ipomœ'a and Convólvulus species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 sepals. Corolla campanulate. Stamens inclosed. Style one; stigma capitate, 2-lobed. Ovarium 4-celled; cells 1-seeded. Capsule 4-celled, or only 3-celled by abortion.—Creeping or twining herbs.

1 B. edu'lis (Choisy, in mem. soc. phys. gen. 6. p. 435.) stem creeping, rarely twining; leaves variable, usually angular, also lobed; peduncles equal in length to the petioles, or exceeding them, 3-4-flowered; sepals acuminately mucronate, rarely subtruncate, outer ones a little shorter. ♃. S. Native of the East Indies, and now cultivated every where within the tropics. Convólvulus Batàtas, Michx. fl. bor. amer. 1. p. 138. Lin. amœn. acad. 6. p. 138. Roxb. in Wall. fl. ind. 2. p. 69. Ipomœ'a Batàtas, Lam. dict. 6. p. 14, exclusive of the syn. of Feuille. Convólvulus I'ndicus Orientàlis, &c. Moris. hist. 2. sect. 1. t. 3. f. 4. Convólvulus esculéntus, &c. Catesb. car. 2. p. 60. t. 60. Ipomœ'a Catesbæ'i, Meyer, prim. esseq. p. 113. Conv. esculéntus, Sal. prod. p. 123. Spreng. syst. 1. p. 607. Conv. edùlis, Thunb. jap. p. 84. Batàtas, Rumph. amb. 5. p. 367. t. 130. Kappa-Kalénga, Rheed. mal. 7. p. 95. t. 50. Root tuberous, edible. Stems prostrate. Leaves cordate. Corolla an inch long, glabrous, white outside, and purple inside. The red-rooted sort is in general cultivation all over the warmer parts of Asia, and very deservedly esteemed one of the most palatable and nutritious roots; the white-rooted sort is more generally cultivated in other parts.

The Spanish or Sweet Potatoe is a native of both Indies, and was cultivated by Gerarde, in 1597. He calls the roots potatus, potades, or potatoes, and says they are by some named skirrets of Peru. They flourished in his garden till winter, when they perished and rotted. Batatas were then sold at the exchange in London, and are still annually imported into England from Spain and Portugal. They were, in 1315, the common potatoes of our old English writers, the now common potatoe, *Solànum tuberòsum*, Lin., being then little known. The tubers of the Batatas are sweet, sapid, and nourishing. They are very commonly cultivated in all tropical climates, where they eat not only the roots, but the young leaves and tender shoots, boiled. There are several varieties, differing in the size, figure, colour, and taste of the roots, as well as the form, hairiness, and smoothness of the leaves, and colour of the flowers. In warm climates this plant is cultivated in the same manner as we do the potatoe, but requires much more room, for the trailing stalks extend 4 or 5 feet every way, sending out large tubers, 40 or 50 to a plant. In the national garden at Paris, the plants are raised on a hot-bed, and, about the middle of May, transplanted into the open ground, where they are earthed up, and otherwise treated like the potatoe. In warm seasons they produce a tolerable crop. M. Thouin considers it a much lighter food than the potatoe, and equally nourishing. In England, Miller observes, the roots must be planted on a hot bed in spring; and if the plants are kept covered in bad weather with glasses, they will produce flowers, and many small tubers, from the joints; but if they are exposed to the open air, they seldom make much progress.

Batatas, or Sweet or Spanish Potatoe. Fl.? Clt. 1797. Pl. tw.

2 B. paniculàta (Choisy, l. c. p. 436.) twining, glabrous; leaves palmate, 5-7-cleft: lobes ovate-lanceolate or elliptic, bluntish, rarely sub-acuminated; peduncles much exceeding the petioles, many-flowered, dichotomously and corymbosely panicled; sepals ovate-roundish-concave, very blunt, equal. ♃. ◠. S. Native of the East Indies, as of Silhet, banks of the Irawaddi, Tavoy, Goalpara, &c.; New Holland; Java; Africa, in Guinea; Cayenne, Maranham, and the banks of the Orinoco, in America. Pal-Modécca, Rheed, mal. 11. p. 101. t. 49, exclusive of Modecca. Conv. macrorhìzus, Heyne, herb. Root thick, round, in the Guinea plant elongated. Leaves large, 3-4 inches long, and as much broad. Corolla large, purple. Capsule usually 4-celled, but sometimes 3-celled by abortion. Seeds furnished with long hairs at top, which are bent in within the capsule.

Panicled-flowered Batatas. Fl. June, Sept. Clt. 1799. Pl. twining.

3 B. heterophy'lla; plant very villous; stem twining; leaves quinately palmate: lobes or leaflets ovate-spatulate, acute; peduncles solitary, axillary, bearing each 3 sessile flowers; corolla blue. ♃. ◠. S. Native of Cuba and New Spain. Ipomœ'a heterophýlla, Ort. dec. p. 9. Jacq. fragm. p. 37. t. 42. f. 4. Cav. descr. p. 99. Ipomœ'a Ortègæ, Poir. suppl. 4. p. 633. Conv. heterophy'llus, Spreng. syst. 1. p. 592. Root tuberous, fleshy. Outer sepals larger, cuspidate, somewhat cordate. Capsule 4-celled.

Various-leaved Batatas. Fl. July, Oct. Clt. 1817. Pl. tw.

4 B.? Willdenòwii; stem twining, beset with silky pili; leaves palmately 5-7-cleft, clothed with adpressed, silky hairs. leaflets or lobes ovate, nearly equal, the 2 outer lobes always smaller; peduncles 3-flowered: corolla purple. ♃. ◠. S. Native country unknown. Ipomœ'a Willdenòwii, Rœm. et Schultes, syst. 4. p. 211. Ipomœ'a heterophy'lla, Willd. enum. 1. p. 207. Calyx enveloped in a cordate bractea. Corollas large.

Willdenow's Batatas. Fl. July, Aug. Clt. 1818. Pl. tw.

5 B. macrorhìzos; glabrous; leaves digitate, with 7 entire, ovate, lanceolate, acute leaflets; peduncles 3-flowered; corolla scarlet. ♃. ◠. S. Native of St. Domingo. Convólvulus macrorhìzos, Lin. spec. 223. Desr. in Lam. dict. 3. p. 567.—Plum. spec. 1. Burm. amer. 90. f. 1. Plum. cat. p. 1. Tourn. 84. Root tuberous, turnip-formed. Petioles and middle nerve of leaves purplish. Peduncles 5-6-flowered. Limb of corolla undulated. Root purgative.

Large-rooted Batatas. Fl. July, Oct. Clt. 1817. Pl. tw.

6 B. Senegale'nsis; glabrous; stem white, tubercular, twining; leaves quinately palmate; lobes ovate, obtuse, middle one the largest; peduncles usually 3-flowered; corolla white or purplish. ♃. ◠. S. Native of Guinea, from Senegal to the Line, &c. Ipomœ'a Senegalénsis, Lam. ill. 1. p. 464. no. 2113. Poir. dict. 6. p. 11. Calyx short; sepals ovate, with white, membranous edges. Corollas large. Root tuberous. Very like *B. paniculàta*, and probably only a variety of it.

Senegal Batatas. Fl. July, Aug. Clt. 1823. Pl. tw.

7 B. Papìrin; hairy; leaves quinately palmate, cordate; lobes lanceolate, entire; peduncles 1-flowered; corolla funnel-shaped, purplish. ♃. ◠. S. Native of Peru, upon the hills of Tarma, where it is called *Papirin*. Ipomœ'a Papìrin, Ruiz. et Pav. fl. per. 2. p. 11. t. 120. f. a. Pers. ench. 1. p. 182. Conv. Papìrin, Spreng. syst. 1. p. 592. Root large, drastic, globose or oblong. Stems numerous, filiform. Bracteas subulate. Sepals subcordate. Corollas large.

Papirin Batatas. Pl. tw.

8 B. subtríloba; downy; leaves cordate, somewhat 3-lobed; peduncles 1-flowered. ♃. ◠. S. Native of Peru, along with the preceding. Ipomœ'a subtríloba, Ruiz. et Pav. fl. per. 2. p. 11. Ipomœ'a Papìrin, β, subtríloba, Pers. syn. 1. p. 185. Corolla purple, as in *B. Papìrin*. Root tuberous, drastic.

Sub-trilobed-leaved Batatas. Pl. tw.

9 B. bignonioìdes; glabrous; leaves 3-lobed: hind lobes rounded, imbricate; peduncles many-flowered, nutant, shorter than the petioles; sepals ovate, nearly equal; corolla funnel-shaped; with a curled limb. ♃. ◠. S. Native of Cayenne. Ipomœ'a bignonioìdes, Herbert, ex Sims, bot. mag. 2645. Root tuberous. Corollas dark purple.

Bignonia-like Batatas. Fl. July, Aug. Clt. 1824. Pl. tw.

10 B.? venòsa; glabrous; leaves digitately quinate; leaflets petiolate, acuminated, quite entire; peduncles many-flowered. ♃. ◠. S. Native of the Isle of France and Bourbon. Ipomœ'a venòsa, Rœm. et Schultes, syst. 4. p. 212. Convólvulus venòsus, Vahl, symb. 3. p. 32. Willd. spec. 1. p. 865. Desr. Lam. dict. 3. p. 180. no. 78. Root tuberous. Intermediate leaflets obovate, 2 inches long, lateral ones gradually smaller and narrower. Peduncles umbellate, with an ovate-cordate, solitary leaf at the base of each pedicel. Corolla funnel-shaped.

Var. β; leaflets usually 7, narrower. ♃. ◠. S. Native of the Isle of France, Desr. in Lam. dict. l. c.

Veiny Batatas. Fl. July, Aug. Clt. 1820. Pl. tw.

11 B. pentaphy'lla (Choisy, in mem. soc. phys. gen. 6. p. 436.) hairy; leaves quinate; leaflets petiolate, elliptic-lanceolate or oblong, entire, acuminated; peduncles longer than the leaves, loose, dichotomous; corolla white, or cream-coloured. ♃. ◠. S. Native of the East Indies, Guinea, Islands of Bourbon and France; South America, as in St. Domingo, St. Thomas, Martinico, &c.; as well as of the Sandwich and Friendly Islands. Convólvulus pentaphýllus, Roy, lugdb. p. 429. Lin. amœn. acad. 8. p. 252. spec. 223. Schum. pl. guin. p. 97. Conv. aphýllus, Viviani, ann. bot. 1. p. 95. Ipomœ'a pentaphýlla, Jacq. coll. 2. p. 297. icon. rar. t. 319. Ipomœ'a pilòsa, Cav. icon. 4. p. 11. t. 323. Conv. hirsùtus, Roxb. fl. ind. 2. p. 65. Conv. munìtus, Wight. ill. ind. bot. p. 17. t. 7. Conv. tenuifòlius, Ham. herb.—Plum. amer. t. 91. f. 2. The whole plant is clothed with long, yellow hairs, which rise from black glands. The 3 outer sepals lanceolate, acute. Corolla exceeding the calyx a little, white or cream-coloured. Capsule covered by the calyx. Seeds glabrous.

Five-leaved Batatas. Fl. Aug. Sept. Clt. 1739. Pl. tw.

12 B. cissoìdes (Choisy, l. c. p. 437.) hairy; leaves quinate; leaflets ovate, acutish, toothed, somewhat mucronate; peduncles 2-3-flowered, equal in length to the leaves; sepals ovate, acuminated, hispid at the base; corolla white. ♃. ◠. S. Native of the East Indies, and tropical America. Convólvulus cissoìdes, Vahl. ecl. 2. p. 15. Lam. ill. p. 462. no. 2103. Conv. calycìnus, H. B. et Kunth, nov. gen. amer. 3. p. 109. Conv. trichósporus, Wall. cat. no. 1423. Conv. digitàtus, Ham. herb. Stem scabrous from black dots. Leaflets petiolate. Common petioles downy. Corolla veiny, a little longer than the calyx. Capsule girded by the calyx. Seeds glabrous.

Var. β; all parts of the plant larger. ♃. ◠. S. Native of

Cayenne, Cuba, Brazil, banks of the Orinoco. Convólvulus ripàrius, H. B. et Kunth, nov. gen. 3. p. 109. Conv. Orinocénsis, Willd. herb. ex. Rœm. et Schultes, syst. 4. p. 303.

Cissus-like Batatas. Pl. tw.

13 B. Cavanille'sii; glabrous; leaves quinate; leaflets ovate, entire, unequal; peduncles 1-3-flowered; corolla of a pale whitish red. ♃. ⌒. S. Native country unknown. Ipomœ'a Cavanillèsii, Rœm. et Schultes, syst. 4. p. 214. Ipomœ'a pentaphýlla, Cav. icon. 3. p. 29. t. 256. Pers. ench. 1. p. 184. Ip. Cavanillèsii, Rœm. et Schultes, syst. 4. p. 214. Convólvulus Cavanillèsii, Spreng. syst. 1. p. 590. Stems filiform. Sepals ovate, coriaceous, the 2 outer ones rough from dots. Lobes of corolla obtuse, crenulated.

Cavanilles's Batatas. Fl. Aug. Sept. Clt. 1815. Pl. tw.

14 B. terna'ta; glabrous; leaves ternate; leaflets petiolulate, ovate, repandly crenated; peduncles axillary, 1-flowered; corolla dirty white, with the rays cream coloured; calyx clammy; sepals obovate, obtuse, inflated. ♃. ⌒. S. Native of Brazil. Ipomœ'a ternàta, Jacq. hort. schœnbr. 1. p. 16. t. 37. Poir. suppl. 4. p. 632. Conv. ternàtus, Spreng. syst. 1. p. 590. Root tuberous, large. Peduncles purplish. Lobes of corolla bearded. Stamens exserted.

Ternate-leaved Batatas. Fl. July, Aug. Clt. 1824. Pl. tw.

15 B. glaucifòlia; glabrous; leaves sagittate, truncate behind, on long petioles; peduncles 2-flowered, length of leaves; sepals ovate, acute. ♃. ⌒. S. Native of Mexico, in corn fields. Ipomœ'a glaucifòlia, Lin. spec. 229. Willd. spec. 1. p. 884. Convólvulus glaucifòlius, Spreng. syst. 1. p. 604.—Dill. elth. 103. t. 87. f. 101. Corolla small, purplish or flesh-coloured; with an inflated tube, and ovate, acute segments. Capsule 3-4-celled; cells 1-seeded.

Glaucous-leaved Batatas. Fl. May, July. Clt. 1732. Pl. tw.

16 B. Loure'irii; stems procumbent; leaves cordate, palmate, on long petioles; corolla purple. ♃. ⌒. S. Native of Cochinchina. Ipomœ'a tuberòsa, Lour. coch. p. 138. Tubers oblong, edible, as in *B. edùlis*, to which they are much like in size, taste, and form.

Loureiro's Batatas. Pl. procumbent.

Cult. The species of *Batàtas* are strong, free growing plants, of easy culture, only requiring plenty of room to spread. They are well adapted for trellis-work, or to run up pillars in stoves. They are all tuberous rooted plants; and, therefore, require to be kept dry when in a dormant state. Light rich soil answers them best. Young cuttings strike root readily under a hand-glass, in heat. They are all very showy when in blossom.

X. PHARBITIS (meaning unknown to us.) Choisy in mem. soc. phys. gen. 6. p. 438.—Convólvulus and Ipomœ'a species of authors.—Convolvuloìdes, Mœnch. meth. 452.

Lin. syst. *Pentándria Monogýnia.* Calyx of 5 sepals. Corolla campanulate, or campanulately funnel-shaped. Style one; stigma capitately granulate. Ovarium 3, rarely 4-celled; cells 2-seeded.—The species of this genus are readily distinguished from other convolvulaceous plants. They are mostly climbing American herbs, usually beset with retrograde hairs.

§ 1. *Leaves cordate, entire.*

1 P. híspida (Choisy in mem. soc. phys. 6. p. 438.) leaves cordate, acuminated, entire: auricles diverging; peduncles usually exceeding the leaves, 3-5-flowered, somewhat umbellate; sepals ovate-lanceolate, acute. ⊙. ⌒. H. Native of South America, Sandwich Islands, and probably cultivated in the East Indies. Convólvulus purpùreus, Lin. spec. p. 219. Ehrh. pict. t. 7. f. 2. Curt. bot. mag. t. 113. 1005. and 1682. H. B. et Kunth, nov. gen. amer. 3. p. 104. Ipomœa purpùrea, Lam. ill. no. 2129. Ipomœ'a híspida, Zucc. cent. obs. no. 36. Ipomœ'a Zuccágni, Rœm. et Schultes, syst. 4. p. 230. Ipomœ'a glandulífera, Ruiz. et Pav. fl. per 2. p. 12. t. 121. f. a. Ipomœ'a intermèdia, Schultes, obs. no. 236. p. 37. Ip. Schultèsii, Schultes, syst. 4. p. 790. Conv. mutábilis, Sal. prod. 123. Convolvuloìdes leucospérma, and Conv. purpùrea, Mœnch. meth. p. 452. Conv. glandúlifer, Spreng. syst. 1. p. 599. Ipomœ'a díscolor, Spreng. mss. ex Schultes, obs. Conv. eriocaúlos? Willd. mss. in Rœm. et Schultes, syst. 4. p. 301.—Dill. elth. 97. t. 82. f. 94. ibid. p. 100. t. 84. t. 97. Stem beset with retrograde hairs. Pedicels usually drooping or twisted. Sepals hispìd, particularly so at the base; inner ones smoothish. Capsule glabrous, 3-celled. Seeds brown, roundish.—This species varies much in the colour of the flowers; white, purple, violet, and mixed with these colours.

Hispid Pharbitis. Fl. June, Sept. Clt. 1629. Pl. tw.

2 P. insula'ris (Choisy, l. c. p. 439.) leaves entire, cordately acuminated, clothed with greyish down; peduncles exceeding the petioles from 2 to many-flowered; sepals cuneate-lanceolate, very acute, downy. ⊙. ⌒. H. Native of Marianne Island; Sandwich Islands; Norfolk Island; New South Wales, at Endeavour river. Convólvulus multiflòrus, herb. britt. mus. Stem beset with retrograde soft hairs. Petioles villous. Bracteas narrow, villous. Corolla tubularly campanulate, 2-3 inches long, purple.

Var. β; down on the plant longer, of a rusty, silky colour.

Island Pharbitis. Pl. tw.

3 P. barbígera; stem downy; leaves cordate, acuminated, entire, hairy on both surfaces; hind lobes rounded: peduncles 1-flowered, shorter than the petioles, bibracteate near the calyx; sepals acuminated, spreadingly reflexed at apex, and densely bearded at the base. ⊙. ⌒. H. Native of North America. Ipomœ'a barbígera, Sweet. fl. gard. t. 86. Corolla campanulately funnel-shaped, 5-lobed, slightly crenulated; limb of a bright azure blue; tube pale, or nearly white. Stigma capitate, hardly lobed. Capsule smooth, 3-celled; cells 2-seeded. Seeds black, roughish, downy.

Beard-bearing Pharbitis. Fl. July, Oct. Pl. tw.

§ 2. *Leaves 3-5-lobed.*

4 P. Níl (Choisy, l. c.) hairy; leaves cordate, 3-lobed: intermediate lobe dilated at the base, and not contracted; peduncles 2-3-flowered, commonly exceeding the petioles; sepals ovate-lanceolate, hispid at the base. ⊙. ⌒. H. Native everywhere within the tropics, both in America, Africa, and Asia. Convólvulus Níl, Lin. spec. 219. Ipomœ'a Níl, Roth. cat. bot. 1. p. 36. Ipomœ'a cærùlea, Kœn. mss. Roxb. fl. ind. 2. p. 91. Ker. bot. reg. 276. Convólvulus hederàceus, Lin. spec. p. 219. Ipomœ'a hepaticifòlia, Hayne, herb. Conv. hederàceus, pilòsus, and purpùreus, Herb. madr. Conv. Caladòna, and Conv. Sucbèdea, Ham. herb. Conv. hepaticifòlius, Russ. herb.—There are several varieties of this species, particularly the following. Flowers blue. Gerarde says this plant is called by the Arabians Nil; of Serapio Hab al Nil; and in Syria, the inhabitants call it Hasmisen; and the Italians *Campana azurea.* Plant hairy.

Var. β. *Ipomœ'a cærule'scens* (Roxb. fl. ind. edit. Wall. 2. p. 90.) This differs from the species, in the leaves being never lobed, and in the plant being perennial. Flowers of a beautiful lively pale blue.

Var. γ. *Conv. Cæléstis* (Forst. prod. no. 77.) The leaves of this variety are described as entire, downy. ⊙. ⌒. H. Native of the Island of Tarma, in the Pacific.

Nil Pharbitis. Fl. July, Sept. Clt. 1597. Pl. tw.

5 P. HEDERA'CEA (Choisy, l. c. p. 440.) leaves cordate, 3-5-lobed; middle lobe ovate, acuminated, and coarctate at the base; peduncles very short, usually 1-flowered, shorter than the petioles; sepals lanceolate-linear, dilated at the base, and hispid from yellow bristles. ⊙. ◠. H. Native of North America, and New Holland; and of the province of Caraccas, near La Victoria; also of Mexico, near Jalapa. Ip. hederàcea, Lin. syst. 15. p. 207. Jacq. coll. 1. p. 124. icon. rar. t. 36. R. Br. prod. p. 485. Ker. bot. reg. t. 85.—Dill. elth. t. 80. f. 91.? Plant pilose. Corolla deep blue. Stem beset with retrograde hairs. Leaves clothed with strigose down.

Ivy-like Pharbitis. Fl. Aug. Oct. Clt. 1729. Pl. tw.

6 P. VA'RIA; leaves cordate, entire, and 3-5-lobed; peduncles erect, 1-flowered; sepals spreading at apex, bearded on the back, the 3 outer ones cordate-lanceolate; root fusiform. ↄ.? ◠. S. Native country unknown. Ipomœ'a vària, Roth. cat. 2. p. 17. Convolvuloìdes pilòsus, Mœnch meth. 452. Convólvulus pubéscens, Willd. enum. 1. p. 203. Poir. suppl. 3. p. 463. Ipomœ'a tuberòsa, Hortul. Stem beset with retrograde white pili. Corolla bluish-violet, like those of *P. barbàta*.

Various-leaved Pharbitis. Fl. May, Oct. Clt. 1816. Pl. tw.

7 P. PU'RSHII; hairy; leaves cordate, 3-lobed, acuminated: lateral lobes small: middle lobe large, dilated at the base; peduncles short, 1-2-flowered; bracteas subulate; calyxes very villous, long, acuminated. ⊙. ◠. H. Native of Virginia and Carolina, near gardens, and in hedges on river sides. Conv. Níl, Michx. fl. amer. bor. 1. p. 139. Sims, bot. mag. t. 188, but not of Lin. Ipomœ'a Níl, Pursh, fl. amer. sept. 1. p. 146.—Dill. elth. t. 80. f. 91. Flowers beautiful pale blue, only open early in the morning, from which it has been called Morning-glory.

Pursh's Pharbitis. Fl. July, Sept. Clt. 1597. Pl. tw.

8 P. SCA'BRIDA; leaves cordate, somewhat 5-lobed, and are as well as the stem, scabrous from hairs: peduncles usually 1-flowered; sepals beset with strigose hairs. ⊙. ◠. H. Native country unknown. Ipomœ'a scábrida, Rœm. et Schultes, syst. 4. p. 223. Ipomœ'a scàbra, Schultes, obs. bot. p. 238. Said to be intermediate between *Ipomœ'a hederàcea* and *Ipomœ'a tríloba*. Corolla white.

Scabrous Pharbitis. Pl. tw.

9 P. FORSKŒ'LI; leaves 5-lobed, scabrous on both surfaces, as well as the calyxes; peduncles solitary, 1-flowered. ⊙. ◠. H. Native of Arabia, at Hadie. Ipomœ'a scàbra, Forsk. ægypt. p. 44. Flowers blue. Bracteas linear. Stigma capitate. Said to be nearly allied to *P. hederàcea*.

Forskoel's Pharbitis. Pl. tw.

10 P. CUSPIDA'TA; leaves cordate, 3-lobed; lobes cuspidate; peduncles 1-flowered; sepals linear, very hairy at the base. ⊙. ◠. H. Native of Peru, in stony places. Ipomœ'a cuspidàta, Ruiz. et Pav. fl. per. 2. p. 13. t. 119. f. a. Poir. dict. 6. p. 20. Conv. Peruviànus, Spreng. syst. 1. p. 593. Leaves on long petioles. Lateral lobes of leaves short. Peduncles shorter than the petioles. Bracteas subulate. Corolla funnel-shaped, purplish; limb spreading, nearly entire. Stamens exserted. Stigma 3-lobed.

Cuspidate-leaved Pharbitis. Fl. June, July. Clt. 1732. Pl. tw.

11 P. BARBA'TA; leaves cordate, 3-lobed; peduncles 1-flowered, twisted; calyx bearded; sepals and bracteas revolutely spreading at the apex. ⊙. ◠. H. Native of Virginia and Carolina, from whence the seeds were sent to Dillenius. Ipomœ'a barbàta, Roth. cat. 1. p. 27. Pers. ench. 1. p. 184. Ipomœ'a hederàcea, Ker. bot. reg. t. 85, but not of Lin.—Dill. elth. t. 80. f. 92. Calyx beset with elevated warts. Capsule 3-celled, cells 2-seeded.

Bearded-calyxed Pharbitis. Fl. Aug. Oct. Clt. 1729. Pl. tw.

12 P. DILLE'NII; hairy; leaves cordate, entire, and 3-lobed; flowers solitary, almost sessile; calyxes oblong, pilose. ⊙. ◠. H. Native of Æthiopia. Ipomœ'a Dillènii, Rœm. et Schultes, syst. 4. p. 227. Conv. Dillènii, Desr. in Lam. dict. 3. p. 544.—Dill. elth. 97. t. 81. f. 93. Stem beset with long hairs, as well as the petioles. Leaves rather villous. Corolla beautiful blue, with a white bottom, and a spreading, nearly entire limb.

Dillenius's Pharbitis. Fl. June, July. Clt.? Pl. tw.

13 P. SCA'BRA; leaves cordate, 3-lobed; peduncles 3-flowered, longer than the petioles; calyx tubercled; fruit nutant. ⊙. ◠. H. Native country unknown. Ipomœ'a scàbra, Gmel. syst. Cav. descr. p. 101. Stem filiform. Flowers white. Capsule small, 3-celled.

Scabrous Pharbitis. Fl. June, Nov. Clt. 1823. Pl. tw.

14 P. VILLÒSA; very villous; leaves cordate, 3-lobed; lobes acuminated: lateral ones excavated outside: intermediate one elongated, attenuated at the base; peduncles 3-flowered, involucrated. ⊙. ◠. H. Native of Peru, in groves, and on the edges of fields. Ipomœ'a villòsa, Ruiz. et Pav. fl. per. 2. p. 12. t. 121. f. 1. Poir. dict. 6. p. 20. Conv. Ruìzii, Spreng. syst. 1. p. 594. Corolla funnel-shaped, purplish, glabrous, with an entire, large, revolute limb. Stamens villous at the base. Stigma capitate, granular, 3-lobed.

Villous Pharbitis. Pl. twining.

15 P. PUNCTA'TA; pilose; leaves cordate, entire, or 3-lobed; peduncles usually 3-flowered; calyx beset with long hairs and black tubercles; sepals acute, unequal. ⊙. ◠. H. Native of India, Asia, Africa, and America. Ipomœ'a punctàta, Pers. ench. 1. p. 184. Conv. hederàceus, Lin. spec. 219. Willd. spec. 1. p. 851.—Dill. eth. 99. t. 83. f. 96. Stems dark red. Corolla of a purplish-violet colour, middle sized; limb spreading, nearly entire.

Dotted-calyxed Pharbitis. Fl. July, Nov. Clt.? Pl. tw.

Cult. Pharbìtis is a genus of very showy, tender, annual, twining plants. They should be reared in a hot-bed; and when the plants are of sufficient size, they should be planted into other pots, and afterwards shifted from size to size of pots as they grow; and some of them may be tried in the open ground, in a warm sheltered situation. A light, rich soil, or a mixture of loam and decayed leaves suits them best.

XI. CALONY'CTION (from καλος, *kalos*, beautiful; and νυξ, *nyx*, night; the flowers are large and showy, and expand at night.) Choisy in mem. soc. phys. gen. 6. p. 441. Convólvulus and Ipomœ'a species of authors.—Bòna nóx, Rafin.

LIN. SYST. *Pentándria, Monogýnia*. Sepals 5. Corolla very showy, funnel-shaped. Stamens exserted. Style one; stigma capitate, 2-lobed. Ovarium 2-celled, or somewhat 4-celled, from the rudiment of a dissepiment, 4-ovulate. Pedicels fleshy. —Twining showy herbs, bearing flowers resembling those of *Datùra*. Peduncles axillary, usually 1-flowered.

1 C. SPECIÒSUM (Choisy, l. c.); sepals unequal, awned. ♂. ◠. S. Native of most parts of America within the tropic. Ipomœ'a bòna-nóx. Lin. spec. p. 228. Sims, bot. mag. t. 752. Pursh. fl. amer. 1. p. 145. Cav. icon. 3. p. 52. t. 300. Jacq. schœnbr. 1. p. 16. t. 36. Argyrèia bòna nóx. Sweet. hort. brit. p. 289. Conv. bòna-nóx. Spreng. syst. 1. p. 600.—Sloane jam. p. 55. hist. 1. p. 151. t. 96. f. 1.—Plukn. alm. 115. t. 276. f. 3. Leaves cordate, entire, acuminated, or hastately 3-5-lobed; peduncles racemose, 3-5-flowered. Corolla with a long cylindrical yellowish tube, and a white spreading limb; lobes rounded, mucronate.

Showy Calonyction. Fl. July, Oct. Clt. 1773. Pl. tw.

2 C. ROXBU'RGHII; sepals unequal, awned; leaves cordate, entire, rarely lobed, glabrous. ♂. ◠. S. Native of the East Indies. Ipomœ'a grandiflòra, Roxb. fl. ind. 2. p. 87. but not of Lin. Ipomœ'a longiflòra, Wild. enum. 1. p. 207. Mundaválli, Rheed. mal. 11. p. 103. t. 50. Asiat. res. 4. p. 257.

Conv. muricàtus, Ham. herb. Stem hardly prickly. Peduncles clavate, 2-4-flowered. Flowers very large, pure white, the border being from 4-6 inches in diameter, delightfully but faintly fragrant, opening at sun-set and drooping at day-light; tube very long, cylindrical.

Roxburgh's Calonyction. Fl. July, Oct. Clt. 1799.

3 C. MURICA'TUM; sepals equal, long, acuminated; leaves cordate, acuminated, entire. ☉. ⌒. S. Native of Persia and the East Indies. Ipomœ'a muricàta, Jacq. schœnbr. 3. p. 40. t. 323. Roxb. fl. ind. 2. p. 89. Convólvulus muricàtus, Lin. mant. p. 44. Willd. enum. 1. p. 204. Ipomœ'a turbinàta, Lagasc. gen. et spec. nov. diagn. p. 10. no. 139. C. speciòsum, var. β. muricàtum, Choisy, l. c.) I. bòna-nóx. β. purpuráscens, Ker. bot. rep. 290. Stem and peduncles muricated from prickles. Flowers large, pale bluish-purple; lobes mucronate, tube widening a little towards the mouth, hairy inside, ex Roxb. Peduncles 2-6-flowered.

Muricated Calonyction. Fl. July, Oct. Clt. 1777. Pl. tw.

4 C. PSEUDOMURICA'TUM (Bernh. hort. elfort, ex Link. enum. 1. p. 200. under *Ipomœ'a*) stem muricated; leaves cordate, acuminated, glabrous, 7-nerved; peduncles shorter than the petioles; sepals acuminated. ♄. ⌒. S. Native country unknown. Corolla purple. Very like *C. muricàtum*, but smaller, and the leaves are 7-nerved instead of 9-nerved.

False-muricated Calonyction. Fl. July, Oct. Clt. 1820. Shrub tw.

5 C. A'SPERUM (Choisy, l. c. p. 442.) sepals unequal, short-acuminated. ♂. ⌒. S. Native of Silhet. Convólvulus ásper, Wall. cat. no. 1388. Stem beset with retroflexed, spiny tubercles, particularly on the older branches. Leaves cordate, acuminated; hind lobes sometimes roundish-obtuse, and sometimes angularly toothed. Peduncles 1-flowered. Sepals adpressed to the base of the calyx. Corolla tubularly funnel-shaped, 3-6 inches long. Capsule glabrous, size of a cherry. Seeds angular, downy, especially on the angles.

Rough-stemmed Calonyction. Pl. tw.

6 C. TRICHOSPE'RMUM (Choisy, l. c.) sepals unequal, obtuse. ♃. ? ⌒. S. Native of Java. Ipomœ'a trichospérma, Blum. bijdr. p. 710. Stem quite glabrous. Leaves hastately 3-5-lobed; middle lobe elliptic-oblong, attenuated at both ends, very acute at apex; lateral ones acute at apex, and cuneated at the base, as also bifid, quite glabrous. Peduncles 1-flowered. Sepals ovate; inner ones rarely mucronate at apex. Corolla tubular, much longer than the calyx, white. ?

Hairy-seeded Calonyction. Pl. tw.

7 C. GRANDIFLÒRUM (Choisy, l. c.) sepals equal, acute. ♃. ⌒. S. Native of the West Indies. Convólvulus grandiflòrus, Lin. suppl. p. 136. Desr. in Lam. dict. 3. p. 543. And. bot. rep. t. 403. Convólvulus latiflòrus, Desr. in Lam. dict. 3. p. 561. Ipomœ'a latiflòra, Rœm. et Schultes, syst. 4. p. 240. —Plum. cat. 1. mss. vol. 2. p. 52.—Tourn. p. 83. Leaves large, glabrous, cordate, acuminated. Corolla snow-white, with a long, cylindrical, greenish tube; limb 5 inches in diameter, expanding at night, and fading at day-light. According to Rœm. et Schultes, l. c. the 2 outer sepals are longer, and acute, and the 3 inner obtuse.

Great-flowered Calonyction. Fl. Aug. Oct. Clt.? Pl. tw.

8 C. PTE'RIPES; glabrous; peduncles winged, 2-flowered; pedicels clavate, divaricate; sepals large, elliptic-oblong, obtuse. ♂. ? ⌒. S. Native of Huayaquil. Leaves cordate, acuminated: auricles rounded. Peduncles longer than the leaves. Corolla downy, (v. s. in herb. Ruiz. et Pav.)

Winged-peduncled Calonyction. Pl. tw.

9 C. CLAVA'TUM; sepals wide, mucronate, nearly equal, membranous; stem and petioles pilose; leaves glabrous. ♂. ? ⌒. S. Native of Huayaquil. Convólvulus clavàtus, Ruiz. et Pav. mss. in herb. Lamb. Leaves cordate, glaucous beneath, acuminated: auricles rounded. Corolla blue, like those of a species of *Datùra*, with narrow segments.

Clavate Calonyction. Pl. tw.

10 C. JACQUI'NII; sepals unequal, obtuse; leaves cordate, acute. ♄. ⌒. S. Native of Martinico, on the banks of rivers. Convólvulus grandiflòrus, Jacq. vind. 3. p. 39. t. 69. Plant glabrous. Leaves large, cordate. Peduncles axillary, 1-flowered. Corolla pure white; tube widening to the top. Seeds brown, rather woolly.

Jacquin's Calonyction. Shrub tw.

Cult. The species of *Calonyction* are among the largest flowering convolvulaceous plants. A light rich soil is the best for them, or a mixture of loam, peat, and sand. They should be reared on a hot-bed, and when of sufficient size they should be planted in separate pots, and shifted from size to size as they grow. They succeed best when trained up trellis-work, or rafters in stoves.

XII. EXOGO'NIUM (from εξω, *exo*, outwardly; and γωνια, *gonia*, an angle; in reference to the exserted stamens.) Choisy in mem. soc. phys. gen. 6. p. 443. but not of Mocino and Sesse.—Convólvulus and Ipomœ'a species of authors.

LIN. SYST. *Pentándria*, *Monogýnia*. Calyx of 5 sepals. Corolla middle-sized, tubular. Stamens exserted. Style one; stigma capitate, 2-lobed. Ovarium 2-celled; cells 2-ovulate. —Climbing plants, natives of America.

1 E. BRACTEA'TUM (Choisy, l. c.) glabrous; leaves cordate; racemes elongated, many-flowered; flowers bracteate; bracteas large, cordately reniform, coloured. ♄. ⌒. S. Native of New Spain, near La Venta de Acaguisotla, at the altitude of 504 hexapods. Ipomœ'a bracteàta, Cav. icon. 5. p. 51. t. 477. Ipomœ'a spicàta, H. B. et Kunth, nov. gen. 3. p. 112. Conv. obovallàtus, Spreng. syst. 1. p. 595. Ipomœ'a cíncta, Willd. Branches angular, white, glabrous. Flowers pedicellate, distinct, reflexed. Corollas tubularly funnel-shaped, glabrous, yellowish outside and purplish-red inside; the limb in the plant described by Cav. is entire and reflexed, but in the plant described by Kunth, the limb is plicately 5-cleft, and the segments mucronate. Seeds oblong, black, downy.

Bracteate-flowered Exogonium. Shrub. tw.

2 E. FILIFÓRME (Choisy, l. c.) leaves oblong-cordate, obtuse, mucronate; peduncles racemose, filiform. ♄. ⌒. S. Native of Martinico and the Antilles, in woods. Ipomœ'a filifórmis, Jacq. amer. p. 27. t. 19. pict. p. 20. t. 26. Willd. spec. 1. p. 883. Convólvulus filifórmis, Desr. in Lam. dict. 3. p. 555. Plant quite glabrous. Racemes loose-flowered. Flowers purple, copious. Calyx small, acute. Corolla with a very long tube, and obtuse segments. Filaments 5, exceeding the corolla, alternating with 5 sterile ones, which are much shorter.

Filiform Exogonium. Fl. Sept. Oct. Clt. 1823. Sh. tw.

3 E. REPA'NDUM (Choisy, l. c.) leaves cordate, oblong, repand, acuminated; peduncles branched, cymose. ♄. ⌒. S. Native of South America and Martinico. Ipomœ'a repánda, Jacq. amer. 28. t. 20. pict. t. 27. Sal. par. t. 81. Convólvulus repándus, Desr. in Lam. dict. 3. p. 555. Plant quite glabrous. Stem terete. Lower leaves sometimes 3-lobed, all glaucous beneath. Peduncles length of leaves; partial ones often trichotomous. Flowers scarlet, 2 inches long. Calyx the same colour as the corolla, small, obtuse. Limb of corolla reflexed; segment narrow, obtuse.

Repand-leaved Exogonium. Fl. Feb. Nov. Clt. 1793. Shrub. tw.

Cult. All the species of this genus are elegant and singular. Light rich soil, or a mixture of loam and peat, or decayed leaves and loam suits them best. They are well adapted for

training up trellis-work, or pillars in stoves. Young cuttings strike root readily under a hand-glass, in heat.

XIII. LEPISTE'MON (from λεπις, *lepis*, a scale; and στημων, *stemon*, a stamen; in reference to the stamens being furnished with 5 scales; that is, one to each, which are arched over the ovarium.) Blum. bijdr. p. 722. Choisy, in mem. soc. phys. gen. 6. p. 443.—Convólvulus species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 equal sepals. Corolla tubular, inflated at the base. Stamens 5, furnished each with a scale at the base, which is arched over the ovarium. Style one. Stigma capitate, 2-lobed. Ovarium 2-celled; cells 1-seeded. Fruit capsular.—Climbing perennial herbaceous plants.

1 L. Wallíchii (Choisy, l. c.) stem hairy; leaves cordate, acuminated: upper ones somewhat 3-lobed; peduncles very short, umbellately many-flowered; sepals oblong-lanceolate, acute. ↄ. ⌒. S. Native of Silhet. Convólvulus ampullàceus, Vahl. mss. in herb. Juss. Conv. híspidus? Vahl. symb. 3. p. 29. Conv. binectaríferus, Wall. in. Roxb. fl. ind. 2. p. 47. Conv. cephalánthus, Wall. cat. no. 1402. Leaves beset with adpressed hairs, pale beneath, 3-5 inches long, and nearly as much broad. Stem and petioles beset with spreading hairs. Sepals hairy outside. Corolla glabrous. Flowers rather small, pure white, 18 lines long, and the scales of the stamens acute and villous.

Wallich's Lepistemon. Pl. tw.

2 L. flave'scens (Blum. bijdr. p. 722.) plant pilose; leaves cordate-ovate, quite entire, or 3-lobed; cymes pedunculate, axillary, dense-flowered, shorter than the petioles. ↄ. ⌒. S. Native of Java, among bushes on the mountains. Perhaps the same as the preceding species.

Yellowish Lepistemon. Pl. tw.

Cult. For culture and propagation see *Exogònium* above.

XIV. IPOMŒ'A (from ιψ ιπος, *ips ipos*, bind-weed; and ομοιος, *omoios*, similar; the genus is nearly allied to *Convólvulus*, or bind-weed.) Choisy in mem. soc. phys. gen. 6. p. 444.—Convólvulus and Ipomœ'a species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 sepals. Corolla campanulate. Stamens inclosed. Style one; stigma 2-lobed: lobes capitate. Ovarium 2-celled; cells 2-seeded. Capsule 2-celled; cells 2-seeded.—Twining or creeping plants, usually natives within the tropics in both hemispheres.

Sect. I. Erpipomœ'a (from ερπω, *erpo*, to creep, and *Ipomœ'a*; the plants contained in this section creep along the ground.) Choisy, l. c. Stems creeping.

1 I. re'ptans (Poir. dict. suppl. 3. p. 460.) stems smooth, striately furrowed, rooting below; leaves sagittately-lanceolate: auricles acutish, sometimes entire and sometimes toothed; petioles glabrous; peduncles 1-5-flowered; sepals ovate, acutish, or obtuse. ↄ. S. Native of China; East Indies; Arabia, and Senegal. Convólvulus réptans, Lin. syst. veg. 171. spec. 225. Osb. itin. p. 196. Ipomœ'a réptans, β. aquática, Poir. dict. 6. p. 18. Ipomœ'a rèpens, Roth. nov. spec. p. 110. Convólvulus rèpens, Vahl. symb. 1. p. 17. Willd. spec. 1. p. 874. but not of Lin. Wall. fl. ind. 2. p. 68.—Rumph. amb. 5. p. 419. t. 155. f. 1.—Rheed. mal. 11. p. 107. t. 53. Ipomœ'a sepiària, Russ. herb. Conv. rèpens, Ham. herb. Conv. palústris, Ham. herb. Ipomœ'a aquática, Forsk. descr. p. 44. There are varieties having from 1 to many-flowered peduncles; the sepals acute or obtuse; it is, therefore, not separated from Ipomœ'a aquática, Forsk. (Conv. Adansònii, Desr.) but not of Blume.

Creeping Ipomœa. Fl. May, June. Clt. 1806. Pl. creeping.

2 I. acetosæfòlia (Vahl. eclog. 1. p. 18.) glabrous; stems angular, creeping; leaves oblong-lanceolate and hastate; peduncles elongated, 1-flowered; sepals oblong, glabrous; bracteas alternate, subulate. ↄ. S. Native of tropical America, by the sea-side. Willd. spec. 1. p. 874. Conv. rèpens, Swartz. obs. p. 64. but not of Roth.—Plum. amer. 91. t. 105. Leaves 2 inches long, and a nail broad, obtuse, sometimes emarginate. Flowers white.

Sorrel-leaved Ipomœa. Pl. creeping.

3 I. pe's-ca'præ (Sweet, hort. brit. 289.) leaves roundish, emarginate, or 2-lobed, veiny, thickish; peduncles 1, or many-flowered; sepals ovate-lanceolate, obtuse. ↄ. S. Native of India; China; New Holland; Arabia; Island of Bourbon; Sandwich Islands; and South America, in the sand, by the sea-side. Convólvulus pés-càpræ, Lin. spec. 226. Wall. fl. ind. 2. p. 74. Conv. Brasiliénsis, Lin. spec. 226. Willd. spec. 1. p. 877. Conv. marítimus, Desr. in Lam. dict. 3. p. 550. Conv. bilobàtus, Wall. fl. ind. 2. p. 73. Conv. bauhiniæfòlius, Sal. prod. 125. Ipomœ'a marítima, R. Br. prod. 486. Ker, bot. reg. 319. Ipomœ'a orbiculàris, Ell. sketch. 257. Ipomœ'a Brasiliénsis, Meyer. ess. 97. Ipomœ'a bíloba, Forsk, ægypt. p. 44. Vittm. summ. 1. p. 440.—Rheed. mal. 11. p. 117. t. 57.—Herm. lugdb. 174. t. 175.—Rumph. amb. 5. p. 433. t. 159. f. 1. Leaves biglandular at the base, more or less 2-lobed. Peduncles 1-6-flowered. Flowers large, reddish-purple. Seeds downy.

Goatsfoot-leaved Ipomœa. Fl. June, July. Clt. 1770. Pl. creeping.

4 I. rotundifòlia; glabrous; leaves roundish, retuse, mucronate; petioles shorter than the leaves; peduncles twice longer than the petioles, bifid, many-flowered. ↄ. S. Native of Guinea, in the sea-sand. Conv. rotundifòlius, Schum. pl. guin. p. 102. Root woody, creeping. Stems trailing, rooting, purplish. Petioles purplish, biglandular at top. Sepals ovate, obtuse, mucronate: outer ones rather wrinkled: inner ones twice the size, and somewhat diaphanous. Corolla campanulately funnel-shaped, purple; limb flat, obsoletely 5-lobed. Filaments downy at the base. Seeds hairy. Allied to *I. pés-càpræ.*

Round-leaved Ipomœa. Pl. creeping.

5 I. littora'lis (Blum. bijdr. p. 713.) stems creeping; leaves roundish-cordate, emarginate, with a mucrone, a little angled, ciliated on the edges; peduncles 1-flowered; sepals cuspidate: outer ones shorter, erectly spreading. ↄ. S. Native of Java and Nusakambanga, in the sand by the sea-shore. Corollas lilac, with a purplish bottom.

Sea-shore Ipomœa. Pl. creeping.

6 I. ripa'ria; downy; stems prostrate, radicant; leaves cordate, acute, on long petioles; umbels pedunculate, 4-5-flowered; calyx pilose. ↄ. S. Native of Guinea, on the banks of rivers. Corollas red.

River-side Ipomœa. Pl. creeping.

7 I. crassifòlia (Cav. descrip. p. 100. Pers. ench. 1. p. 184.) stem decumbent, branched; leaves reniform, emarginate, somewhat plicate; peduncles axillary, usually 3-flowered, shorter than the petioles; 2 outer sepals fleshy, and shorter than the 3 inner. ↄ. S. Native of Guayaquil. Nearly allied to *I. pés-càpræ.* Nerves of leaves white. Petioles biglandular at the base. Corollas white.

Thick-leaved Ipomœa. Pl. creeping.

8 I. carnòsa (R. Br. prod. p. 485.) plant prostrate, glabrous;

leaves cordate, emarginate, fleshy, glandless, hardly an inch long; peduncles 1-2-flowered; sepals equal. ↄ. S. Native of New Holland, within the tropic. Convólvulus carnòsus, Spreng. syst. 1. p. 609. Flowers red. ?

Fleshy-leaved Ipomœa. Pl. prostrate.

9 I. incìsa (R. Br. prod. p. 486.) plant prostrate, rather villous; leaves subcordate, dentately cut: upper ones hastate; peduncles 1-flowered, glabrous, longer than the leaves; sepals equal, lanceolate, acuminated. ↄ. S. Native of New Holland, within the tropic, by the sea-side. Conv. incìsus, Spreng. syst. 1. p. 609.

Cut-leaved Ipomœa. Pl. prostrate.

10 I. cinera'scens (R. Br. prod. p. 486.) plant creeping, tomentose; leaves nearly cordate, ovate-oblong, cut, rather silky; peduncles 1-2-flowered, villous, longer than the leaves; sepals glabrous, equal, oblong-lanceolate, acute. ↄ. S. Native of New Holland, within the tropic. Conv. cineráscens, Spreng. syst. 1. p. 609.

Greyish Ipomœa. Pl. creeping.

11 I. rugòsa (Choisy in mem. soc. phys. gen. 6. p. 446.) stems creeping; leaves cordately reniform, glabrous, obtuse, mucronulate; peduncles usually not equalling the leaves in length; sepals ovate: outer ones shortest, and rugosely plicate. ↄ. S. Native of Mysore and Malabar. Convólvulus rugòsus, Rottl. in Willd. am. act. berol. 4. p. 196. Rœm. et Schultes, 4. p. 273. 303. and 790. Convol. flagellifórmis, Wall. fl. ind. 2. p. 68. Conv. Beladámbu, Spreng. syst. 1. p. 608. Ipomœ'a rèpens, Lam. ill. no. 2134. Poir. dict. 6. p. 18. Ipomœ'a Beladámboe, Rœm. et Schultes, syst. 4. p. 233. Conv. muricàtus, Russ. herb. Beladámboe, Rheed mal. 11. p. 119. t. 58. Stems compressedly angular. Peduncles 3-8-flowered. Seeds black, glabrous. Flowers large, pure white.

Wrinkled Ipomœa. Pl. creeping.

12 I. renifórmis (Choisy, l. c.) creeping, glabrous; leaves reniform, with sinuately-toothed edges, emarginate; pedicels very short, 1-flowered, rarely 2-3-flowered; sepals small, ovate-roundish, ciliately jagged. ↄ. S. Native of the East Indies; as of Bengal, Nopalry, Coromandel, and Island of Timor. Convólvulus renifórmis, Wall. fl. ind. 2. p. 67. Conv. Gangéticus, Lin. amœn. acad. 4. p. 306. no. 121. Evólvulus emarginàtus, Burm. fl. ind. 77. t. 30. f. 1. Evólvulus Gangéticus, Lin. spec. p. 391. Stem angular at top. Leaves 3-6 lines long. Corolla small, 5-cleft, yellow; lobes acute. Seeds glabrous, reddish.—In some soils this species is found of a dark purple or rusty colour.

Kidney-shaped leaved Ipomœa. Fl. Oct. Clt. 1823. Pl. creeping.

13 I. rumicifòlia (Choisy, l. c. p. 447.) stems diffuse, hairy; leaves cordately reniform, obtuse at top, also emarginate, glabrous, with entire edges; peduncles axillary, solitary, twin or tern, 1-2-flowered; sepals linear-lanceolate, hairy. ⊙. S. Native of Travancore. Convólvulus hírtus, Wall. cat. no. 2254. and probably of Lin. Stem diffusely creeping, beset with retrograde hairs, which rise from black glands. Leaves an inch long. Corolla tubular, exceeding the calyx, glabrous.

Dock-leaved Ipomœa. Pl. creeping.

14 I. incu'rva; creeping; stems erect, sarmentose; leaves broad, linear, emarginate, mucronate, subhastate: lobes linear, acute, curved in front; peduncles 1-flowered; sepals nearly equal, lanceolate. ↄ. S. Native of Guinea. Conv. incúrvus, Schum. pl. guin. p. 99. Stem nearly a span high, with filiform creepers. Corolla white, larger than those of *C. arvénsis*; with a dark purple bottom, and a usually mucronate 5-cleft limb; lobes roundish. Capsule ovate-roundish, 4-valved, usually 1-seeded. Said to be related to *I. emarginàta*, and *I. acetocæfòlia*.

Incurved-leaved Ipomœ'a. Pl. creeping.

Sect. II. Orthipomœ'a (from *ορθος*, *orthos*, straight; and *Ipomœ'a*; in reference to the species contained in this section being erect or diffuse, but never twining.)

* *Plants herbaceous.*

15 I. tridenta'ta (Roth. cat. 2. p. 19. Rœm. arch. 3. p. 38.) stems diffuse, filiform; leaves sessile, oblong-linear, truncate at apex, and often tridentate, but auriculately toothed at the base; peduncles 1-flowered, exceeding the leaves; sepals ovate, awned. ⊙. S. Native of the East Indies; at Pagamew, Irrawaddi, Ceylon, &c. Convólvulus tridentàtus, Lin. spec. ed. 1. p. 157. Wall. fl. ind. 2. p. 56. Conv. víscidus, Roxb. hort. beng. p. 14. Evólvulus tridentàtus, Lin. spec. ed. 2. p. 392. Burm. ind. 77. t. 16. f. 3. Conv. I'ndicus, &c. Plukn. alm. 117. t. 276. f. 5. Conv. mìnor, &c. Plukn. mant. 117. t. 167. f. 5. Sendera-Claudi, Rheed. mal. 11. p. 133. t. 65. Stem herbaceous, angular. Leaves hardly 3-4 lines broad, and an inch long, quite glabrous. Peduncles downy. Calyx whitish-yellow. Corollas small, yellow.

Tridentate-leaved Ipomœa. Fl. June, July. Clt. 1778. Pl. diffuse.

16 I. filicau'lis (Blum. bijdr. p. 721.) stems diffuse, filiform; leaves linear, or linear-lanceolate, obtuse, mucronate, on short petioles, somewhat hastately denticulated at the base; peduncles 1-2-flowered, length of the leaves; sepals equal, ovate, or oblong, acuminated, acute. ⊙. S. Native of the East Indies; as of Travancore, Ceylon, Penang, Rangoon, banks of the Irawaddi, &c.; also of China, Japan, New Holland, Java, Timor; Africa, at the Cape of Good Hope, and in Guinea; and of America, in various parts. Convólvulus filicaúlis, Vahl. symb. 3. p. 24. Schum. pl. guin. p. 92. Conv. hastàtus, Desr. in Lam. dict 3. p. 542. Conv. símplex, Pers. ench. 1. p. 178. Conv. mèdium, Lour. coch. p. 106. edit. Willd. 1. p. 130. Ait. hort. kew. 1. p. 328. Wall. fl. ind. 2. p. 56. but not of Lin. Conv. filifórmis, Thunb. fl. cap. 2. p. 16. Conv. denticulàtus, Desr. in Lam. dict. 3. p. 540. Spreng. syst. 1. p. 603. Conv. angustifòlius, Desr. in Lam. dict. 3. p. 547. Vahl. symb. 3. p. 25. Conv. Japónicus, Thunb. jap. p. 85. ? Vahl. symb. 3. p. 25. Ipomœ'a denticulàta, R. Br. prod. 1. p. 485. Ker. bot. reg. 317. I. angustifòlia, Jacq. coll. 2. p. 367. icon. rar. t. 317. I. Japónica, Rœm. et Schultes, syst. 4. p. 245.? Pers. ench. 1. p. 184. Tàla-Neli, Rheed. mal. 11. p. 113. t. 55. Conv. linifòlius, Wall. cat. no. 1389. Stem branched, angular. Leaves sometimes 2-3 lines broad, sometimes very narrow; hind lobes generally toothed. Pedicels clavate. Corolla pale yellow, or yellow. Seeds glabrous.

Var. β, (Schum. pl. guin. p. 92.) leaves narrow-linear; teeth of auricles subsetaceous. ⊙. S. Native of Guinea.

Thread-stemmed Ipomœa. Fl. July, Aug. Clt. 1778. Pl. 1 foot, diffuse.

17 I. Clappertòni (R. Br. in Denh. append. p. 35.) glabrous, creeping; leaves sagittate, having the hind lobes entire, and acute; peduncles 1-flowered. ↄ. F. Native of Bornou.

Clapperton's Ipomœa. Pl. creeping.

18 I. bidenta'ta; glabrous, erectish; leaves linear- hastate, sessile, having the hind lobes bidentate; peduncles 1-flowered; stem furrowed. ↄ. S. Native of Guinea, in fields; common among grass. Stem furrowed. Flowers small, yellow. Nearly allied to I. filicaúlis, and probably only a variety of it.

Bidentate-leaved Ipomœa. Pl. ½ foot, nearly erect.

19 I. Ature'nsis; branched, glabrous, twiggy; leaves scale-formed; peduncles 2-flowered, spicate; sepals lanceolate, ob-

long, acuminated: the 2 outer ones rather the smallest. ♃. S. Native on the sandy banks of the Orinoco, near the cataract of Ature. Convólvulus Aturénsis, H. B. et Kunth, nov. gen. amer. 3. p. 96. Stem dichotomously branched; branches terete. Corolla white, glabrous, 3 times longer than the calyx. Capsule globose, covered by the calyx, size of a pea.

Ature Ipomœa. Fl. March. Pl. $1\frac{1}{2}$ foot.

20 I. capilla'cea; stems nearly simple, erect; leaves sessile, many-parted; segments capillary, glabrous; flowers axillary, solitary, pedunculate, longer than the leaves; calyx smoothish; sepals ovate, acute, concave, rugose on the back, unequal. ♃. S. Native of New Granada, in the temperate regions, betwixt Villa San Miguel and the river Putes, at the altitude of 800 hexapods. Convólvulus capillàceus, H. B. et Kunth, nov. gen. 3. p. 97. Root tuberous, milky, turnip-formed. Plant smoothish. Corollas funnel-shaped, purple, glabrous. Perhaps a species of *Leptocállis*.

Capillary-leaved Ipomœa. Pl. 1 foot.

21 I. biflòra (R. Br. prod. p. 487.) tomentose; stem flexuous at the apex; leaves lanceolate, acute, quite entire, obtuse at the base; peduncles usually 2-flowered; sepals ovate, acuminated. ♃. ? S. Native of New Holland, within the tropic, on the sea shore. I. diántha, Rœm. et Schultes, syst. 4. p. 254. Conv. flexuòsus, Spreng. syst. 1. p. 612.

Two-flowered Ipomœa. Pl. erect.

22 I. ere'cta (R. Br. l. c.) tomentose, erect; leaves oblong-linear, obtuse, quite entire; peduncles usually 1-flowered; sepals acute; capsule 6-valved. ♃. S. Native of New Holland, within the tropic, on the sea shore. Conv. eréctus, Spreng. syst. 1. p. 612.

Erect Ipomœa. Pl. erect.

23 I. heterophy'lla (R. Br. l. c.) plant annual, ascending, smoothish; leaves oblong, semihastate, entire, obtuse, sometimes pinnatifid at the base, and toothed at top; peduncles 1-flowered, very short; sepals equal, lanceolate, acuminated. ⊙. S. Native of New Holland, within the tropic, on the sea shore. Ipomœ'a polymórpha, Rœm. et Schultes, syst. 4. p. 254. Convólvulus Bròwnii, Spreng. syst. 1. p. 612.

Variable-leaved Ipomœa. Pl. ascending.

24 I. confe'rta; stems prostrate, diffuse; leaves cordate-sagittate, lanceolate, entire, acute; petioles scabrous; flowers nearly sessile, axillary, crowded; calyx hairy. ⊙. S. Native of Guinea, common in fields. Corollas white.

Crowded-flowered Ipomœa. Pl. prostrate.

25 I. hu'milis; roots creeping; stem 3 inches high; leaves linear-lanceolate, or lanceolate, obtuse, thick, entire, glabrous, petiolate; peduncles terminal and axillary, elongated, 1-flowered. ♃. S. Native of Sierra Leone, and along the coast of Guinea, on the sea shore. Corollas large, pale red. Habit of *Calystègia soldanélla*.

Humble Ipomœa. Pl. $\frac{1}{4}$ foot.

26 I. ovalifòlia (Choisy, l. c. p. 449.) stem erect or prostrate, suffruticose; leaves oval-oblong, acute at the base, obtuse at the apex, and emarginate, on short petioles; peduncles 3-7-flowered; sepals unequal. ♄. S. Native of the East Indies and Sandwich Islands. Convólvulus ovalifòlius, Vahl, eclog. 2. p. 16. Hook. et Arn. in Beech. voy. pt. bot. p. 90. Ip. microphýlla, Roth. nov. spec. p. 112. Conv. parvifòlius, Spreng. syst. 1. p. 611.? Stems terete. Leaves an inch long, and 5 lines broad. Peduncles twice as long as the petioles. The 3 exterior sepals ovate, bluntish: the 2 interior smaller, linear, acute. Corolla glabrous.

Var. α; *glàbra* (Choisy, l. c.) stem, leaves, calyxes, and peduncles, quite glabrous.

Var. β, *pubéscens* (Choisy, l. c.) all parts of the plant are ciliated with long hairs. ♄. S. Native of the Sandwich Islands, Guinea, and Angola.

Var. γ, *tomentòsa* (Choisy, l. c.) every part of the plant is of a yellow colour, from intricate, simple, adpressed hairs. ♄. S. Native of the Sandwich Islands, Guinea, and Angola.

Oval-leaved Ipomœa. Shrub erect.

* * *Shrubby or arboreous plants.*

27 I. arbore'scens; arboreous; leaves ovate-cordate, acute, clothed with hoary tomentum on both surfaces; peduncles many-flowered; calyx clothed with white wool outside; sepals oblong, obtuse, concave, unequal: outer ones the broadest; seeds woolly on the angles. ♄. S. Native of Mexico, on the western declivities of the mountains betwixt Acaguisotla and Chilpancingo, at the altitude of 600 hexapods, where it is called *Guausaguate*. Convólvulus arboréscens, Willd. enum. 1. p. 204. Lactescent. Pedicels tomentose. Corolla glabrous, white, purple inside at the throat.

Arborescent Ipomœa. Tree large.

28 I. macra'ntha; arboreous; leaves oblong-lanceolate, acuminated, rounded at the base, glabrous; flowers axillary, solitary, pedunculate; calyx clothed with white wool; sepals unequal, oblong, rounded at apex, concave: outer ones broadest. ♄. S. Native of Mexico, near Guanaxuato and Santa Rosa, at the altitude of 1100 feet. Convólvulus macránthus, H. B. et Kunth, nov. gen. 3. p. 95. Branches angular, clothed with white tomentum while young, as well as the peduncles. Corolla white, woolly outside.

Large-flowered Ipomœa. Tree.

29 I. serpyllifòlia; shrubby; leaves ovate-elliptic, rounded at the apex, rather downy; axillary peduncles 1-flowered: terminal ones 2-flowered, exceeding the leaves; calyx smoothish; sepals ovate, acuminately-mucronate, rather concave, nearly equal, with incumbent edges. ♄. S. Native of New Spain, in temperate places, near Moran and Regla, at an altitude of 1250 hexapods. Convólvulus serpyllifòlius, H. B. et Kunth, nov. gen. amer. 3. p. 95. Bark corky. Stems tufted, procumbent, slender, nearly terete, glabrous; branchlets downy. Leaves 3 lines long. Flowers white, about the size of those of *Convallària majàlis*, glabrous. Habit of *Evólvulus nummulàrius*.

Wild Thyme-leaved Ipomœa. Shrub procumbent.

30 I. rudera'ria; shrubby; leaves lanceolate-oblong, retuse at the apex, and mucronate, downy; peduncles axillary, usually 3-flowered, twice shorter than the leaves; calyx glabrous; sepals roundish, acute: the 2 outer ones rather the shortest. ♄. S. Native of Cuba, among rubbish, near Havannah. Convólvulus ruderàrius, H. B. et Kunth, nov. gen. 3. p. 96. Shrub prostrate; branches terete, downy when young. Leaves 8-9 lines long. Flowers a little larger than those of *I. serpyllifòlia*. Corolla 3 times longer than the calyx.

Rubbish Ipomœa. Shrub prostrate.

31 I. floribu'nda; shrubby, clothed with hoary tomentum; leaves ovate-oblong, acuminately-mucronate, cordate; corymbs axillary, pedunculate, shorter than the leaves; calyx clothed with woolly tomentum; sepals oblong, bluntish, concave: the 3 outer ones the largest. ♄. S. Native on the banks of the river Amazon, on hills near Tomependa. Convólvulus floribúndus, H. B. et Kunth, nov. gen. 3. p. 96. t. 210. Shrub much branched; branches terete. Leaves on long petioles, 2 inches long. Corolla 4 times longer than the calyx, obsoletely 5-lobed, glabrous, blue, size of those of *Fálkia rèpens*.

Bundle-flowered Ipomœa. Shrub 3-4 feet.

32 I. sta'ns (Cav. icon. 3. p. 26. t. 250.) suffruticose; leaves

ovate, or oblong-lanceolate, sinuately-toothed, smoothish; flowers axillary, solitary, pedunculate, longer than the leaves; calyx glabrous, sepals unequal, linear, obtuse. ♄. S. Native of Mexico, near Guanaxuato. Convólvulus stáns, H. B. et Kunth, nov. gen. amer. 3. p. 96. Conv. fírmus, Spreng. syst. 1. p. 613. Corolla campanulate, pale violet, with a whitish tube and rounded segments.

Standing Ipomœa. Shrub erect.

33 I. pannòsa (R. Br. l. c.) tomentose, suffruticose, erectish; leaves quite entire, oblong, bluntish, pannosely tomentose; peduncles 1-flowered; sepals acuminated: the 2 inner ones one half smaller than the outer ones. ♄. S. Native of New Holland, within the tropic, on the sea shore. Convólvulus pannòsus, Spreng. syst. 1. p. 612.

Cloth-leaved Ipomœa. Shrub erect.

34 I. filifòlius (Hook. et Arn. in Beech. voy. pt. bot. p. 35. under *Convólvulus*) shrubby, much branched, diffuse; leaves very narrow-linear, terete; flowers axillary, solitary, on short peduncles; corolla campanulate. ♄. G. Native of Chili, at Coquimbo. Calyx 5-cleft; with linear teeth on the segments. Corolla blue, an inch broad.

Thread-leaved Ipomœa. Shrub diffuse.

Sect. III. Strophipomœ'a (from *στροφαω, strophao*, to turn or twist; and *Ipomœ'a;* in reference to the twining stems of the species). Choisy, in mem. soc. phys. gen. 6. p. 450. Stems twining.

§ 1. *Leaves entire, undivided, usually cordate. Capsules generally large. Anthers usually twisted.*

* *Stems angular or winged.*

35 I. Turpe'thum (R. Br. prod. p. 485.) stems angular, glabrous, or a little downy; leaves cordate-ovate, acuminated, sometimes entire, sometimes angularly sinuated, or crenated; peduncles thick, 1-4-flowered, bracteate at apex; outer sepals the largest, ovate-roundish. ♃. ◠. S. Native of the East Indies, on the banks of the Hoogly and Ganges; New Holland; Timor; Otaheite; Friendly and Marianne Islands, &c. Ker. bot. reg. 279. Roth. nov. spec. p. 111. Convólvulus Turpèthum, Lin. spec. p. 221. Blackw. t. 397. Sims, bot. mag. t. 2093. Wall. fl. ind. 2. p. 57. Hook. bot. misc. 3. p. 297. Wight, ill. suppl. t. 88. Conv. Gaudichaúdii and Riédlei, Choisy, mss.—Herm. lugdb. 177. t. 178. and 179. Conv. velutìnus, Wall. cat. no. 1371.—Plenck. off. t. 105. Root thick, purgative. Leaves nearly glabrous or downy. Corolla campanulate, twice longer than the calyx, white, size of those of *Calystègia sèpium*. Capsule showy, size of a nut. The bark of the roots is employed by the natives of the East Indies as a purgative, which they use fresh rubbed up with milk. About 6 inches in length of the root they reckon a dose. Cattle do not eat the plant. The root being free from nauseous taste and smell, gives it a decided superiority over jalap, for which it might be substituted. *Turpèthum* is derived from its Arabic name *Turbib.*

Turpethum Ipomœa. Fl. March, June. Clt. 1752. Plant twining.

36 I. a'nceps (Rœm. et Schultes, syst. 4. p. 231.) stem 4-winged; leaves cordate-oblong, somewhat sagittate or ovate, mucronulate at apex; peduncles 2-5-flowered, bracteate at apex; sepals unequal: 2 outer ovate, villous outside: the 3 inner smaller, oblong. ♃. ◠. S. Native of Bengal, Ceylon, Java, &c. Convólvulus ánceps, Lin. mant. p. 43. Vahl, symb. 3. p. 31. Peduncles and pedicels villous. Capsule large.

Two-edged-stemmed Ipomœa. Pl. tw.

37 I. trí'quetra (Rœm. et Schultes, syst. 4. p. 231.) stem downy, triquetrous; leaves cordate, acute, rather villous; peduncles 2-5-flowered, bracteate; outer sepals bractea-formed, ovate, acute, mucronate: inner ones shorter, and rounded at the apex. ♃. ◠. S. Native of the Islands of Santa Cruz, St. Thomas, &c. Conv. tríquetra, Vahl. symb. 3. p. 30. Willd. spec. 1. p. 858. Lateral pedicels 2-flowered, middle one 1-flowered. Bracteas ovate, coloured, downy.

Triquetrous-stemmed Ipomœa. Pl. tw.

38 Hamiltònii; stems a little winged; leaves scattered, recurved, petiolate, cordate-ovate, acuminated, veiny, concave; peduncles usually 1-flowered, at first terete, afterwards 4-winged, and at length 5-angled; bracteas sessile, lanceolate, acuminated, a little coloured, nearly opposite; flowers large, yellow. ♃. ◠. S. Native of Tobago, near the town of Scarborough. Conv. alàtus, Hamilt. prod. p. 24. This species is said to come nearest *I. ánceps*, and *Conv. flàvus*.

Hamilton's Ipomœa. Pl. tw.

* * *Stems terete.*

39 I. campanula'ta (Lin. spec. 228. Lour. coch. p. 112.) leaves cordate, acute; peduncles many-flowered, spicately branched; sepals equal, ovate-orbicular, glabrous. ♃. ◠. S. Native of the East Indies, Timor, Cochin-china, &c. Convólvulus campanulàtus, Spreng. syst. 1. p. 608. Adámboe, Rheed. mal. 11. p. 115. t. 56. Stem reddish, glabrous, terete, densely branched, fistular. Leaves glabrous, reticulated with red-feathered nerves, 4-6 inches long, and 1-3 broad. Corolla large, yellow, ex Lour. Capsule large, globose, glabrous. Seeds clothed with silky villi.

Campanulate-flowered Ipomœa. Fl. Aug. Sept. Clt. 1800. Pl. tw.

40 I. sulphu'rea; glabrous?; leaves cordately-sagittate, entire; peduncles 3-flowered, much longer than the petioles; sepals glabrous, obtuse, adpressed; filaments villous at the base; anthers twisted into a spire. ♃. ◠. S. Native of Mexico, on walls at St. Jose de Corral. Convólvulus sulphùreus, La Lave, et Lexarza, nov. veg. mex. fasc. 1. p. 17. Calyx yellowish. Corolla sulphur-coloured, campanulate, with a 5-plicate limb: each plica composed of 2 roundish crenatures. Capsule round, velvety, black.

Sulphur-coloured-flowered Ipomœa. Fl. Feb. Pl. tw.

41 I. petaloídea (Choisy, in mem. soc. phys. gen. 6. p. 451.) leaves sometimes saggittately-lanceolate, acute, with sinuated edges; sometimes linear, and sometimes ovate; sometimes ovate-lanceolate; often hardly cordate; sometimes obtuse at the apex, and mucronulate; peduncles 1-4-flowered, bracteate, sometimes numerous, approximate, appearing like a 9-flowered peduncle; sepals ovate-orbicular; corolla 5-cleft. ♃. ◠. S. Native of the East Indies; at Prome; and Gorukpur; as well as of Timor. Convólvulus crispátulus, Wall. cat. no. 1403. Conv. reticulàtus, Ham. herb. Stems terete, glabrous, branched. Leaves reticulately veined, 2-3 inches long, glabrous. Corolla 3 times longer than the calyx, deeply divided, silky outside, red.—This is a very variable plant in the leaves. Capsule large, size of a nut.

Petaloid Ipomœa. Pl. tw.

42 I. bufalìna (Choisy, in mem. soc. phys. gen. 6. p. 452.) leaves cordately sagittate, glabrous; peduncles many-flowered; corolla yellow, campanulate. ♃. ◠. S. Native of Cochinchina, in woods. Convólvulus bufalìnus, Lour. coch. p. 109. ed. Willd. 1 p. 134. Stem woody, scandent, glabrous. Corolla large, campanulate. Capsule large, 2-celled, 2-seeded. Anthers filiform, spirally twisted.

Buffalo's Ipomœa. Shrub tw.

43 I. PELTA'TA (Choisy, l. c. 6. p. 452.) leaves peltate; peduncles long, many-flowered; sepals ovate-elliptic, obtuse; corolla yellow, campanulate. ♄. ⌒. S. Native of Java, Amboyna, Society Islands, and Bourbon. Convólvulus peltàtus, Lin. spec. p. 221. Forst. prod. p. 78. Ipomœ'a nymphiæfòlia, Blum. bijdr. p. 719.—Rumph. amb. 5. p. 428. t. 157. Stem terete, black, glabrous. Leaves glabrous, 3-4 inches long, entire, furnished with rufous hairs in the axils of the petioles. Peduncles branched at the apex; flowers spicate, on short pedicels. Corolla large, inflated. Anthers woolly. Stigma large. Capsule large.

Peltate-leaved Ipomœa. Shrub tw.

§ 2. *Leaves cordate, entire. Capsules and sepals middle-sized. Flowers capitately aggregate.*

44 I. PILEA'TA (Wall. fl. ind. 2. p. 94.) leaves cordate, acuminated; peduncles hardly equal in length to the petioles; flowers 3-6, sessile, in a boat-shaped, perfoliate, involucrum; bracteas obovate, hairy; sepals rather unequal. ⊙. ⌒. S. Native of the East Indies, China, &c. Convólvulus pileàtus, Roxb. ex Wall. cat. no. 1376. Spreng. syst. 4. p. 61. Ipomœ'a peltàta, Heyne, herb. Stems villous, slender. Leaves $1\frac{1}{2}$ inch long, often glabrous, but sometimes downy. Petioles and peduncles villous. Corolla rose-coloured, funnel-shaped. Seeds glabrous. Nearly allied to *I. involucràta*.

Cap Ipomœa. Pl. tw.

45 I. INVOLUCRA'TA (Beauv. fl. d. ow. 2. p. 52. t. 89.) plant downy; leaves cordate, quite entire, acutish: hind lobes rounded; peduncles many-flowered: flowers surrounded by 2 large involucrum-formed perfoliate bracteas. ⊙. ⌒. S. Native of Guinea, among bushes. Conv. involucràtus, Spreng. syst. 1. p. 600. Pedicels short, unequal. Corolla large, red.

Involucrate-flowered Ipomœa. Fl. Aug. Oct. Clt. 1822. Pl. tw.

46 I. PERFOLIA'TA; leaves cordate, villously tomentose, having the hind lobes roundish and subacuminated; flowers capitate, involucrated by one perfoliate leaf; sepals downy: the 3 outer ones lanceolate, and the 2 inner ones setaceous at the apices. ♃.? ⊙.? ⌒. S. Native of Africa, at Aquapim. Conv. perfoliàtus, Schum. pl. guin. p. 89. Stem filiform, pilose. Peduncles covered with retrograde villi. Corolla campanulate, plicate, red, with villous angles; lobes of the limb emarginate. Stigmas villous.

Perfoliate Ipomœa. Pl. tw.

47 I. BREVIFLÒRA (Meyer, prim. esseq. p. 100.) glabrous; leaves sagittately-cordate; peduncles shorter than the petioles; flowers subumbellate, involucrated; outer sepals plicately wrinkled, mucronate. ⊙. ⌒. S. Native about Essequibo, in humid plantations. Stems angular, scabrous from scattered rigid hairs. Corolla large, purple.

Short-flowered Ipomœa. Pl. tw.

48 I. CAPITELLA'TA (Choisy, l. c. p. 457.) stem pilose; leaves cordate, acuminated, pilose; peduncles equal in length to the petioles; bracteas unequal, obtuse, ovate-linear; flowers aggregate, umbellate; sepals linear-lanceolate, very acute. ⊙. ⌒. S. Native of the East Indies, at Mungger, &c. Ipomœ'a tamnifòlia, Burm. ind. p. 50. but not of Lin. Conv. capitellàtus, Ham. herb. ex Wall. cat. no. 2250. Hairs on the stem glandular at the base. Peduncles hairy. Corolla violaceous, tubularly campanulate, villous outside. Seeds glabrous.

Headed-flowered Ipomœa. Pl. tw.

49 I. TRICHOCE'PHALA; stem and peduncles pilose; leaves cordate, acuminated, sometimes a little angular; heads of flowers involucrated by bracteas, 2 of which are larger than the others; flowers crowded, sessile; calycine segments linear, acute, ciliated with long fuscous hairs. ♃. ⌒. S. Native of Guayaquil, (*v. s.* in herb. Ruiz. et Pav.)

Hairy-headed Ipomœa. Pl. tw.

50 I. GUINEE'NSIS; leaves cordate, acuminated, with a few scattered hairs above, but clothed with rusty hairs beneath on the veins; petioles, peduncles, and calyx, hairy. ♃.? ⊙.? ⌒. S. Native of Guinea. Conv. Guineénsis, Schum. pl. guin. p. 90. Stems herbaceous, pilose. Flowers crowded into heads, which are involucrated by leaves. Peduncles length of leaves. Corollas blue, size of those of *Lysimàchia, nummulària*. Lobes of stigma thick, recurved. Capsule size of a pea. Seeds naked. Said to be allied to *I. ciliàtus*. Perhaps a species of *Jacquemóntea*.

Guinea Ipomœa. Pl. tw.

51 I. TAMNIFÒLIA (Lin. spec. ed. 1. p. 885.) plant pilose; leaves cordate, acuminated; peduncles axillary; flowers aggregate, on the tops of the peduncles; bracteas linear, hairy, involucrating; sepals linear, subulate. ⊙. ⌒. S. Native of Carolina, in hedges; and on the banks of the Mississippi. Pursh. fl. amer. 1. p. 146. Conv. tamnifòlius, Spreng. syst. 1. p. 602.—Dill. elth. p. 428. t. 318. f. 410. Corollas small, tubular, blue; segments of the limb roundish, spreading; capsule glabrous.

Tamnus-leaved Ipomœ'a. Fl. July. Clt. 1732. Pl. tw.

52 I. ATROPURPU'REA (Choisy, l. c. p. 457.) stem hispid; leaves cordate, acuminated, hispid, very acute, petiolate; peduncles thick, hardly half an inch long; bracteas 9-12, unequal, lanceolate, acute; flowers capitate; sepals lanceolate, very acute, hairy. ⊙. ⌒. S. Native of Nipaul. Convólvulus atropurpùreus, Wall. fl. ind. 2. p. 54. asiat. rar. 1. p. 38. t. 43. Ipomœ'a sphærocéphala, D. Don. prod. fl. nep. p. 98. Hairs on the stem retrograde. Corolla oval, hispid before expansion, at length tubularly campanulate, 18 lines long, dark purple.

Dark-purple-flowered Ipomœa. Pl. tw.

53 I. SESSILIFLO'RA (Roth. nov. spec. p. 117. Rœm. et Schultes, syst. 4. p. 243) stem beset with retrograde bristles; leaves cordate, ovate-lanceolate, or sagittate; flowers axillary, sometimes only 1-3 together, but sometimes 4-12 together, almost sessile, or on very short pedicels; sepals acuminately subulate; corollas small; capsule usually villous. ⊙. ⌒. S. Native of the East Indies, in several parts; as of Nipaul, Madras, Bengal, &c.; Coromandel, Tranquebar; and of the Cape Verd Islands. Convólvulus sessiliflòrus, Spreng. syst. 1. p. 599. Conv. híspidus, Vahl. symb. 3. p. 29. Conv. sphærocéphalus, Wall. fl. ind. 2. p. 53. Conv. tamnifòlius, Klein. in Rœm. et Schultes, syst. 4. p. 301. Ipomœ'a sphærocéphala, Sweet, hort. brit. p. 288. but not of D. Don. Conv. curtàna, Ham. herb. Conv. cynanchifòlius, Wall. cat. no. 1399. Conv. hírtus, Wight, herb. Conv. pàtulus, Ham. herb. Leaves 1-3 inches long, entire, or sinuated on the edges. Flowers small, rose-coloured. There is also a variety of this with white flowers, in round sessile heads.

Sessile-flowered Ipomœa. Fl. Aug. Oct. Clt. 1816. Plant twining.

54 I. BARBA'TA (Choisy, l. c. p. 458.) stem very pilose; leaves ovate-oblong, acute, entire, woolly beneath, rounded at the base; flowers axillary, 7-9 together in a capitate fascicle, which is involucrated by very long, linear, incurved bracteas. ♄. ⌒. S. Native of the East Indies; at Rangoon, in Pegu, Donabew; and on the banks of the Irawaddi. Convólvulus barbàtus, Wall. pl. rar. asiat. 2. p. 45. t. 155. cat. no. 1391. Stem beset with rusty silky hairs. Leaves 5-12 inches long, furnished with long hairs above, which are glandular at the

base. Corolla an inch long, contracted at the base, pale yellow, tinged with red inside.

Bearded Ipomœa. Shrub tw.

55 I. POLYCA'RPA; stems downy; leaves ovate-oblong, mucronate, cordate, downy above, canescent and tomentose beneath; umbels axillary, nearly sessile, shorter than the leaves; sepals ovate, acuminated, downy, nearly equal. ♃. ⌒. S. Native of Mexico, near Regla and Omitla, at the altitude of 1100 hexapods. Convólvulus polycárpus, H. B. et Kunth, nov. gen. 3. p. 98. Stem terete, downy. Leaves obtuse, mucronate, 10 lines long, and 4 broad. Umbels 6-8-flowered. Corolla funnel-shaped, of a violaceous rose-colour, glabrous; limb plicately 5-toothed. Capsule glabrous.

Many-fruited Ipomœa. Pl. tw.

56 I. POLYA'NTHES (Rœm. et Schultes, syst. 4. p. 234.) leaves cordate, acute, glabrous, on longish petioles; umbels peduncular. ♃. ⌒. S. Native of Martinico, St. Domingo, Jamaica, and Cuba, about the Havannah. Conv. umbellàtus, Lin. spec. p. 221. Desr. in Lam. dict. 3. p. 555.—Plum. icon. 88. t. 102. Petioles furnished with 2 stipulas at the base, which run down the stem. Peduncles rather angular, thickened at the apex. Corollas small, yellow, with a tinge of green, very like those of a species of *Prímula*. Capsule clothed with silky yellow tomentum.

Many-flowered Ipomœa. Fl. June, July. Clt. 1739. Plant twining.

57 I. PRIMULÆFLÒRA; suffruticose, downy; leaves cordate, acute, with the hind lobes obtuse; petioles pilose; peduncles long, many-flowered; flowers umbellate. ♄. ⌒. S. Native of Sierra Leone, on the banks of rivers and rivulets. Flowers small, yellow.

Primrose-flowered Ipomœa. Shrub twining.

58 I. VERRUCÒSA (Blum. bijdr. p. 718.) leaves cordate-ovate, acute, ciliated, smooth; peduncles elongated, thick, bearing umbels; sepals oval, nearly equal: outer ones warted; stems downy. ♃. ⌒. S. Native of Java, in marshes near Batavia. Flowers dark purple, with a lilac limb.

Var. β; leaves spotted.

Warted Ipomœa. Fl. Year. Pl. tw.

§ 3. *Leaves cordate, hastately cordate, or hastate, with entire edges. Flowers not crowded into heads. Capsules and sepals middle-sized.*

* *Peduncles* 1*-flowered.*

† *Leaves cordate.*

59 I. SINE'NSIS (Choisy, in mem. soc. phys. gen. 6. p. 469.) plant very hairy; leaves cordate, acute, mucronulate, hairy on both surfaces; peduncles 1-flowered, shorter than the petioles; outer sepals cordately cuneated at the base, acuminated at the apex. ☉. ⌒. H. Native of China. Convólvulus Sinénsis, Desr. in Lam. dict. 3. p. 557. Conv. Ser, Spreng. syst. 1. p. 598. Stem terete, beset with retrograde white hairs. Leaves 3-4 inches long, and 2-3 broad; hind lobes approximate. Inner sepals lanceolate, acute. Corolla campanulate.

China Ipomœa. Pl. tw.

60 I. ALBIVE'NIA; stems tomentose; leaves roundish-cordate, somewhat repand, having the veins elevated and woolly beneath; peduncles 1-flowered, shorter than the petioles, but the flowers are much longer than the leaves; calyx glabrous: the 2 outer sepals larger, and the 3 inner obtuse. ♄. ⌒. S. Native of Algoa Bay. Conv. albivènius, Lindl. bot. reg. 1116. Adult stems nearly glabrous, tubercular. Flowers terminating the branchlets, solitary. Corolla large, having the tube dirty-white outside, and purple inside; limb white, with obcordate lobes, and yellow plicæ.

White-veined-leaved Ipomœa. Clt. 1824. Fl. Sept.

61 I. OCHRA'CEA; stems terete, pilose; leaves cordate, acuminated, entire, and are, as well as the petioles, pilose; peduncles pilose, 1-flowered, shorter than the petioles; calyx downy, with nearly equal, ovate-acute sepals. ☉. ⌒. S. Native of Guinea, on the gold coast. Conv. ochràceus, Lindl. bot. reg. t. 1060. Limb of corolla flat, with apiculated, crenulated lobes. Stigma small, capitate. Corolla of orange-yellow colour, having the tube deep purple inside. Nearly allied to *I. obscùra*, Ker. bot. reg. 239. but that plant is glabrous.

Ochraceous-flowered Ipomœa. Fl. Aug. Clt. 1826. Pl. tw.

62 I. DÍSCOLOR; stems striated, downy; leaves ovate, deeply cordate, obtuse, mucronate, very soft, pubescent above, but clothed with white tomentum beneath; peduncles 1-flowered, longer than the leaves; sepals oblong, obtuse, downy. ♃. ⌒. S. Native on the banks of the river Orinoco, near Carichana, where it is called by the natives *Corazoncillo*. Conv. díscolor, H. B. et Kunth, nov. gen. 3. p. 105. t. 212. Conv. leucophy'llus, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 301. Leaves an inch long; hind lobes rather diverging. Peduncles downy. Corolla violaceous, downy outside, funnel-shaped. A decoction of the leaves of this species is used in gonorrhœa by the natives.

Discoloured-leaved Ipomœa. Pl. tw.

63 I. CILIOLA'TA (Pers. ench. 1. p. 183.) glabrous; leaves finely cordate, with the edges a little ciliated; peduncles rather long, 1-flowered; calyx bractless; sepals broad-oval, obtuse; corollas tubularly-campanulate. ♃. ⌒. H. Native of Tennessee, at Knoxville. Ip. ciliòsa, Pursh, fl. amer. 1. p. 146. Conv. ciliolàtus, Michx. fl. amer. bor. 1. p. 137.

Ciliated-leaved Ipomœa. Pl. tw.

64 I. SOLANIFÒLIA (Lin. spec. 226.) leaves cordate, acute; peduncles 1-flowered, solitary, equal in length to the leaves. ♂. ⌒. S. Native of America. Willd. spec. 1. p. 881. Convólvulus solanifòlius, Spreng. syst. 1. p. 596. Quámoclit solanifòlia, flore roseo. Plum. spec. 3. Burm. amer. icon. 94. f. 1. Tourn. inst. p. 116. Corolla tubular, rose-coloured. Genitals exserted. Leaves acuminated. Perhaps a species of *Quámoclit*.

Solanum-leaved Ipomœa. Fl. July, Aug. Clt. 1759. Plant twining.

65 I. PU'LCHRA (Blum. bijdr. p. 716.) leaves cordate-ovate, mucronulate, entire, smooth above, and rather downy beneath; peduncles 1-flowered, about equal in length to the petioles; sepals roundish, rather silky. ♃. ? ⌒. S. Native of Java, and the Moluccas. Corolla large, funnel-shaped, purplish.

Var. β; leaves acuminated, with a mucrone; peduncles longer than the petioles. ♃. ? ⌒. S. Native of the Island of Timor.

Fair Ipomœa. Fl. Year. Pl. tw.

66 I. LEUCA'NTHA (Jacq. coll. 2. p. 280. icon. rar. 2. t. 318.) glabrous; leaves cordate, acuminated; peduncles 1-flowered; solitary, shorter than the leaves; sepals broad, short, acutish. ☉. ⌒. S. Native of tropical America. Scop. del insub. fasc. 2. t. 4. Willd. spec. 1. p. 881. Conv. leucánthus, Desr. in Lam. dict. 3. p. 541. Ip. Philadélphica, Hort. Leaves sometimes repand. Corolla white, hardly twice as long as the calyx, which is acuminated. Seeds blackish-brown.

White-flowered Ipomœa. Fl. Aug. Oct. Clt. 1823. Plant twining.

67 I. ACULEA'TA (Blum. bijdr. p. 715.) glabrous; leaves roundish-cordate, acuminated, entire; peduncles axillary, shorter than the petioles, thickened, 1-flowered; sepals roundish; tube of corolla elongated; stem triquetrous, and prickly at bottom.

88 I. oblor[illegible] S. Native of Java, in the province of Tjangor, on the Parang mountains, among bushes. Said to be allied to *I. tubulòsa*. Corolla with a white limb and green rays.

Prickly Ipomœa. Fl. July. Pl. tw.

68 I. melanostícta; downy; leaves roundish-ovate, deeply cordate, with an acutish recess, and very blunt lobes, which are acutish or mucronate at the apex, downy, and dotted with black beneath; peduncles 1-flowered, shorter than the petioles; sepals nearly equal, suborbicular, obtuse, mutic. ♃. ? ◠. S. Native of the Island of St. Thomas. Conv. melanostíctus, Schlecht, in Linnæa. 6. p. 737. Corolla large, with a funnel-shaped limb and ciliated margins.

Black-dotted-leaved Ipomœa. Pl. tw.

69 I. tu'ba; leaves petiolate, broad-ovate, acuminated, deeply cordate: hind lobes obtuse; peduncles bractless, 1-flowered; sepals nearly equal, obtuse, mucronulate; corolla large, with a long cylindrical tube, and a funnel-shaped limb. ♄. ? ◠. S. Native of the Island of St. Thomas. Conv. tùba, Schlecht, in Linnæa. 6. p. 735. Stigmas orbicular. Seeds villous.

Tube-flowered Ipomœa. Pl. tw.

70 I. lute'ola (R. Br. l. c.) glabrous; leaves cordate, acuminated, quite entire, hardly an inch long; peduncles usually 1-flowered; sepals acute; corolla yellow. ♃. ? ◠. S. Native of New Holland, within the tropic, on the sea shore. I. Bròwnii, Rœm. et Schultes, syst. 4. p. 252.

Yellowish-flowered Ipomœa. Pl. tw.

71 I. abru'pta (R. Br. l. c. p. 485.) glabrous; leaves cordate, acutish, having the recess at the base closed; peduncles 1-flowered, hardly equalling the petioles in length; sepals equal, oval, obtuse. ♃. ? ◠. S. Native of New Holland, within the tropic. Conv. abrúptus, Spreng. syst. 1. p. 596.

Abrupt-leaved Ipomœa. Pl. tw.

72 I. Sibírica (Jacq. coll. 3. p. 304.) smooth; stem triangular; leaves cordate, acuminated; peduncles 1-2-flowered, shorter than the leaves; calyx bractless, ovate. ☉. ◠. H. Native of Siberia. Pers. ench. 1. p. 183. Conv. Sibíricus, Lin. mant. p. 203. Conv. rupéstris, Pall. itin. 3. p. 723. t. k.? Leaves hardly repand. Stipulas small, running down the stem. Corolla white, or very pale red, with a yellow bottom, campanulate, one-half smaller than those of *Conv. arvénsis*.

Siberian Ipomœa. Fl. July, Aug. Clt. 1779. Pl. tw.

73 I. Curassa'vica (Rœm. et Schultes, syst. 4. p. 237.) glabrous; stems angular; leaves roundish-cordate, thickish, nerved and pale beneath, rather repand; peduncles 1-flowered, thickened, bractless, shorter than the lower leaves, and longer than the superior ones; calyx subtubercled; sepals ovate, adpressed. ♃. ◠. S. Native of Curassoa. Corolla white, verging to a cream-colour, smaller than those of *Conv. arvénsis*. Capsule glabrous.

Curassoa Ipomœa. Pl. tw.

74 I. ala'ta (R. Br. prod. p. 484.) glabrous; leaves cordate, acuminated, entire; petioles margined; peduncles tetragonal, 1-flowered, winged on the angles; bracteas caducous. ♃. ? ◠. S. Native of New Holland, within the tropic, on the sea shore. Conv. alàtus, Spreng. syst. 1. p. 596.

Winged-peduncled Ipomœa. Pl. tw.

†† *Leaves hastately and sagittately cordate or hastate, or sagittate.*

75 I. gra'cilis (R. Br. l. c.) glabrous; leaves hastate, biglandular beneath at the base, acute at both ends; peduncles 1-flowered; sepals wrinkled, acute, 3 times shorter than the corolla; seeds bearded at the umbilicus. ♃. ? ◠. S. Native of New Holland, within the tropic, on the sea shore. Conv. grácilis, Spreng. syst. 1. p. 604.—There are varieties of this plant with pilose stems, and having the hind lobes of leaves bluntish.

Slender Ipomœa. Pl. tw.

76 I. plebe'ia (R. Br. l. c.) downy; leaves hastately cordate, acuminated, entire: hind lobes rounded; peduncles 1-flowered, shorter than the petioles, bibracteate near the base; sepals equal, acuminated, pilose; capsule glabrous; seeds woolly. ♃. ? ◠. S. Native of New Holland, within the tropic. Conv. plebèius, Spreng. syst. 1. p. 604.

Plebeian Ipomœa. Pl. tw.

77 I. sagittæfòlia (Ker. bot. reg. 437.) glabrous; leaves oblong-sagittate, the hind recess very deep, and the hind lobes somewhat acuminated; peduncles 1-flowered; sepals roundish-oval; corolla campanulately funnel-shaped. ♃. ◠. H. Native from Virginia to Carolina, in wet situations, among bushes. Convólvulus sagittæfòlius, Michx. fl. bor. amer. 1. p. 138. Pursh. fl. 1. p. 144. Conv. speciòsus, Walt. fl. car. p. 93. Conv. formòsus, Gmel. syst. 1. p. 343.—Catesb. car. 1. t. 35. Flowers large, of a beautiful rose-colour.

Arrow-leaved Ipomœa. Fl. June, Sept. Clt. 1819. Plant twining.

78 I. setòsa (Blum. bijdr. p. 714.) leaves cordate, or subhastately cordate, acuminated, entire, downy above, and rather villous beneath; peduncles 1-2-flowered, equal in length to the petioles; sepals linear-lanceolate, acuminated, setigerous; stem covered with retrograde hairs. ♃. ◠. S. Native of Java, among bushes on the mountains. Flowers purplish. Perhaps a species of *Pharbìtis*.

Bristly Ipomœa. Fl. Year. Pl. tw.

79 I. Ja'lapa (Schiede et Deppe, mss.) glabrous; stems angular; leaves membranous, perfectly glabrous, and even on both surfaces, cordate-sagittate, acuminated: hind lobes rounded, obtuse, quite entire; peduncles 2-flowered, longer than the petioles; sepals lanceolate, obtuse, rather unequal; tube of corolla long, narrow, twice as long as the limb, which is nearly entire and spreading. ♃. ◠. S. Native of Mexico, in the woods of Chiconquiaco, from whence it is brought to Vera Cruz by the inhabitants of Jalapa. The plant is called *Purga* and *Laschachne* in Mexico. Convólvulus Jálapa, Houst. mss. in Miller, dict. ed. 8. no. 31. Lin. mant. 1. p. 43, but not of others. Ipomœ'a Púrga, Wenderoth. Ipomœ'a Schièdeana, Zucc. Stems purplish. Leaves often purplish beneath. Corolla long, tubular; tube ventricose above, constricted a little at the throat; with a flat limb, and exserted genitals. Anthers oblong, emarginate at both ends. The leaves are said to be variable in shape by Miller, who reared some plants from seeds sent by Houston, in 1733, in the Apothecaries' Garden at Chelsea. The peduncles generally bear 2 flowers, one of the flowers always much earlier than the other. Houston and Miller seem to be the only authors who knew the plant which produces the true Jalap of the shops; as the plant generally described, cultivated, and known as such, is a very distinct species, and appears to be only a purple-flowered variety of *Ipomœ'a macrorhìza* of Michx. This plant is found principally in the neighbourhood of Jalapa or Xalapa, hence the name. It abounds also on the eastern slope of the Cordillera of Anahuac; and in the same latitude is procured the *Vanilla* and *Sarsaparilla*. From 200,000 to 300,000 lbs. are annually exported from Vera Cruz. Although the root forms a well-known and valuable cathartic, which is perhaps more generally employed than any other of vegetable origin, it was not until lately that the genus to which it belongs was accurately ascertained. In its wild state, the plant delights in a dry sandy soil. The dried root of jalap is imported in thin, transverse slices, and in round masses; it is solid, hard, and heavy, of a dark grey colour. It has a sickly smell, and a sweetish, subacid, nauseous taste. Powdered it is

of a pale yellow brown colour. Jalap, when dear, is often adulterated with scammony, gamboge, briony root, &c. Jalap is an active purgative, which can always be relied upon, and would be administered much more often were it not for the disagreeable effects produced by it, as nausea and griping. It is, notwithstanding, a safe medicine, and, combined with other purgatives, has been proved by Dr. Hamilton to be of eminent use in typhus, scarlatina, cynanche maligna, marasmus, chorea, and tetanus. Added to the supertartrate of potass, it is called compound powder of jalap; and much good has been effected by a judicious and persevering use of this preparation in dropsical cases. The alcoholic extract, when good, is a more active preparation than the former, exerting its effects in doses of 10 or 12 grains. Jalap is best given in substance, in doses from 10 grains to half a drachm, combined with a drop or two of any essential oil. Mr. Hume, of Long-Acre, is said to have discovered a vegeto-alkaline principle in jalap, and proposes to call it jalapine.

Jalap Ipomœa. Fl.? Clt. 1733. Shrub tw.

* * *Peduncles many-flowered, umbellately-racemose, umbellate, corymbose, &c.*

80 I. sidæfòlia (Choisy, l. c. p. 459.) glabrous; leaves cordate-ovate, or roundish-acuminated, smooth; peduncles many-flowered, leafy, umbellately racemose, equalling the petioles in length, or exceeding them; outer sepals shorter, all with white scarious edges; corolla whitish-yellow. ♄. ⌒. S. Native of the Caribbee Islands, Mexico, and Ceylon. Also gathered in the gardens of Teneriffe, Cumana, and Calcutta; but is probably only indigenous to Ceylon. Conv. Domingénsis, Desr. in Lam. dict. 3. p. 554. Conv. sidæfòlius, H. B. et Kunth, nov. gen. 3. p. 99. Conv. multiflòrus, H. B. et Kunth, l. c. p. 100. Conv. (Ipomœ'a) Zeylánica, Moon, ex Wall. cat. no. 1379. Conv. lævicaúlis, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 303. Conv. políferus, Willd. l. c. p. 302.—Sloane, jam. 1. p. 153. t. 97. f. 2.—Young branches rather downy. Leaves rarely rather downy, 2-3 inches long, and 1-2 broad. Bracteas small, linear, ciliated, or glabrous. Corolla campanulate, glabrous, white, with a yellow bottom, and marked with 5 black spots. Capsule surrounded by a membrane at the base. Seeds downy, rufous. There are varieties of this having the flowers more or less numerous, the leaves glabrous or downy, and the sepals more or less unequal.

Sida-leaved Ipomœa. Shrub tw.

81 I. Staphylìna (Rœm. et Schultes, syst. 4. p. 249.) plant suffruticose, glabrous; leaves ovate-oblong, rather cordate, acute, glabrous; flowers racemosely panicled; sepals equal, very blunt, ovate-roundish; corolla tubularly cylindrical. ♃. ⌒. S. Native of the East Indies, as of Coromandel, Penang, Pondicherry. Ipomœ'a racemòsa, Roth. nov. spec. p. 115. but not of Poir. Conv. Malabáricus, Wall. fl. ind. 2. p. 49. but not of Lin. Conv. racemòsus, Rottler and other authors; but not of Spreng. Willd. in Rœm. et Schultes, syst. 4. p. 302. Conv. Kleínii, Spreng. syst. 1. p. 606. 4. p. 61. Conv. máximus, Ham. herb. Conv. polyánthus, Wall. cat. no. 1378. Branchlets rough, blackish. Leaves 3 inches long and 2½ broad. Racemes 2-3 inches long, many-flowered. Corolla 6-12 lines long, rose-coloured. Seeds woolly.

Staphylina Ipomœa. Shrub tw.

82 I. caliginòsa (Choisy, l. c. p. 461.) glabrous; leaves ovate-lanceolate, mucronulate, deeply cordate at the base; peduncles axillary, shorter than the leaves, cymosely corymbose; sepals coriaceous, ovate, obtuse, surrounding the fruit. ♃.? ⌒. S. Native of the East Indies. Conv. caliginòsus, Kœn. mss. in R. Br. herb. Stem blackish. Leaves 3 inches long and 1½ broad. Corolla glabrous, longer than the calyx. Seeds ± silky.

Obscure Ipomœa. Pl. tw.

83 I. cymòsa (Rœm. et Schultes, syst. 4. p. 462. but not of Meyer. Choisy, l. c. p. 461.) stem terete; leaves ovate-cordate, acute at the apex, also acuminated, elongated, blackish above; peduncles axillary, bifidly many-flowered, short; sepals coriaceous, obtuse, rarely acutish, darkish yellow: the exterior ones usually the shortest. ♃. ⌒. S. Native of the East Indies, almost everywhere. Conv. cymòsus, Desr. in Lam. dict. 3. p. 556. Conv. bífidus, β. Vahl. symb. 3. p. 31. Conv. læ'vis mìnor, Rumph. amb. 5. p. 431. t. 158. Conv. blándus, Wall. fl. ind. 2. p. 50. t. 70. Ipomœ'a bífida, Roth. nov. spec. p. 118. Ip. corymbòsa, Roth. l. c. p. 109. Ip. Hèynei, Rœm. et Schultes, syst. 4. p. 237. Ip. blánda, Sweet, hort. brit. p. 288. Conv. Lotuòha, Ham. herb. Conv. multiflòrus, Wall. mss. Stem blackish. Leaves 1-3 inches long, and 6-18 lines broad, glabrous. Corolla campanulately funnel-shaped, pure white, an inch long, glabrous: lobes bearded at top. Seeds rufous, hairy.

Var. β, *pilòsa* (Choisy, l. c. p. 462.) plant hairy, or downy. ♃. ⌒. S. Native of the East Indies. Conv. cymòsus, β. Desr. in Lam. dict. 3. p. 556. Conv. bífidus, Vahl, symb. 3. p. 30. Conv. Ròthii, Spreng. syst. 1. p. 600. Conv. læ'vis mas. Rumph. amb. 5. p. 431. Conv. pentagònus, Roxb. fl. ind. 2. p. 72. Ipomœ'a bífida, Rœm. et Schultes, syst. 4. p. 241. Ip. Ròthii, Rœm. et Schultes, syst. 4. p. 237. Ip. cymòsa, Roth. nov. spec. p. 116. Blum. cat. hort. buit. p. 50. Conv. blándus, β. pubéscens, Roxb. Conv. blándus, β. màjor, Wall. mss. Seeds hairy.

Var. γ, *sagittàto-angulàta* (Choisy, l. c. p. 463.) leaves sagittate, angular. ♃. ⌒. S. Native of Java. Ip. radìcans, Blum. bijdr. p. 712.? Leaves form of those of var. β.

Var. δ, *cúlta* (Choisy, l. c.) stem rather downy; leaves cordate-ovate; peduncles 3-12-flowered; corolla glabrous; all parts of the plant more elongated. ♃. ⌒. S. This is a cultivated variety.

Cymose-flowered Ipomœa. Fl. July, Aug. Clt. 1820. Pl. tw.

84 I. velutìna (R. Br. l. c.) tomentose; leaves cordate, obtuse, entire, soft, having the recess at the base, rather truncate; peduncles many-flowered; sepals glabrous, obtuse. ♃.? ⌒. S. Native of New Holland, within the tropic, on the sea shore. Conv. velutìna, Spreng. syst. 1. p. 601.

Velvety Ipomœa. Pl. tw.

85 I. conge'sta (R. Br. l. c.) tomentose; leaves cordate, acuminated, entire, soft; peduncles many-flowered: pedicels crowded; sepals ending in subulate awns: inner ones smaller. ♃.? ⌒. S. Native of New Holland, within the tropic, on the sea shore. Conv. congéstus, Spreng. syst. 1. p. 601.

Crowded-flowered Ipomœa. Pl. tw.

86 I. urceola'ta (R. Br. l. c.) tomentose; leaves cordate, rather reniform, entire; cymes many-flowered, nearly sessile; sepals equal, pilose, orbicular, obtuse; tube of corolla urceolate, subovate. ♃. ⌒. S. Native of New Holland, within the tropic. Conv. urceolàtus, Spreng. syst. 1. p. 601.

Urceolate-flowered Ipomœa. Pl. tw.

87 I. dumetòrum (Willd. rel. ex Rœm. et Schultes, syst. 4. p. 789.) glabrous; leaves ovate, much acuminated, cordate, having the hind lobes angularly toothed, and diverging; peduncles axillary, dichotomous, 5-flowered, shorter than the leaves; sepals ovate, acutish, glabrous, wrinkled, nearly equal. ⊙. ⌒. S. Native of New Granada, on the Andes of Quito. Conv. dumetòrum, H. B. et Kunth, nov. gen. 3. p. 101. Stem angularly striated. Pedicels rather rough. Capsule globose, glabrous.

Bush Ipomœa. Pl. tw.

88 I. altíssima (Bertero, mss.) arboreous; leaves cordate-oblong, mucronate, clothed with silky villi beneath; peduncles terminal, twin; bracteas remote, and are, as well as the calyxes, coloured, obtuse, and mucronate. ♄. S. Native of Hispaniola. Convólvulus altíssimus, Spreng. syst. 1. p. 613. This and the following species ought probably to have followed *I. stàns*, no. 32, p. 267, from their upright habit.

Tallest Ipomœa. Tree.

89 I. pareiræfòlia; shrubby; leaves ovate, truncate at the base, acuminated, quite entire, hoary beneath, and reticulated with veins; peduncles cymose, 4-flowered; sepals obtuse; tube of corolla elongated. ♄. S. Native of New Granada. Convólvulus pareiræfòlius, Spreng. syst. 1. p. 613.

Pareira-leaved Ipomœa. Shrub.

90 I. ca'ndicans; glabrous; leaves cordate, acuminated, rather downy beneath; peduncles many flowered, bractless; outer sepals nerved, obtuse. ♃. ? ◠. H. Native of North America? Conv. cándicans, Sol. mss. ex Sims, bot. mag. t. 1603. Corolla large, white, with a purple throat; lobes rounded, plicæ mucronate.

Whitish Ipomœa. Fl. June, Aug. Clt. 1776. Pl. tw.

91 I. ru'bens (Choisy, l. c. p. 463.) stem downy; leaves cordate, acuminated, usually glabrous above, but clothed with grey down beneath; peduncles stiff, much exceeding the petioles, umbellately many-flowered; sepals ovate, acuminated, or lanceolate, mucronate, equal; corolla showy, purple. ♃. ◠. S. Native of the East Indies, as of Silhet, Gualpara, Pirgum, &c. Conv. rùbens, Wall. cat. no. 1421. Conv. bífidus, Ham. herb. Conv. Gualpàra, Ham. herb. Leaves 2-3 inches long, and nearly as broad at the base. Umbels 5-8-flowered. Corolla campanulately tubular, 15 lines long, red, glabrous.

Var. β, lanàta (Choisy, l. c.) leaves roundish-cordate, short-acuminated, clothed with woolly tomentum on both surfaces, but especially beneath; stem villous. ♃. ◠. S. Conv. glandulòsus, Ham. ex Wall. cat. no. 2252.

Reddish-flowered Ipomœa. Pl. tw.

92 I. sepia'ria (Konig. mss. ex Wall. fl. ind. 2. p. 90.) stem alternately glabrous and villous from loose hairs; leaves cordate-oblong; peduncles many-flowered; sepals oblong-ovate, acute, or obtuse; corolla showy, tubularly funnel-shaped. ♃. ? ◠. S. Native of the East Indies, everywhere; Timor, China, and Java. Ip. striàta, Pers. ench. 1. p. 183. Roth. nov. spec. p. 111. Conv. máximus, Vahl, symb. 3. p. 26. Lin. suppl. p. 137. Wall. fl. ind. 2. p. 49.? Conv. marginàtus, Desr. in Lam. dict. 3. p. 558. Conv. striàtus, Vahl. symb. 3. p. 28. Conv. hastàtus, Heyne, herb. Conv. incrassàtus, Wall. cat. no. 1386. 1. and 2. Tiru-tali, Rheed. mal. 11. p. 109. t. 53.—This species differs from the preceding in the peduncles being always many-flowered, and in the corolla being longer. Corollas large, of a beautiful rose-colour; white, with a brown bottom, ex Vahl.

Var. β, sagittàta (Choisy, l. c. p. 465.) leaves sagittate, also somewhat 3-lobed. ♃. ◠. S. Native of the East Indies. Ipomœ'a sphérica, Roxb.

Hedge Ipomœa. Fl. May, June. Clt. 1817. Pl. tw.

93 I. Cumane'nsis; plant clothed with rusty tomentum; leaves ovate, cordate, acuminated; peduncles few-flowered, about equal in length to the leaves: the 3 outer sepals large, ovate, acute: the 2 inner lanceolate-oblong, acuminated. ♃. ◠. S. Native of America, in the province of Cumana, in shady places of Laguna, Chica, and Golfo de Cariaco. Conv. Cumanénsis, H. B. et Kunth, nov. gen. amer. 3. p. 99. Stems terete. Leaves 1½ inch long and 1 broad. Peduncles 3-4-flowered. Corolla campanulately funnel-shaped, blue, glabrous. Nearly allied to *Conv. nodiflòrus*, Lam.

Cumana Ipomœa. Shrub tw.

94 I. cane'scens; plant clothed with canescent tomentum; leaves ovate, cordate, acuminated; peduncles many-flowered, about equal in length to the leaves; sepals downy: 3 outer ones large, ovate, acuminated: the 2 inner ones lanceolate, acuminately subulate. ♄. ◠. S. Native of America, between Carthagena and Mount La Papa, in hot sandy places. Conv. canéscens, H. B. et Kunth, nov. gen. 3. p. 99. Leaves 1 inch long and 8-9 lines broad, clothed with hoary tomentum beneath. Flowers nearly sessile, in capitate heads. Corolla campanulate, 5-plicate, longer than the calyx, pale blue.—This and *I. Cumanénsis* might form a distinct genus, from the form of the calyx, according to Kunth, l. c. This and the following species ought probably to have been placed under § 2. p. 269. from their capitate or umbellate inflorescence.

Canescent Ipomœa. Shrub tw.

95 I. sagíttifer; plant smoothish; leaves oblong-lanceolate, acuminated, deeply cordate-sagittate at the base, glabrous, except on the veins beneath, which are downy: hind lobes roundish, diverging; umbels pedunculate, one half shorter than the leaves; sepals glabrous, roundish, nearly equal. ♃. ◠. S. Native of Cuba, near Havannah, in moist places. Conv. sagíttifer, H. B. et Kunth, nov. gen. amer. 3. p. 100. Conv. Caracasànus, Schlecht, in Rœm. et Schultes, syst. 4. p. 301. Conv. Havanénsis, Willd. herb. Leaves 3 inches long. Umbels 6-7-flowered. Corolla yellow, ex Bonpl. glabrous. Capsule glabrous.

Arrow-bearing Ipomœa. Pl. tw.

96 I. Bogote'nsis; stem branched, angular, clothed with canescent villi and retrograde hairs; leaves ovate, deeply cordate, acuminated, beset with silky strigæ above, and hoary tomentum beneath; peduncles many-flowered, shorter than the leaves; sepals silky, hispid, oblong-lanceolate, subulately-acuminated, nearly equal. ♄. ? ◠. S. Native of New Granada, on high plains, near Santa Fe de Bogota, at the altitude of 1370 hexapods. Conv. Bogoténsis, H. B. et Kunth, nov. gen. 3. p. 104. Leaves 2 inches long; hind lobes approximate. Peduncles and pedicels villous. Corolla purple, downy outside, towards the apex, twice longer than the calyx.—Perhaps a species of *Pharbìtis*. Capsule glabrous.

Bogota Ipomœa. Shrub tw.

97 I. abutiloìdes; branches terete, hoary from down; leaves roundish-ovate, cordate, acuminated, glabrous above, but clothed with hoary tomentum beneath; corymbs axillary, trichotomous, longer than the leaves; sepals oblong, obtuse, smoothish. ♄. ◠. S. Native of Quito, near Guayaquil, on the shores of the Pacific. Conv. abutiloìdes, H. B. et Kunth, nov. gen. amer. 3. p. 106. Leaves 3 inches long; hind lobes diverging. Petioles biglandular at apex. Peduncles and pedicels downy. Corolla funnel-shaped, violaceous, size of those of *Calystègia sèpium*, downy outside; lobes of limb emarginate. Capsule 1-celled, 1-seeded, crowned by the base of the style, and girded by the calyx.

Abutilon-like Ipomœa. Shrub tw.

98 I. ca'rnea (Jacq. amer. p. 26. t. 18. pict. t. 25.) leaves roundish-cordate, glabrous; peduncles many-flowered; corollas emarginate; sepals small, roundish. ♃. ◠. S. Native of America, near Carthagena, where it is called *Campanilla*. Willd. spec. 1. p. 883. Conv. cárneus, Spreng. syst. 1. p. 602. All parts of plant glabrous. Leaves obtuse, mucronate, or acuminated. Peduncles subracemose. Corolla pale red, 3 inches long. Capsule tetragonal, 4-celled. Seeds black.

Flesh-coloured-flowered Ipomœa. Pl. tw.

99 I. viola'cea (Lin. spec. 1. p. 229.) leaves cordate; flowers crowded: corolla undivided. ⊙. ◠. S. Native of South America. Conv. violàceus, Spreng. syst. 1. p. 599. Quamoclit foliis amplissimis cordiformibus, Plum. spec. 3. icon. 93. f. 1.—Sloan. jam. p. 55. hist. 1. p. 155. t. 98. f. 1. Flowers large, purple. Conv. I'ndicus, Mill. dict. no. 5.?

Violaceous-flowered Ipomœa. Fl. Aug. Sept. Clt. 1792. Pl. tw.

100 I. corymbòsa (Roth. nov. spec. p. 220.) leaves cordate; peduncles umbellate; stem creeping. ♃. ⌒. S. Native of tropical America, Lin.; St. Domingo, and the East Indies, Heyne. Conv. corymbòsus, Lin. spec. p. 225. Desr. in Lam. dict. 2. p. 555.—Plum. ed. Burm. t. 89. f. 2. mss. vol. 2. t. 50. Leaves like those of *Calystègia sèpium*, 2-3 inches long, thin. Corolla white, spreading; star of limb of 5 white rays. Capsule turbinate, 1-celled, 2-3-seeded. Seeds roundish, brown.

Var. β; petioles stipulate at the base. ♃. ⌒. S. Native of Cayenne, Bonpl.

Corymbose-flowered Ipomœa. Fl. Aug. Sept. Clt. 1823. Pl. creeping.

101 I. amœ'na (Blum. bijdr. p. 718.) leaves roundish-cordate, acuminated, quite entire, very soft on both surfaces; peduncles elongated, cymosely many-flowered; sepals lanceolate, acuminated, spreading: outer ones the largest. ♃.? ⌒. S. Native of the Moluccas. Corolla purple.

Pleasant Ipomœa. Fl. Nov. Pl. tw.

102 I. multiflo'ra (Rœm. et Schultes, syst. 4. p. 234.) leaves cordate, glabrous; peduncles many-flowered; seeds rusty, villous. ⊙. ♃. ⌒. S. Native of Jamaica. Conv. multiflòrus, Mill. dict. no. 15.—Plukn. phyt. t. 167. f. 1. Stems slender. Flowers racemose, on long peduncles. Corolla purple. Capsule trigonal, 3-celled; cells 1-seeded.—Perhaps a species of *Batàtas*.

Many-flowered Ipomœa. Fl. June, July. Clt.? Pl. tw.

103 I. tri'color (Cav. icon. 3. p. 5. t. 208) glabrous; leaves cordate, acuminated; flowers axillary, subumbellate; peduncles thicker than the stem; calyx fleshy, pentagonal; sepals keeled. ⊙. ⌒. S. Native country unknown. Conv. venústus, Spreng. syst. 1. p. 600. Calyx of a dark violet colour. Corolla with a 5-lobed, crenulated blue limb and a whitish tube, having the inside angles spotted with red.

Three-coloured-flowered Ipomœa. Pl. tw.

104 I. Osyre'nsis (Roth. nov. spec. p. 220. Rœm. et Schultes, syst. 4. p. 239.) shrubby; leaves cordate-ovate, obtuse, undivided, glabrous above, but clothed with dense, silky tomentum beneath; flowers subcapitate, almost sessile, mixed with oblong-lanceolate bracteas; corolla oblong-campanulate, strigose outside; stem tomentose. ♃.? ⌒.? S. Native of the East Indies, in Osyre, where it is called *Mala-Erikaliga*. Conv. Osyrénsis, Heyne. Stigma capitate, didymous, tubercled.

Osyre Ipomœa. Shrub twining.

105 I. racemòsa (Poir. suppl. 4. p. 634.) stem terete, grey, downy; leaves ovate-cordate, obtuse, coriaceous, downy beneath; flowers racemosely panicled; peduncles hispid; bracteas downy, concave, lanceolate, involving the calyx and exceeding it; sepals lanceolate, acuminated, glabrous. ♄. ⌒. S. Native of St. Domingo. Conv. racemòsus, Spreng. syst. 1. p. 600. Leaves 2 inches long, clothed with white silky down beneath. Peduncles beset with numerous short hairs. Corolla white, with a thick cylindrical tube, twice as long as the bracteas; limb short of 5 acute lobes.

Racemose-flowered Ipomœa. Shrub tw.

106 I. ferrugínea (Rœm. et Schultes, syst. 4. p. 240.) plant clothed with rusty tomentum; stem terete; leaves ovate-cordate, acute; peduncles axillary, 4-flowered; sepals unequal: the 3 outer cordate, acuminated, and the 2 inner shorter and lanceolate. ♄. ⌒. S. Native of South America. Conv. ferrugíneus, Vahl, eclog. 1. p. 17. Willd. spec. 1. p. 858. Petioles length of leaves. Leaves linear above. Peduncles length of petioles. Corolla unquicular, blue. Stigma thickened, ex Vahl.

Rusty Ipomœa. Shrub tw.

107 I. heterophy'lla; twining, rather downy; leaves hastately 3-lobed: lobes acute, entire; peduncles many-flowered; sepals equal, oblong, acute. ♃. ⌒. S. Native of Guinea. Conv. diversifòlius, Schum. pl. guin. p. 94. but not of Choisy. Stems filiform, hairy. Leaves glaucous, as well as downy beneath. Peduncles naked, usually 7-flowered. Corolla campanulately funnel-shaped, size of *C. sepium*, white, with a violaceous throat; limb obsoletely 5-lobed. Seeds tomentose.

Various-leaved Ipomœa. Pl. tw.

108 I. ventricòsa (Bert. in Coll. hort. rip. p. 37. under *Convólvulus*) glabrous; leaves broad-cordate, acuminated, quite entire, glabrous; peduncles generally 4-flowered, bracteate; calyxes acute, coriaceous, ventricose. ⊙. ⌒. S. Native of Guadaloupe, in gardens; but originally introduced from the Island of St. Bartholomew. Corolla large, white, funnel-shaped, glabrous.

Ventricose-calyxed Ipomœa. Pl. twining.

109 I. Hooke'ri; glabrous; leaves on long petioles, deeply cordate, acuminated; peduncles 3-4-flowered, thickened, and somewhat racemose; sepals small, erect, adpressed, linear-subulate, margined with white; corolla large, funnel-shaped, with a very short tube, and a 5-angled limb; having the angles mucronate. ♄. ⌒. S. Native of Mexico, in the province of Guanaxuato. Ipomœ'a rùbro-cœrùlea, Hook. bot. mag. t. 3297. Corolla white in the bud, with the limb of a rich lake-red, which when the flower is fully expanded, becomes of a fine purplish blue. Filaments hairy. Stigma capitate, 2-lobed. This is probably a species of *Rìvea*.

Hooker's Ipomœa. Fl. July, Aug. Clt. 1830. Shrub tw.

* * * *Peduncles generally 3-flowered.*

110 I. obscu'ra (Ker. bot. reg. t. 239. Rœm. et Schultes, syst. 4. p. 236.) stem herbaceous, interruptedly glabrous, and villous from hairs; leaves cordate, acuminated, glabrous; peduncles exceeding the petioles, 1-3-flowered; pedicels thickened, bracteate; sepals oblong-ovate, sometimes obtuse, sometimes acuminated. ⊙. ⌒. S. Native of the East Indies, everywhere. Ip. solanifòlia, Burm. ind. p. 49. Ip. insuàvis, Blum. bijdr. p. 716. Conv. obscùrus, Lin. spec. p. 220. Burm. ind. 44. Wall. fl. ind. 2. p. 52. Conv. geméllus, Vahl, symb. 3. p. 27.—Dill. elth. 98. t. 83. f. 95. Conv. trigònus, Ham. herb. Ip. gemella, Roth. nov. spec. 240. Bracteas lanceolate, acute, glabrous; calyx glabrous. Corolla campanulate, glabrous, 3-4 times longer than the calyx, yellow, with a purple throat; lobes emarginate. Seeds downy.

Var. β, *glàbra* (Choisy, l. c. p. 464.) stem glabrous; pedicels equal; seeds sometimes clothed with grey down, and sometimes glabrous. ⊙. ⌒. S.

Obscure Ipomœa. Fl. June, Aug. Clt. 1732. Pl. tw.

111 I. tria'ntha (Rœm. et Schultes, syst. 4. p. 243.) glabrous; leaves cordate-lanceolate, attenuated, glabrous, obtuse; peduncles 3-flowered, shorter than the leaves; sepals obtuse. ⊙.? ⌒. S. Native of the East Indies. Conv. triflòrus, Vahl, symb. 3. p. 30. Leaves 2 inches long, rounded and mucronate at apex; hind lobes obtuse, very rarely angular. Pedicels bractless, angular. Corolla 3 times longer than the calyx; lobes pilose at apex.

Three-flowered Ipomœa. Pl. tw.

112 I. triflòra (Forsk. egypt. p. 44.) glabrous; leaves cordate, acuminated, glabrous; peduncles axillary, 3-flowered. ⊙. ⌒. S. Native of Arabia, in Hadje. Gmel. syst. p. 343. Vittm. summ. 1. p. 440. Corolla pale yellow; limb undivided, an inch in diameter.

Three-flowered Ipomœa. Pl. tw.

113 I. Weinma'nni (Rœm. et Schultes, syst. 4. p. 245.)

pilose; leaves cordate, acute; peduncles axillary, usually 3-flowered, shorter than the leaves. ⊙. ⌒. S. Native of Bengal. I. Schultèsii, Weinm. in litt. Leaves ciliated. Sepals equal, 3 outer ones sagittately cordate, the 2 inner ones linear. Corolla small, white; segments ovate, acute. Capsule 3, rarely 4-seeded. Seeds clothed with brown hairs.

Weinmann's Ipomœa. Pl. tw.

114 I. glaucéscens; glabrous; leaves ovate, cordately hastate, glabrous, glaucescent beneath, having the hind lobes diverging; peduncles axillary, 2-3-flowered, shorter than the leaves; sepals oblong, obtuse, mucronulate under the apex, wrinkled, glabrous, nearly equal. ⊙. ⌒. S. Native of Quito, near Chilo, at the altitude of 1350 hexapods. Conv. glaucéscens, H. B. et Kunth, nov. gen. 3. p. 101. Stem angular. Leaves 2 inches long. Corolla funnel-shaped, glabrous, of a violaceous purple colour, size of those of *Conv. arvénsis*.

Glaucescent Ipomœa. Pl. tw.

115 I. Meyèri; leaves cordate, acuminated, smoothish; peduncles very short, 2-flowered; sepals linear-lanceolate, cuspidate, parted to the base, hairy. ↄ.? ⌒. S. Native country unknown. Convólvulus Meyèri, Spreng. syst. 1. p. 597. Conv. cuspidàtus, Willd. herb.

Meyer's Ipomœa. Pl. tw.

116 I. trichocàlyx; leaves cordate, acutely acuminated, mucronate, smoothish, somewhat ciliated; stem, petioles, and peduncles hairy; peduncles short, 3-flowered; calyx hairy; sepals ovate-acute, or ovate-lanceolate, acuminated.—Native of Guinea. Conv. trichocàlyx, Schum. pl. guin. p. 91. Stems herbaceous, hairy or glabrous. Lateral pedicels bracteate: middle one naked. Corolla like that of *C. arvénsis*, cream-coloured, with a purple bottom. Capsule globose. Seeds clothed with black tomentum. Limb of corolla flat, with 5 small incisures.—Nearly allied to *I. gemélla*.

Hairy-calyxed Ipomœa. Pl. tw.

117 I. eriocárpa (R. Br. l. c.) downy; leaves cordate, lanceolate, acuminated, entire; peduncles 2-3-flowered, very short; sepals acuminated, and are, as well as the capsules, pilose. ↄ.? ⌒. S. Native of New Holland, within the tropic, on the sea shore. Conv. eriocárpus, Spreng. syst. 1. p. 598.

Woolly-fruited Ipomœa. Pl. tw.

118 I. parasítica; stem muricated with prickles; leaves roundish, deeply cordate, acuminated, downy on the veins on both surfaces, ciliated; peduncles 3-flowered, shorter than the leaves; sepals ovate-oblong, mucronate, smoothish, nearly equal. ↄ. ⌒. S. Native near Caraccas. Conv. parasíticus, H. B. et Kunth, nov. gen. amer. 3. p. 103. Conv. circinnàtus, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 302. Stems angular, beset with retrograde hairs and deciduous prickles. Leaves 2 inches long: hind lobes approximate. Peduncles and pedicels downy. Corolla funnel-shaped, much longer than the calyx, blue, covered with adpressed down towards the base. Seeds angular. Capsule glabrous. Perhaps a species of *Pharbìtis*.

Parasitical Ipomœa. Pl. tw.

119 I. supérba; stem angular, beset with retrograde strigæ; leaves roundish-ovate, deeply cordate, acuminated, beset with strigose hairs beneath, ciliated; peduncles usually 3-flowered, twice as long as the leaves; sepals oblong, acutish, hispid, nearly equal. ↄ. ⌒. S. Native of New Spain, betwixt Aguasarca and the burning mount Jorullo, at the altitude of 550 hexapods. Conv. supérbus, H. B. et Kunth, nov. gen. amer. 3. p. 103. Conv. sanguíneus, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 302. Leaves 2 inches long, beset with adpressed scattered hairs above; hind lobes approximate. Peduncles and pedicels beset with retrograde bristles. Corollas funnel-shaped, purple, downy outside, 3 lines longer than those of *I. purpùrea*. Perhaps a species of *Pharbìtis*.

Superb Ipomœa. Pl. tw.

120 I. móllis; stems compressed, roughish; leaves roundish-ovate, cordate, acuminated, strigose above, and clothed with soft down beneath; peduncles 3-flowered, shorter than the leaves; sepals rather downy, oblong-lanceolate, subulately acuminated, nearly equal. ↄ. ⌒. S. Native of New Andalusia, near Cumanacoa. Conv. móllis, H. B. et Kunth, nov. gen. amer. 3. p. 104. Conv. cynanchifòlius, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 301. Leaves hardly 3 inches long; hind lobes diverging. Peduncles and pedicels rather downy. Corolla violaceous, downy outside. Perhaps a species of *Pharbìtis*.

Soft Ipomœa. Shrub tw.

121 I. petiolàris; stem angularly furrowed, muricated with prickles; leaves roundish-ovate, deeply cordate, acuminated, glabrous, on long petioles; peduncles 3-flowered, shorter than the leaves; sepals oblong, subulately-acuminated, glabrous, nearly equal. ↄ. ⌒. S. Native of Mexico, on the burning mount Jorullo, near the volcano, at the altitude of 600 hexapods. Conv. petiolàris, H. B. et Kunth, nov. gen. amer. 3. p. 105. Plant glabrous. Leaves 4 inches long; hind lobes approximate. Petioles 5 inches long. Corolla funnel-shaped, violaceous, glabrous.

Long-petioled Ipomœa. Pl. tw.

122 I. lilácina (Blum. bijdr. p. 716.) leaves cordate, acuminated, with a mucrone, downy above, soft beneath; peduncles 2-3-flowered, about equal in length to the petioles; sepals acute, downy. ↄ. ⌒. S. Native of Java, about Batavia, in grassy bogs. Flowers lilac. Said to be allied to *I. gemélla*, Roth.

Lilac-flowered Ipomœa. Fl. Year. Pl. tw.

123 I. Batatílla: branches terete, clothed with hoary tomentum; leaves ovate, obsoletely cordate, acuminated, downy above, but clothed with hoary tomentum beneath; peduncles terminal? and axillary, usually 3-flowered, shorter than the leaves; sepals roundish obtuse, downy: the 3 outer ones rather the smallest; seeds comose. ♄. ⌒. S. Native near Cumana, Caraccas, and in the valleys of Aragua, where it is called by the natives *Batatílla*.— Conv. Batatílla, H. B. et Kunth, nov. gen. amer. 3. p. 106. Leaves 2 inches long. Petioles biglandular at apex. Corollas funnel-shaped, downy outside, of a violaceous rose-colour; lobes of limb emarginate. Capsule glabrous, 4-celled? 4-valved? Cells 1-seeded. Seeds size of the nuts of *Córnus máscula*, black, trigonal.

Batatilla Ipomœa. Shrub tw. 6 feet high.

124 I. verticillàta (Forsk. descr. p. 44.) decumbent, hairy; leaves cordate, bluntish, with a short mucrone, the veins beset with a few hairs above in the young state; peduncles axillary, tern, from all the axils, reflexed, 1-flowered, angular; sepals ovate, acute, hispid, glabrous in the old state, but ciliated. ↄ. ⌒. S. Native of Arabia Felix. Vahl, symb. 3. p. 33. Willd. spec. 1. p. 883. Convólvulus Forskœ'lii, Spreng. syst. 1. p. 596. Peduncles bracteate. Capsule size of a pea, glabrous. Seeds clothed with silky tomentum.

Whorled-flowered Ipomœa. Pl. decumbent.

§ 4. *Leaves cordate at the base, often 3-lobed, with toothed or repand edges; sometimes varying in the same plant, with entire, angular, or toothed edges. Flowers not crowded into heads. Capsules and sepals middle-sized.*

125 I. acutángula (Ruiz. et Pav. fl. per. 2. p. 11. t. 119. f. b.) leaves sagittately triangular, having the angles toothed behind; peduncles 3-5-flowered, length of leaves; stems terete. ⊙. ⌒. S. Native of Peru, in the woods of Chincao and Pozuzo. Leaves on long petioles. Bracteas subulate at the divisions of the peduncle. Corolla funnel-shaped, scarlet; limb middle-sized, with a lobed margin. Perhaps a species of *Quámoclit*.

Acute angled-leaved Ipomœa. Pl. tw.

126 I. Herma'nniæ; leaves oblong, acute, sagittately cordate, sinuately repand towards the base, clothed with silky tomentum on both surfaces, hoary; peduncles axillary, 2-flowered, longer than the leaves; sepals ovate, acuminated, downy, nearly equal. ♃. ⌒. S. Native near Truxillo, on the shores of the Pacific. Conv. Hermánniæ, Lher. stirp. nov. fasc. 4. p. 67. t. 33. Ruiz. et Pav. fl. per. 2. p. 10. H. B. et Kunth, nov. gen. 3. p. 98. Willd. spec. 1. p. 862.

Hermann's Ipomœa. Pl. tw.

127 I. stipula'cea (Sweet, hort. brit. p. 289. Choisy, in mem. soc. phys. gen. 6. p. 466.) smooth; leaves cordate-sagittate; auricles usually repand, glabrous; petioles bistipulate at the base; peduncles 3-6-flowered, equal in length to the petioles; sepals ovate, equal, concave. ♃. ⌒. S. Native of Chittagong. Conv. stipulàceus, Wall. fl. ind. 2. p. 71. Stems terete, creeping at base, and twining at apex. Leaves 2-3 inches long. Stipulas recurved, acute. Peduncles and pedicels clavate. Corollas showy, white, with obcordate lobes. Capsule globose. Seeds clothed with olive-coloured wool.

Stipulaceous Ipomœa. Fl. Aug. Sept. Clt. 1805. Pl. tw.

128 I. pulche'lla; glabrous; leaves ovate-oblong, much acuminated, hastately cordate, angularly toothed at the base; peduncles axillary, 1-flowered, longer than the leaves; sepals oblong, obtuse, glabrous, nearly equal. ⊙. ⌒. S. Native of Peru. Conv. pulchéllus, H. B. et Kunth, nov. gen 3. p. 101. Conv. pauciflòrus, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 302. Stems rather angular. Hind lobes of leaves diverging. Corolla funnel-shaped, glabrous, purple, size of those of *Conv. arvénsis.* Capsule globose, glabrous.

Neat Ipomœa. Pl. tw.

129 I. suffu'lta; hairy; leaves roundish-ovate, acuminated, deeply cordate, angularly toothed; peduncles 1-flowered, propped each by a cordate bractea or leaf; sepals oblong, acutely acuminated, glabrous: outer ones rather the smallest. ♃. ⌒. G. Native of Mexico, on the burning mount Jorullo, at the altitude of 580 hexapods. Conv. suffúltus, H. B. et Kunth, nov. gen. 3. p. 103. Peduncles distant, solitary, on the axils of the upper leaves or bracteas. Corolla funnel-shaped, size of those of *Calystègia sèpium*, glabrous, purple. Stigmas granular.

Propped Ipomœa. Pl. tw.

130 I. fastigia'ta (Sweet, hort. brit. p. 288.) glabrous; leaves cordate, acuminated and mucronulate, entire, sinuated, fiddle-shaped, or 3-lobed; peduncles exceeding the petioles, 3-12-flowered, cymose; sepals lanceolate, mucronately awned; outer ones the shortest. ♃. ⌒. S. Native of the West India Islands, Guiana, and Bengal. I. platanifòlia, Rœm. et Schultes, syst. 4. p. 220, exclusive of the syn. of Plukn. Ip. cymòsa, Meyer, ess. p. 99, but not of Roth. Conv. fastigiàtus, Wall. fl. ind. 2. p. 48. Conv. platanifòlius, Vahl, symb. 3. p. 26. Conv. Essequibénsis, Spreng. syst. 1. p. 600.—Feuill. per. 3. p. 16. t. 1. Stems terete. Stolons long, creeping along the earth. Leaves 2-3 inches long. Corolla showy, purple, glabrous. Capsule smooth. Seeds glabrous. Leaves, like the young branches, often tinged with purple, particularly the margins, veins, and nerves.

Var. β; stem angular; peduncles elongated, few or many-flowered; sepals short, or long-awned; also the leaves and veins are downy.

Fastigiate Ipomœa. Fl. Ju. Aug. Clt. 1816. Pl. tw.

131 I. denticula'ta (Choisy, in. mem. soc. phys. 6. p. 467.) glabrous; leaves cordately hastate, quite glabrous: auricles obtuse, and laterally unidentate; peduncles 1-flowered, shorter than the petioles; sepals ovate, obtuse, sometimes mucronulate. ♃. ⌒. S. Native of the island of Rawak, and the Society Islands, &c. Conv. denticulàtus, Desr. in Lam. dict. 3. p. 540. Conv. lævigàtus, R. Br. herb. Stems terete. Leaves obtuse, mucronulate, 1-2 inches long. Corolla 1¼ inch long, glabrous, with a hardly spreading limb. This species varies with many-flowered peduncles, and in the auricles being rounded.

Denticulated-leaved Ipomœa. Pl. tw.

132 I. pudibu'nda; glabrous; leaves cordate, entire, and 3-lobed, acuminated; peduncles many-flowered, shorter than the petioles; sepals ovate, acute, somewhat foliaceous; limb of corolla 5-lobed. ⊙. ⌒. S. Native of St. Vincent. Convólvulus pudibúndus, Lindl. in bot. reg. t. 999. Corolla of a fine rose-colour; tube subcylindrical, inflated.

Blush Ipomœa. Fl. Aug. Sept. Clt. 1822. Pl. tw.

133 I. Montevide'nsis; leaves hastate, lanceolate, smoothish; auricles divaricate, emarginately angular; peduncles 2-flowered, exceeding the petioles; sepals scarious. ♃. ? ⌒. S. Native of Monte Video. Convólvulus Montevidénsis, Spreng. syst. 1. p. 604.

Monte-Video Ipomœa. Pl. tw.

134 I. Deppea'na; downy; leaves sagittate at the base, sinuately toothed on the margins, mucronate; peduncles 1-flowered, twice as long as the leaves, bibracteate near the apex; bracteas linear, obtuse; sepals unequal, obtuse. ♃. ? ⌒. S. Native of Mexico. Conv. sinuàtus, N. E. in herb. Lamb. Flowers large, purple.

Deppe's leaved Ipomœa. Pl. twining.

135 I. Marianne'nsis (Choisy, l. c. p. 468.) glabrous; leaves cordate, acuminated, sometimes entire, sometimes 3-lobed and trifid: intermediate lobe dilated at the base; peduncles 3-4-flowered, exceeding the petioles; sepals lanceolate, very acute, ciliately hairy. ♃. ⌒. S. Native of the Marianne Islands. Auricles of leaves entire or lobed. Corolla tubular, hardly 3 times longer than the calyx, glabrous. Capsule pilose. Root tuberous. Nearly allied to *I. tríloba.*

Marianne Island Ipomœa. Pl. tw.

136 I. pilòsa (Sweet, hort. brit. p. 289. Choisy, l. c.) hairy; leaves broadly cordate, entire, or a little 3-lobed, clothed with white wool beneath; peduncles exceeding the petioles, cymosely many-flowered; sepals linear, hairy. ⊙. ⌒. S. Native of Mysore, Bengal, at Patturghata. Conv. pilòsus, Wall. fl. ind. 2. p. 55. Rottl. in act. n. c. berol. 4. p. 196. Conv. álbicans, Wall. no. 1401. Stems terete. Bracteas oblong-lanceolate. Corolla tubular, hardly twice as long as the calyx, glabrous, rose-coloured, or pink, expanding an inch. Capsule globose glabrous. Seeds villous on the angles.

Pilose Ipomœa. Fl. July, Oct. Clt. 1815. Pl. tw.

137 I. Aitònii (Hort. ex Lindl. bot. reg 1794.) villous; leaves cordate-roundish, 3-lobed: lobes acute; peduncles many-flowered, longer than the petioles, having the bracteas and sepals diverging and acuminated; corolla campanulate, with a thickened tube; stamens glandular at the base. ♃. ⌒. S. Native country unknown. Flowers densely aggregate. Bracteas length of sepals; sepals longer than the tube of the corolla Corolla middle-sized, violaceous: lobes acute.

Aiton's Ipomœa. Fl. April. Oct. Clt.? Pl. tw.

138 I. geme'lla (Roth, nov. spec. p. 110. Choisy, l. c. p. 469.) plant clothed with grey down; leaves cordate, acuminated, entire, or somewhat 3-lobed, clothed with grey villi beneath; peduncles much exceeding the petioles, loose, generally 2-flowered sometimes dichotomously many-flowered; sepals coriaceous obtuse, with sub-lacerated edges; corolla striated. ⊙. ⌒. S. Native of Tranquebar, Java, Manilla, banks of the Irawaddi, &c. Conv. geméllus, Burm. ind. 46. t. 21. f. 1. Conv. affìnis, Wall. cat. no. 1385. Conv. subangulàris, Ham. herb. Stem terete, villous, or smoothish. Leaves 1⅓ inch long, and 1¼ broad, glabrous, green on the upper surface, except the middle nerve. Corolla twice longer than the calyx, marked with converging black stripes; lobes acute, spreading.

Twin-flowered Ipomœa. Pl. tw.

139 I. chrysèides (Ker. bot. reg. t. 270.) stem twisted; leaves oblong-cordate, subhastate, entire, or often angular, also 3-lobed, acuminated, glabrous; peduncles stiff, exceeding the petioles, 2-7-flowered; sepals coriaceous, rayed with green, ovate retuse, mucronulate; corolla small, yellow. ↿. ⌒. S. Native of the East Indies, as of Silhet, banks of the Irawaddi, Soaddi, Goalpara, Segaen, Coromandel, Bengal; China, and Timor. Ip. dentàta, Willd. herb. ex Rœm. et Schultes, syst. 4. p. 789. ex Klein. Conv. chryseìdes, Spreng. syst. 1. p. 598. Conv. dentàtus, Vahl, symb. 3. p. 25. Wall. fl. ind. 2. p. 62. cat. no. 1349. Conv. lutèolus, Wight. herb. Conv. flàvus, Ham. herb. Stem terete and striated, glabrous, downy at the insertion of the leaves. Leaves 12-24 lines long; lateral lobes dentately serrated. Petioles warted. Capsule 4-angled, glabrous. Seeds red, downy, under a lens.

Var. β; stem villous; hairs straight, much crowded at the base of the petioles, as well as on the middle nerves of the leaves.

Golden-flowered Ipomœa. Fl. Ju. Oct. Clt. 1817. Pl. tw.

140 I. Wíghtii (Choisy, in mem. soc. phys. gen. 6. p. 470.) villous; leaves cordate, acuminated: lower ones oblong, with sinuately toothed edges; younger ones 3-lobed; all woolly and rusty above, and clothed with white tomentum beneath; peduncles exceeding the petioles, 2-5-flowered; sepals oblong-linear, awned, very acute, hairy. ↿. ⌒. S. Native of the Nellighery mountains. Conv. Wíghtii, Wall. pl. rar. asiat. 2. p. 55. t. 171. Conv. gossypìnus, Wall. cat. no. 1407. Conv. lanuginòsus, Heyne, herb. Stem terete, beset with retrograde hairs, as well as the petioles. Leaves 1-3 inches long, and 1-2 broad. Bracteas like the sepals, but larger. Corolla campanulate, rose-coloured, glabrous. Capsule downy. Seeds glabrous. Nearly allied to *Ip. tricolor,* Desr.

Wight's Ipomœa. Pl. tw.

141 I. sagitta'ta (Poir. dict. 4. p. 17.) glabrous; leaves cordately sagittate; peduncles 1-flowered, shorter than the leaves, rarely 2-flowered; sepals linear-elliptic, obtuse. ↿. ⌒. S. Native on the banks of lakes, about the Calle, and the bastions of France, in Barbary, ex Poiret; abundant about Castellon, in Valentia, in humid places, ex Cav. Poir, voy. in barb. 2. p. 122. edit. germ. 2. p. 160. t. 3. Lam. ill. t. 104. f. 2. Cav. icon. 2. p. 4. t. 107. descr. p. 98. Desf. fl. atl. 1. p. 177. Conv. Whelèri, Vahl, symb. 2. p. 36. Willd. spec. 1. p. 845, exclusive of the syn. of Plukn. alm. p. 113. t. 85. f. 3. Conv. Valentìnus, Hort.—Tourn. inst. p. 82. Lower leaves cordate, 3 inches long, and 1 inch broad. Corolla large, of a reddish purple colour. Capsule globose. Seeds brown, angular.

Sagittate-leaved Ipomœa. Pl. tw.

142 I. lacunòsa (Lin. spec. ed. 3d. 228.) glabrous; leaves cordate, acuminated, angular at the base: lower ones obscurely repand; peduncles short, generally 1-flowered; calyx pilose; sepals lanceolate, acute, ciliated; corolla tubular, short. ↿. ⌒. H. Native of Virginia, Carolina, and Florida; rather abundant on the banks of the Arkansas, ex Nutt. in amer. phil. trans. n. s. 5. p. 195. Michx. fl. bor. amer. 1. p. 140. Pursh, fl. amer. 1. p. 145. Conv. lacunòsus, Spreng. syst. 1. p. 597.—Dill. elth. p. 103. t. 87. f. 102. Nearly allied to *Ip. coccínea;* but the peduncles are 1 or 2-flowered; the corollas with a thicker white tube; and purplish rim, not scarlet, ex Lin., and in the Arkansas plant white, ex Nutt., short, and somewhat campanulate. Nearly allied to *I. tríloba,* ex Michx. Lobes of corolla, which is tubular, nearly straight, ending in small setaceous mucrones. Capsule globose, rather hairy.

Lacunose-leaved Ipomœa. Fl. July, Aug. Clt. 1640. Pl. twining.

143 I. aristolochiæfòlia; glabrous; leaves ovate, much acuminated, having the hind lobes dentately angular and diverging; peduncles 3-flowered, shorter than the leaves; sepals ovate-oblong, acute, glabrous, wrinkled at the base, nearly equal; capsules ovate-conical. ↿. ⌒. G. Native of Caraccas, and La Venta de la Cumbre, in rather cold places. Conv. aristolochiæfòlius, H. B. et Kunth, nov. gen. amer. 3. p. 102. Stem angularly striated, rather scabrous; branchlets downy. Leaves glabrous, but when young downy above, 2 inches long. Corolla funnel-shaped, glabrous, with a white tube, and a violaceous limb. Capsule glabrous.

Aristolochia-leaved Ipomœa. Pl. tw.

144 I. pandura'ta (Ker. bot. reg. 588.) downy; leaves broad-cordate, entire or lobed, panduriform; peduncles long; flowers in fascicles; sepals glabrous, mutic; corolla tubularly-campanulate. ↿. ⌒. H. Native from Canada to Carolina, in sandy fields, and among bushes. Convólvulus panduràtus, Michx. fl. bor. amer. 1. p. 138. Pursh, fl. 1. p. 144.—Dill. elth. t. 85. f. 99. Root thick, turnip-formed. Corollas white. There is a variety of this, with double flowers, cultivated in the gardens of America, which is a singular circumstance among Convolvulaceous plants. The roots grow to an enormous size, sometimes as thick as a man's thigh, and more than 2 feet long. Taken in place of jalap, it has the same effect, only in a less degree. A variety, with entire leaves, is very common on the banks of the Arkansas, ex Nutt.

Fiddle-shaped-leaved Ipomœa. Fl. Ju. Sept. Clt. 1732. Pl. tw.

145 I. setífera (Poir. ency. 6. p. 17.) branches villous; leaves cordately auriculate, glabrous; peduncles usually 2-flowered; sepals large, ovate-oblong, glabrous, ending each in a bristle. ⊙. ? ⌒. S. Native of Guiana. Conv. sétifer, Spreng. syst. 1. p. 597. Plant glabrous. Auricles of leaves rounded. Corolla large, campanulate, purplish or reddish.

Bristle-bearing Ipomœa. Pl. tw.

146 I. macrorhìza; downy; leaves cordate, entire or lobed, plicately wrinkled, rather tomentose beneath; peduncles 1-3-flowered; sepals oval, mutic; corolla campanulate, 5-lobed; seeds woolly; root very thick. ↿. ⌒. G. Native of Georgia and Florida, near the sea-shore. Ip. Jálapa, Pursh, fl. amer. sept. 1. p. 146. Ker. bot. reg. t. 342. Conv. macrorhìza, Michx. fl. amer. bor. 1. p. 141. Pers. ench. 1. p. 184. Poir. dict. 6. p. 17. I. Michaúxii, Sweet, hort. brit. p. 288. Flowers very large, white. This is the Jalap of North America.

Var. β, rùbra; stem tubercular; peduncles many-flowered; sepals ovate, obtuse, downy; filaments tomentose at the base; ♄. ⌒. S. Native of Mexico, about Vera Cruz, &c. Conv. Jálapa, Lam. ill. t. 104. f. 2. Pers. ench. 1. p. 179. Woodv. med. bot. p. 59, with a figure. Plenk, off. t. 94. Desf. ann. mus. 2. p. 126. t. 40-41. Sims, bot. mag. 1572. I. Jálapa, Sweet, hort. brit. p. 288. Conv. Jálapa, *β,* ròsea, Ker. bot. reg. t. 621. Root very large, white inside, milky, fleshy, form of a turnip. Stems villous at top. Corolla having the tube violaceous inside, and lilac or pale red outside: limb purple. Stigma depressed, 2-lobed.

Large-rooted Ipomœa. Fl. Aug. Oct. Clt. 1815. Pl. tw.

147 I. Owarie'nsis (Beauv. fl. d'ow. 2. p. 41. t. 82.) stems, peduncles, petioles, and calyxes, beset with stiff hairs; flowers axillary, umbellate; leaves cordate, toothed, sublobate, beset with stiff hairs; sepals ovate, acuminated. ↿. ⌒. S. Native of Guinea, about the town of Waree. Poir. suppl. 4. p. 634. Conv. Owariénsis, Spreng. syst. 1. p. 594. Leaves on long petioles: lobes roundish. Pedicels simple, 1-flowered, unequal, crowded together. Corolla small, campanulate, red; lobes short, obtuse.

Waree Ipomœa. Pl. twining.

148 I. catha'rtica (Poir. suppl. 3. p. 633.) glabrous; leaves cordate, 3-lobed, acuminated; peduncles generally 1-flowered;

tube of corolla sub-cylindrical, inflated.—Native of St. Domingo, in humid places. Conv. Africànus, Nicols, hist. nat. st. dom. p. 260. Stems twining, but sometimes rooting along the ground. Leaves large, on long petioles; lobes unequal. Corolla an inch long, pale green; limb large, 5-lobed, with 5 lanceolate rays beneath. Stamens unequal, shorter than the corolla.

Cathartic Ipomœa. Pl. tw.

149 I. fu'nis (Cham. et Schlecht. in Linnæa. 5. p. 118.) shrubby; smoothish; leaves variable, cordate, hastately cordate, ovate, and 3-lobed, with the sides angular, toothed and entire, finely acuminated, hairy beneath on the nerves and veins, and at the insertion of the petioles, with a few hairs above in the young state; cymes on very long peduncles, 2-3 times dichotomous, with elongated branches; sepals ovate-orbicular, obtuse, with a long weak dorsal mucrone. ♄. ◠. S. Native of Mexico, in woods, near Jalapa; also among bushes, near San Andres. Corolla somewhat salver-shaped, scarlet; tube an inch long; limb expanded, an inch and a half. Leaves 4 inches long. Cymes a foot or more long. Perhaps a species of *Quámoclit*.

Rope Ipomœa. Shrub tw.

150 I. puncta'ta (Macfadyen, in Hook. bot. misc. 2. p. 116.) stems roundish, hairy; leaves cordate, 3-lobed, acuminated, hairy; petioles hairy: hairs proceeding from purplish glands, as in the stems; peduncles twice as long as the leaves, 6-flowered, hairy; bracteas as long as the pedicels, linear-subulate, hairy; calyx hairy: the hairs proceeding from roundish glands; sepals linear-lanceolate; stigma papillose, somewhat 3-lobed. ⊙. ? ◠. S. Native of Jamaica.

Dotted Ipomœa. Pl. twining.

151 I. Portorice'nsis; leaves deeply cordate, somewhat 3-lobed, glabrous: lateral ones very short; peduncles usually 3-flowered, shorter than the leaves; sepals lanceolate; tube of corolla inflated. ↄ. ? ◠. S. Native of Porto Rico. Convólvulus Portoricénsis, Spreng. syst. 1. p. 595.

Porto Rico Ipomœa. Pl. twining.

152 I. Jamaice'nsis; leaves deeply cordate, 3-lobed, sinuated, villous beneath, canescent; peduncles 1-flowered, shorter than the leaves, and are, as well as the sepals, which are lanceolate, glabrous. ↄ. ? ◠. S. Native of Jamaica. Convólvulus Jamaicénsis, Spreng. syst. 1. p. 595.

Jamaica Ipomœa. Pl. twining.

153 I. Rudólphi (Rœm. et Schultes, syst. 4. p. 222.) leaves cordate and 3-lobed; peduncles 2-flowered; bracteas and bracteoles lanceolate; the 3 outer sepals the largest. ⊙. ? ◠. S. Native of St. Domingo. Ip. bracteàta, Ledeb. dec. pl. doming. no. 4, but not of Cav. nor Rœm. et Schultes.

Rudolphe's Ipomœa. Pl. tw.

154 I. muta'bilis (Ker, bot. reg. t. 39.) downy; leaves cordate, entire or 3-lobed, acuminated, beset with adpressed hairs above, roughish tomentose beneath; flowers numerous, cymosely aggregate on the tops of the peduncles; cymes generally aggregate; calyx close, villous, nearly equal, loose above. ♄. ◠. S. Native of South America. Conv. mutábilis, Spreng. syst. 1. p. 593. Root and stems purple. Corolla large blue; limb campanulate; lobes roundish, cleft at apex. Stamens bearded at the base. Stigma granulately globose. Perhaps a species of *Pharbìtis*. Nearly allied to *I. congésta*, R. Br. prod. 1. p. 485. which is probably *Conv. multiflòrus*, Banks, herb.

Changeable-flowered Ipomœa. Fl. May, Sept. Clt. 1812. Shrub tw.

155 I. bractea'ta (Rœm. et Schultes, syst. 4. p. 227.) stem a little hairy at top; leaves glabrous, cordate, nearly entire, and 3-lobed, hastate, attenuated; peduncles 1-flowered, length of petioles; outer sepals form of bracteas. ⊙. ◠. S. Native of the East Indies. Conv. bracteàtus, Vahl, symb. 3. p. 25. Willd. spec. 1. p. 850. Nearly allied to *I. platanifòlia*. Leaves 2 inches long, intermediate lobe lanceolate, attenuated, entire; lateral ones broader, rounded upwards, entire, or retusely somewhat lobed outside. Bracteas 2, opposite under the calyx, lanceolate, acute. Calyx downy. Corolla villous outside, silky; limb 5-lobed.

Bracteate-flowered Ipomœa. Pl. tw.

156 I. acumina'ta (Rœm. et Schultes, syst. 4. p. 228.) stem beset with a few adpressed hairs; leaves glabrous, cordate, entire and 3-lobed, acuminated; peduncles elongated, many-flowered, glabrous; sepals lanceolate, attenuated, glabrous: inner ones shorter. ⊙. ? ◠. S. Native of the Island of Santa Cruz. Conv. acuminàtus, Vahl, symb. 3. p. 26. Willd. spec. 1. p. 851. Leaves 4 inches long; lateral lobes lanceolate; intermediate one ovate, attenuated. Corollas large, campanulate, purple, with a pale bottom, and 5 lanceolate, excurrent, paler rays at the margins; stigma capitate.

Acuminated-leaved Ipomœa. Pl. tw.

157 I. trichoca'rpa (Ell. fl. car. 2. p. 260.) plant smoothish; leaves deeply 3-lobed or entire; peduncles usually 2-flowered; sepals oval-lanceolate, pilose; corollas short; capsule globose, hairy. ⊙. ◠. H. Native of Carolina, in hedges. Conv. Carolìnus, Michx. fl. amer. bor. 1. p. 139. Desr. in Lam. dict. 3. p. 563. Ip. commutàta, Rœm. et Schultes, syst. 4. p. 228. Conv. trichocárpus, Spreng. syst. 1. p. 593. Ipomœa Carolìna, Pursh, fl. amer. sept. 1. p. 145.—Dill. elth. p. 100. t. 84. f. 98. Bracteas subulate. Corolla large, pale purple.

Hairy-fruited Ipomœa. Fl. July, Aug. Clt. 1732. Pl. tw.

158 I. longiflòra (R. Br. l. c.) leaves cordate, undivided or 3-lobed, acute; petioles biglandular beneath at the apex; peduncles 1-3-flowered, thickened in the fruit-bearing state; sepals somewhat unequal, obtuse, mutic; corollas very long. ↄ. ◠. S. Native of New Holland, within the tropic. Ip. macrántha, Rœm. et Schultes, syst. 4. p. 251. Conv. longiflòrus, Spreng. syst. 1. p. 595.

Long-flowered Ipomœa. Pl. tw.

§ 5. *Leaves palmately, digitately, or pedately lobed; rarely trifid, or 3-lobed. Flowers not in heads. Capsules and sepals middle-sized.*

* *Peduncles 1-3-flowered.*

159 I. Cóptica (Roth, nov. spec. p. 110. Choisy, in mem. soc. phys. gen. 6. p. 471.) plant herbaceous, smooth; leaves palmate or pedate; leaflets serrated, glabrous; petioles compressed, stipulaceous at the base; peduncles 1-2-flowered, exceeding the petioles; sepals rugosely muricate, glabrous. ⊙. ◠. S. Native of Senegal, East Indies, and Cuba. Ip. Brunètii, Pers. cat. mss. no. 150. Ip. verrucòsa, Ort. dec. p. 10.? Ip. dissécta, Heyne, herb. Conv. Cópticus, Lin. mant. p. 559. Wall. fl. ind. 2. p. 62. Conv. stipulàtus, Desr. in Lam. dict. 3. p. 546. Conv. disséctus, Wall. cat. no. 1351. Stem angular, prostrate, rather long. Leaves palmate or pedate; outer lobes the shortest, and usually bifid: middle ones ovate-lanceolate, acute. Sepals ovate-oblong. Corolla white, tubular, 4-5 lines long, glabrous; lobes acute. Seeds glabrous.

Coptic Ipomœa. Pl. prostrate.

160 I. pentada'ctylis (Choisy, in mem. soc. phys. gen. 6. p. 471.) herbaceous; leaves quinate; leaflets linear-lanceolate or linear, petiolulate, entire, glabrous, obtuse; peduncles exceeding the petioles, 1-2-flowered; sepals glabrous, ovate, obtuse, unequal; outer ones the shortest. ⊙. ◠. S. Native of the East Indies, as on Mount Taong-Dong, near Ava. Conv. pentadáctylis, Wall. cat. no. 1367. Conv. tenuifòlius, Vahl, symb. 3. p. 33. Stem terete. Leaves decreasing in size to the tops of the stems. Corolla tubularly campanulate, glabrous, with the limb hardly spreading. Capsule and seeds glabrous.

Var. β; stem and petioles clothed with long, straight, rufous hairs; leaves a little larger.

Five-fingered-leaved Ipomœa. Pl. tw.

161 I. Horsfa'lliæ (Hook. bot. mag. 3315.) glabrous; leaves quinately digitate: leaflets lanceolate, quite entire, with undulated margins; peduncles about as long as the petioles, bearing dichotomous cymes of flowers; sepals imbricate, obtuse, equal; corolla funnel-shaped. ♃. ⌒. S. Native of Africa, or the East Indies. Corolla of a deep, rich, and glossy rose colour. Stigma capitate, 2-lobed, hairy. Filaments glabrous, upon a hairy scale or gland, which is vaulted beneath. Leaflets generally 5, rarely 6-7. Perhaps a species of *Batàtas*, or a new genus from the vaulted scale at the base of each filament.

Horsfall's Ipomœa. Fl. Dec. Jan. Clt. 1833. Pl. tw.

162 I. ennea'loba (Beauv. fl. d'ow. 2. p. 69. t. 101.) stem angular; leaves palmately 9-lobed: lobes unequal; peduncles 3-flowered; corollas purple. ♃. ⌒. S. Native of Guinea, at Chama. Nearly allied to *I. almàta*, Forsk, but is without any digitate stipulas. Corolla with the tube narrow at the base, and swollen at top.

Nine-lobed-leaved Ipomœa. Pl. twining.

163 I. pulche'lla (Roth, nov. spec. p. 115.) herbaceous, glabrous; leaves quinate; leaflets sometimes entire, sometimes bifid: all elliptic-ovate, petiolate, mucronulate at apex; peduncles about equal in length to the petioles, 1-2-flowered; sepals glabrous: inner ones obtuse: outer ones shorter, acutish; seeds villous. ♃. ⌒. S. Native of the East Indies, at Pagamew and Segaen, &c. Conv. béllus, Spreng. syst. 1. p. 590. Conv. heptaphýllus, Rottl. ex Willd. act. nat. cur. 4. p. 196. Wall. fl. ind. 2. p. 66. Conv. digitàtus, Roxb. ex Wall. cat. no. 1353. Conv. dasyspérmus, Spreng. Wight. herb. Conv. venòsus, Madr. herb. Stem terete. Petioles tubercled. Corolla an inch long, funnel-shaped, small, pale pink, with the bottom of the bell deeper coloured. Capsule glabrous. This is a beautiful delicate, though extensive plant, and uncommonly interesting on account of its slender, pendulous, spiral peduncles, with their pretty small pink flowers, standing erect on their thickened curved apexes.

Pretty Ipomœa. Pl. tw.

164 I. tubercula'ta (Rœm. et Schultes, syst. 4. p. 208. Choisy, l. c. p. 474.) stem glabrous, verrucosely muricated; leaves quinate; lobes lanceolate, mucronate, entire: outer ones often bifid; petioles stipulaceous; peduncles usually 1-3-flowered, longer than the leaves; sepals obtuse, unequal, ovate-oblong, with membranous edges; corolla campanulate, rose-coloured, 2 inches; seeds glabrous, ex Choisy; woolly on the convex side, ex Wall. ♃. ⌒. S. Native of the East Indies, China; Sandwich Islands; South America; Para, Monte Video, and Rio Janeiro, in Brazil; and of the province of Caraccas, on the bank of Lake Tacarigua, where it is called *Vejaquilo* by the natives. Ip. stipulàta, Jacq. schœnb. 2. p. 39. t. 199. Ip. frutéscens, Desf. cat. par. p. 74. Ip. tuberculòsa, Desf. cat. par. p. 74. Ip. tuberòsa, Lour. coch. 112. ed. Willd. 1. p. 138. Conv. tuberculàtus, Desr. in Lam. dict. 3. p. 545. H. B. et Kunth, nov. gen. 3. p. 108. Conv. digitàtus, Wall. fl. ind. 2. p. 65. Rœm. et Schultes, syst. 4. p. 303. Flowers purple, size of those of *Batàtas paniculàta*. Very nearly allied to *Ipomœ'a Caírica*.

Tubercled-stemmed Ipomœa. Fl. Ju. Sept. Clt. 1818. Pl. twining.

165 I. ampelopsifòlia; glabrous, except the petioles, which are glandularly downy; leaves quinate; leaflets lanceolate, serrated, cuspidate; peduncles 1-3-flowered, shorter than the leaves; sepals ovate, obtuse, mutic, each furnished with a dorsal mucrone; outer ones rather the shortest. ♃. ⌒. S. Native of Mexico, near Vera Cruz, among bushes. Conv. ampelopsifòlius, Cham. et Schlecht. in Linnæa, 5. p. 118.

Ampelopsis-leaved Ipomœa. Pl. twining.

166 I. operculà'ta (Mart. reise. bras. ex Linnæa, 5. p. 40.) glabrous; stems winged; leaves pedately 5-parted; segments broad-lanceolate, acuminated, quite entire, or repandly toothed: pedicels solitary or twin, winged; capsule compressed, globose, circumcised. ♃. ⌒. S. Native of Brazil. Conv. operculàtus, Gomez, mem. corresp. acad. lisb. 1812. p. 27. icone.

Operculate-capsuled Ipomœa. Pl. tw.

167 I. dasyspe'rma (Jacq. eclog. 1. p. 132. t. 89.) herbaceous, smooth; leaves tripartite; segments trifid: the larger ones pinnately 5-lobed, with the lower lobes bifid, all glabrous; peduncles 1-3-flowered, shorter than the petioles; sepals ovate, obtuse, unequal, and as if they were cordately spurred at the base before flowering: outer ones the shortest. ☉. ⌒. S. Native of the East Indies, China, New Holland. Ip. tuberculàta, Ker. bot. reg. t. 86, but not of Rœm. et Schultes. Conv. dasyspérma, Spreng. syst. 1. p. 591. Conv. pedàtus, Roxb. fl. ind. 2. p. 63. Stipulas small, filiform, pedate. Flowers in profusion, pretty large, of a bright sulphur colour. Pedicels clavate. Seeds pilose on the ribs. "Leaves pedately tripinnate. Calyx warted," ex Roxb, &c.

Thick-seeded Ipomœa. Fl. Aug. Sept. Clt. 1815. Pl. tw.

168 I. disse'cta (R. Br. prod. p. 487.) glabrous; leaves palmate, 7-parted; segments linear, dentately pinnatifid: middle segment elongated; peduncles 1-2-flowered; calyx half the length of the corolla; sepals ovate, with crested nerves. ☉. ⌒. G. Native on the shores of New Holland, within the tropic. Corolla white, 1 inch long, a little longer than the calyx.

Dissected-leaved Ipomœa. Fl. Ju. Sept. Clt. 1813. Pl. twining.

169 I. sinua'ta (Orteg. dec. 7. p. 84.) stem, petioles, and peduncles very pilose; leaves glabrous, deeply 7-parted; segments sinuated or pinnatifid; peduncles 1-flowered, longer than the leaves; sepals oval, glabrous, acute, nearly equal; corollas campanulate. ♃. ⌒. H. Native of Georgia and Florida, on calcareous hills; and of Cuba, near Havannah, and Regla, in cultivated places. Ip. dissécta, Pursh, fl. amer. sept. 1. p. 145. Conv. disséctus, Lin. mant. p. 204. Michx. fl. bor. amer. 1. p. 139. Jacq. obs. 2. p. 4. t. 28. hort. vind. t. 159. Corollas white, with a reddish throat.

Sinuated-leaved Ipomœa. Fl. June, Sept. Clt. 1813. Pl. twining.

170 I. quinque'loba (Rœm. et Schultes, syst. 4. p. 268.) glabrous; leaves palmately 5-lobed: lobes finely serrulated, obtuse; axils of leaves hairy; peduncles length of petioles, bractless; sepals obtuse, glabrous. ♃. ? ⌒. S. Native of the Island of Santa Cruz. Conv. quinquélobus, Vahl, symb. 3. p. 32. Willd. spec. 1. p. 863. Nearly allied to *I. Caírica* and *Ip. stipulàta*, but differs, in the leaves being smaller, and the peduncles 1-flowered, &c. Lateral lobes of leaves narrower, mucronate. Stipulas 2, small. Corolla subcampanulate, glabrous, purple.

Five-lobed-leaved Ipomœa. Pl. tw.

171 I. pe'ndula (R. Br. prod. p. 486.) glabrous; stems trailing or creeping; leaves quinately digitate; leaflets lanceolate, mucronulate, with entire edges: outer leaflets undivided or bifid; peduncles 1-3-flowered; sepals nearly equal, obtuse, 3 times shorter than the corolla. ♄. G. Native of New Holland, within the tropic; and in New South Wales, about Port Jackson; as well as of New Caledonia, and the Island of Tanna. Conv. mucronàtus, Forst. prod. no. 79. Conv. péndulus, Spreng. syst. 1. p. 590. "Lobes of leaves ciliated, mucronate; peduncles 1-flowered." Forst.

Pendulous-flowered Ipomœa. Fl. May, Oct. Clt. 1805. Pl. trailing.

172 I. PINNATÍFIDA ; glabrous ; leaves pinnately 7-cleft ; segments lanceolate, acuminated, almost quite entire ; peduncles 1-2-flowered, longer than the leaves ; sepals roundish-concave, nearly equal, glabrous. ♃. ◠. S. Native of Cuba, betwixt Havannah and Regla. Conv. pinnatífidus, H. B. et Kunth, nov. gen. 3. p. 108. Stem angularly striated. Leaves ovate in circumference, 2 inches long. Leaflets sometimes furnished with one or two teeth, or quite entire ; intermediate one large, and the lateral ones becoming gradually smaller. Corolla downy outside.

Pinnatifid-leaved Ipomœa. Pl. tw.

173 I. TRÍFIDA ; downy ; leaves cordate, trifid ; segments quite entire ; peduncles 2-3-flowered, longer than the leaves ; sepals glabrous, ovate-oblong, mucronate : outer ones rather the smallest. ♃. ◠. S. Native on the banks of the Orinoco, between Carichana and San Borja, in woods. Conv. trífidus, H. B. et Kunth, nov. gen. amer. 3. p. 107. Conv. hepaticifòlius, Willd. rel. ex Rœm. et Schultes, syst. 4. p. 303. Leaves 1½ inch long ; middle segment oblong, acuminated, mucronate : lateral ones a little shorter, diverging somewhat triangular, having the superior angle acuminated, and the lower one rounded. Corolla funnel-shaped, purple, glabrous, size of those of *Ip. purpùrea*. Perhaps a species of *Pharbìtis*.

Trifid Ipomœa. Pl. tw.

174 I. QUINA'TA (R. Br. prod. p. 486.) glabrous ; leaves quinately digitate ; leaflets lanceolate, quite entire, mucronulate ; peduncles 1-flowered ; sepals obtuse, the inner 2 twice the length of the outer 3, about equal to the middle of the corolla in length. ♃. ◠. S. Native of New Holland, within the tropic, on the sea shore. Very nearly allied to *I. hirsùta*. Convólvulus quinàtus, Spreng. syst. 1. p. 590.

Quinate-leaved Ipomœa. Pl. tw.

175 I. THONNÍNGII ; twining or prostrate, glabrous ; leaves digitately 5-parted ; segments narrow, pinnatifid, serrated ; stipulas palmate ; peduncles 1-flowered, bibracteate in the middle, simple, twin ; sepals oblong, acute, scabrous ; stigma capitate, 3-lobed. ♃. ◠. S. Native of Guinea. I. dissécta, Willd. spec. 1. p. 880. phyt. 1. p. 5. no. 19. t. 2. f. 3. Conv. Thonníngii, Schum. pl. guin. p. 98. Stems angular. Corolla campanulately funnel-shaped, white. Capsule hidden by a calyx, divided by a thin membrane into 3 cells ; cells 1-seeded. Seeds tomentose. Said to be allied to *I. Cópticus* and *I. laciniàtus*. Perhaps a species of *Batàtas*.

Thonning's Ipomœa. Pl. twining.

176 I. Hispaniòlæ ; leaves quinately digitate, glabrous ; leaflets lanceolate, serrated, cuspidate ; peduncles 1-flowered, exceeding the leaves ; sepals obtuse, glabrous. ♃. ◠. S. Native of Hispaniola. Convólvulus Hispaniòlæ, Spreng. syst. 1. p. 590. Stems hairy.

Hispaniola Ipomœa. Pl. twining.

177 I. HIRSU'TA (R. Br. l. c.) plant beset with spreading hairs ; leaves quinately digitate ; leaflets oblong-lanceolate ; peduncles generally 1-flowered ; calyx glabrous ; sepals obtuse, the 2 inner a little longer than the outer 3. ♃. ? ◠. S. Native of New Holland, on the sea-shore, within the tropic. Conv. Brównii, Spreng. syst. 1. p. 590.

Hairy Ipomœa. Pl. tw.

178 I. DIVERSIFÒLIA (R. Br. l. c. p. 487.) glabrous ; leaves palmately 7-parted ; segments linear, dentately pinnatifid : intermediate one elongated, and nearly entire ; peduncles 1-2-flowered ; calyx about equal in height to ¼ of the corolla, which is one inch and more long ; sepals oblong, wrinkled on the nerves. ♃. ◠. S. Native of New Holland, within the tropic. Conv. diversifòlius, Spreng. syst. 1. p. 592.

Diverse-leaved Ipomœa. Pl. tw.

179 I. CAROLÌNA (Lin. spec. 227, but not of Pursh nor Michx.) glabrous ? ; leaves digitate ; leaflets 5-7, lanceolate, attenuated at the base, petiolate ; peduncles 1-flowered ; calyx short. ♃. ◠. S. Native of the Bahama Islands. Willd. spec. 1. p. 880. Pers. ench. 1. p. 183. I. Caroliniàna, Poir. dict. 6. p. 11.—Cat. carol. 2. p. 91. t. 91. Corolla funnel-shaped ; tube green outside, and violet inside : limb purple ; segments reflexed.

Carolina Ipomœa. Fl. July, Aug. Clt. 1732. Pl. tw.

* * *Peduncles many-flowered.*

180 I. PLATE'NSIS (Ker, bot. reg. t. 333.) branches, petioles, and peduncles beset with prickly tubercles ; leaves palmate : lobes 7, cuneate-oblong, bluntish, with a short mucrone : outer ones the smallest ; peduncles few-flowered, cymose at apex, a little longer than the petioles ; sepals nearly orbicular. ♃. ◠. S. Native on the banks of the Plata. Conv. Platénsis, Spreng. syst. 1. p. 591. Root tuberous. Corollas pale purple, size of those of *Batàtas paniculàtus*. Stigma capitate, hardly lobed.

Plata Ipomœa. Fl. Ju. Sept. Clt. 1817. Pl. tw.

181 I. SETÒSA (Ker. bot. reg. t. 335.) branches, petioles, and peduncles hispid from bristles ; leaves naked, cordate, 3-lobed : lobes dentately sinuated ; peduncles robust, longer than the petioles, many-flowered, trichotomously cymose ; sepals oblong. ♃. ◠. S. Native of Brazil. Conv. setòsus, Spreng. syst. 1. p. 594. Root tuberous ?. Corolla salver-shaped, purplish red, size of those of *Batàtas paniculàtus*. Stigma globose. Said to be nearly allied to *Ip. platanifòlius*, and *Batàtas edùlis*.

Bristly Ipomœa. Fl. Aug. Oct. Clt. ? Pl. tw.

182 I. VESICULÒSA (Beauv. fl. d'ow. 2. p. 73. t. 106.) plant beset with numerous vesicles ; leaves palmately 5-7-lobed : lobes unequal ; peduncles 4-6-flowered ; corollas purple. ♃. ◠. S. Native of Guinea, in the kingdom of Waree, in woods. Axils of the leaves woolly.

Vesiculose Ipomœa. Pl. tw.

183 I. PALMA'TA (Forsk, descript. p. 43. Rœm. et Schultes, syst. 4. p. 207.) glabrous ; leaves palmate ; leaflets 5, serrulated, outer ones bifid : stipulas foliaceous, palmate : axils woolly ; peduncles longer than the leaves, dichotomously corymbose ; sepals glabrous, ovate, obtuse. ♃. ◠. G. Native of Egypt, Guinea, also of the Sandwich Islands. Conv. Caíricus, Lin. spec. 222. Vahl, symb. 1. p. 15. Willd. spec. 1. p. 863. Sims, bot. mag. 699. Conv. Ægy'ptius, Berl. ægypt. p. 73. t. 74. Ip. Caírica, Sweet, hort. brit. p. 287.—Barrel, icon. t. 30. Corolla campanulate, purple. Seeds woolly.

Palmate-leaved Ipomœa. Fl. Ju. Sept. Clt. 1680. Pl. tw.

184 I. PES-TÍGRIDIS (Lin. fl. zeyl. 79. spec. 230. Wall. fl. ind. 2. p. 93.) leaves palmate, 5, rarely 7-lobed : lobes ovate, entire, clothed with silky hairs ; peduncles many-flowered, equal in length to the leaves ; flowers aggregate ; bracteas 6-8, surrounding the head of flowers, and longer than it. ⊙. ◠. S. Native of the East Indies, as of Travancore, Sukanagur, banks of the Irawaddi, Ceylon, Java, &c. Conv. pes-tígridis, Spreng. syst. 1. p. 455. Conv. bryoniæfòlius, Sal. prod. p. 125. Convolvuloìdes palmàta, Mœnch. meth. 452.—Dill. elth. 420. t. 318. f. 411.—Rheed, mal. 11. p. 121. t. 59.—Knip. cent. 9. t. 53.—Herm. lugdb. 184. t. 187.—Act. bonn. 2. p. 362. t. 23. f. 2. Hairs on the stem furnished with glands at the base. Lobes of leaves acute, 1-2 inches long. Bracteas bluntish, hairy, ovate, linear. Sepals ovate, acuminated, hairy outside. Corolla hairy outside, funnel-shaped, purplish. Capsule glabrous. Seeds rather villous.

Tiger's-foot-leaved Ipomœa. Fl. Aug. Oct. Clt. 1732. Pl. tw.

184 I. AGGREGA'TA (Poir. suppl. 4. p. 633. Choisy, in mem. soc. phys. gen. 6. p. 455.) leaves palmate, 7-lobed, pilose; peduncles long; flowers sessile, aggregate, surrounded by 10-12 ovate-oblong, unequal, pilose, involucra-formed bracteas. ♄. ⌒. G. Native of Cochinchina. Convólvulus aggregàtus, Lour. coch. p. 109. Poir. suppl. 3. p. 471. Stem very hairy, terete. Lobes of leaves acutish, ovate, entire. Sepals lanceolate, pilose. Corolla tubular, 5-cleft, large, white; segments acute, hairy, closed.

Aggregate-flowered Ipomœa. Shrub tw.

185 I. VITIFÒLIA (Sweet, hort. brit. p. 289. Blum. bijdr. 709.) leaves cordate, palmately 5-cleft: lobes finely toothed; peduncles many-flowered; corolla orange yellow. ♄. ⌒. S. Native of the East Indies, as of Silhet, Travancore, Malabar, &c. Conv. vitifòlius, Lin. mant. p. 203. Burm. ind. 45. t. 18. f. 1. Wall. fl. ind. 2. p. 61. Conv. angulàris, Roxb. herb. Stems terete, downy, or with a few villi. Leaves lobed to the middle, variously pilose; lobes unequal, irregularly crenate-toothed. Sepals ovate-lanceolate, blackish. Capsules large, and are, as well as the black seeds, glabrous.

Vine-leaved Ipomœa. Fl. June, Sept. Clt. 1820. Shrub twining.

186 I. ANGULA'RIS (Choisy, in mem. soc. phys. gen. 6. p. 454.) leaves cordate, 5-lobed: lobes short, entire, acute; peduncles 3, many-flowered; corolla orange-yellow. ♄. ⌒. S. Native of Java. Conv. angulàris, Lin. mant. 203. Burm. ind. 46. t. 19. f. 2. Hardly more than a variety of *I. vitifòlia*. Capsule large.

Angular-leaved Ipomœa. Shrub twining.

187 I. TUBERÒSA (Lin. hort. ups. p. 39. spec. 227.) glabrous; leaves palmately 7-parted: lobes elliptic-lanceolate, entire; peduncles dichotomous; sepals equal, an inch long. ♃. ⌒. S. Native of tropical America, Madras, Islands of Bourbon, France, Ceylon, &c. Jacq. amer. p. 37. Ker, bot. reg. 768, but not of Lour. Conv. tuberòsus, Spreng. syst. 1. p. 591.—Sloane, jam. 56. hist. 1. p. 152. t. 96. f. 2. Stems terete. Lobes of leaves acute, 1-3 inches long. Petioles 3 inches long. Flowers solitary, and pedicellate in the forks, and spicate along the branches of the peduncle. Sepals ovate, obtuse. Corolla 2 inches long, tubularly campanulate, yellow. Capsule large. Seeds large, black.

Var. β. uniflòra (Choisy, in mem. soc. phys. gen. 6. p. 453.) peduncles 1-flowered; sepals acutish. ♃, ⌒. S. Native of South America. Convólvulus gossypifòlius, H. B. et Kunth, nov. gen. amer. 3. p. 107. Conv. macrocárpus, Spreng. syst. 1. p. 592.

Tuberous-rooted Ipomœa. Fl. Aug. Oct. Clt. 1731. Shrub twining.

188 I. HEPATICIFÒLIA (Lin. spec. 230. Burm. ind. 50. t. 20. f. 2.) very hairy; leaves 3-lobed: lobes very blunt; peduncles equal in length to the petioles; flowers capitate, involucrated; bracteas ovate-linear. ⊙. ⌒. S. Native of Ceylon and China. Convólvulus hepaticifòlius, Spreng. syst. 1. p. 594. Stems simple. Leaves deeply lobed; lobes sometimes entire, subemarginate, ovate; middle one coarctate at the base, more than an inch long. Corolla purplish.

Hepatica-leaved Ipomœa. Fl. Aug. Sept. Clt. 1759. Pl. twining.

189 I. PEDA'TA; glabrous; leaves pedately 3-5-cleft: lobes lanceolate, obtuse, mucronate; peduncles cymose; sepals rounded: inner ones the largest. ♄. ⌒. S. Native of Guayaquil. Flowers purple, funnel-shaped. (v. s. in herb. Ruiz, et Pav.)

Pedate-leaved Ipomœa. Shrub twining.

190 I. PARVIFLÒRA (Vahl, symb. 3. p. 34.) glabrous; leaves cordate, palmately 5-lobed; umbels axillary, pedunculate; calyx and capsules hairy; sepals ovate, mucronate, length of capsule. ⊙. ⌒. S. Native of the Island of Santa Cruz. Willd. spec. 1. p. 885. Pers. ench. 1. p. 185. Conv. Sloànei, Spreng. syst. 1. p. 593.—Sloane, jam. p. 55. hist. 1. p. 153. t. 97. f. 1. Ip. tríloba and I. sanguínea of some gardens. Nearly allied to *I. tríloba*, but differs in being glabrous, not hairy; stem triangular, from decurrent lines. Leaves 1½ inch long; lobes lanceolate, obtuse, mucronate: outer ones gibbous at the base, outside. Pedicels muricated. Flowers small, purplish.

Small-flowered Ipomœa. Fl. July, Oct. Clt. 1822. Pl. tw.

191 I. UMBELLA'TA (Lin. spec. 227.) glabrous; leaves digitate; leaflets 7, nearly equal, lanceolate, entire, acuminated; peduncles very short, sub-umbellate. ♃. ⌒. S. Native of tropical America. Poir. dict. 6. p. 10. Conv. septenàta, Spreng. 1. p. 591.—Plum. spec. 3.—Burm. amer. p. 81. t. 92. f. 2. Tourn. inst. p. 116. Flowers scarlet. Stamens exserted. Capsule glabrous, oblong, acuminated, 3-celled. Perhaps a species of *Quámoclit*.

Umbellate-flowered Ipomœa. Fl. June, July. Clt. 1739. Pl. tw.

192 I.? CLAU'SA (Rudolph. ex Led. dec. pl. dom. no. 5.) leaves ternate or quinate; peduncles dichotomous, many-flowered; corollas tubular, closed. ♃.? ⌒. S. Native of St. Domingo.

Closed-flowered Ipomœa. Pl. tw.

§ 6. *Leaves entire at both ends, never cordate. Flowers not crowded into heads. Capsules and sepals middle-sized.*

193 I. BUCHANA'NI (Choisy, in mem. soc. phys. 6. p. 474.) glabrous; leaves linear-lanceolate, acuminated, on short petioles, entire: peduncles ½ an inch long, 1-3-flowered; sepals ovate, glabrous. ⊙.? ⌒. S. Native of Bengal. Ip. salicifòlia, Roxb. in Wall. fl. ind. 2. p. 88. Stem terete. Leaves 3-8 inches long. Corolla white, with a cylindrical tube, 1½ inch long, and an obscurely divided limb. Cells of capsule 3-seeded, ex Wall.

Buchanan's Ipomœa. Fl. May, July. Clt. 1816. Pl. tw.

194 I. LINIFÒLIA (Blum. bijdr. p. 721.) plant rather pilose; leaves linear, quite entire, blunt at both ends, mucronulate, sometimes somewhat hastate at the base; peduncles axillary, about equal in length to the leaves, few-flowered; sepals obtuse, glabrous. ⊙.? ⌒. S. Native of the Moluccas.

Flax-leaved Ipomœa. Pl. tw.

195 I. PHILIPPE'NSIS (Choisy, in mem. soc. phys. gen. 6. p. 475.) glabrous; leaves linear, mucronulate, glabrous, on short petioles, entire; peduncles terete, 1-flowered, about ½ an inch long; sepals ovate, rather mucronulate: outer ones a little smaller. ♃.? ⌒. S. Native of the Philippines, and China, near Wangoo. Stem terete, filiform. Leaves 1-2 inches long, and 1-2 lines broad; petioles ciliated. Peduncles glabrous, bibracteate. Corolla unopen, a little larger than the calyx. Capsule pea-formed, glabrous.

Philippine Ipomœa. Pl. tw.

196 I. GRAMÍNEA (R. Br. prod. p. 414.) glabrous; leaves long-linear, mucronate, quite entire; peduncles 1-flowered; sepals obtuse; corollas very long. ♃.? ⌒. S. Native of New Holland, within the tropic, on the shore. Conv. gramíneus, Spreng. syst. 1. p. 607.

Grassy-leaved Ipomœa. Pl. tw.
